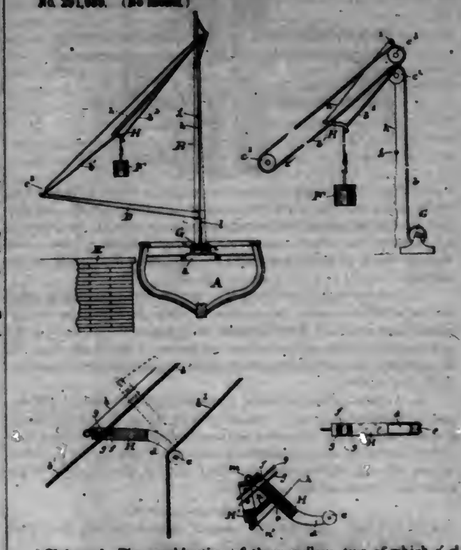
Claim.—1. In a faucet, the combination, with the shell or casing, of a stem and valve operating therein, the lower cam *b*, having the rectangular lug *b'* upon its under side, and detachably connected to the upper end of the stem, the guiding-partition B, removably clamped in position and having a rectangular opening K, in which the rectangular lug operates, and a handle and connections, substantially as set forth.



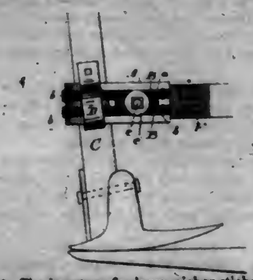
2. In a faucet, the combined valve and stem formed of two hollow hemispheres connected together, and each having a stem section or extension in combination with a shell, handle, and connections, substantially as set forth.

3. In a faucet, the combined valve and stem consisting of two hollow hemispheres or sections connected together, and each having a stem section or extension, one valve section or hemisphere having an enlargement provided with a central passage connecting with the chamber of the valve and branching out through said enlargement into lateral passages, in combination with a shell, handle, and connections, substantially as set forth.

4. In a faucet, the hollow apertured upper valve having an enlargement at one side provided with a central passage branching into lateral passages through the corner edges of said enlargement, a stem-extension projecting from said enlargement, the lower valve E, fitted upon said stem-extension, in combination with a shell, handle, and connections, substantially as shown and described.

5. In a faucet, the hollow valve and the solid elastic ball or cushion D, loosely arranged within said hollow valve, in combination with a shell, handle, and connections, substantially as set forth.

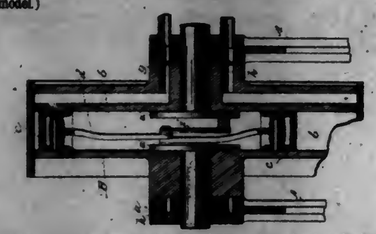
408,702. APPARATUS FOR LOADING OR UNLOADING VESSELS. JOHN D. FISHER, Baltimore, Md. Filed Nov. 23, 1888. Serial No. 291,699. (No model.)



Claim.—1. The combination of three pulleys, two of which c' c^2 are near together and the other c^3 at a lateral point therefrom, one winch, rope arranged over said pulleys to form a lateral carrier-stretch b', and a lift-stretch b^3, a clutch coacting with said two stretches of rope, and a cord A, attached to the clutch for actuating it, as set forth.

2. The combination of three pulleys, two of which c' c^2 are near together, and the other c^3 at a lateral point therefrom, one winch, a rope passing from the winch to the first pulley c', then laterally to the second pulley c^2, thereby forming a carrier-stretch b', thence to the third pulley c^3, and then down to form a lift-stretch b^3, and a clutch coacting with said carrier-stretch and lift-stretch, for the purpose set forth.

3. The combination of a rope lift-stretch b^3, a carrier-stretch, both of said stretches passing over pulleys, a rope-clutch having a body provided with a slot through which the lift-stretch passes freely, and having two pivoted clutch-plates *g*, between which the carrier-stretch b' passes, and a cord *h*, attached to the said clutch for actuating it, as set forth.

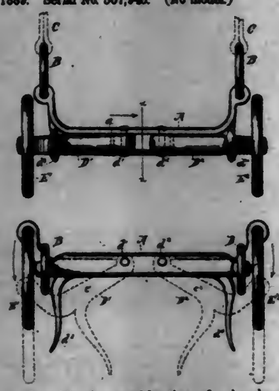


408,703. LUG-STRAP FOR LOOM PICKER-STICKS. CHARLES C. FOLLETT, Waterville, Me. Filed Jan. 26, 1889. Serial No. 297,943. (No model.)

Claim.—1. The lug-strap for loom picker-sticks, consisting of a metal bar bent or folded to form a loop, combined with a leather or other elastic lining for said strap extending from end to end thereof, substantially as shown.

2. The lug-strap for loom picker-sticks, consisting of a pair of metal bars bent or folded on their centers and embracing a single inner strap or lining of elastic material having longitudinal slots in its ends, said metal strap being secured to said inner strap, one at each side of said longitudinal slots, substantially as shown.

408,704. STEAM-ENGINE. ALFRED J. FOULDS and HENRY A. FOULDS, Philadelphia, Pa. Filed Oct. 8, 1888. Serial No. 287,501. (No model.)



Claim.—1. A steam-engine consisting of a wheel, cylinders carried thereby extending inwardly eccentrically, pistons in the said cylinders, rods having pivoted connections with the pistons, and a stationary shaft for the ends of each pair of rods of opposite cylinders, said rods having a pivoted connection at each end, substantially as described.

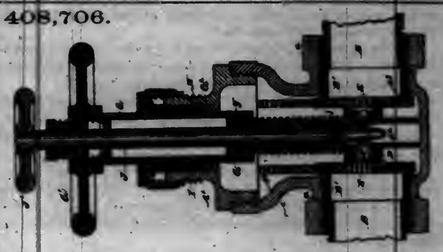
2. A steam-engine consisting of a wheel, cylinders carried thereby, pistons within the same, two stationary shafts having a supporting-plate i between them, the said shafts being placed eccentrically to the center of the wheel, and rods from the pistons to the shafts, the rods of oppositely-placed cylinders being pivoted on the same shaft, substantially as described.

3. A steam-engine consisting of a wheel, cylinders carried thereby, pistons within the same, a stationary shaft for each pair of pistons, piston-rods pivotally connected between the stationary shafts and their pistons, and induction and eduction ports at one side for the cylinders of one pair and like ports on the other side for the cylinders of the other pair, substantially as described.

408,705. BRIDLE-BIT. AMOS F. GERALD, Fairfield, Me. Filed Apr. 20, 1889. Serial No. 307,945. (No model.)

Claim.—1. In a bit, the combination of a bar having a trough-shaped middle portion, and the upwardly-turned ends provided with rings, and two other bars having their ends fitted in said trough-shaped portion and pivotally secured in place, substantially as specified.

2. In a bit, the combination of a bar, two other bars pivotally connected at the inner end thereto, provided with rearward projections between their inner and outer ends, and having their outer ends forwardly curved, substantially as specified.

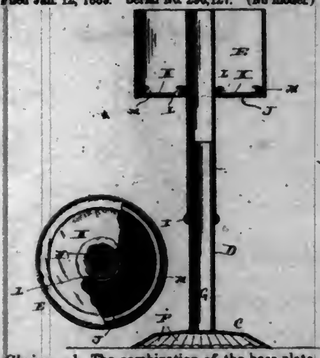


3. In a bit, the combination of a bar A, having a trough-shaped middle portion, and the bars D' D^2, pivotally connected within the trough-shaped middle portion of the bar A, provided with projections d^3 d^4, and having their outer ends forwardly curved, substantially as specified.

408,706. STOP-VALVE. RICHARD S. GILLESPIE, Hamilton, Bermuda. Filed Apr. 29, 1889. Serial No. 309,034. (No model.)

Claim.—1. In a valve, the casing A, carriage D, and disks E, carried by the carriage, but free to move apart and together, in combination with each other and with the separately-operated screw J, provided with a tapering portion J^3, arranged to force the disks apart or to relax such force, all substantially as herein specified.

2. In a valve having a carriage D, with disks E, carried thereby, but capable of movement apart and together, and also of revolving on their axes, the tapering rod J, screw-threaded at *j*, and means J'

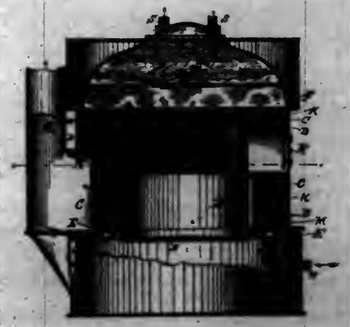


408,706.

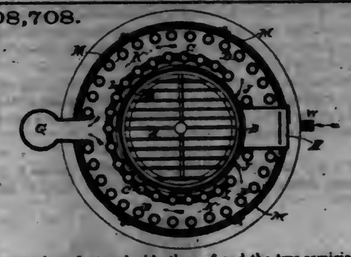
for turning it at will, in combination with each other and with the racks A^3, arranged to revolve the disks as they are raised and lowered, all substantially as herein specified.

3. In a valve having a carriage D, with disks E, carried thereby, and means, as the screw-threaded tapering rod J J^2 *j* and hand-wheel J', for forcing the disks apart and relaxing the force at will, the bushings B', of yielding and incorrodible material, arranged to serve the double function of seats for the disks and of an incorrodible connection between the casing A and the pipes B, as herein specified.

408,707. COFFEE-POT. HANSON GOODRICH, McLeansborough, Ill. Filed Jan. 12, 1889. Serial No. 296,127. (No model.)



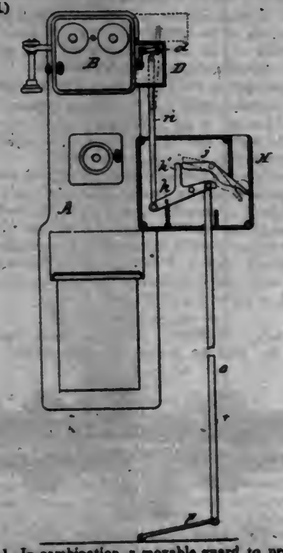
Claim.—1. The combination of the base-plate, the tube rising from the base-plate and composed of two sections, the lower section being secured to the base-plate and the upper section fitting over the lower section, the spring-collar mounted on the lower section and supporting the upper section, and the cup secured upon the upper section of the tube and having a perforated bottom, as set forth.



2. The combination of the base-plate, the telescopic tube rising therefrom, the cup secured to the said tube and having a perforated bottom, the straining-cloth covering the said perforated bottom, and the clamping-rings binding the edges of the said cloth around the tube and against the sides of the cup, as specified.

408,708. STEAM-GENERATOR. EDWARD F. GORDON and HORATIO HOBBS, Concord, N. H.; Armenia W. Hobbs administratrix of said Horatio Hobbs, deceased. Filed Nov. 24, 1886. Serial No. 219,735. (No model.)

Claim.—1. In a steam-generator, the water-ring E and water and steam space F, united by the two series of vertical water-pipes C D surrounding the fire-pot, in combination with the lateral feed-door



408,708.

H, the openings J at each side thereof, and the two semicircular flues K, leading thence to the funnel G, substantially as set forth.

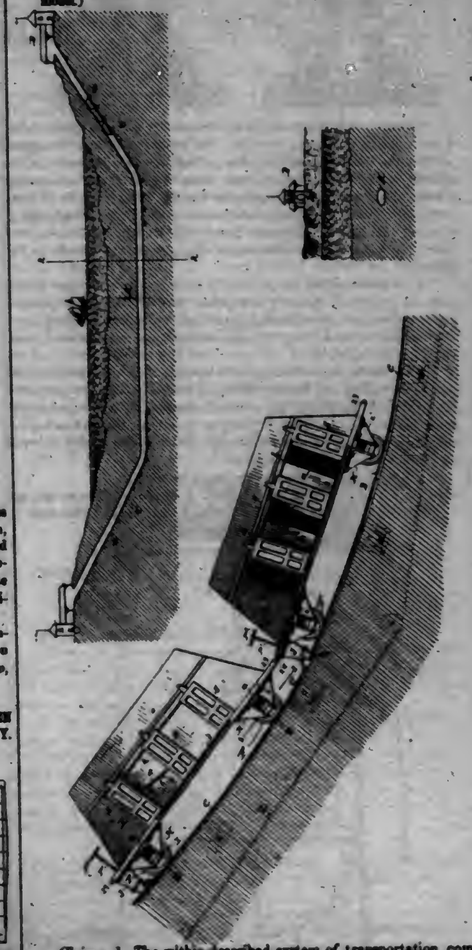
2. In a steam-generator, the water-ring E and water and steam space F, connected by the two series of vertical water-pipes C D, and having a suitable feed-opening, in combination with the fire-pot surrounded by said pipes, with flue-opening J and funnel G on opposite sides of the fire-pot, and with semicircular flues K K connecting them, substantially as set forth.

408,709. COIN-CONTROLLED APPARATUS FOR TELEPHONES. WILLIAM GRAY, Hartford, Conn. Filed Aug. 13, 1888. Serial No. 282,676. (No model.)

Claim.—1. In combination, a movable guard to prevent access to the crank or button of the telephone, a tilting lever having an arm, a rod connecting the lever and guard, a coin-controlled lever arranged to engage the arm of the tilting lever and to project into the coin-channel, an inclosing-box having a coin-channel, and a rod to operate the tilting lever, substantially as described, and for the purpose specified.

2. The combination of the hinged cover D, the rod *n*, the coin-box H, having fulcrumed therein the tilting lever A, having projection *k'* and the coin-controlled lever *j*, and the rod *e*, having a treadle *p*, substantially as described.

408,710. METHOD OF ORNAMENTING OPEN-MESH WOVEN MATERIAL WITH PLASTICS. JOHN H. HARDING, New York, N. Y. Filed Mar. 10, 1888. Serial No. 266,916. (No specimens.)



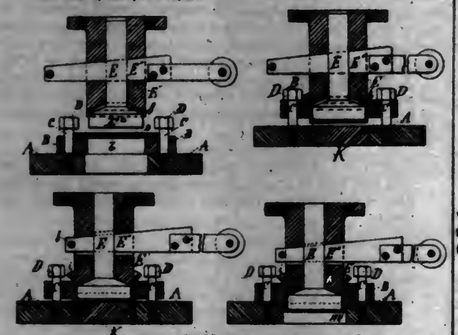
Claim.—1. The method of ornamenting coarse or fine open-meshed material, the same consisting in placing beneath the open-meshed material absorbent paper or like absorbent material, and pouring over the open-meshed material a semi-liquid plastic in any desired form, which adheres to the open-meshed material and absorbent paper beneath, substantially as set forth.

2. The method of ornamenting coarse or fine meshed material, the same consisting in placing beneath the open-meshed material absorbent paper or other absorbent material, and pouring over the open-meshed material a semi-liquid plastic in any desired form, which adheres to the open-meshed material and absorbent paper beneath, and then finishing the same in bronze while the plastic is soft, then removing the absorbing material, and leaving the ornamentation upon the open-meshed fabric, substantially as set forth.

3. The method of ornamenting coarse or fine open-mesh material, the same consisting in placing woven-wire fabric or like material upon absorbent paper or similar absorbent material, and then placing over the wire fabric or other open-mesh material a stencil pattern or design of desired form, and pouring over and through the same a semi-liquid plastic which fastens itself into and around the meshes of the wire fabric or other open-woven material, substantially as set forth.

4. The method of ornamenting coarse or fine open-mesh material, the same consisting in applying thereto a semi-liquid plastic material and bronzing the same while the plastic is soft and adhesive, substantially as set forth.

408,711. SYSTEM OF TRANSPORTATION. BENJAMIN S. HEMMING, New York, N. Y., assignor to the Hemming Gravity Tunnel Company, of West Virginia. Filed May 1, 1888. Serial No. 272,496. (No model.)

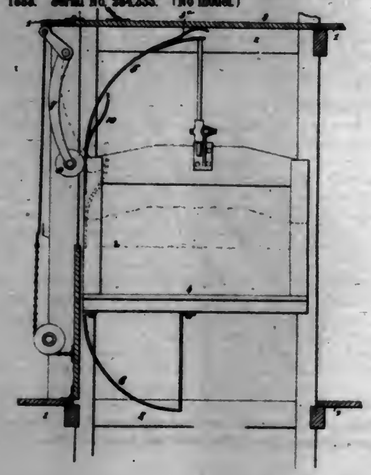


Claim.—1. The within-described system of transportation, comprising a single track inclined at both ends from an intermediate lower

portion, two traveling cables moving upwardly in opposite directions, each at one of the inclined ends of the track, and cars provided with cable-grips constructed to pass each cable without engaging when the car is moving downward on either incline and to automatically engage the cable when the car is moving upward on either incline, substantially as described.

2. The combination, with the track inclined at the ends and with the cables moving in opposite directions, of cars provided with grips, each constructed to grip automatically one only of the said cables, substantially as described.

408,712. PAPER-BOX-MAKING MACHINE. HERMANN HENSCHEL, Luckenwalde, Prussia, Germany. Filed Aug. 8, 1887. Serial No. 246,471. (Model.) Patented in Germany Jan. 27, 1887, No. 40,405, and in England Oct. 4, 1887, No. 13,416.



Claim.—1. In combination, the female die having a plain cylindrical opening extending through it to a point at or near its upper surface, the cutting-plunger E', having cutting-edges to pass into the opening in said die and cut a blank from the body of the material when it reaches said upper surface of the die, and a male die E^2, carried by the plunger projecting at all times beyond the cutting-edge *f*, whereby the body of the material will first be pressed to form the box by the male die and then cut by the edge *f*, substantially as described.

2. In combination, the female die B, the cutting-plunger E, the male die projecting normally beyond the cutting-edge of said plunger and arranged movably in said plunger, the said female die being movable, means for controlling the male die, and an anvil or plate K, substantially as described.

3. In combination, the female die having an opening therethrough, means for cutting and forming the blank and for forcing the same partially through the female die, so that its lower edge will project therefrom, and the anvil or plate K, adapted in size to afford a bearing for the projecting edge of the box, the said female die and anvil K being movable, substantially as described.

408,713. HATCHWAY. EMILE J. HERMAN, St. Louis, Mo., assignor to the Safety Hatch Door Company, same place. Filed Sept. 1, 1888. Serial No. 284,333. (No model.)

Claim.—1. The combination, with a series of tooth-bars, of distance-pieces separating the said bars and a continuous wire rope at the front and rear of the narrow passing through and fitting closely in holes in each of the tooth-bars and having its ends rigidly secured to the end bars of the series, substantially as and for the purpose set forth.

2. In a narrow, the combination, with a series of tooth-bars, of castings secured in the said bars and provided with a socket at each end, the distance-pieces having their ends inserted loosely in the said sockets and keeping the bars apart, and a continuous wire rope at the front and rear of the narrow passing through holes in each of the tooth-bars and having its ends rigidly secured to the end bars of the series, substantially as and for the purpose set forth.

408,718. VELOCIPEDE-SADDLE. THOMAS B. JEFFERY, Chicago, Ill. Filed Dec. 4, 1886. Serial No. 220,686. (No model.)

Claim.—1. In combination with the perch, an elastically-tensile seat and its support at one end secured to the perch, the spring-support at the other end pivoted to the perch at a point below the seat and between the vertical planes of its ends, and a stop to limit the motion of said support toward the other end, substantially as set forth.

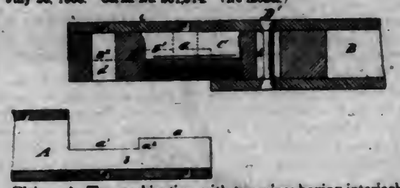
2. In combination with the perch, an elastically-tensile seat and its spring-support at one end secured to the perch and yielding longitudinally with respect to the seat, the spring-support at the other end pivoted to the perch at a point below the seat and between the vertical planes of its ends, and a stop to limit the motion of said support toward the other end, substantially as set forth.

3. In combination with the perch, the clip pivoted thereto and having sockets d^3, and the spring bowed and secured above to the seat and having its ends secured by being inserted in said sockets, said clip being provided with the extension d^{30}, which projects forward of its pivot and is stopped against the perch, substantially as set forth.

4. In combination with the perch, the seat and its support at one end secured to the perch, the support at the other end also secured to the perch and adapted to oscillate in a vertical plane, and the yielding stop secured to the perch and extended above said oscillating seat-support to limit yieldingly its upward movement, substantially as set forth.

5. In combination with the perch, the seat and its support at one end secured to the perch, its support at the other end pivoted to the perch at one end and at the other end secured to the seat and adapted to oscillate vertically, and the yielding stop secured to the perch and extended above said oscillating support to limit yieldingly the upward movement, substantially as set forth.

6. In combination with the perch, the seat and its support at one end secured to the perch, the support at the other end also secured at one end to the perch and at the other end to the seat and adapted to oscillate vertically, and a yielding stop secured to the perch and located below said oscillating support to limit yieldingly its downward movement, substantially as set forth.



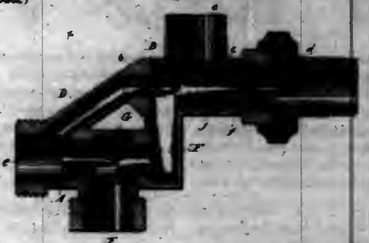
7. In combination with the perch, the seat and its support at one end secured to the perch, its support at the other end also secured at one end to the perch and at the other end to the seat and yielding intermediately, and a stop to limit the downward movement of said support, substantially as set forth.

8. In combination with the perch and the seat, the spring comprising the spiral coil C, the wire running from one end of it being stopped on the seat and that running from the other end being stopped on the perch, and the entire spring being secured to the perch on a pivot passing through the spiral coil, substantially as set forth.

9. In combination with the perch and the seat, the spring comprising the two spiral coils C C, stopped above against the seat and connected below by the yoke C^3, which constitutes a means of stopping the lower ends on the perch, substantially as set forth.

10. In combination with the perch and the seat, the spring comprising the spiral coils C C, formed of one piece of wire and joined by the loop C' and having said loop connected to the seat, and the yoke C^3, connecting the ends of the wire of which the coils are formed and serving to stop the spring on the perch, said spring being secured to the perch on a pivot through the coils, substantially as set forth.

408,719. PIPE-JOINT. HENRY JOHNSON, Jersey City, N. J. Filed July 23, 1888. Serial No. 281,314. (No model.)



Claim.—1. The combination, with two pipes having interlocking end portions, of a plug arranged within the pipes and extending across said interlocking end portions, and rivets or bolts extending through the pipes and the plug, substantially as herein described.

2. The combination, with two pipes having interlocking end portions, of a plug arranged within said pipes and extending across said interlocking end portions, said plug being provided with transversely-extending apertures, and rivets or bolts extending through said pipes and the apertures in the plug, said apertures being larger than the exterior of the rivets or bolts, substantially as and for the purpose herein described.

408,720. METHOD OF ROLLING AXLES. JOHN B. JOHNS, Philadelphia, Pa. Filed Apr. 10, 1889. Serial No. 306,947. (No model.)

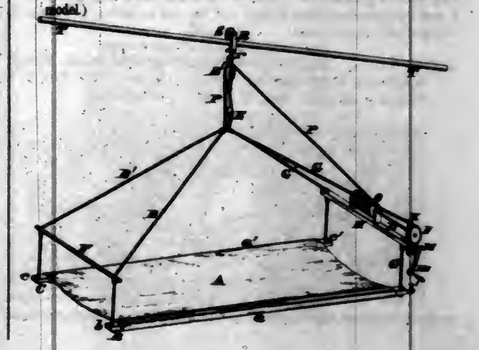
Claim.—1. The herein-described method of making axles, which consists in first passing a bar of metal between a pair of rolls provided with grooves constructed to form a tapering passage; secondly, giving said bar a partial rotation, and, thirdly, again passing it between the rolls, in the manner and for the purpose specified.

408,714. INJECTOR FOR STEAM-BOILERS. LOVREN R. HOGUE, Greenville, Mercer County, Pa. Filed Mar. 15, 1889. Serial No. 303,490. (Model.)

Claim.—1. In an injector, the combination, with the shell formed with two barrels, of the inclined tube D, the chamber F, connecting the two barrels, and the nozzle *b* and valve J upon opposite sides of the overflow, substantially as shown and described.

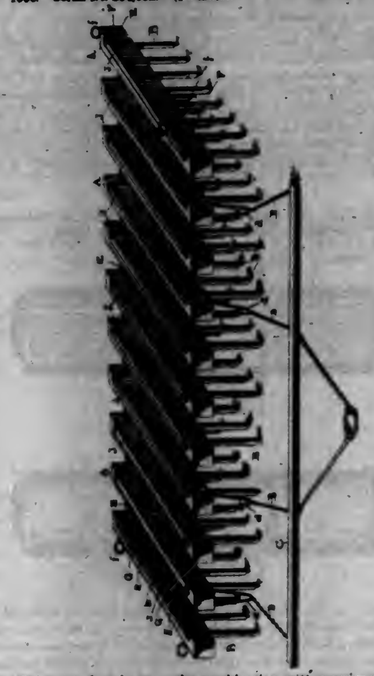
2. In an injector, the combination, with the shell formed with two barrels and the inclined tube D, arranged as shown, of the forcing-tubes H and I in one of said barrels, the nozzle *b* in the other, and the valve *f* in the barrel with said nozzle upon the opposite side of the overflow, substantially as shown and described.

3. In an injector, the combination of the shell formed with two barrels, the tubes H and I, the nozzle *b*, the seats *c* and *e*, and the valve J, having valve *f*, substantially as shown and described.



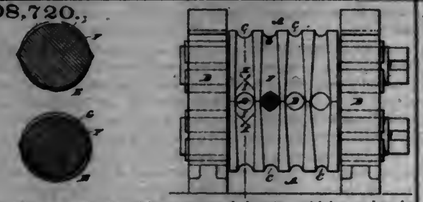
4. In an injector, the combination of the shell formed with two barrels, the inclined tube D, the chamber F, connecting said barrels, the tubes H and I in one of said barrels, the nozzle *b* in the other barrel, the seats *c* and *e*, the valve J, and the valve *f* on said valve J, substantially as shown and described.

408,715. INJECTOR. LOVREN R. HOGUE, Greenville, Mercer County, Pa. Filed Mar. 15, 1889. Serial No. 303,491. (No model.)



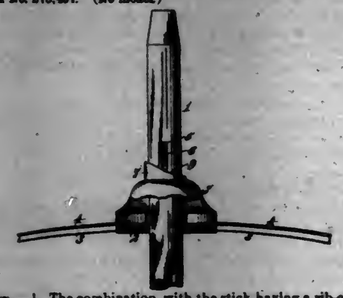
Claim.—In an injector, the combination, with the shell A, formed with the seat *h*, of the nozzle *c*, the tube F, extended through said nozzle and having tapered end, as shown, with a passage *i* around the tube at the end of the nozzle *c*, the tube H, having its inner end embracing the tapered end of the tube F and guided by the walls forming said seat *h*, and the valve on the other end of the tube H and bearing on said seat, substantially as shown and described.

408,716. INVALID ELEVATOR AND CONVEYER. TYREE L. HOLTON, Maysville, Ky. Filed Apr. 22, 1889. Serial No. 308,073. (No model.)



Claim.—The combination, in an invalid elevator and conveyer, of the flexible sling A, slotted side rails B *b* B' C *c*, suspenders D D' G G', engaged with the slots of said rails and attached to a common elevated support, as the sheave E, a spreader H, carried by the suspenders G G' and having a drum O, a hoisting-rope P, coiled around said drum, an upper sheave E', through which said rope is passed before being attached to said common support, a traveler R, that carries said upper sheave E', and an elevated track T, upon which said traveler runs, as herein described.

408,717. HARROW. MARSHALL E. HOWE, Davenport, Iowa, assignor of one-half to HIRAM P. Goodwin, same place. Filed Aug. 26, 1888. Serial No. 284,002. (No model.)



Claim.—1. In a harrow, the combination, with a series of tooth-bars, of distance-pieces separating the said bars and a continuous wire rope at the front and rear of the harrow passing through and fitting closely in holes in each of the tooth-bars and having its ends rigidly secured to the end bars of the series, substantially as and for the purpose set forth.

408,720.

2. The method of making taper-rolled axles, which consists in first passing a bar of metal into tapering passages; secondly, giving the bar a partial rotation; thirdly, reversing the rolls in the opposite direction, and, fourthly, passing the bar into or through the rolls, in the manner and for the purpose substantially as described.

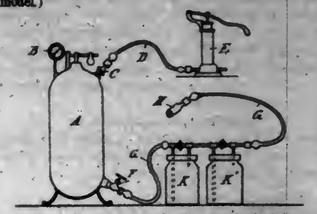
408,721. UMBRELLA OR PARASOL. HERMANN A. L. C. KAHLE and FREDERICK W. KIRCHHOFF, New Orleans, La. Filed May 29, 1888. Serial No. 275,467. (No model.)

Claim.—1. The combination, with the stick having a rib-carrying disk and a vertically-sliding sleeve for binding the cover in place, of a laterally-projecting spring-pin connected with the stick and springing into engagement with the sleeve when the latter is moved down upon the cover, substantially as described.

2. An umbrella or parasol consisting of a stick having a stationary rib-carrying disk, a vertically-sliding sleeve mounted on the stick above said disk to clamp the cover thereupon, tips stitched to the cover and detachably engaging the ribs, and a spring secured to the stick and provided with a laterally-projecting pin which springs into engagement with the sleeve when the latter is moved down upon the cover, substantially as described.

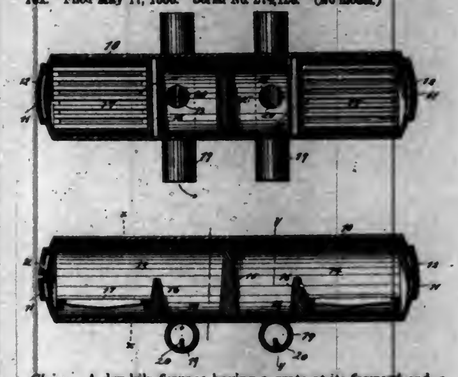
3. An umbrella or parasol consisting of a stick having a rib-carrying disk and provided with a spring having a lateral pin, a rotating and vertically-sliding sleeve having an inclined upper end and a collar at its lower end, the cover and tips stitched to the cover and detachably engaging the ribs, substantially as described.

408,722. JOINT FOR UMBRELLA RIBS AND STRETCHERS. HOWARD R. KEMP, Gloucester City, N. J., and HERBERT E. MARSDEN, Philadelphia, Pa., assignors of one-third to Charles T. Schoen, Philadelphia, Pa. Filed Feb. 19, 1888. Serial No. 300,413. (No model.)



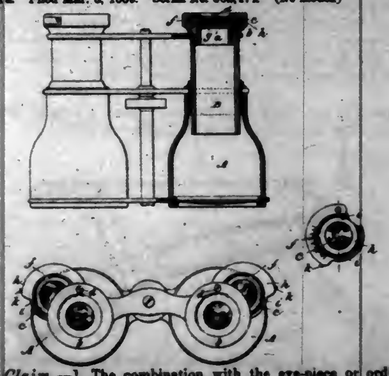
Claim.—1. A joint for connecting the ribs and stretchers of umbrellas and the like, constructed of sheet metal bent to conform to the shape and size of the inside of the rib and arranged within the trough of the rib, and having outwardly-projecting ears for connection of the stretcher, substantially as described.

2. A joint for connecting the ribs and stretchers of umbrellas and the like, constructed with a trough-like body b', arranged wholly within the trough of the rib and secured by coincident indentations in its sides and the sides of the rib, and having the upwardly and outwardly projecting ears b^2, substantially as described.



3. The combination, with the rib and stretcher of an umbrella-frame, of a joint having a trough-like body b', of sheet metal, arranged wholly within the trough of the rib and secured by coincident indentations, and having ears b^2 projecting upwardly and outwardly from opposite edges of the body to receive the stretcher and its connecting device, substantially as described.

408,728. PROCESS OF ADMINISTERING AERIFORM FLUIDS. JOHN C. KENNEDY, Detroit, Mich. Filed Dec. 13, 1888. Serial No. 292,443. (No model.)

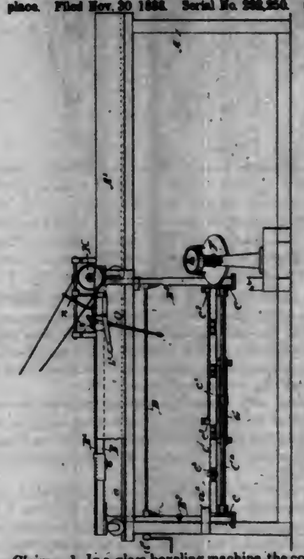


Claim.—As an improvement in the art of administering aeriform fluids for the treatment of pulmonary disease and diseases of the air-passages, the herein-described method, which consists in first compressing the air or gas in a suitable receiver to a tension sufficiently great to forcibly fill and expand the air-cells of the lungs by its own elasticity, and then forming a communication with the lungs through the mouth or nose by suitable tubing in such manner as to allow of the escape of the surplus gas from the mouth, substantially as described.

408,724. DRY-KILN FURNACE. WILLIAM KETCHAM, Gladewater, Tex. Filed May 17, 1888. Serial No. 274,128. (No model.)

Claim.—A dry-kiln furnace having a grate at its forward end, a bridge-wall extending upwardly from the lower side at the rear end of the grate, a smoke-outlet in the bottom between the rear end and bridge, and a transverse flue under the furnace, open at each end and dividing the draft at the smoke-outlet, said flue communicating with the interior of the drying-chamber, and having a vertical baffle-plate under the smoke-outlet extending longitudinally along its bottom in each direction from said outlet, arresting the rotary motion of the products of combustion, substantially as set forth.

408,725. ASTIGMATIC EYE-PIECE FOR OPTICAL INSTRUMENTS. JOSEPH KORNBLUH, JOHN A. BRASHEAR, and PARK PAINTER, Allegheny, Pa. Filed Mar. 8, 1889. Serial No. 302,474. (No model.)



Claim.—1. The combination, with the eye-piece or ordinary primary lens of optical instruments—such as telescopes, opera-glasses, &c.—of a semi-cylindrical secondary lens capable of rotation on its axis within the secondary-lens holder, substantially as and for the purposes described.

2. The combination, with the eye-piece or ordinary primary lens of a telescope, opera-glass, or similar optical instrument, of a secondary lens or eyeglass, of semi-cylindrical shape, set in a frame or secondary-lens holder so as to be rotatable on its axis therein, such secondary-lens holder being pivoted to the instrument to permit of the secondary lens being turned in or out of the line of vision, substantially as described.

3. In a binocular telescope, lorgnette, or opera-glass, the combination, with the ordinary object-glass and eyeglass at each end of the instrument, of a semi-cylindrical lens set near to and substantially parallel with the eyeglass and set in a circular frame capable of rotation on its axis in an annular frame or auxiliary-lens holder, which is pivoted to the frame of the instrument so as to be readily turned into or out of the line of vision of the instrument, as and for the purposes described.

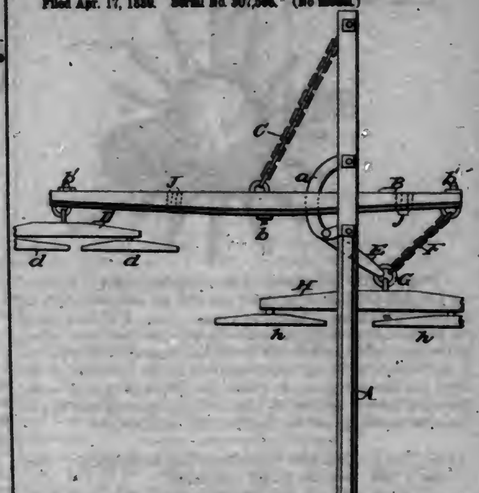
4. In combination with the eye and object glasses of a telescope or similar optical instrument and the frame carrying the same, an annular lens-holder for carrying a secondary astigmatic lens, within which frame said lens is capable of being turned on its axis, and a graduated scale for indicating the angle of astigmatism when the primary and secondary lenses are adjusted in use, substantially as described.

408,726. GLASS-BEVELING MACHINE. ALCIDE LAPERLE, Montreal, Quebec, Canada, assignor of one-half to A. Ramsay & Son, same place. Filed Nov. 20, 1888. Serial No. 292,250. (No model.)

Claim.—1. In a glass-beveling machine, the combination of frame-work supporting tracks, a movable carriage adapted to travel along same, hangers suspended from such carriage, a table carried in such hangers, on which glass plates are placed, a grinding-disk in stationary bearings, driving mechanism and automatic reversing mechanism controlling same for giving said carriage reciprocal motion, whereby the glass plates are subjected to the action of such disk.

2. In a glass-beveling machine, the combination of frame-work supporting tracks, a movable carriage adapted to travel along same, hangers suspended from such carriage, a table supporting the glass plates carried axially in such hangers and being capable of adjustment at various angles, screws for securing such adjustment, a grinding-disk in stationary bearings, and driving mechanism and automatic reversing mechanism controlling same for giving the aforesaid carriage reciprocal motion, whereby the glass plates are subjected to abrasion from the under surface of said disk.

3. In a glass-beveling machine, the combination, with a frame-work supporting tracks, a movable carriage traveling on same, and hangers suspended from said carriage, a shaft carried in movable blocks capable of adjustment in said hangers, and screw mechanism for obtaining such adjustment, of a table for supporting the glass plates mounted eccentrically on such shaft, and an adjustable counterpoise adapted to counterbalance the preponderance of table on one side of its axis and secure the pressure of the glass plates against the face of the grinding-disk.



4. In a glass-beveling machine, the combination of a frame A, tracks a a, carriage B, hangers B^2, and blocks c c, working in same, screws for adjusting said blocks, shaft C, carried by said blocks, table C, mounted on such shaft, driving mechanism and automatic reversing mechanism for controlling same for imparting to said carriage reciprocal motion, and means for governing such reciprocal motion, all substantially as herein shown and described.

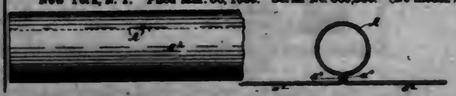
5. In a glass-beveling machine, the combination, with carriage B, driving mechanism and automatic reversing mechanism controlling same for imparting to such carriage reciprocal motion, and hand-lever for governing such motion, of cut-off mechanism, substantially as shown and described, consisting of dog M, lever O, and pin O' on same.

6. In a glass-beveling machine, a grinding-disk with grinding-face on its under side, a rotary shaft and bearings carrying such shaft at an angle both to the longitudinal and transverse axes of the machine, the grinding-face on the under side of such disk being beveled to compensate for the inclination of the shaft out of the transverse vertical axis.

7. In a glass-beveling machine, the combination, with the rotating shaft c, mounted in bearings, of recessed shield H cast on it, as and for the purpose described.

408,727. DRAFT-EQUALIZER. WILLIAM LEWIS, Sauk Centre, Minn. Filed Apr. 17, 1888. Serial No. 307,866. (No model.)

Claim.—1. The combination of a tongue, a draft-bar connected to the tongue by a chain or link which receives the pull, the said bar being of unequal lengths on the opposite side of the tongue, a chain attached to the rear end of the said bar and to the tongue and having single and double trees attached thereto, and single and double trees on the far end of the bar, as and for the purposes described.

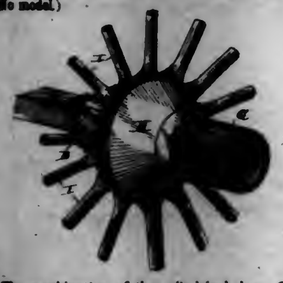


2. In a draft-equalizer, the combination, with a tongue, of a bracket on the bottom thereof, a draft-bar passing between them, a draft-chain connecting the said bar to the tongue, a chain and plate, one end of which is attached to one end of the bar and the other to the tongue, and traction devices attached to the said chain and plate and to the other end of the bar, as and for the purposes described.

408,728. TUBING. ALEXANDER H. LIBOUT, Waterbury, Conn., assignor to Holmes, Booth & Haydens, New York, N. Y. Filed Dec. 24, 1888. Serial No. 294,474. (No model.)

Claim.—Tubing having two ducts, one within the other, and made from one sheet or strip of metal, substantially as specified.

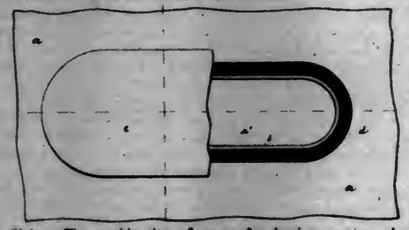
408,729. PROCESS OF MAKING DUPLEX TUBING. ALEXANDER H. LIBOUT, Waterbury, Conn., assignor to Holmes, Booth & Haydens, New York, N. Y. Filed Mar. 30, 1889. Serial No. 305,280. (No model.)



Claim.—1. The process of making duplex tubing, consisting in taking a strip of metal, bending it at about midway between the side edges, and also bending it at two points intermediate of the middle portion of the side edges back upon itself, substantially as specified.

2. The process of making duplex tubing, consisting in taking a strip of metal, bending it at the middle longitudinal portion into the form of a semicircle, with tangential portions extending from said semicircle, then bending the tangential portions into a continuation of the curve of the semicircle, so as to complete the circle, and subsequently bending the edge portions of the strip back to form a larger circle surrounding the circle or duct first completed, substantially as specified.

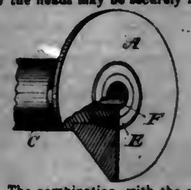
3. The process of making tubing, consisting in forming two ducts, one within the other, the outer being extended from and formed around the inner, substantially as specified.



4. The process of making tubing, consisting in forming two ducts, the inner being made by bending the middle portion of a sheet or strip of metal into form, and the outer being made by bending the side portions of the metal outwardly in opposite directions around the inner duct until the edges meet, substantially as specified.

408,730. VEHICLE-HUB. JOHN M. LINGLE, Sedalia, Mo., assignor of one-half to P. F. Brashear, same place. Filed May 17, 1889. Serial No. 311,122. (No model.)

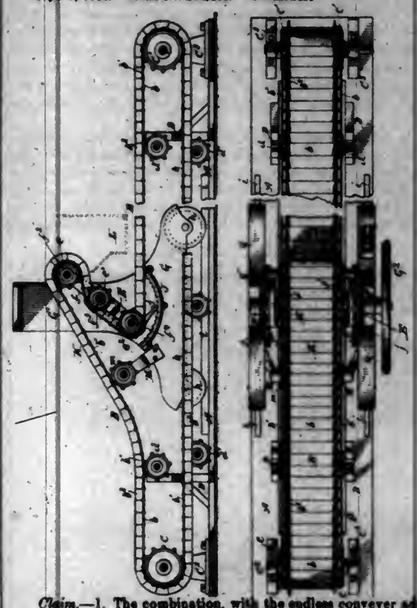
Claim.—The combination of the cylindrical sleeve C, fitted on the axle and provided at its inner end with an annular plain-faced flange D, the said flange having an annular groove E at the angle of the flange and the sleeve, the spokes having their inner ends resting on the sleeve and provided with lateral lips engaging the said groove E, the smooth-faced ring loosely mounted on the outer end of the sleeve and bearing against the spokes, and the collar secured on the sleeve and bearing against the ring, so as to cause the said ring to clamp the spokes against the annular flange, as specified.



408,731. CAR-ROOF. JOHN MARTHALER, Jersey City, N. J. Filed Jan. 4, 1889. Serial No. 295,426. (No model.)

Claim.—The combination of car-roof *a*, having openings *a'* and flanges *b*, with the dome *c* and with the hinged bars *e*, having bent ends *e' e²*, and with the hinged link *f*, staple *g*, and pin *h*, substantially as specified

408,732. SPOOL. HERVEY D. MELENDY, Nashua, N. H. Filed June 13, 1888. Serial No. 277,002. (No model.)



Brief.—The invention consists in the improved construction of spools, whereby the heads may be securely fastened to the body.

Claim.—1. The combination, with the cylinder having an annular groove in its end, of the head having a tapering hole therethrough, and the annular wedge entering the groove in the cylinder end and expanding the cylinder end to fill the hole in the head, substantially as described.

2. The combination of the head A, having the tapering hole B, the cylinder C, having the annular groove D, and the annular wedge E, substantially as and for purposes described.

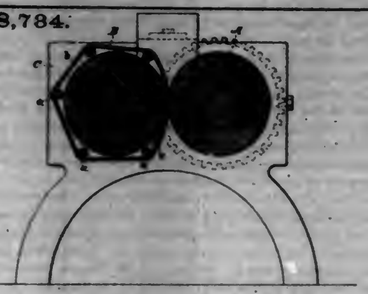
408,733. CONVEYER. FREDERICK H. C. MEY, Buffalo, N. Y. Filed Sept. 3, 1888. Serial No. 284,460. (No model.)

Claim.—1. The combination, with the endless conveyer adapted to run around guide or sprocket wheels mounted in stationary supports, of a carriage, an elevated tightener-frame pivoted at or near its center to said carriage, and guide or sprocket wheels journaled at opposite ends of said tightener-frame, around which the upper portion of the endless conveyer runs, substantially as set forth.

2. The combination, with the endless conveyer adapted to run around guide or sprocket wheels mounted in stationary supports, of a carriage G, a swinging tightener-frame E, mounted on said carriage, and guide or sprocket wheels *c c' c²*, arranged in said tightener-frame, substantially as set forth.

3. The combination, with the endless conveyer adapted to run around guide or sprocket wheels mounted in stationary supports, of a carriage, an elevated tightener-frame pivoted at or near its center to said carriage, guide or sprocket wheels journaled at opposite ends of said tightener-frame, around which the upper portion of the endless conveyer runs, and means whereby said tightener-frame is held in position after being adjusted, substantially as set forth.

4. The combination, with the endless conveyer adapted to run around guide or sprocket wheels mounted in stationary supports, of a carriage, an elevated tightener-frame pivoted at or near its center to said carriage, guide or sprocket wheels journaled at opposite ends of said tightener-frame, around which the upper portion of the endless conveyer runs, and a pawl and ratchet, whereby said tightener-frame is held in position after being adjusted, substantially as set forth.



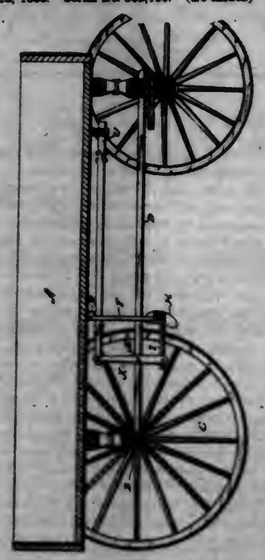
408,734. MILL FOR GRINDING AND SHEETING RUBBER. NATHANIEL C. MITCHELL, Philadelphia, Pa. Filed May 23, 1889. Serial No. 311,375. (No model.)

Claim.—1. In a rubber grinding or sheeting mill, the combination, with the rolls, of guides for conducting the rubber sheet around one of said rolls out of contact therewith, substantially as described.

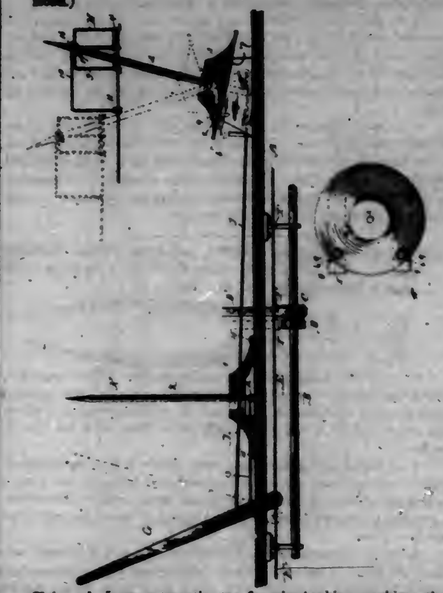
2. The combination, with the grinding and sheeting rolls, of guiding devices for conducting the rubber sheet around one of said rolls, said guiding devices comprising rollers placed, respectively, above and beneath the nip of the rolls, and a curved smooth-surfaced sheet behind one of said rolls, substantially as described.

3. The combination of the grinding and sheeting rolls, the guides arranged around one of said rolls, and the doctor-blade for guiding the sheet over the first of said guide-rollers, substantially as described.

408,784.



408,785. DEVICE FOR PRESERVING CUT FLOWERS. THEOPHILUS W. MOORE, Fruit Cove, Fla. Filed Dec. 31, 1888. Serial No. 295,057. (No model.)

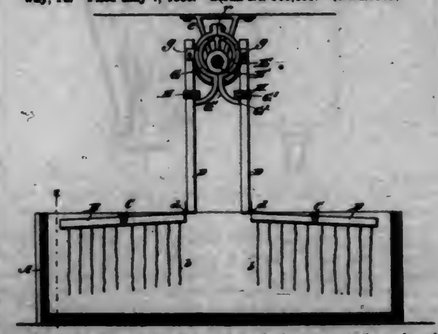


Claim.—The flower-preserving device herein described, the same comprising a bulb A, having an elastic neck B at its upper end, grasping the stem of the flowers and making a water-tight connection therewith, a neck C at its lower end, adapted to be closed by a cord c or the like, the bulb being filled with an amount of water sufficient to distend the same, whereby the elasticity of said bulb will press upon the water and force it into the stem of the flower, substantially as described.

408,736. VEHICLE-BRAKE. JOSEPH C. MORTON, Hamilton, Mo. Filed Mar. 13, 1889. Serial No. 303,186. (No model.)

Claim.—The combination, with the rear wheels of a vehicle, of the transverse brake-bar carrying the brake-shoes, the spring-hangers supporting said brake-bar, and the operating-levers and connections whereby the brake-bar is operated to apply the brakes, substantially as and for the purpose specified.

408,737. AUTOMATIC STOP FOR BARBING-MACHINES. ANDREW M. MUNSON, Lee, Ill. Filed Dec. 13, 1888. Serial No. 293,087. (No model.)



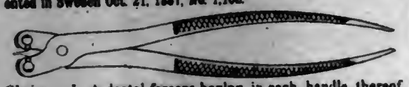
Claim.—1. In an automatic stop for wire-barbing machines, the combination of the standard 2, inclined from said machine and provided with the frame 3, the base-plate 1, and the block 5, interposed between said plate and the floor A, substantially as shown, and for the purpose described.

2. In an automatic stop for wire-barbing machines, the combination of the base-plate 1, standard 2, seated in said plate and provided with rotating frame 3, and block 5, interposed between said plate and floor A, and provided with upper face 7, sloped downward and from said machine, and adapted to support said plate and normally incline it from said machine, substantially as shown, and for the purpose described.

3. In an automatic stop for wire-barbing machines, the combination of a rocking wire-reel H, a feed-arm 10, provided with slot 11, a shifting-lever G, and means, substantially as shown, for communicating the oscillations of said reel to said lever, substantially as shown, and for the purpose described.

4. In an automatic stop for wire-barbing machines, the combination of a wire-bearing reel H, provided with a rocking base 1, a guide-arm 10, provided with slot 11, a belt-shifting lever G, suitably connected to driving-belt D', and a rod or rope J, connecting said reel to said lever, substantially as shown, and for the purpose described.

408,788. ECCENTRIC-CONNECTION. JAMES H. MCELWEE, Ridgeway, Pa. Filed May 7, 1888. Serial No. 309,235. (No model.)



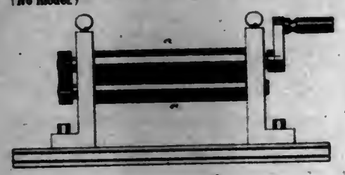
Claim.—1. In combination with a shaft, an eccentric, and a pitman, an eccentric-strap surrounding said eccentric and provided with a lug at the side of said strap, and an arm extending laterally from a

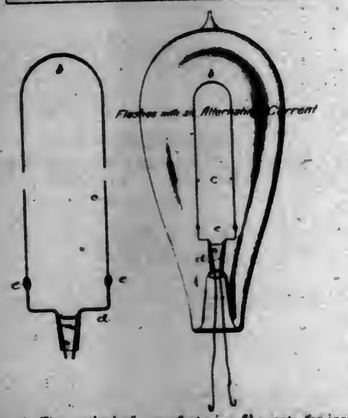
lower point of said strap, said lug and arm being attached to said pitman independently at different points of its length, the one being directly below the other, substantially as described.

2. In combination with a shaft, an eccentric, and a pitman, an eccentric-strap having a lug which is detachably fastened to said pitman, and having also an arm G', which is provided with an upward extension G^2, and a collar which is movable up and down on said pitman to cover and uncover said extension at will, for the purpose set forth.

3. A pair of pitmen in combination with an eccentric-strap attached removably to each of them at two different points and set between them, an eccentric within said strap, and the shaft on which said eccentric is mounted, the said pitmen being adapted to be attached to hide-suspending frames oscillating in vats and actuated by said shaft and eccentric, substantially as set forth.

408,739. DENTAL FORCEPS. ANDERS G. NYBLIN, Stockholm, Sweden. Filed Oct. 3, 1888. Serial No. 287,122. (No model.) Patented in Sweden Oct. 21, 1887, No. 1,102.



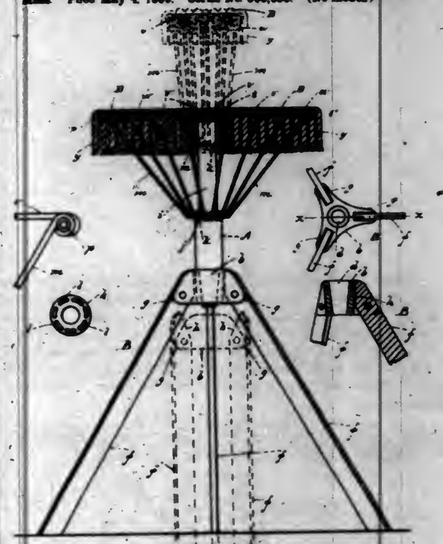


Claim.—1. A dental forceps having in each handle thereof a cylindrical socket to receive the shank of the removable jaw, a spring-latch mounted on the handle, and a jaw the cylindrical shank of which has a recess which is engaged by said spring-latch when said jaw is in place.

2. A dental forceps having in each handle thereof a cylindrical socket furnished with a recess or keyway, and having a jaw with a cylindrical shank that fits said socket, said shank being furnished with a projection adapted to engage said keyway in the socket when the jaw is in place.

3. As an improved article of manufacture, a pair of forceps, each handle of which is provided with two obliquely-arranged intersecting sockets to receive removable jaws, which latter have shanks that fit into said sockets, and retainers for said jaws, substantially as set forth.

408,740. FILAMENT FOR INCANDESCENT ELECTRIC LAMPS. ADOLF F. OPPERMANN, Chicago, Ill. Filed Apr. 11, 1889. Serial No. 306,848. (No model.)



Claim.—1. The method of manufacturing filaments for incandescent lamps, which consists in crushing the twisted fiber of the filament, carbonizing the same, and then subjecting the filament thus carbonized to the action of an alternating current while surrounded by hydrocarbon gas, substantially as and for the purpose specified.

2. The process of manufacturing filaments for incandescent lamps, which consists in crushing the twisted fiber before it is carbonized, then carbonizing the filament and subjecting the same to an alternating current while surrounded by hydrocarbon gas, the gas being denser at the upper or curved portion of the filament, substantially as and for the purpose specified.

3. In the manufacture of a filament for an incandescent lamp, the process consisting of subjecting the carbonized filament to the action of an alternating current while surrounded by hydrocarbon gas, the exposure to the hydrocarbon gas at the curved portion thereof or central portion of the resistance thereof being continued for a greater time than the exposure of the other portions thereof, whereby the coating is made thicker at the said central or curved portion thereof, substantially as and for the purpose specified.

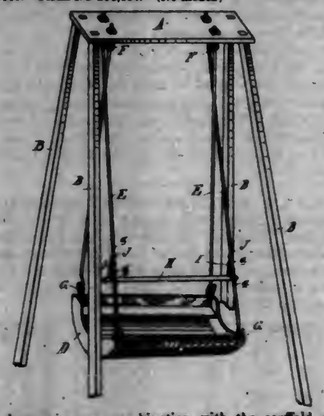
4. The method of manufacturing filaments for incandescent lamps, which consist in crushing the twisted fiber of the filament, carbonizing the same, and then subjecting the filament thus carbonized to the action of an electric current while surrounded by hydrocarbon gas, the curved portion or center of resistance of the filament being exposed longer to the gas than the other portions of the filament.

408,741. CAMP-STOOL. JAMES W. OSLTON, Cambridge, and DAVID A. MEISTER, Boston, assignors of one-half to Charles A. Morse, Boston, Mass. Filed May 4, 1889. Serial No. 309,638. (No model.)

Claim.—1. In a camp-stool, a tripod provided with a socket and hinged legs, a standard, a ring fitted to slide thereon, a collar secured to the upper end thereof, and two series of rods hinged, respectively, to said collar and ring and to each other, substantially as described.

2. In a camp-stool, the combination of a standard provided with a shoulder, a tripod having a body provided with hinged legs and a socket for said standard, a ring fitted to slide on the standard above said shoulder, and a seat comprising two series of rods hinged, respectively, to said ring and collar, the outer ends of corresponding rods of each series being hinged together, substantially as described.

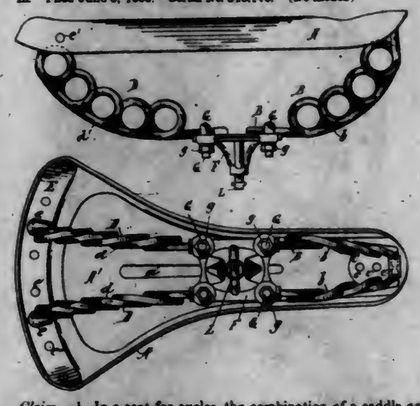
3. In a camp-stool, the combination of a standard provided with a shoulder, a socketed tripod for said standard having hinged legs, a ring fitted to slide on said standard, a collar secured thereto, two series of rods hinged, respectively, to said collar and ring, the outer ends of corresponding rods being pivoted on a sleeve, and a flexible cord supporting said sleeve, substantially as described.



4. In a camp-stool, a standard having its upper portion reduced to form a shoulder and provided with a fixed collar, a ring fitted to slide on said reduced portion, a tripod having pivoted legs and a socket for said standard, two series of rods hinged, respectively, to said ring and collar, the outer ends of corresponding rods in each series being pivoted on a sleeve, a flexible cord supporting said sleeve, and a flexible cover on the upper series of rods, substantially as described.

5. A folding stool consisting of a standard detachably supported by a tripod having hinged legs and a collapsible seat comprising two series of rods hinged, respectively, to said standard and a ring sliding thereon, the outer ends of corresponding rods in each series being pivoted together, substantially as described.

6. In a camp-stool, the tripod B, having the hinged legs *f* and socket *d*, in combination with the standard A, provided with the shoulder *j* and collar *l*, the ring *k*, the wires *m n*, hinged, respectively, to said ring and collar and to each other, and the cord *w*, arranged to operate substantially as described.



7. In a camp-stool, the combination of the tripod B, the standard A, having the shoulder *j* and collar *l*, the ring *k*, sliding on said standard, the wires *m v*, pivoted, respectively, to said ring and collar and to the sleeves *p*, the cord *w*, supporting said sleeves, and the cover D, all being arranged substantially as described.

408,742. SWING. SAMUEL W. PARSONS, Ypsilanti, Mich. Filed Feb. 7, 1889. Serial No. 299,057. (No model.)

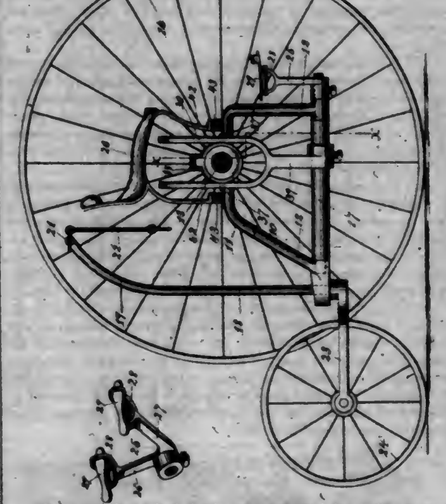
Claim.—In a swing, the combination, with the scaffold, of the suspension-rods crossed, as shown, the vehicle carried by the lower ends of said rods, the projections *s* on said rods, the bar H, arranged transversely of the vehicle, and the chains I, attached at one end to said bar and at the other provided with links loosely engaging the rods and adjustable vertically thereon, substantially as and for the purpose specified.

408,743. SEAT FOR BICYCLES. CHARLES H. PHELPS, Cuyahoga Falls, Ohio, assignor to Edwin Lee Brown and Edwin F. Brown, Chicago Ill. Filed June 5, 1889. Serial No. 313,170. (No model.)

Claim.—1. In a seat for cycles, the combination of a saddle and spiral springs having the general contour of semi-elliptic springs, substantially as set forth.

2. In a seat for cycles, the combination of a saddle of flexible material, the spiral springs having the general contour of semi-elliptic springs, and a spring-seat provided with adjustable clips, substantially as set forth.

408,744. STATIONARY SWITCH FOR HORSE-RAILWAYS. ARTHUR L. PLIMPTON and EPHRAIM HARRINGTON, Boston, Mass. Filed Dec. 6, 1888. Serial No. 292,804. (No model.)

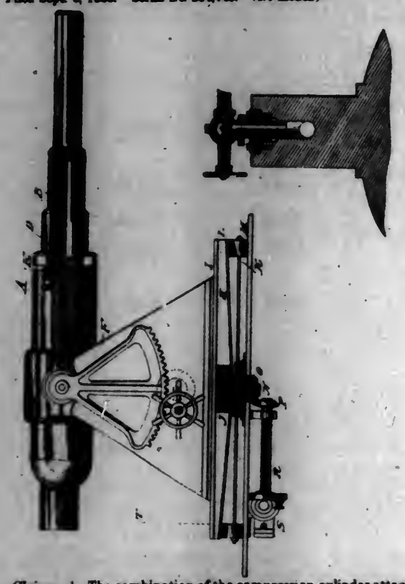


Claim.—1. In a horse-railway switch, the combination of the outside rail 2 with the stationary tongue 1 and the filling-in part 4 5,

the latter having a dropping-off edge A B, extending diagonally from the point of the tongue to the outside rail.

2. The combination of the rail 2, tongue 1, guard 3, and filling-in part 4 5, having the diagonal drop edge A B, substantially as and for the purpose set forth.

408,745. TRICYCLE. FRANCIS W. POOT, St. Paul, Minn. Filed Feb. 18, 1889. Serial No. 300,304. (No model.)



Claim.—1. In a tricycle having a right and left spirally-grooved axle, and a rock-shaft at right angles to said axle, provided with suitable pedals secured thereto, the combination, with a sleeve traveling upon the said axle having rings loosely held in the sleeve provided with lugs entering the grooves, of a grooved guide-bar arranged parallel with said axle and engaging lugs upon said sleeve, and a connection between the rock-shaft and sleeve, substantially as shown and described.

2. In a tricycle having a right and left spirally-grooved axle, and a rock-shaft at right angles to the axle, the combination of a sleeve reciprocating upon the axle provided with toothed rings centrally and loosely held within it having lugs entering the axle-grooves, and

toothed rings secured to the sleeve adapted to engage said loose rings, and an upright forked bar secured to said rock-shaft and having its members slotted to engage with pins upon said sleeve, substantially as and for the purposes set forth.

408,746. GUN-CARRIAGE. HENRY A. RAMSAY, Baltimore, Md. Filed Sept. 6, 1888. Serial No. 284,746. (No model.)

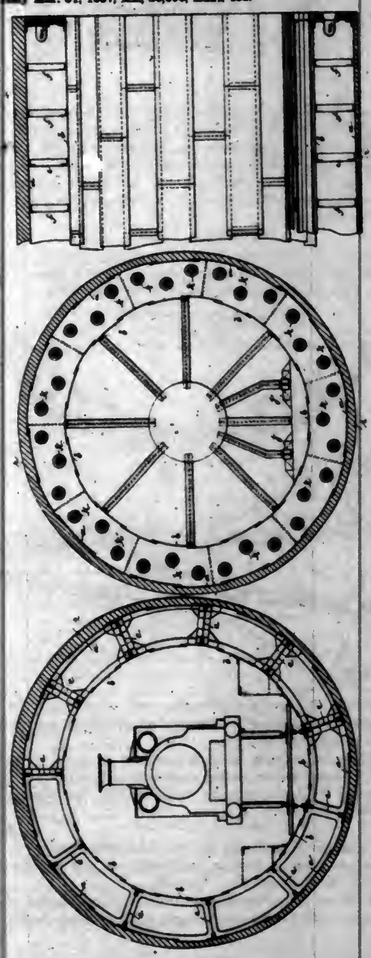
Claim.—1. The combination of the compression-cylinder attached to the barrel of a gun, with hollow plunger-rods which enter the cylinders and are secured to the trunnions, which are independent of the longitudinal movement of the barrel, said trunnions being hollow, and a suitable valve governing communication through the passage in the trunnions.

2. The combination, with a gun and compression-cylinders secured to the barrel thereof, of a re-enforcing band encircling but permitting free movement of the barrel, said band having hollow trunnions rigidly secured thereto and carrying hollow plunger-rods, which operate in the compression-cylinders, and a valve connected to and governing the passage in the hollow trunnions, whereby access of air to or from the compression-cylinders may be regulated.

3. The combination, with a gun and compression-cylinder secured to the barrel thereof, of a re-enforcing band encircling but permitting free movement of the barrel, said barrel having hollow trunnions rigidly secured thereto and carrying hollow plunger-rods, which operate in the compression-cylinders, an accumulator, conduits connecting the accumulator and the hollow trunnions, and a three-way valve in the conduit, such valve having also communication with the open air.

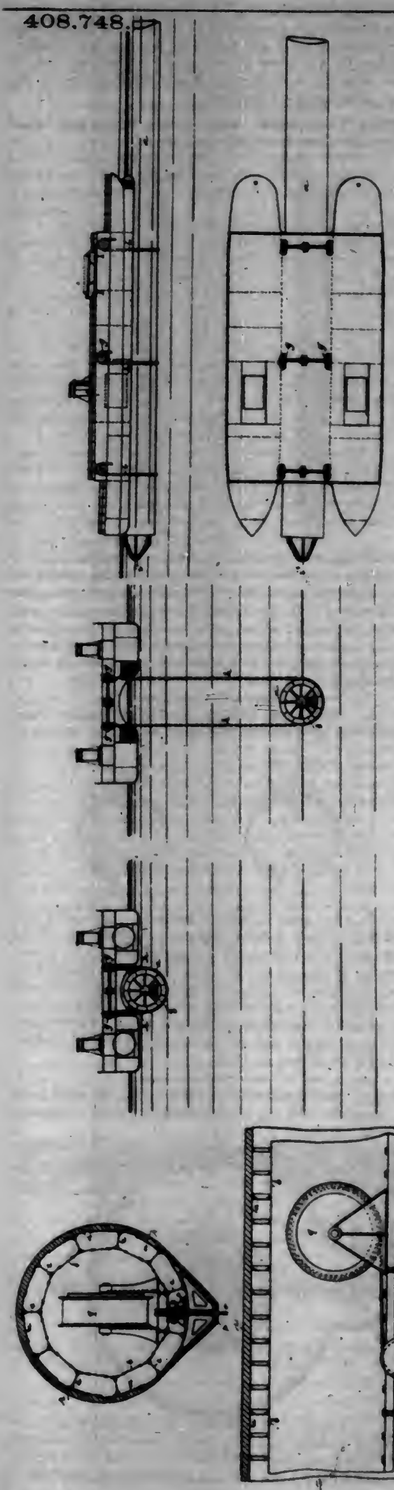
4. The combination of the compression-cylinders attached to the barrel of a gun, hollow plunger-rods entering the cylinders and secured to the trunnions independent of the longitudinal movement of the barrel, said trunnions being hollow, and a suitable valve governing communication through the passage in the trunnions, all combined with a rack-sector secured to the trunnions, whereby the gun may be elevated or depressed and its longitudinal movement governed at any elevation, substantially as set forth.

408,747. PRINTER'S STAND. STEPHEN W. RATHBUN, Marion, Iowa. Filed Aug. 13, 1888. Serial No. 282,682. (No model.)



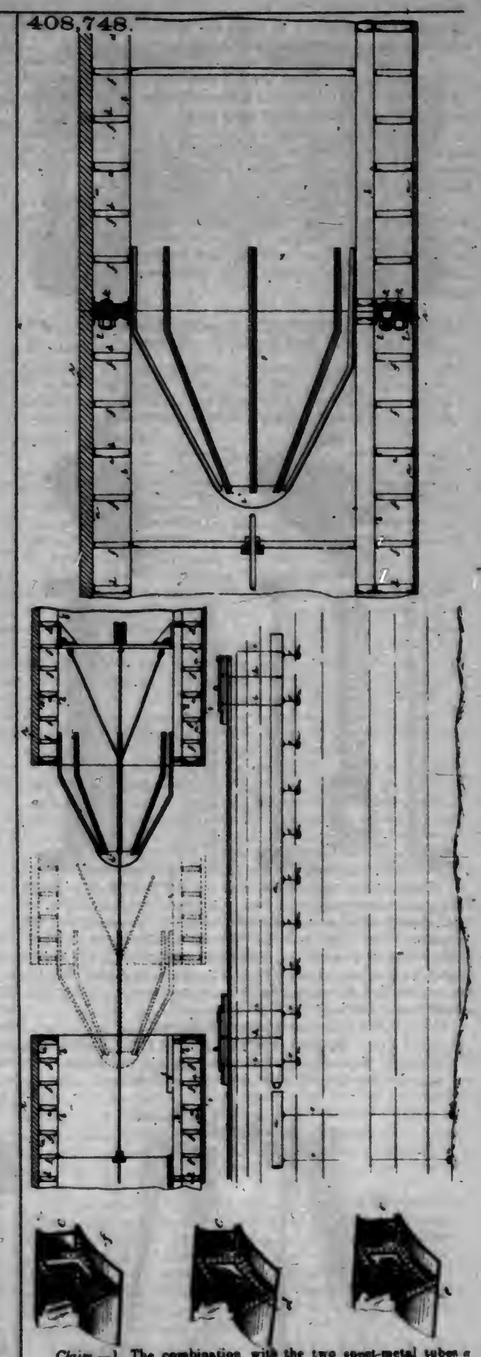
Claim.—1. In a printer's stand, the combination of the body A, having a front upper piece A′ and the ends A″ A″, inclined at the top, said front piece extending slightly above said inclination, whereby the lower case is supported, and the arms B B hinged to said stand and adapted to support the upper case, substantially as and for the purpose set forth.

2. The combination, in a printer's stand, of the stand A A′ A″, adapted to support the lower case, the arms B B, connected board D, supporting-blocks C C, and double-jointed hinges *a a*, substantially as and for the purpose set forth.



3. In a printer's stand, the combination, with the stand, substantially as described—that is to say, having a support for the lower case and the hinged support for the upper one adapted to fold downward when not in use—of the supplemental stand connected to said main stand by telescoping arms, and having a hinged support for the upper case, substantially as described, whereby said supplemental stand is adapted to be closed against the main stand, or drawn outward to form a double stand, as specified.

4. In a printer's stand, the combination of a main stand, substantially as described, having supports for upper and lower type-cases, the mortises *b b*′, adapted to allow limited backward and forward movement of bars E′ E″, and supplemental stand E, having connected bars F E′ and F F, extending through mortises in the main stand, the forward bar E′ having a gain *c*, matching a similar gain in the board A′ of the main stand, all substantially as and for the purpose set forth.



408,748. BUOYANT SUBAQUEOUS TUNNEL FOR RAILWAYS, &c. EDWARD J. REED, London, England. Filed Dec. 13, 1886. Serial No. 221,376. (No model.) Patented in England July 23, 1886, No. 9,558; in France Oct. 21, 1886, No. 173,106; in Belgium Oct. 26, 1886, No. 74,995; in Germany Oct. 26, 1886, No. 41,263; in Denmark Nov. 6, 1886; in Spain Nov. 26, 1886, No. 6,383; in Canada Mar. 10, 1887, No. 26,192, and in Italy Mar. 31, 1887, XX, 20,696, XLII, 156.

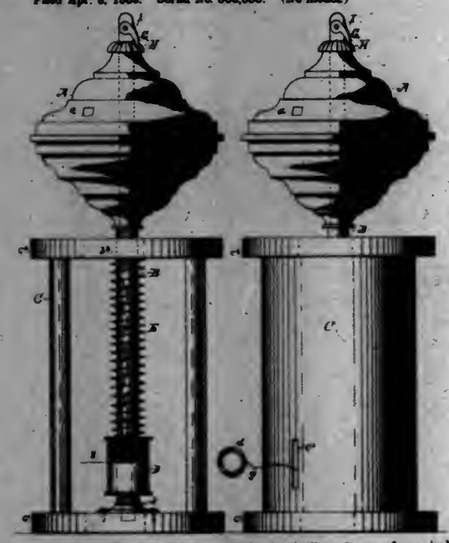
408,748.

408,748.

Claim.—1. The combination, with the two sheet-metal tubes *a* and *b*, arranged concentrically, of the tight partitions *c*, extending longitudinally, the apertured transverse partitions *e*, the water-tight transverse partitions *d*, and the angle-irons *f*, all arranged within the annular space between tubes *a* and *b* and connecting the latter, as set forth.

2. The tube-section having tight partitions near its ends to prevent the entry of water into its interior, and having at one end a coni-

cal projection or nose, as *i'*, to enable said tube to be axially aligned with the adjacent section while submerged.



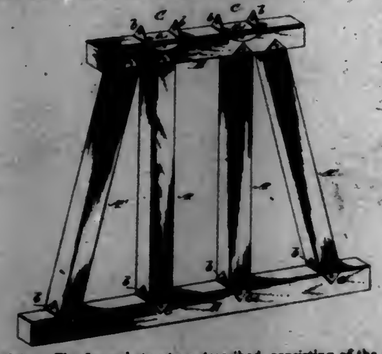
3. The tube-section having at one end a projecting conical nose *i'* for axially aligning it with the adjacent section, and having at its other end guides *j j* to effect the proper coincidence of the bolt-holes in the two sections, substantially as set forth.

4. In a subaqueous tunnel, the combination of two tube-sections, one of which is provided with conical bolt-holes and the other with conical bolts *k k*, secured in the said section in position to engage said bolt-holes in the abutting or adjacent section, as set forth.

5. The combination, with the tube provided with windlasses or winding apparatuses in its interior and with stuffing-boxes in its bottom for the passage of chains, of the said chains, connected each to the barrels of one of said windlasses and passing out through said stuffing-boxes, and anchor-weights, one connected to each chain, substantially as set forth.

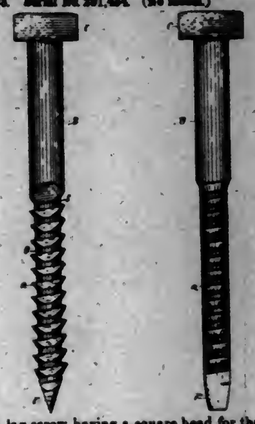
408,749. SPINNING TOP. WALSTEIN H. ROBINSON, Bellport, N. Y.

Filed Apr. 8, 1889. Serial No. 306,355. (No model.)



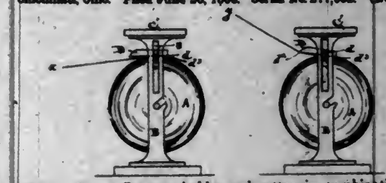
Claim.—The combination, with the hollow base, of a spindle having journal-bearings in the base, a drum on the spindle within the base, a spring coiled around the spindle within the base, having one end secured to the base and the other end secured to the spindle, a cord secured to the drum, a top loosely mounted on the spindle, a ratchet on the top, and a pawl on the spindle engaging with the ratchet, the said top being rotated by the action of the spring, substantially as specified.

408,750. TIMBER-COUPLING FOR FRAMED STRUCTURES.



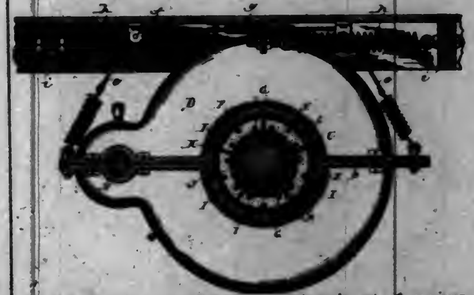
MORGAN P. ROCKWELL and GEORGE W. PEARSALL, Chattanooga, Tenn.

Filed Nov. 28, 1888. Serial No. 292,059. (No model.)



Claim.—The framed structure described, consisting of the cross-timbers B B and the metallic couplings C, having binding-flaps *c* secured to the sides of said cross-timbers, and the longitudinal timbers of the same dimensions in cross-section as the plate *a* of the couplings and resting directly thereon, and having the flaps *b* of said couplings extending upon the outer faces thereof and secured to said longitudinal timbers upon the sides thereof, substantially as shown and described, and for the purposes specified.

408,751. LAG-SCREW. GEORGE P. ROSS, Pontoo, Mich. Filed Nov. 21, 1888. Serial No. 291,494. (No model.)



Claim.—A lag-screw having a square head for the attachment of a wrench thereto, said screw being flattened and having threads on two opposite sides, the upper sides of said threads being at right angles to the screw-body and having vertically-straight intermediate surfaces between the threads, a cross-section of the body through said surfaces being circular in cross-section, and the body having a bearing portion between the upper thread and the head circular in cross-section, substantially as set forth.

408,752. ROLL-PAPER HOLDER AND CUTTER. ABBOTT G. ROSS, Cincinnati, Ohio. Filed June 20, 1888. Serial No. 277,602. (No model.)

Claim.—In a roll-paper holder and cutter, in combination with the roll and the vertically-slotted side supports, a friction-bar resting tangentially upon the roll by gravity and guided in the slots by vertically-elongated projections, the bar being formed to a tearing-edge forward of said projections and to a friction-edge in rear thereof, and adapted by the pull of the paper outward and upward against said tearing-edge to clamp the projections diagonally in the guide-slots and depress the rear or friction edge of the bar against the roll, substantially as and for the purpose set forth.

408,753. ELECTRIC MOTOR FOR STREET-CARS. WILBER S. SALISBURY, Chicago, Ill. Filed Aug. 22, 1888. Serial No. 283,323. (No model.)

Claim.—1. In a motor for street-cars, the axle and a frame journaled thereon, in combination with an electric motor supported in said frame, the field-magnet cores of which straddle the axle, and a gear-connection between said motor and axle, substantially as described.

2. In a motor for street-cars, the axle and a metallic frame journaled thereon, in combination with an electric motor supported on said frame, the field-magnet cores of which straddle the axle, a yoke therefor constituting a portion of said frame, and a gear-connection between said motor and axle, substantially as described.

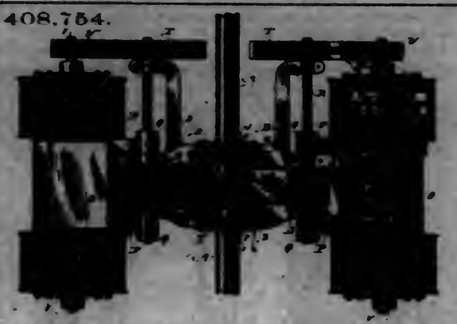
3. In a motor for street-cars, the axle, a metallic frame journaled thereon, and a shaft journaled in said frame, extending parallel with the axle in combination with an electric-motor armature on said shaft and field-magnet cores attached to said frame astride the axle, extending at a right angle and in the same direction from the armature, and a gear-connection between said shaft and axle, substantially as described.

4. In a motor for street-cars, the axle and a frame journaled thereon, in combination with an electric motor supported in said frame, the armature of which extends parallel with and in the same plane as the axle, and the field-magnet cores of which straddle the axle, and a gear-connection between said motor and axle, substantially as described.

5. In a motor for street-cars, the axle, gears mounted thereon near the ends thereof, and a frame journaled on said axle, in combination with an electric motor supported on said frame, the field-magnet cores of which straddle the axle, and the armature-shaft of which extends parallel with the axle, and gears on said shaft meshing with the gears on the axle, substantially as described.

6. In a motor for street-cars, the axle, gears mounted thereon near the ends thereof, and a frame journaled on the axle in combination with an electric motor supported upon said frame, the field-magnet cores of which straddle the axle, a shaft journaled in said frame parallel with and in the same plane as the axle upon which the armature of the motor is mounted, and gears on said shaft meshing with the gears upon the axle, substantially as described.

7. In a motor for street-cars, the axle-gears mounted thereon and a frame journaled on said axle, in combination with an electric motor supported on said frame, the field-magnet cores of which straddle the axle, a three-part shaft journaled in said frame extending parallel with and in the same plane as the axle, the motor-armature mounted on the central portion of said shaft, gears mounted on the end portions of the shaft meshing with the gears on the axle, adjustable coupling-plates for uniting the parts of the shaft, and casings attached to said frame for covering said gears, substantially as described.



8. In a motor for street-cars, the axle, a frame journaled thereon, an electric motor supported on said frame, the armature-shaft of which extends parallel with and to one side of the axle and the field-magnet cores of which straddle the axle from the opposite side thereof, in combination with pulleys attached to the car-body and a flexible guy secured at its ends, respectively, to said frame on each side of the axle and working over said pulleys, substantially as described.

9. In a motor for street-cars, the axle and gears mounted thereon near the ends thereof, provided with elongated hubs, in combination with a frame supporting the electric motor for operating the axle, a ring provided with bearing-sockets on the inner and outer peripheries thereof, and anti-friction rollers having contracted central portions constituting journals therefor and working in said sockets, the inner and outer sets of rollers bearing, respectively, upon the hubs of the gears and bearing-walls of the frame, substantially as described.

10. In a motor for street-cars, the axle, a frame journaled thereon, an electric motor supported on said frame, the armature-shaft of which extends parallel with and to one side of the axle and the field-magnet cores of which straddle the axle from the opposite side thereof, in combination with pulleys attached to the car-body, a flexible guy attached at its ends, respectively, to said frame at each side of the axle and working over said pulleys, and a turn-buckle in said guy between the pulleys, substantially as described.

11. In a motor for street-cars, the axle and gears mounted thereon near the ends thereof, provided with elongated hubs, in combination with a frame for supporting the electric motor operating the axle, a casing mounted thereon having a hub of larger bore than the hub of the gears, a sectional ring working freely between the hubs of the gears and casings, each section of which is provided with bearing-sockets in the inner and outer peripheries thereof, and anti-friction rollers having contracted central portions constituting journals therefor and working in said sockets, the inner and outer sets of rollers bearing, respectively, upon the hubs of the gears and casings, substantially as described.

408,754. MOTOR FOR STREET-CARS. WILBER S. SALISBURY, Chicago, Ill. Filed Mar. 1, 1889. Serial No. 301,710. (No model.)

Claim.—1. In a motor for street-cars, the combination, with the axle and a gear-wheel mounted thereon, of a balanced casing-frame journaled on said axle, a pair of supplemental frames pivotally connected with said casing-frame at each side of the axle, a yielding connection between said frames, electric motors mounted on said frames, and gear-connection between both of said motors and the axle gear-wheel, substantially as described.

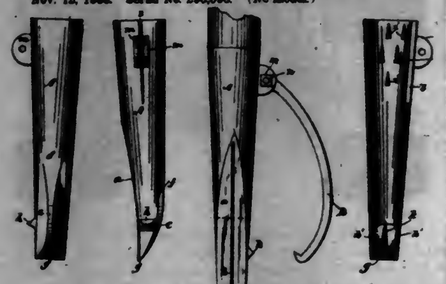
2. In a motor for street-cars, the combination, with the axle and a gear-wheel mounted thereon, of a casing-frame journaled upon the axle, a counter-shaft journaled in said frame, a supplemental frame journaled upon said shaft, an electric motor mounted upon said frame, a gear-connection between said motor and shaft and between said shaft and the axle gear-wheel, and a yielding connection between said supplemental and casing frames, substantially as described.

3. In a motor for street-cars, the combination, with the axle and a gear-wheel mounted thereon, of a casing-frame journaled upon the axle, a counter-shaft journaled in said frame, a supplemental frame journaled upon said shaft, an electric motor mounted upon said frame, a gear-connection between said shaft and motor and between said shaft and the axle gear-wheel, a bracket projecting from the casing-frame, a depending bar from the supplemental frame working through said bracket, and coiled springs sleeved on said bar and confined between the supplemental frame and said bracket on the upper side thereof and between a washer on the end of said bar and the bracket on the under side thereof, substantially as described.

4. In a motor for street-cars, the combination, with the axle and a gear-wheel mounted thereon, of a casing-frame journaled upon the axle, a counter-shaft journaled in said frame, a supplemental frame journaled upon said shaft, an electric motor mounted upon said frame, a gear-connection between said shaft and motor and between said shaft and the axle gear-wheel, a bracket projecting from the casing-frame, a depending bar from the supplemental frame working through said bracket, and coiled springs sleeved on said bar and confined between the supplemental frame and said bracket on the upper side thereof and between a washer on the end of said bar and the bracket on the under side thereof, substantially as described.

5. In a motor for street-cars, the combination, with the axle, a gear-wheel mounted thereon, a casing-frame balanced upon the axle, and yielding cushions connecting said frame with the car-superstructure and directly opposing the oscillation of said casing on the axle, of supplemental frames yieldingly supported upon said casing-frame, electric motors mounted on said supplemental frames, gear-connections between said motors and the axle gear-wheel, and a yielding connection between said supplemental and casing frames, substantially as described.

6. In a motor for street-cars, the combination, with the axle, a gear-wheel mounted thereon, a casing-frame journaled upon said axle, and coil-springs attached at their ends, respectively, to said frame and the car-superstructure, extending in opposite directions from said frame, of supplemental frames pivotally connected with the casing-frame, electric motors mounted on said supplemental frames, gear-connections between said motors and the axle gear-wheel, and yielding connection between said supplemental and casing frames, substantially as described.



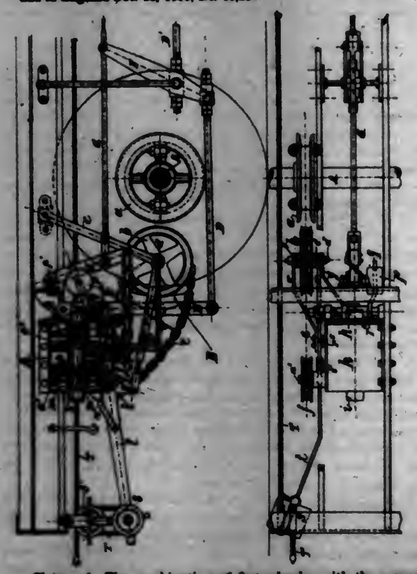
7. In a motor for street-cars, the combination, with the axle, a gear-wheel mounted thereon having elongated hubs, and a casing-frame balanced on said axle constituting a support for electric motors operating said wheel, of anti-friction rollers bearing on said hubs, having contracted portions, and a bearing-ring provided with recesses for reception of said contracted portions of the rollers interposed between said rollers and the bearing-walls of the casing-frame, substantially as described.

8. In a motor for street-cars, the combination, with the axle, a gear-wheel mounted thereon having elongated hubs, and a casing-frame balanced on the axle constituting a support for electric motors operating said wheel, of anti-friction rollers bearing on said hubs having contracted portions, and adjustable segmental bearing-plates provided with recesses for reception of said contracted portions of the rollers interposed between said rollers and the bearing-walls of the casing-frame, substantially as described.

9. In a motor for street-cars, the combination, with the axle, a gear-wheel mounted thereon having elongated hubs, and a casing-frame balanced upon the axle and constituting a support for electric motors operating said wheel, of anti-friction rollers, removable bearing-sleeves on the hubs of said gear-wheel on which the rollers bear, said rollers having contracted central portions, and adjustable segmental bearing-plates provided with recesses on the inner faces thereof in which said contracted portions of the rollers bear, said plates be-

ing interposed between the rollers and the bearing-walls of the casing-frame, substantially as described.

408,755. CANT-HOOK. ALBERT SANFORD, Oshkosh, Wis. Filed Nov. 12, 1888. Serial No. 290,563. (No model.)



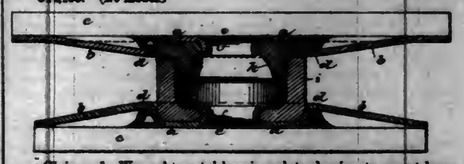
Claim.—1. The combined socket and pick formed of a single piece hollow down to the point to receive the wooden handle, having the flattened face *a* extending up on the outside of the hollow portion, and the convexed back portion terminating in the chisel-shaped edge, substantially as described.

2. The combined socket and pick formed of a single piece made hollow to receive the wooden handle and having the flattened face *a* on the outside provided with the rib or ribs *b*, and the convex back portion terminating in a chisel-shaped edge, substantially as described.

3. The combined socket and pick made hollow to receive the wooden handle and having the flattened face *a*, with the rib or ribs *b* thereon, the convex back portion terminating in a chisel-shaped edge, the pointed projection on the side, and the hook co-operating therewith, substantially as described.

4. The combined socket and pick formed in a single piece made hollow to receive the handle having the split upper end, the wedge-shaped ribs at the upper end and the wedge at the lower end of the hollow portion, the flattened face *a*, the convexed back portion *c*, and terminating in the chisel-shaped edge, substantially as described.

408,756. BRAKE. WOLFGANG SCHMID, Munich, Bavaria, Germany. Filed Mar. 15, 1889. Serial No. 303,441. (No model.) Patented in Germany Aug. 26, 1884, No. 32,465; in Belgium Feb. 15, 1886, No. 71,731; in Italy Mar. 6, 1886, No. 19,413; in France May 3, 1886, No. 173,661, and in England Dec. 13, 1888, No. 16,267.



Claim.—1. The combination of fast wheel *a* with the suspended swinging wheel *b* and with chain *c*, pulley *f*, worm *l*, worm-wheel *m*, and friction-wheels *c' c² c³*, and with chain E, connected with the brake-operating device, substantially as specified.

2. The combination of swinging wheel *b* with rod *v*, arm r^6, lever *t*, pulleys *c* and *c'*, and rope T, as and for the purpose described.

3. The combination of wheel c^3 with fork *r*, rod *r'*, lever r^5, shaft r^3, and with weighted lever *g*, as and for the purpose described.

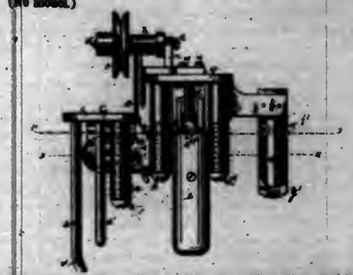
4. In combination with wheel c^3, fork *r*, rod *r'*, lever r^5, shaft r^4, the lever r^4, rod r^2, arm *t'*, lever *t*, pulley *c c'*, and rope T, substantially as specified.

408,757. CENTER-BEARING PLATE FOR RAILWAY-CARS. CHARLES T. SCHOEN, Philadelphia, Pa. Filed June 13, 1889. Serial No. 314,135. (No model.)

Claim.—1. Wrought-metal bearing-plates having two-part bearing-rings interposed between them and held in place, substantially as described.

2. Pressed-steel bearing-plates having annular ribs and central flanged openings, combined with rings arranged between the ribs and flanged openings, the flanges of said openings being turned over upon said rings to hold them in place, substantially as described.

3. Center-bearing plates of wrought metal having strengthening-ribs and central flanged openings, combined with two-part rings held in place between the ribs by the overturned flanges of the central openings and riveted or clinched lugs, substantially as described.



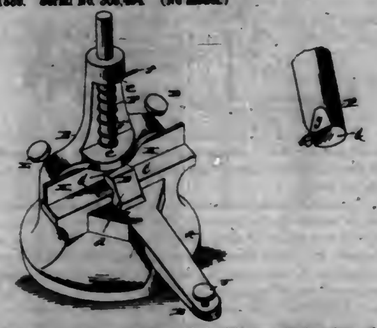
4. The bearing-plates, the two-part outer bearing-ring secured thereto, and the two-part central ring, also secured to the plates and adapted to resist concussion, substantially as described.

5. The bearing-plates provided with ribs, combined with a two-part bearing-ring, one part of which ring is provided with a trough to receive the other, substantially as described.

6. The bearing-plates provided with ribs, combined with a bearing-ring made in two sections, each section applied to the rib of its plate by straddling the same, substantially as described.

7. Inner and outer rings made in sections fitted to one another, substantially as described, combined with bearing-plates, to which said sections are secured, substantially as set forth.

408,758. DEVICE FOR GUIDING THE EDGES OF FABRICS. JOSEPH J. SCHOLFIELD, Providence, R. I. Filed Apr. 12, 1889. Serial No. 307,093. (No model.)



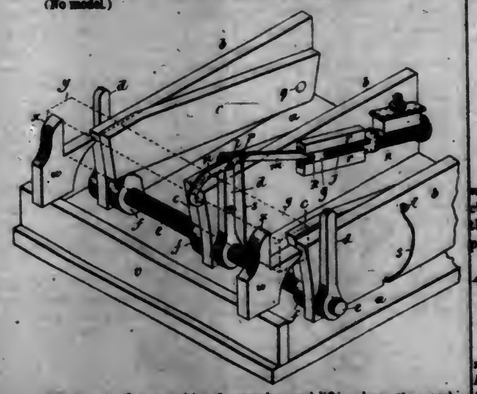
Claim.—1. In a cloth-guiding machine, the combination, with the ratchet member adapted for reverse movement, the slide frictionally holding the same, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector the movement of which serves to cause the required movement of the ratchet member, a guide-roller held upon a pivoted head or frame at that side of the axis of the pivot which is toward the outgoing portion of the web, and the pivoted head or frame supporting the guide-roller and geared with the ratchet member, whereby the guide-roller will have a greater or less endwise movement in the same direction as that of the required movement of the edge of the web to correct a specific variation from the true line, substantially as described.

2. In a cloth-guiding machine, the combination, with the ratchet member adapted for reverse movement, the slide frictionally holding the same, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector the movement of which serves to cause the required movement of the ratchet member, a guide-roller held upon a pivoted head or frame at that side of the axis of the pivot which is toward the outgoing portion of the web, the pivoted head or frame supporting the guide-roller and geared with the ratchet member, and the two guide-fingers at one side of the guide-roller, the outer being the longer, substantially as described.

3. In a cloth-guiding machine, the combination, with the ratchet member adapted for reverse movement, the slide frictionally holding the same, and reciprocating means therefor, which together constitute a power-dispensing mechanical movement, as set forth, of a detector the movement of which serves to cause the required movement of the ratchet member, a guide-roller held upon a pivoted head or frame at that side of the axis of the pivot which is toward the outgoing portion of the web, the pivoted head or frame supporting the guide-roller and geared with the ratchet member, the curved guide-plate for guiding the edges of the web to the detector, and the rollers at opposite sides of the curved guide-plate, substantially as described.

4. In a cloth-guiding machine, the combination, with the ratchet member adapted for reverse movement, the slide frictionally holding the same, and reciprocating means therefor, of the overbalanced detector provided with a frictional engaging-surface, and an attached guide for holding the edge of the web against the said surface, substantially as described.

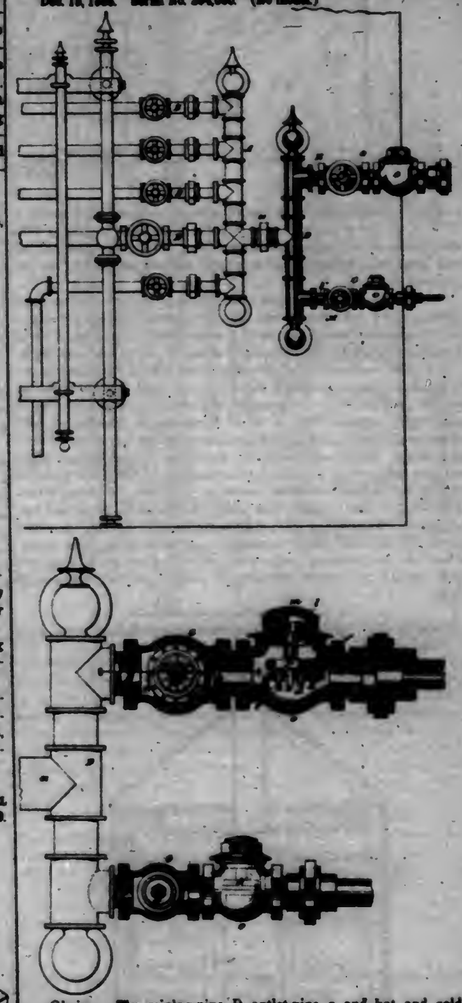
408,759. SAW-SET. SIMON SNOUP, Fish Lake, Ind. Filed Mar. 15, 1889. Serial No. 303,464. (No model.)



Claim.—1. In a saw-set provided with opposite bearings, the reciprocating punch F, having the face G and opposite inclined faces *g g* and intermediate inclined face G', and provided with the pin *f* for rotating the punch, substantially as specified.

2. In a saw-set provided with opposite bearings, the reciprocating punch F, having the face G and opposite inclined faces *g g* and intermediate inclined face G', substantially as specified.

3. In a saw-set having a standard provided with opposite perforations, the opposite T-shaped guides H, mounted on the base and having stems *h* inserted in the openings in the standard, and set-screws L, inserted through the standards and bearing upon the stems *h*, substantially as specified.

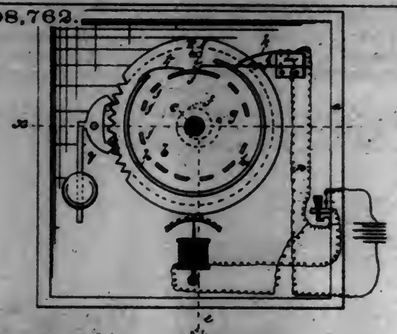


408,760. LOG LIFTING AND TURNING MACHINE. FLAVEL RIDGDELL, Batesville, Ark. Filed Dec. 17, 1888. Serial No. 293,929. (No model.)

Claim.—1. In a machine for turning and lifting logs, the combination, with an engine, a rock-shaft, an arm secured to the shaft, a hook pivoted to the free end of the arm, a pitman-rod pivotally connecting the hook with the piston-rod of the engine, and guides *r*, for regulating the direction of movement of the piston-rod, substantially as and for the purpose specified.

2. The combination, in a log lifting and turning machine, of a log-lifter *c*, a rock-shaft *e*, an eccentric *f*, fastened on the shaft for raising the log-lifter, a straight arm *d* on the shaft, and the engine *h*, connected with the arm, substantially as and for the purpose specified.

408,761. NEEDLE-BATH WATER-SUPPLY VALVE. BENJAMIN G. SMITH, Brooklyn, assignor to Fred. Ades & Co., New York, N. Y. Filed Dec. 19, 1888. Serial No. 294,089. (No model.)



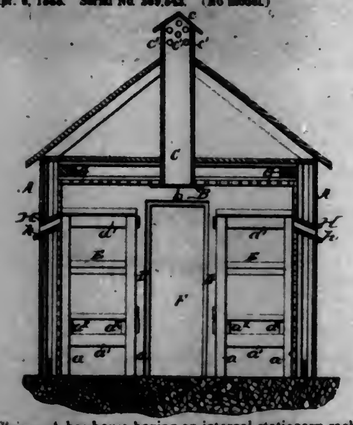
Claim.—The mixing-pipe D, outlet-pipe *c*, and hot and cold water supply pipes E F, connected with the pipe D, combined with a check-valve, substantially as described, in each pipe E and F, whereby the water from one pipe E or F is prevented passing along the other pipe to mix with the water therein, substantially as specified.

408,762. FIRE-ALARM BOX. JOHN SCHNEIDER, Jersey City, assignor, by direct and mesne assignments, to the Newark District Telegraph Company, Newark, N. J. Filed Oct. 3, 1888. Serial No. 287,083. (No model.)

Claim.—1. In a fire-alarm box, a circuit-wheel, a rib *h*, open at *i*, and a series of projections *j*, in combination with contact-points *k l*, one of which engages said rib and projections, substantially as and for the purposes set forth.

2. In combination, in a fire-alarm box, a circuit-wheel having teeth *b'*, a rib *h*, and projections *j j*, corresponding with the number of the box, a spring *l*, having an extension *o*, a contact-spring *k*, and a governor, all said parts being arranged and operating substantially as and for the purposes set forth.

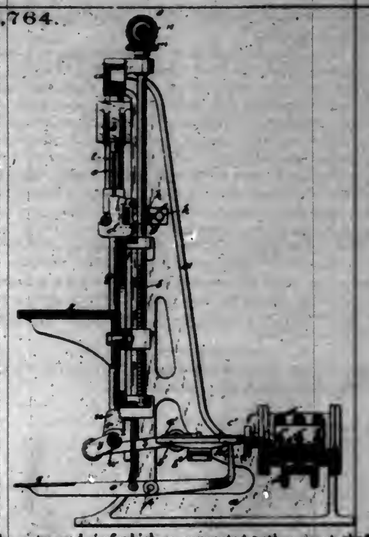
408,762.



3. In combination, in a fire-alarm box, a circuit-wheel having a drum *d*, rib *h*, a concentric series of projections *j*, corresponding with the number of the signal-station, a spring *f*, cord *e*, and governor, all said parts being arranged and combined substantially as and for the purposes set forth.

4. In a fire-alarm box, the combination of the wheel *b*, having a spring *p*, rib *h*, and projections *j j*, and a contact-spring *l*, having a lateral extension and co-operating contact-point, all said parts being arranged and combined substantially as and for the purposes set forth.

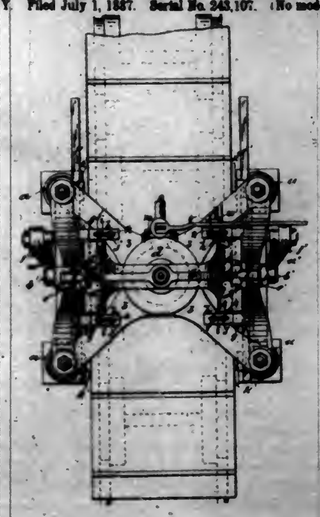
5. The combination, in a fire-alarm-box, with a reciprocating circuit-changer having a series of signaling projections thereon for changing the relations of the terminals of the circuit on which the box is stationed to one another, a rib or formation *h*, disposed on said changer adjacent to said signaling projections to hold one of said terminals during the initial stroke or movement of the reciprocating changer, and having a guide *p*, of a handle *e*, to allow the operator to give said initial movement, means, as described, for giving return movement to said changer, and said terminals arranged in said box adjacent to said changer and engaging the same, first during the initial stroke on the said rib or formation *h* and then during the return-stroke on the signaling projections, all said parts being arranged and adapted to operate substantially as and for the purposes set forth.



408,763. BEE-HOUSE. LOUIS W. SPRADLIN, Garnett, Kans. Filed Apr. 6, 1888. Serial No. 269,843. (No model.)

Claim.—A bee-house having an internal stationary rack consisting of uprights, longitudinal parts, and cross-pieces fastened together, in combination with supporting-frames provided with two parallel upper bars of uneven length, which are disconnected at their outer ends, and said supporting-frames being hinged to the stationary rack and carrying removable comb-frames, as and for the purpose described.

408,764. BOX-NAILING MACHINE. JOSEPH H. SWIFT, Brooklyn, N. Y. Filed July 1, 1887. Serial No. 243,106. (No model.)

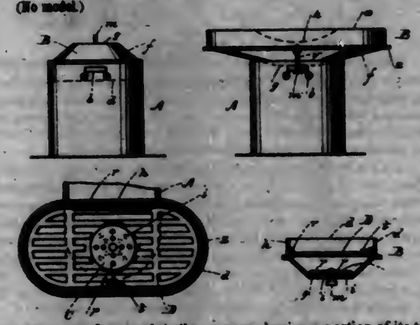


Claim.—1. The combination, in a box-nailing machine, of a support for the box or box-frame to be nailed, a reciprocating cross-head provided with the necessary nail-punches, nail-boxes adapted to co-operate with the nail-punches, and mechanism for operating the cross-head, consisting of a cylinder *d'*, supported on the frame of the machine, the piston-rod *c'* of which is connected with a crank-shaft arranged and adapted to operate the reciprocating cross-head, substantially as set forth.

2. The combination, within and upon the frame of the box-nailing machine, of a table for the support of the box or box-frame to be nailed, a vertically-reciprocating cross-head provided with the necessary nail-punches, nail-boxes adapted to co-operate with the nail-punches, and mechanism for operating the reciprocating cross-head, consisting of a steam-cylinder *d'*, provided with suitable connecting and operating parts, piston-rod *c'*, cross-head *a'*, ways *b'*, pitman *z*, crank *y*, crank-shaft *w*, crank-arms *v*, and connecting-rods *q*, which latter are connected with the crank-arms *v* and with the reciprocating cross-head, substantially as set forth.

3. The combination, within and upon the frame of a box-nailing machine of the form herein set forth, of a table for the support of the box or box-frame to be nailed, a vertically-reciprocating cross-head provided with the necessary nail-punches, nail-boxes adapted to co-operate with the nail-punches, and mechanism consisting of a steam-cylinder *d'*, with suitable connecting parts, valve-rod *l'*, treadle *o'*, spring *r'*, suitably connected with the treadle and with the machine, piston-rod *c'*, cross-head *a'*, ways *b'*, pitman *z*, crank *y*, crank-shaft *w*, crank-arms *v*, connecting-rods *q*, wrist-pins *r*, and castings *s*, for operating the reciprocating cross-head *b*, substantially as described.

408,765. BOX-NAILING MACHINE. JOSEPH H. SWIFT, Brooklyn, N. Y. Filed July 1, 1887. Serial No. 243,107. (No model.)



Claim.—1. The combination, in a box-nailing machine, of a support for the box or a box-frame to be nailed and a reciprocating cross-head provided with the necessary nail-punches and operated directly by the piston-rod of a cylinder *d*, supported on the frame of the machine, together with nail-boxes adapted to co-operate with the nail-punches, substantially as set forth.

2. The combination, in a box-nailing machine, of a car for the support of the box or box-frame to be nailed and a reciprocating cross-head provided with the necessary nail-punches and operated directly by the piston-rod of a cylinder *d*, supported on the frame of the machine, together with nail-boxes adapted to co-operate with the nail-punches, substantially as set forth.

3. The combination, in a box-nailing machine, substantially as set forth, of a car for the support of the box or box-frame to be nailed, and having shoulders *m'* on its opposite longitudinal sides, a vertically-reciprocating cross-head provided at or near each end with a set or series of nail-punches, sets or series of nail-boxes adapted to co-operate with the nail-punches, and mechanism, consisting of the castings *c'*, wrist-pins *b'*, rods *a'*, bell-cranks *f'*, studs *i'*, bars *j'*, and pawls *e'*, for automatically moving the car into proper position for the respective boxes to be nailed in turn.

408,766. WASH-BOILER. ARTHUR P. TURNELL and GEORGE S. BRADSTREET, Beverly, Mass. Filed Apr. 1, 1889. Serial No. 305,563. (No model.)

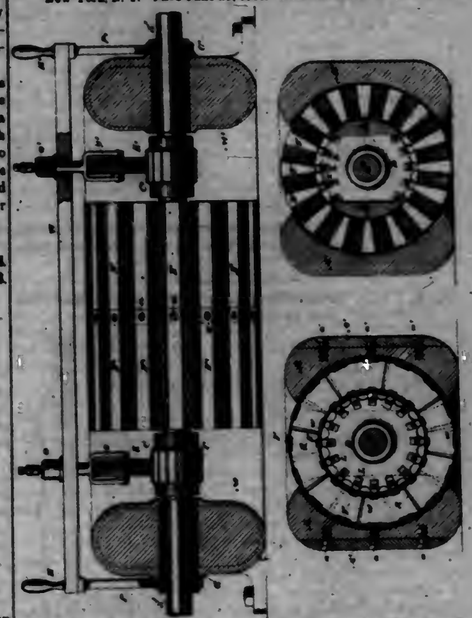
Claim.—1. In a wash-boiler, a cover having a portion of its top flattened and perforated, a disk swiveled to said flattened portion and provided with drain-openings, and a slotted tray adapted to be detachably secured in said cover, all being combined to operate substantially as described.

2. In a wash-boiler, a cover having the central portion of its top flattened and provided with drain-holes, a perforated disk swiveled to said flattened portion, a key for said disk, a slotted tray disposed within said cover, and a flange and catch in said cover for securing said tray, substantially as described.

3. In a wash-boiler, the combination of a body provided with handles, a cover having elongated sides and a central flattened portion in its top provided with drain-openings, a perforated disk swiveled to said top, a key for revolving said disk, a slotted tray adapted to be inserted in said cover, a flange and catch for detachably securing it therein, and a hook on the supporting-flange of said cover for securing it in an inverted position on said body, all being arranged to operate substantially as described.

4. In a wash-boiler, the combination of the body A, having the handles *b*, with the cover B, provided with the groove *k*, perforated flattened portion *g*, the perforated disk C, key *m*, and hook *r*, arranged to operate substantially as described.

5. In a wash-coiler, the combination of the body A, provided with handles *b*, the cover B, having the groove *k*, flattened portion *g*, and drain-holes *i*, the perforated disk C, the key *m*, the tray D, the flange *r*, and catch *l*, and the hook *r*, all being arranged to operate substantially as described.



408,767. PRESSER-FOOT FOR SEWING-MACHINES. CHARLES TIBBS, Washington Heights, assignor to The Union Special Sewing Machine Company, Chicago, Ill. Filed Feb. 25, 1889. Serial No. 301,066. (No model.)

Claim.—1. The inclined roller presser-foot for sewing-machines, having a straight lateral axial stud in combination with a split inclosing bearing or box for such stud on the supporting-arm, means for confining the stud in the bearing, and independent means for tightening the bearing, substantially as set forth.

2. The roller presser-foot having the axial stud recessed and split at its outer end, the supporting-arm having the split bearing for the stud, the collar H, for confining the stud in said bearing, and the screw J, for expanding the outer end of the stud, all combined and operating substantially as set forth.

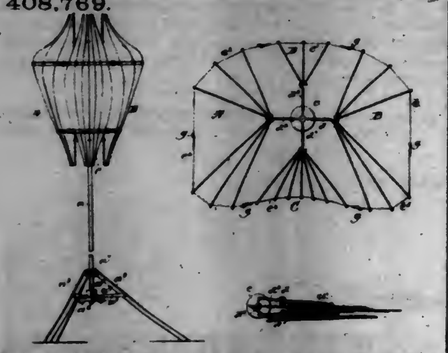
408,768. DYNAMO-ELECTRIC MACHINE. JEAN T. VAN GEETEL, New York, N. Y. Filed June 25, 1888. Serial No. 278,117. (No model.)

Claim.—1. A dynamo-electric machine having two field-magnets of horseshoe type, said field-magnets being joined together at their polar ends by scarf-splices, substantially as shown, and having interior projecting pole-pieces, in combination with an armature of the Gramme type carried on a shaft journaled at the neutral portions of said field-magnets and adapted to rotate in the groove formed at the junction thereof, said armature having commutators at its opposite ends attached to the shaft, and commutator-brushes connected together by a common connection and journaled to the frame of the machine, whereby said brushes may be adjusted conjointly, substantially as described.

2. An armature for a dynamo-electric machine or motor, having commutators on the opposite ends of its shaft, and commutator brushes or rollers bearing thereon, with means for simultaneously adjusting the brushes in either direction, substantially as described.

3. An armature-core for dynamo-electric machines, consisting of a magnetic ring attached to a hub, in combination with magnetic disks and retaining-bands F F', held in position by screws, substantially as shown and described.

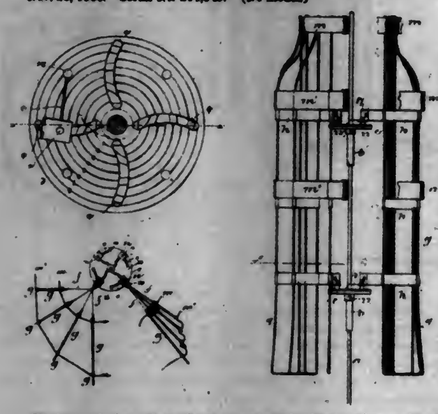
408,769. DRESS-FORM. WILLIAM VOGLER, Somerville, Mass. Filed Aug. 26, 1888. Serial No. 283,746. (No model.)



Claim.—1. In a dress-form for wearing-apparel, a supporting-rod combined with a series of independently-movable folding sections, each section consisting of separable wings and pivotally supported independently of each other on or with relation to the said rod, substantially as described.

2. In a form for wearing-apparel, a supporting-rod combined with a series of folding sections containing wings, substantially as described, and pivoted on or with relation to the said rod, the separate wings of the sections varying in shape and being independently movable with relation to each other, substantially as described.

3. The supporting-rod and the folding sections pivotally and independently connected thereto, combined with the adjusting-straps to connect the outer edges of the wings of the sections and vary their distance apart individually or the sections one from the other, substantially as described.



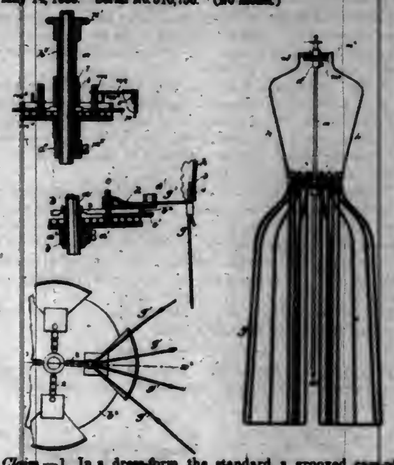
4. The supporting-rod and the sections containing wings *w w'*, pivotally supported on the said rod and swinging independently thereon, the said wings being collected in folding sections to constitute both

408,769.

the bust and skirt portion, and being adjustable toward or from the said rod in the direction of their length to vary their inclination thereto, substantially as described.

408,770. DRESS-FORM. WILLIAM VOGLER, Somerville, Mass. Filed Nov. 20, 1888. Serial No. 291,343. (No model.)

Claim.—1. In a dress-form, a series of wings, and a series of spring-arms, as *f*, arranged in groups to which the said wings are connected at one end, the other ends of the said groups of arms being joined together to form a clip or eye, as described, combined with a series of studs forming pivotal points for the connected ends of the group of spring-arms, and pivoted supports for the studs, substantially as described.



2. In a dress-form, a standard, cams thereon, slotted plates *e*, adjacent to said cams and rotatable with relation thereto, arms 15 and studs 14, extended through said plates *e*, engaging with and made movable by the said cams toward and from the said standard by rotation of plates *e*, combined with a series of arms, as *f*, connected together at one end and pivotally supported by the said studs, and with wings connected to the outer ends of the said arms, substantially as described.

3. In a dress-form, a standard, rotatable plates thereon, spring-arms *f*, pivoted thereto, and a series of pivoted wings arranged in groups and supported at the outer end of said spring-arms, the said groups of wings being each composed of several wings, as *g*, normally held together by said spring-arms, the arms being connected together at their inner ends, as described, and with a series of flexible straps, as *m*, at their outer ends to separate the wings one from the other and hold them in such position, substantially as described.

4. In a dress-form, a standard, cam-plates thereon, and rotatable slotted plates *e*, having an index or scale and concentric with said cam-plate, combined with the arms 15, pivoted upon the plates *e*, and having pins 14, and with a series of adjustable wings supported at their inner ends by the said pins, substantially as described.

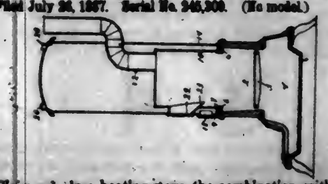
5. In a dress-form, a standard, cam-plates thereon, and slotted plates *e*, adjacent thereto and having an index or scale, combined with the pivoted arms 15, having pins 14, extended through said plates *e*, and having slotted holders *n*, and with a series of adjustable wings held in said slotted holders and supported by the said pins, substantially as described.

408,771. DRESS-FORM. WILLIAM VOGLER, Somerville, Mass. Filed May 14, 1888. Serial No. 310,756. (No model.)

Claim.—1. In a dress-form, the standard, a grooved cam-plate thereon, an independent slotted cap-plate, a series of carriages having studs and shoes to be actuated by the said grooved cam-plate, combined with a series of arms arranged in groups and having depending wings attached thereto, the said arms being connected with the said carriages, to operate substantially as described.

2. In a dress-form, the combination of the following instrumentalities, viz: the standard, the grooved cam-plate a^2, an independent slotted cap-plate co-operating therewith, a series of carriages, and connected studs acted upon by said cam-plate, a series of wings having arms connected to and made movable with the said carriages, and the bust or shoulder section connected with the said wings, a series of neck-rods, a series of neck-carriages to which the said neck-rods are connected, and a slotted cam-plate, as m^4, and a cap-plate, as m^5, to actuate the said neck-carriages, substantially as described.

3. In a dress-form, the standard, the carriage notched at one end and provided with a stud, a shoe connected to the said stud, and a series of wings having arms also connected to the said carriage, combined with a grooved cam-plate and a slotted cap-plate, to operate substantially as described.

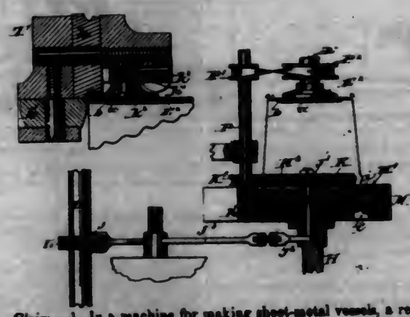


4. In a dress-form, a grooved cam-plate, a slotted cap-plate provided with radial guideways, a series of shoes placed in the said guideways, a series of studs carried by the said shoes, and a series of carriages connected with the said studs and having a series of holding-notches, combined with a series of wings having arms connected to and kept separated at the proper distances apart by the said carriages, substantially as shown and described.

408,772. SOLDERING-IRON. CHARLES I. WAGANDT, Baltimore, Md., assignor of one-half to Keen & Hagerty, same place. Filed June 11, 1888. Serial No. 313,864. (No model.)

Claim.—In a soldering-tool, the combination, with the holder having an internal and continuous screw-thread, as described, of the soldering-tip having the longitudinal channels upon its exterior and a corresponding interrupted screw-thread upon its exterior between said channels, substantially as and for the purposes set forth.

408,773. HEATING-STOVE. SAMUEL S. WALES, Minneapolis, Minn. Filed July 26, 1887. Serial No. 245,209. (No model.)



Claim.—1. In a heating-stove, the combination, with the base 2, constituting a surface for directly radiating heat into the room, of the rim 6, resting upon the top of said pot and provided upon its upper face with the flanges 7 and 9, the drum 10, resting on said rim within the flange 9 above the radiating-base 2 and provided with a closed flat top, the outer drum 14, resting on the rim 6 within the flange 7, to surround the drum 10, and having an air-inlet 18 in its side above the base and rim 6 and opening into the space between the two drums and provided with a closed top having exit-openings 20 for the attachment of conducting-flues, and having a door 16 above the flat top of the inner door, all substantially as and for the purposes set forth.

2. The combination, in a heating-stove, of the fire-pot 2, the rim 6, fitted to the top of said fire-pot and projecting inwardly over the chamber of the same and formed with the flanges 7 and 9, the drum 10, having a closed top and resting on said rim next to the flange 7, the drum 14, resting on said rim next to the flange 9 and provided with inlet-openings 18 above the rim 6 and opposite the sides of the drum 10, and exit-openings 20, the chute 22, inclined, as shown, from the door 22 in the drum 14 to within the drum 10, and the draft-pipe 12, extending upward from the top of the drum 10 near one side thereof and thence laterally to and through the side of the drum 14, all substantially as and for the purposes set forth.

408,774. MACHINE FOR MAKING SHEET-METAL VESSELS. FRANCIS A. WALES, Milwaukee, Wis. Filed Feb. 8, 1887. Serial No. 226,922. (No model.)

Claim.—1. In a machine for making sheet-metal vessels, a revoluble chuck or head having a series of grooved rolls mounted therein, in combination with means, substantially as described, for stopping the rotation of said chuck or head at a certain time and for a predetermined interval, and then permitting it to again revolve, as and for the purpose set forth.

2. In a machine for making sheet-metal vessels, a chuck or head having a series of grooved rolls mounted therein, in combination with a yielding bearing arranged within the head and provided with a series of openings corresponding with the rolls, as and for the purpose set forth.

3. In a machine for making sheet-metal vessels, the combination of a chuck or head having a series of grooved rolls mounted therein, a loose bearing arranged within the head and provided with a series of openings corresponding with the rolls, and a suitable spring or springs arranged to exert their force on said bearing, as and for the purpose set forth.

4. In a machine for making sheet-metal vessels, the combination of a head or chuck having a series of grooved rolls mounted therein and provided with a series of seats, springs arranged in the seats, and a loose plate that rests upon the springs and has a series of openings corresponding with the rolls, as and for the purpose set forth.

5. In a machine for making sheet-metal vessels, the combination, with a suitable chucking mechanism, of a beading-roll arranged to come inside a chucked vessel, a beading-surface arranged upon the outside of said vessel to oppose the said roll, and suitable mechanism for bringing the inside roll in and out of contact with the vessel while the latter is being revolved, substantially as set forth.

6. In a machine for making sheet-metal vessels, the combination of a revoluble chuck or head, a beading-roll having its journal eccentrically arranged in the spindle of said chuck or head and provided with a suitable arm, and a beading-surface in opposition to said roll, as set forth.

7. In a machine for making sheet-metal vessels, the combination of a revoluble chuck or head, a beading-roll having its journal eccentrically arranged in the spindle of said chuck or head, a beading-surface in opposition to the roll, and means, substantially as described, for automatically bringing said beading-roll in and out of contact with the body of the vessel being operated upon by the machine, as and for the purpose set forth.

8. In a machine for making sheet-metal vessels, the combination of a revoluble chuck or head having grooved rolls mounted therein, a beading-roll having its journal eccentrically arranged in the spindle of the chuck or head, a beading-surface in opposition to the roll, a brake for said chuck or head, and means, substantially as described, to automatically operate the brake and bring said beading-roll in and out of contact with the body of a vessel being operated upon by the machine at predetermined intervals, as and for the purpose set forth.

9. In a machine for making sheet-metal vessels, the combination of a revoluble chuck or head, a beading-roll eccentrically journaled to the spindle of said chuck or head, a shaft carrying a beading-roll in opposition to the one first named and provided with a pulley geared to a suitably-arranged driving-pulley, and suitable mechanism for bringing the first-named roll in and out of contact with the body of the vessel being operated upon, as and for the purpose set forth.

10. In a machine for making sheet-metal vessels, the combination of a head, seaming-rolls journaled therein and arranged in pairs, of which the flattening-rolls are arranged at an angle to the beading-rolls, and means, substantially as described, for actuating said head with relation to a vessel on the machine, whereby the flange of a cover spanning the rim of the vessel-body is laid close against the latter, and the three thicknesses of metal thus united are bent at an angle, leaving the outer edge of the cover projecting over and clasping the curve of said rim, as and for the purpose set forth.

11. In a machine for making sheet-metal vessels, the combination of a head, seaming-rolls journaled therein and arranged in pairs, of which the flattening-rolls are at an angle to the beading-rolls, means, substantially as described, for actuating said head with relation to a vessel on the machine, whereby the flange of a cover spanning the rim of the vessel-body are laid close against the latter, and the three thicknesses of metal thus united bent at an angle, leaving the outer edge of the cover projecting over and clasping the curve of said rim, and supporting-wheels for the turned stock, as and for the purpose set forth.

12. In a machine for making sheet-metal vessels, the combination of a head, seaming-rolls journaled therein and arranged in pairs, of which the flattening-rolls are beveled and at an angle to the beading-rolls, and means, substantially as described, for actuating said head with relation to a vessel on the machine, whereby the flanges of a cover spanning the rim of the vessel-body are laid close against the latter, and the three thicknesses of metal thus united bent at an angle, leaving the outer edge of the cover projecting over and clasping the curve of said rim, as and for the purpose set forth.

13. In a machine for making sheet-metal vessels, the combination of a head having seaming-rolls operatively connected thereto, a supporting-wheel for the seam, arranged on a pivoted arm, and a spring arranged to exert its force against said arm, as and for the purpose set forth.

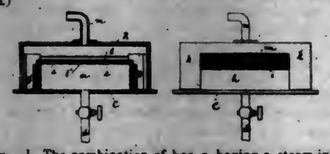
14. In a machine for making sheet-metal vessels, the combination of a bell-crank lever, a loosely-journaled disk having seaming-rolls mounted therein, and means, substantially as described, for tilting said lever and for partially rotating the disk at predetermined intervals, as and for the purpose set forth.

15. In a machine for making sheet-metal vessels, the combination of a bell-crank lever, a loosely-journaled disk having seaming-

roll mounted therein, and means, substantially as described, for tilting said lever and partially rotating the disk at predetermined intervals, and a locking mechanism for holding the disk stationary when the seaming-rolls are in contact with a vessel being operated upon by the machine, as and for the purpose set forth.

16. In a machine for making sheet-metal vessels, the combination of a bell-crank lever carrying a loosely-journaled disk having seaming-rolls mounted therein, supporting-wheels arranged adjacent to the rolls, and means, substantially as described, for tilting said lever and partially rotating said disk at predetermined intervals, as and for the purpose set forth.

17. In a machine for making sheet-metal vessels, the combination of a chucking mechanism, a curling mechanism, a seaming mechanism, and a revoluble shaft provided with a series of cams arranged at intervals thereon to automatically impart a successive action to the several mechanisms, as and for the purpose set forth.



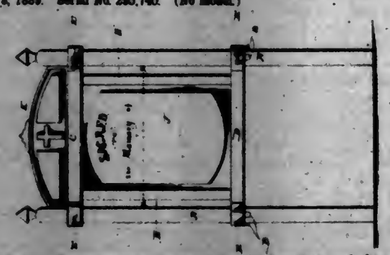
18. In a machine for making sheet-metal vessels, the combination of a chucking mechanism, a beading mechanism, a seaming mechanism, and a revoluble shaft provided with a series of cams arranged at intervals thereon to automatically impart a successive action to the several mechanisms, as and for the purpose set forth.

19. In a machine for making sheet-metal vessels, the combination of a chucking mechanism, a curling mechanism, a beading mechanism, a seaming mechanism, and a revoluble shaft provided with a series of cams arranged at intervals thereon to automatically impart a successive action to the several mechanisms, as and for the purpose set forth.

20. In a machine for making sheet-metal vessels, the combination of the chucks, curling-rolls carried by one of the chucks, a beading-roll arranged to come inside a chucked vessel, a beading-surface arranged to oppose the beading-roll, and suitable mechanism for actuating the chucks and for bringing said beading-roll in and out of contact with the chucked vessel, substantially as and for the purpose set forth.

21. In a machine for making sheet-metal vessels, the combination, with the chucks, of a roll carried by one of the chucks and suitable mechanism for bringing the roll in and out of contact with a chucked vessel from within the circumference thereof, substantially as set forth.

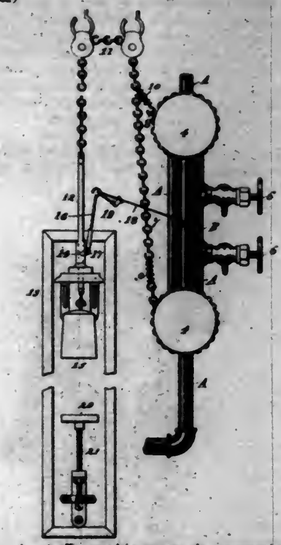
408,775. APPARATUS FOR STRAINING CLOTH. ADAM WARKEWICK, New York, N. Y. Filed May 14, 1889. Serial No. 310,723. (No model.)



Claim.—1. The combination of box *a*, having a steam-inlet and perforated top *c*, with cover *k*, having a steam-outlet, substantially as specified.

2. The combination of box *a*, having steam-inlet and perforated top *c*, with cover *k* and uprights *h*, having cushioned edges for the admission and discharge of the cloth, substantially as specified.

3. The combination of box *a*, having a steam-inlet and a perforated top, with frame *g*, holding muslin *f*, and with cover *k*, having a steam-outlet, substantially as specified.



4. The combination, in a cloth-steaming machine, of the following elements: a steam-box with perforated top, a surrounding muslin-holding frame, a cover having a steam-outlet, cushions between which the cloth is admitted and discharged, and a pair of cloth-feeding heated rollers, substantially as specified.

408,776. MONUMENT. JAMES H. WEBB, Clinton, Ark. Filed Jan. 8, 1889. Serial No. 295,740. (No model.)

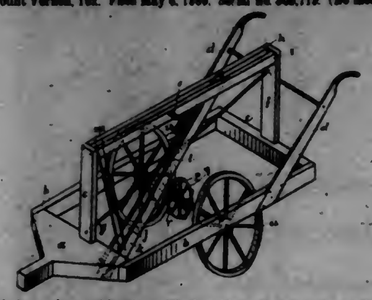
Claim.—The improved monument herein described and shown, consisting of the standards having the studs B, the sill D, having the sockets F in its upper side and provided at its ends with the loops E, encircling the standards and resting on the studs B, the guide-rails having tenons at their ends engaging the sockets F, and having grooves in their inner opposing faces, the panel having its side edges engaging said grooves and its lower edge resting on the sill D, the sill C, resting on the upper edge of the panel and having sockets in its lower side engaging the tenons at the upper ends of the guide-rails and provided at its ends with loops encircling the standards, and the cap-piece K, secured on the upper side of the sill C, as specified.

408,777. AUTOMATIC CUT-OFF FOR WATER-GAGES. RICHARD A. WHEDMAN, Geneva, N. Y. Filed Apr. 20, 1889. Serial No. 308,196. (No model.)

Claim.—A cut-off comprising water-glass connections mounted in the stand-pipe and provided with cut-off valves having pulleys upon the outer ends of the valve-stems, belts upon said pulleys connected to a drop-weight, a drop-weight, a lever supporting the drop, and a cord connected to the lever and a water-glass and released by the breakage of the glass, substantially as described.

408,778. ELECTRO-MAGNETIC MOORING. HARLAN P. WELLMAN, Cuttlettsburg, Ky. Filed Apr. 23, 1889. Serial No. 308,275. (No model.)

Claim.—1. A boat having a mooring-surface, in combination with a shore mooring-surface, one of said surfaces being magnetizable and the other acting as a keeper, substantially as described.



2. A boat provided with a magnetizable mooring-surface, substantially as described.

3. A boat having electro-magnets for mooring, in combination with a second mooring-surface consisting of a metal apron capable of acting as a keeper, substantially as specified.

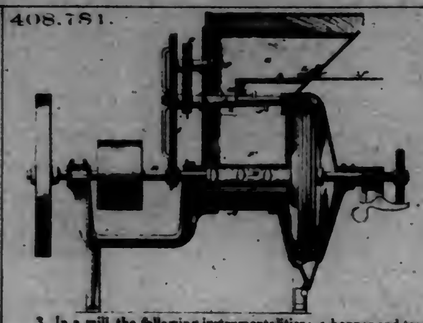
4. A wharf having mooring electro-magnets connected by wires and provided with water-electrodes, in combination with a boat having electro-magnets for contact with said magnets on the wharf, water-electrodes connected with said boat-magnets, and a battery connected with the magnetic series for the purpose of magnetizing the same, substantially as specified.

5. A wharf having electro-magnets thereon for mooring and electrodes under water at each side of said wharf, connected with said magnets, in combination with a boat having a series of mooring-magnets, electrodes connected with said magnets and under water at each side of said boat, a battery connected with said magnets on the boat, and a switch in the circuit for controlling said magnets from the ship, substantially as specified.

408,779. COTTON SCRAPER AND CHOPPER. JOHN C. WHITE, Mount Vernon, Tex. Filed May 6, 1889. Serial No. 309,712. (No model.)

Claim.—In combination with the oblong frame of the uprights *e* and *f*, stayed by the bar *g*, beams *h* and *i*, pivoted longitudinally in the upper ends of said uprights, arms *j* and *k*, secured to the inner faces of said beams *h* and *i*, and braces *m*, secured to said beams and said arms, the scrapers secured to the lower ends of said arms, leaving when closed between them the circular opening *n*, pins *p*, working against the edges of the wheel *q*, diamond-pieces *r*, secured to the periphery of the said wheel *q* and operating to open the said arms *o*, spring *s*, operating to close said arms, said wheel *q* being operated by the axle *t* and wheels *u*, substantially as shown and described.

408,780. COMBINED FLOUR CHEST AND SIFTER. ISAAC B. WILMOT, Aurora, Ill. Filed Mar. 22, 1889. Serial No. 304,262. (No model.)

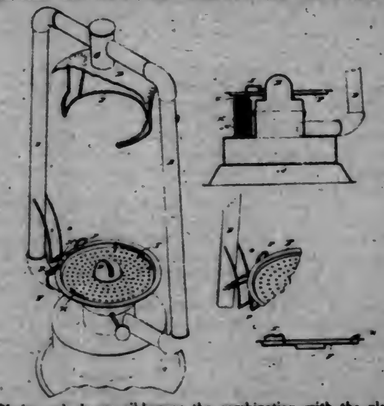


Claim.—In a combined flour chest and sifter, the combination, with a box or receptacle for containing the material, of a horizontal partition arranged in said box and provided with an annular opening, a rigid screen located below said partition and secured to the same, and a shaker adapted to fit and operate within the opening of the partition, said shaker having substantially the form of a wheel, the ribs or arms whereof form chambers for the material, the upper edges being flush with the upper edge of the partition, and means for oscillating said shaker from the outside of the box, for the purpose set forth.

408,781. GRINDING AND CRUSHING MILL. JAMES F. WIDDIFIELD, Springfield, Ohio, assignor to the Foos Manufacturing Company, same place. Filed Sept. 17, 1887. Serial No. 249,961. (No model.)

Claim.—1. In a mill, the combination, with that portion into which the material is fed, of intergearing tapering crushers mounted therein with their axes substantially parallel, whereby a gradually increasing space is formed between their bodies from one end to the other, projections extending from the crushers, and means to actuate the crushers.

2. In a mill, the combination, with that portion into which the material is fed and tapering crushers mounted therein with their axes substantially parallel, whereby a gradually-increasing space is formed between them from end to end, projections extending from the crushers, and means to rotate the crushers, of an adjustable cut-off mounted above the crushers and approximately thereto and arranged to be moved back and forth over the said space.



3. In a mill, the following instrumentalities: a hopper and tapering crushers mounted therein with their axes substantially parallel, whereby the space between them widens from one end toward the other, projections extending from the crushers, and means to rotate the crushers, an adjustable cut-off mounted above the crushers in proximity thereto and arranged to be moved back and forth and over the said space, an opening in the cut-off, a supplemental cut-off to control the size of said opening, an agitator arranged to feed the material through the said opening, and means to actuate the agitator.

4. In a mill, the combination, with the hopper into which the material is fed, of two tapering feeding-crushers mounted therein with their axes parallel and having protuberances extending therefrom which grow shorter and shorter from one end toward the other, for the purpose set forth.

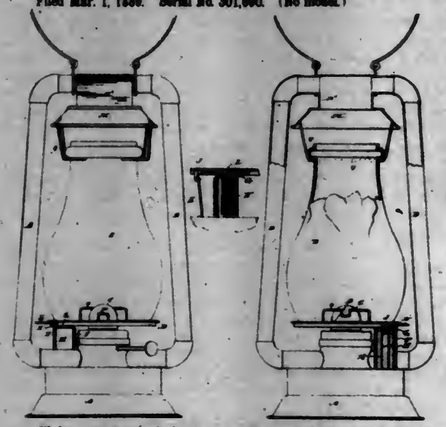
5. In a mill, the combination, with a cut-off proper having a feed-opening therein and a supplemental cut-off fitted thereto and arranged to open and close said feed-opening, of an agitator mounted above said cut-offs and arranged to feed the material to said opening.

6. In a mill, the combination, with the portion into which the material is primarily fed and two independent disconnected crushers mounted therein, of a main shaft, a crushing-conveyer, grinding mechanism, and an intermediate operating mechanism interchangeable from one crusher to the other and arranged to receive motion from the said main shaft.

408,782. TUBULAR LANTERN. OLIVER D. WOODRUFF, Southington, Conn. Filed Jan. 26, 1889. Serial No. 297,057. (No model.)

Claim.—1. In an oil-burner, the combination, with the plate thereof, of two stationary globe-retaining devices, each consisting of a loop secured to the said plate upon which the devices are arranged for engagement throughout their length with the globe, substantially as set forth.

2. In a tubular lantern, the combination, with the plate thereof, of two parallel stationary globe-retaining devices secured to the plate on which they are arranged to be engaged throughout their length by the globe, one of the devices being virtually rigid and hooked outward for the edge of the globe to be slipped under it, and the other being yielding and adapted to be sprung toward the center of the plate when the globe is applied to the plate or removed therefrom, substantially as set forth.



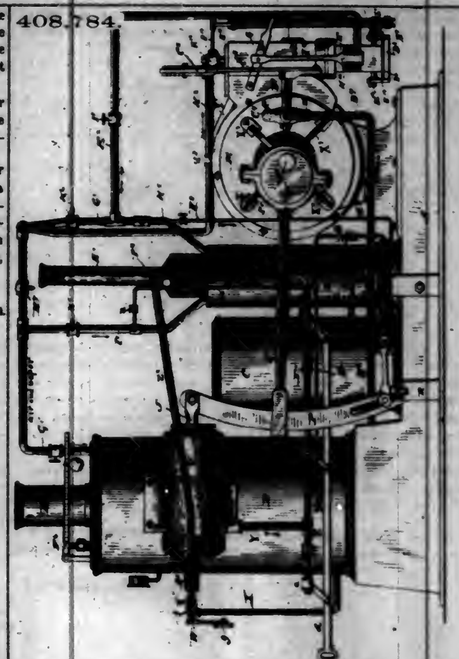
3. A tubular lantern having a rigid frame and a stationary globe-cap or dome, an automatically-lifted burner-plate confined to vertical

movement by guides, globe-retaining devices mounted upon such plate in position to stand up within the globe when the same is in place thereon, and a laterally-yielding globe-holder adapted to permit the upper end of the globe to play up and down in it, substantially as set forth.

4. A tubular lantern having a laterally-yielding globe-holder for the upper end of the globe to play up and down in, attached to the globe-cap of the lantern and braced against lateral displacement, substantially as set forth.

5. A tubular lantern having a laterally-yielding globe-holder for the upper end of the globe to play up and down in, consisting of a single piece of wire bent to embrace more than half of the circumference of the globe, then bent upward and rearward at points on opposite sides of its curved portion, and then bent downward to join such curved portion and brace the whole holder against displacement, substantially as set forth.

408,783. LANTERN. OLIVER D. WOODRUFF, Southington, Conn. Filed Mar. 1, 1889. Serial No. 301,660. (No model.)



Claim.—1. In a tubular lantern, the combination, with the base thereof, of a vertically-movable burner-plate, two telescoping tubes respectively secured to the burner-plate and to the lantern-base and coupled to be relatively non-rotatable, and means for lifting the plate, which is prevented from moving laterally by the coupled tubes, substantially as set forth.

2. A tubular lantern having a movable burner-plate, two telescoping tubes respectively secured to the plate and to the base of the lantern and constructed to confine the plate to vertical movement in one plane, a spring for automatically lifting the plate, a catch consisting of a notched ear rigidly secured to and depending from one edge of the plate, and a long loop for engagement with such catch, secured to the base of the lantern and standing in a virtually upright position, substantially as set forth.

3. In a tubular lantern, the combination, with the draft-tubes thereof, of a fixed globe-cap located below the curved upper ends of the said tube and a long narrow draft-chest extending parallel with the said curved ends of the tubes and opening into them at its upper end and at its lower end into the globe-cap, substantially as set forth.

4. In a tubular lantern, the combination, with the draft-tubes thereof, of a fixed globe-cap located below the curved upper ends of the said tubes, a fixed globe-holder depending below the cap and adapted to have the upper end of the globe play up and down in it, a globe, an automatically-lifted burner-plate, and a long narrow draft-chest extending parallel with the said curved ends of the tubes and opening thereinto and interposed between them and the globe-cap, with the interior of which it communicates through a long narrow opening, substantially as set forth.

408,784. COMPRESSED-AIR ENGINE. BENJAMIN F. WESCOTT, Lovington, Va. Filed Sept. 26, 1888. Serial No. 286,442. (No model.)

Claim.—1. In a motor, the combination of a burner composed of an inner and outer shell with intermediate air-passages, a filling in the inner shell, pipes for feeding the vapor and fluid to the burner, a hinged plate for regulating the supply of air to the burner, links N^{13}, pivoted to this plate, eccentrics M^{13}, embraced by these links, and a shaft carrying these eccentrics, substantially as described.

2. In a motor, the combination of the combustion-chamber G, a burner F, attached thereto at its lower end, a hinged plate for regulating the supply of air to the burner, links N^{13}, connected to this hinged plate, eccentrics M^{13}, embraced by these links, a shaft carrying these eccentrics, a lever L^{10} for operating this shaft, a pipe R^{10}, leading into the combustion-chamber, a valve in this pipe, and links or rods M^{10}, connecting the stem of this valve with the lever L^{10}, substantially as described.

3. In a motor, the combination, with the burner having air-passages at each side for the admission of air to support combustion, of the hinged plate whereby the passages are opened and closed to regulate the supply of air, substantially as specified.

4. In a motor, the combination, with the driving-shaft of the engine or motor, of the eccentrics mounted thereon, the eccentric-arms, the oscillating segments to which said arms are adjustably connected, the air-pumps having their piston-rods connected with said segments, and the compressed-air holder connected with said pumps and with the burner of the motor, substantially as and for the purposes set forth.

5. In a motor, the combination, with the segments P, of a pump having its piston-rod adjustably connected therewith, and the pipe-connections communicating with the feed-water heater and the pump and compressed-air holder, whereby water is supplied to said holder, substantially as and for the purposes specified.

6. In a motor, the combination, with the segments P P', the driving-arms S S', adjustably connected to the said segments, and the eccentrics of the motor, of the air-pumps, the water-pump, and the oil-pump, having their piston-rods connected with said segments, whereby the respective pumps are simultaneously operated, substantially as and for the purposes set forth.

7. In a motor, the combination, with the exhaust-pipe of the engine, of the coil connected therewith and the compressed-air holder, in the lower part of which the coil is located, substantially as and for the purposes set forth.

8. In a motor, the combination, with the coil located in the compressed-air holder, of the feed-water heater, the coil located therein, and the pipe connecting the respective coils, whereby the water in the feed-water heater is heated, substantially as specified.

9. In a motor, the combination, with the coil of the feed-water heater and the air-pumps U, of the pipe Z, having valves *a b c*, the pipe Y, connecting the said pipe with the pump, the pipe W, having valves *e f*, and the pipe Z^3, leading to the stack of the superheater D and arranged to operate substantially as and for the purposes specified.

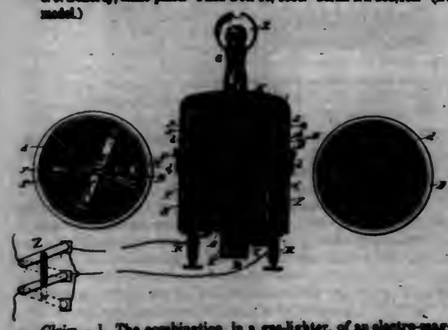
10. In a motor, the combination, with the holder B, of the pipe G^3, leading to the burner and provided with a valve H^7, the pipes G^2 I^3, having valves H^3 K^3, and the coil in the superheater connecting with said pipes H^3 I^3, whereby the air and aqueous vapor may be superheated in its course to the burner, substantially as specified.

11. In a motor, the combination, with the pipe G^2, of the valve Z^3, having an angle-lever Y^3 secured to its stem, of the disk D^3, secured to the driving-shaft of the engine, the friction-roller B^3, secured to this disk, whereby the said arm is actuated, and the lever B^2, connecting with the stem of the reversing-valve O^2 of the engine, whereby the products of combustion are automatically cut off from the cylinder and the oil supplied in properly-regulated quantities to the burner to permit the products of combustion to operate expansively, substantially as specified.

12. In a motor, the combination, with the external shell of the superheater F^2, of the internal shell and the ribs thereon forming tortuous passages for the compressed air and aqueous vapor, substantially as specified.

13. In a motor, the combination, with the burner, of the hinged plate D^2, the lever L^{10}, the shaft L^{12}, the eccentrics M^{12} and straps N^{12}, the rod M^{10}, connecting with the said lever, the connecting-rod N^{10}, and valve P^{10} of the exhaust-pipe, leading from the combustion-chamber F^2, whereby the draft through the combustion-chamber is regulated, substantially as specified.

14. In a motor, the combination, with the burner F and the superheater above the same, of the connecting-pipe B^{10}, having a controlling-valve T^{10}, whereby compressed air and vapor may be supplied to the burner, substantially as set forth.



15. The combination, in a motor, of a rotary engine, a combustion-chamber connected to the valve-box of the engine, this chamber being provided with superheating tortuous passages, these passages being connected to the combustion-chamber proper near its lower end by means of passages I', a burner arranged immediately below this combustion-chamber, and valved pipes for conducting compressed air respectively to the said combustion-chamber and burner, substantially as described.

16. The combination, in a motor, of an engine, a burner and combustion-chamber connected thereto, an air-holder containing water, a coil or its equivalent for heating and vaporizing the water, means for compressing air into this holder, and valved pipes for conveying compressed air and vapor to the combustion-chamber, substantially as described.

17. In a motor, the combination of an engine, a combustion-chamber and burner connected to the engine, a compressed-air holder connected to the combustion-chamber by pipes, a valve Z^3 in these pipes, a weighted operating-lever Y^3, connected to this valve, and a disk or cam on the drive-shaft of the engine, provided with a pin B^3 for operating the said lever Y^3, substantially as and for the purpose specified.

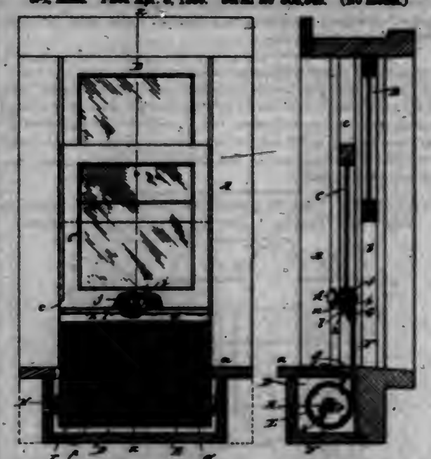
18. In a motor, the combination, with a compressed-air holder, an engine provided with a burner, a pipe connecting this burner with the said compressed-air holder, means for compressing the air into the said holder, and a superheater connected to the said connecting-pipe between the air-holder and burner of the engine, and valves in the said pipe, substantially as described.

408,785. ELECTRIC GAS-LIGHTER. THEODORE J. SCHLLER, Louisville, Ky., assignor to himself, Daniel R. Doherty, R. D. Mattingly, and C. J. Doherty, same place. Filed Dec. 10, 1888. Serial No. 293,102. (No model.)

Claim.—1. The combination, in a gas-lighter, of an electro-magnet, an armature therefor, a feed-pipe having an orifice to discharge the gas, and a valve constructed and arranged to be held in its normally-closed position contiguous to said orifice, but free from the walls thereof, and opened to allow the full force of the gas to pass through without friction between the valve and the walls of the orifice, substantially as described.

2. The combination, in a gas-lighter, of an electro-magnet, a permanent magnetic armature therefor, a feed-pipe having an orifice to discharge the gas, a valve held by the attraction of the permanent magnet in its normally-closed position contiguous but free from contact with the walls of said orifice, and constructed to move away from the same to admit the full discharge therefrom without friction between the walls of said orifice and the valve, substantially as described.

3. The combination, in a gas-lighter, of an electro-magnet, a permanent magnetic armature, a feed-pipe having an orifice to discharge the gas, and a valve moving over said orifice to partially close the same while free from contact with the walls thereof, substantially as described.



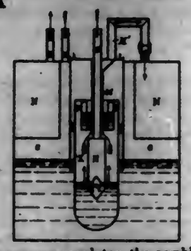
4. The combination, in a gas-lighter, of an electro-magnet, a permanent magnetic circular armature therefor mounted on a central shaft, a feed-pipe having an orifice to discharge the gas, and a valve connected to and moving with said armature and over said orifice, substantially as described.

5. The combination, in a gas-lighter, of an electro-magnet, a permanent magnetic circular armature therefor mounted on a central shaft, a feed-pipe having an orifice to discharge the gas, a valve connected to and moving with said armature, and means, as the screw Q, for regulating the amount of discharge for the taper, substantially as described.

6. The combination, in a gas-lighter having upper and lower chambers, of an electro-magnet set in the lower chamber, a permanent magnetic circular armature therefor working in the upper chamber and mounted on a central shaft, a tube extending into the lower chamber and surrounding the central shaft, a feed-pipe passing through the lower chamber and terminating in the upper chamber, and a valve connected to and moving with the armature and partially closing the mouth of the feed-pipe, substantially as described.

7. The combination, in a gas-lighter, of an electro-magnet, a permanent magnetic armature therefor having its opposite poles arranged on opposite sides of one pole of the electro-magnet, a feed-pipe to discharge the gas, and a valve moving with said armature and governing the emission of the gas from said feed-pipe, substantially as described.

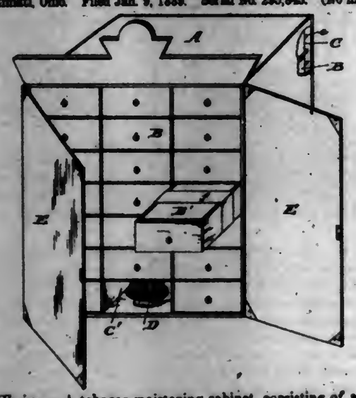
408,786. WINDOW-SCREEN. ABRAHAM ABRAHAMS, Northampton, Mass. Filed Apr. 3, 1888. Serial No. 269,849. (No model.)



Claim.—The combination, with a window-sill having a casing thereunder and an opening *d* therethrough, and the sash having in its lower rail a recess *i* within the thickness thereof and extended upwardly vertically from the lower edge thereof, the horizontal rotatable spindle projected across said recess and provided therein with the hooked arm *l*, said spindle being extended through and beyond the outer side of the sash-rail and there provided with a handle-knob, of the spring-reacting roller, and the flexible screen thereon projected through said casing-opening, and provided with the strip G, having the angular arm *m* adapted to project into said sash-recess *i* and be engaged by said hooked spindle-arm *l*, all substantially as shown, for the purpose set forth.

408,787. DUST-COLLECTOR. JOSEPH S. ASH, Canal Winchester, Ohio, assignor of one-half to Charles B. Cowan, same place. Filed Nov. 14, 1888. Serial No. 290,982. (No model.)

Claim.—In a dust-collector, the combination of an outer cylindrical and conical case having a tangential inlet-spout, a dust-outlet, and a top plate having a central opening therein, an open-bottomed conical funnel *f*, fitted to said opening and provided with vertical slots having outwardly-projecting lips, and an open-bottomed conical funnel *e* between the outer case and the inner funnel *f*, said funnel *e* having a closed top and outwardly-lipped vertical slots, substantially as and for the purpose described.



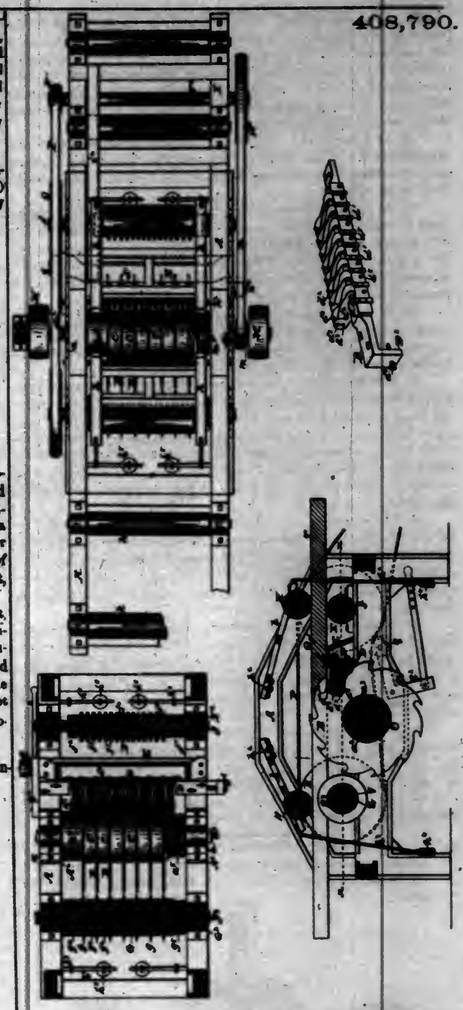
408,788. PRESSURE-REGULATOR. THEOPHILE BACKLEJAN, Mechlin, Belgium. Filed June 10, 1889. Serial No. 313,699. (No model.) Patented in Belgium Sept. 10, 1888, No. 80,317, and in Luxemburg May 13, 1889, No. 1,134.

Claim.—1. In a pressure-regulator, the combination, with a vessel having an inlet, an open-ended chamber dipping into a liquid therein, and a fixed pipe having perforated openings in its base, forming a second inlet, of a float closed by a liquid seal and carrying a liquid adapted to cover the perforations in the fixed pipe to a greater or less degree as the float rises or falls under the varying pressure of the gas in the main chamber, and a suitable outlet from said float, substantially as described.

2. A pressure-regulator consisting of a vessel C, having an inlet, an open-ended chamber dipping into a liquid therein, having air-openings *l*, and a fixed pipe having perforated openings *i* in its base, forming a second inlet, a float closed by a liquid seal and carrying a liquid adapted to cover the perforations *i* to a greater or less degree as the float rises or falls under the varying pressure of the gas, an outlet from said float communicating with a chamber N, and an outlet, substantially as described.

408,789. TOBACCO-MOISTENING CABINET. OSCAR BEJACH, Cincinnati, Ohio. Filed Jan. 9, 1889. Serial No. 295,843. (No model.)

Claim.—A tobacco-moistening cabinet consisting of a case A, provided with vertical partitions *a* and horizontal supporting-pieces *a'* *a²*, covered drawers B, mounted therein, stops *c*, moistening device D, and a moistening-chamber C C', whereby moistened air is brought in contact with each drawer in the case, substantially as described.



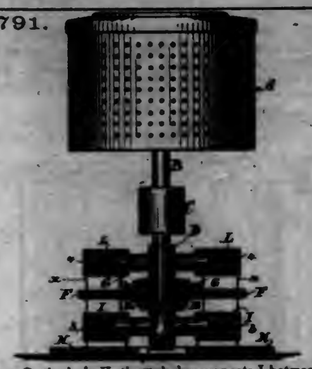
408,790. GANG CIRCULAR SAWING MACHINE. JAMES O. BUTLER, Verbena, Ala. Filed June 23, 1888. Serial No. 277,956. (No model.)

Claim.—1. The combination of a series of saws and collars mounted upon an arbor, a series of fingers between said saws, each finger provided with two horizontal pins located vertically one above the other, and set-screws for each pin, with a bar D and finger-retaining screws d^5, and a rod passing through all the fingers, substantially as and for the purpose described.

2. The combination of a series of saws and removable collars mounted upon an arbor, a series of vertically-adjustable fingers between said saws, and two horizontal pins projecting from each finger, with the transverse bar D, the rod *d*, and the angular protecting-bar E, extending in front thereof and over said fingers, substantially as and for the purpose described.

3. The combination of a series of saws mounted upon a sleeve secured to an arbor, and a series of fingers between said saws, each intermediate finger having two adjustably-retained pins projecting from its sides and located one vertically above the other, with a feed-roll consisting of a series of spur-wheels and washers mounted upon and clamped on a shaft, substantially as and for the purpose described.

4. The combination of a series of saws mounted upon a sleeve carried by an arbor with a shaft having a series of disks and parting-rings thereupon, each disk tapering on both sides adjacent to its periphery and constituting wedges to relieve the saws of pressure, and a smooth-face pressure-roll over said disks, substantially as described.

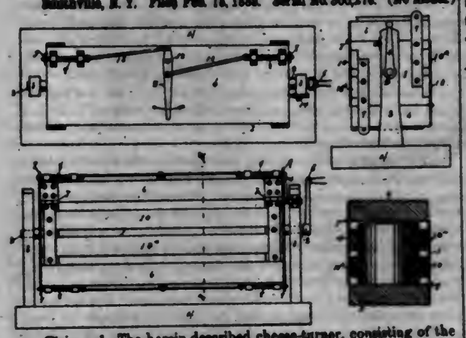


408,790.

408,791. CENTRIFUGAL SEPARATOR. CHARLES L. CAIRNS, Jersey City, N. J. Filed Apr. 15, 1889. Serial No. 307,318. (No model.)

Claim.—1. The combination, with the basket A and vertical shaft B, of the tubular socket D, having a globular bearing around the exterior surface thereof, the ring F and cap G for receiving such globular bearing, and a range of tubular supports, springs, and plugs occupying radial positions to the socket for sustaining the same, substantially as set forth.

2. The combination, with the basket, the vertical shaft, and the pulley, of the tubular socket D, having a globular bearing, the ring



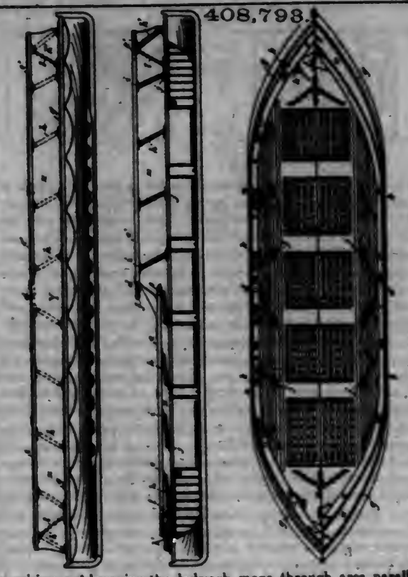
408,791.

F and cap G, the base H, the tubular supports I between the base H and ring F, the plugs K, and springs 3 within the tubular supports and bearing against the lower part of the tubular socket, substantially as set forth.

3. The combination, with the vertical shaft and the basket, of the tubular socket D, having a globular bearing, the ring F and cap G for supporting said bearing, the base-plate H, with which the ring F is connected, and two ranges of plugs and springs placed radially to the socket and acting against the same, said plugs being received into tubes upon the ring and base respectively, substantially as set forth.

408,792. DEVICE FOR TURNING CHEESE. MILO V. CARR, Smithville, N. Y. Filed Feb. 18, 1889. Serial No. 300,276. (No model.)

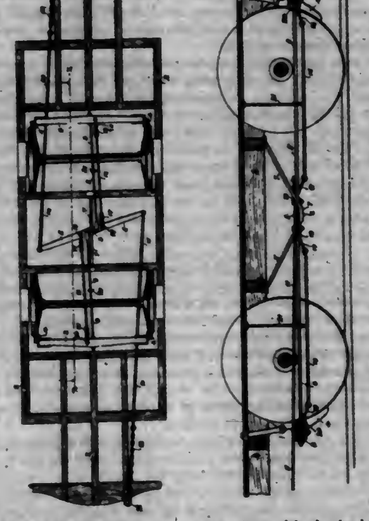
Claim.—1. The herein-described cheese-turner, consisting of the receptacle having end pieces, bars forming sides secured to the end pieces, the hinged covers 6 6 upon opposite sides of the receptacle, the catches for securing the covers of the receptacle in closed position, the removably-secured side bar adjacent to the opening edge of the covers and mounted upon gudgeons in the end pieces, the bearings for the gudgeons, and the catch for securing the receptacle in position with either cover uppermost.



2. The herein-described cheese-turner, consisting of the receptacle 1, having end pieces and bars forming sides secured to the end pieces, the hinged covers 6 6 upon opposite sides of the receptacle, the spring-actuated bolts for securing the covers in closed position and the operating-lever and connecting-rods, the removably-secured side bars adjacent to the opening edges of the covers and mounted upon gudgeons in the end pieces, the bearings for the gudgeons, and the catch for securing the receptacle in position with either cover uppermost.

3. In a cheese-turning device, the combination of the rectangular receptacle having covers 6 6 and the removably-secured bars 10, said receptacle being mounted upon gudgeons, the bearings for the gudgeons, the catches for securing the covers in closed position, and the catch for securing the receptacle in position with either cover uppermost.

408,793. COLLAPSIBLE BULWARK FOR LIFE-BOATS, &c. WILLIAM CHAMBERS, HUGH CHAMBERS, and JAMES CHAMBERS, Strathleven Place, Dumbarton, County of Dumbarton, Scotland. Filed May 23, 1889. Serial No. 312,351. (No model.) Patented in England Nov. 16, 1888, No. 16,628.



Claim.—In a partly-collapsible life or other boat, a gunwale or rail divided at or near midships into two sections *c c'*, adapted to receive and sustain a bulwark of flexible material, said sections being connected to the boat by stanchions pivoted to said sections, which

408,793.

in raising and lowering the bulwark move through arcs parallel to the longitudinal axis of the boat, the stanchions supporting one section of the rail moving in a direction opposite to those supporting the other section, substantially as described.

408,794. CAR-BRAKE. JAMES H. CLARK, Flatbush, assignor to to Charles E. Harris, Brooklyn, N. Y. Filed June 11, 1889. Serial No. 313,828. (No model.)

Claim.—In a car-brake, the combination, with the brake-lever and brake-beam provided with the usual rigid connecting-rod, of a flexible or jointed connection between the brake-lever and brake-beam, as and for the purposes set forth.

408,795. COMBINATION-LOCK. JAMES D. CRAIG, Rogers Park, Ill., assignor to the Keyless Lock Company, of Illinois. Filed Sept. 26, 1887. Serial No. 250,600. (Model.)

Claim.—1. In a combination-lock, the combination, with a suitable casing, a bolt having a pin, and notched tumblers, of an index-

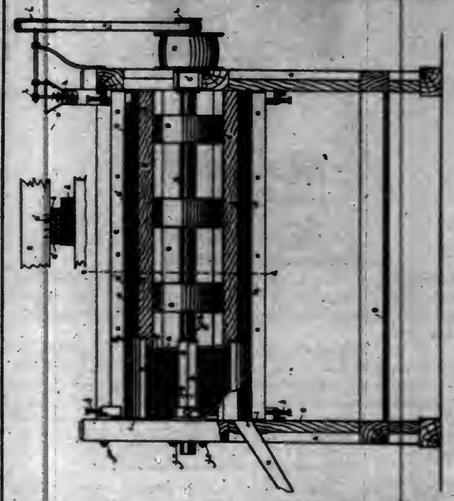
408,795.

plate having a serrated periphery, excepting at one part, which is plain or smooth, said index-plate having at its periphery one or more notches, a cam-plate having a cam-slot which receives the said pin on the bolt, and a spring-pressed lever pivoted to said cam-plate and having a catch-piece or key to bear upon the periphery of the said index-plate and to enter the notches of the said tumblers and index-plate when they are all brought into register, and serving to move the said cam-plate and bolt when the said driver, index-plate, and tumblers are turned, substantially as and for the purpose set forth.

2. In a combination-lock, the combination, with a suitable casing, a bolt, a cam plate, a spring-pressed lever pivoted to the latter and provided with a catch-piece or key, and an index-plate having serrated and smooth portions at its periphery, of a series of notched tumblers connected together and one of which consists of two disks, one of said disks having a pin, and the other of said disks being changeable and reversible and having a series of holes into any one of which the said pin may be entered from either side of the changeable and reversible disk, substantially as and for the purpose set forth.

3. In a combination-lock, the combination, with a suitable casing, a bolt, a cam-plate, a spring-pressed lever pivoted to the latter and thus movable therewith and provided with a catch-piece or key, and a series of connected notched tumblers, of a reversible index-plate having serrated and plain surfaces and notches at its periphery, and having also two or more slots into either of which a pin on the adjacent tumbler may enter, and between said slots an aperture, and a driver having a pin to enter the said aperture, substantially as and for the purpose set forth.

4. In a combination-lock, the combination, with an index-plate and tumblers each having a radial notch and all arranged together for rotary movement on a common support, of a bolt, a cam-plate arranged to rotate on said support, a spring-pressed lever pivoted to said cam-plate and provided with a key or catch-piece, a cap-plate having a curved flange on its under surface to positively hold the said key or catch-piece in engagement with the notches of the index-plate and tumblers during the locking and unlocking movements, and a spring arranged to serve as a stop for the said cam-plate in one direction, substantially as set forth.



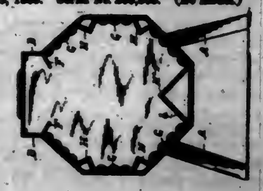
5. In a combination-lock, the combination, with an index-plate and tumblers each having a radial notch and all arranged together for rotary movement on a common support, of a bolt, a cam-plate arranged to rotate on said support, a spring-pressed lever pivoted to said cam-plate and provided with a key or catch-piece, a cap-plate having a curved flange on its under side to positively hold the said key or catch-piece in engagement with the notches of the index-plate and tumblers during the locking and unlocking movements, a spring arranged to serve as a stop for the said cam-plate in one direction and a stop to limit the movement of the said cam-plate in the opposite direction, substantially as set forth.

6. In a combination-lock, the combination, with the bolt, the connected notched rotary tumblers and index-plate, and the driver to turn the said tumblers and plate, of the rotary cam-plate, the spring-pressed lever pivoted thereto and provided with a key or catch-piece to enter the notches of the said index-plate and tumblers, and a stop to be engaged by the said key or catch-piece when it is lifted from the notches of the tumblers and index-plate and thereby limit the turning movement of the cam-plate in one direction when the tumblers and index-plate are to be rotated, and a stop—as part of the spring d'—to limit the movement of the said cam-plate in the opposite direction, substantially as set forth.

7. In a combination-lock, the combination, with the base-plate A, having the hollow standard or tumbler-support B, of the bolt C, having the pin c, the cam-plate D, having the cam-slot d^7 to receive the said pin, the spring-pressed lever d', having the key or catch-piece d^4, a series of notched rotary tumblers on said standard or support, a rotary index-plate I, connected with said tumblers and having a periphery with serrated and smooth portions and one or more radial notches, a driver J, connected with said index-plate, and a cap-plate K, having an internal curved flange k', substantially as set forth.

8. In a combination-lock, the combination, with a bolt, a serrated and notched index-plate, and notched tumblers, of a cam-plate to operate said bolt, a spring-pressed lever pivoted to said cam-plate and provided with a catch-piece or key to enter the peripheral notches of the said index-plate and tumblers and thus communicate the movements thereof to the cam-plate and bolt, substantially as set forth.

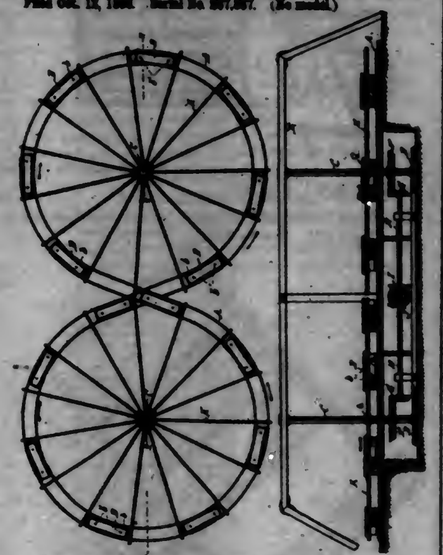
408,796. MACHINE FOR DELINTING COTTON-SEED. GEORGE E. CROMER, Senoraba, County of Chester, assignor of one-half to John Rockwell Clark, Liverpool, England. Filed Mar. 11, 1889. Serial No. 302,816. (No model.) Patented in England May 24, 1888, No. 7,941.



Claim.—1. In a machine for cleaning cotton-seed or the like, the combination, with an inner rotatable drum provided with a stiff brush-surface, of an outer skeleton abrading-cylinder, concentric with the said drum, consisting of a spiral bar c in close proximity to the brush-surface, and having its sides cut with rasped or file-like teeth, and of one or more spiral bars d, alternating with but not quite touching the spiral bar c or each other, arranged with their interned faces at a suitable distance from the brush-surface and having said faces cut with rasped teeth, substantially as set forth.

2. In a machine for cleaning cotton-seed or the like, the combination, with an inner rotatable drum provided with a stiff brush-surface, of an outer concentric skeleton abrading-cylinder consisting of a rectangular spiral steel bar c, alternating with one or more triangular spiral steel bars d, arranged with their angles not quite touching each other or the rectangular spiral bar aforesaid, the rectangular bar c having a pitch decreasing as the exit end of the cylinder is approached and its inner face being located in close proximity to the brush-surface, the triangular bars d having their bases arranged at a suitable distance from the said brush-surface, and provided with rasped teeth gradually decreasing in coarseness toward the exit, substantially as set forth.

3. In a machine for cleaning cotton-seed or the like, an inner rotatable drum provided with a stiff brush-surface and an outer fixed abrading-cylinder formed of a series of approximately-parallel rasped bars d, arranged circumferentially a short distance apart at a suitable distance from the brush-surface, in combination with a fixed spiral bar c, projecting beyond the abrading-surface of the cylinder into close proximity with the brush-surface, substantially as set forth.

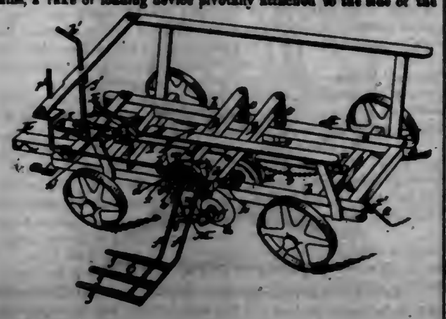


4. In a machine for cleaning cotton-seed or the like, the combination, with an inner rotatable brush-drum B, of the outer skeleton abrading-cylinder E, surrounding said drum and divided longitudinally into sections, each separately removable, the brackets J, supporting said cylinder, and each adjustable in a given direction upon the machine-frame, a bolt-and-slot device j' j^3, whereby the said brackets may be adjusted, and an adjusting-screw j, journaled in each of said jaws and adapted to adjust the cylinder within the same in a direction at right angles to the adjustment of the jaw, substantially as described.

408,797. WASHING-MACHINE. WILLIAM S. CROUT, Apopka, Fla. Filed Jan. 3, 1889. Serial No. 295,902. (No model.)

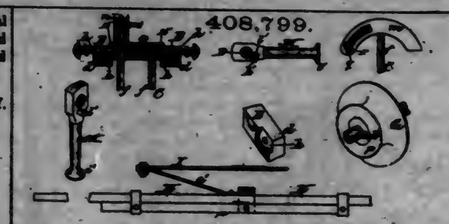
Claim.—The combination, with the frame A, of the polygonal sub-box B, pivotally secured in the top thereof, having neck D and the deflectors F, the transverse U-shaped pieces G, and the V-shaped pieces H and the V-shaped piece H', substantially as described.

408,798. ROUNDABOUT. WILLARD A. DOREE, Alfred Centre, N. Y. Filed Oct. 12, 1888. Serial No. 287,897. (No model.)



Claim.—1. The combination, with a track substantially in the form of two circles and crossing itself on the same plane at the adjacent parts of said circles, of two shafts revolved by intermediate gearing in opposite directions, a series of drivers carried around by said shafts, and a series of cars arranged between the drivers and running in opposite directions around the two circles of the track, substantially as described.

2. The combination, with a track substantially in the form of two circles and crossing itself on the same plane at the adjacent parts of said circles, of a series of cars running on said track, the vertical shafts C C, one set in the center of each track, a series of arms K K, running over said track, for driving the cars, supported by and carried around on said shafts, and intermediate gearing carrying the two shafts around at the same speed in opposite directions, substantially as described.



408,799. COMBINED HAY RAKING AND LOADING DEVICE. LOUIS H. DWELLEY, Fenerok, Me. Filed Nov. 28, 1888. Serial No. 291,906. (No model.)

Claim.—1. The combination, with a wagon or cart provided with a sliding pole or thills connected with and adapted to operate a rake or loading device pivotally attached to the side of the wagon or cart, substantially as described, of an automatically-operated dog or stop adapted to arrest the forward motion of the wagon when the rake or loading device is to be raised to discharge its load, substantially as described.

2. The combination, with a wagon or cart, of a sliding pole or thills, a rake or loading device pivotally attached to the side of the

408,799.

wagon or cart, a longitudinally-movable bar connected with and operated by the pole or thills, a rotating shaft connected with and operated by the longitudinally-movable bar and carrying a load-lifting wheel, a chain or rope operated by the load-lifting wheel, connected to and operating the rake or loading device, substantially as described, and a dog or stop for locking the sliding bar while the wagon is moving forward, and releasing the said bar when the rake or loading device is to be raised, substantially as set forth.

3. The combination, with a wagon or cart, of a sliding pole or thills, a rake or loading device pivotally connected to the side of the wagon or cart, the longitudinally-movable bar I, connected to the sliding pole or thills by a link or bar e', the transverse shaft D, carrying the drum or pulley H and load-lifting wheel G, the chain t, passing around the pulley H and secured at its opposite ends to the bar I, the chain or rope x, operated by the load-lifting wheel and connected to and operating the rake or loading device, and the dog or lever L, operated by the arm f' on the crank-shaft f, and adapted to enter apertures or notches in the bar I, whereby the latter is locked and released, all operating substantially in the manner and for the purpose set forth.

4. The combination, with a wagon or cart provided with a raking or loading device pivotally connected to its side and operated, while the wagon is at rest, by the forward movement of the sliding pole or thills connected therewith, of a dog or stop adapted to be automatically released and dropped to the ground to arrest the forward motion of the wagon just previous to the elevation of the rake or loading device, and to be automatically raised from the ground to allow the wagon to move forward on the descent of the rake, substantially as set forth.

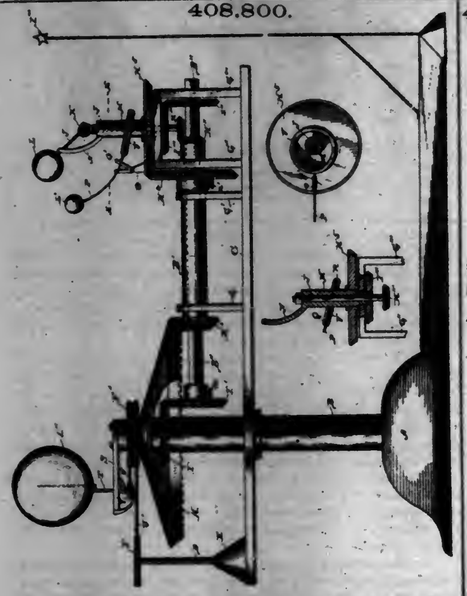
5. The combination, with the load-lifting wheel G, having a lug or projection l' on its side, of the pivoted dog or stop M, provided with a lug or projection l, adapted to be engaged by the lug l', whereby the said dog is forcibly raised from the ground to release the wagon on the descent of the rake or loading device and permitted to drop and engage with the ground just previous to the lifting of the rake with its load, substantially as set forth.

6. The combination, with the wheel G and the dog M, operating as described, of the hook m', operated by the lever g' and adapted to engage and hold up the dog M while the rake or loading device is being raised to pass over an obstruction, substantially as set forth.

7. The combination, with the rake or loading device and its carrier-shaft c, mounted on the wagon or cart and provided with end sockets or cavities 15, of the removable pivots or pins k, adapted to enter the sockets 15, and the clamping-screws i, for holding said pins in place, substantially as described.

8. The combination of the carrier-shaft c, mounted on the wagon or cart between supports provided with semicircular guiding-recesses k, formed around and concentric with the pivot-holes, and the pivots or pins A, fitting into sockets or cavities in the ends of said carrier-shaft c, substantially as and for the purpose set forth.

9. The segmental sheave m, provided with an aperture 16 and slot 17, in combination with the pin q, having an eccentric flange r, and the lip or projection s on the side of the sheave, with which the flange r engages to hold the pin q securely in place, substantially as described.



10. The combination, with a wagon or cart having a rake or loading device pivotally connected to its side and operated by a sliding pole or thills, whereby it is raised with its load while the wagon remains stationary, as described, of the pivoted dog Q, adapted to engage with the ground and prevent the backward movement of the wagon when going uphill in loading, substantially as described.

11. The combination, with the sliding pole or thills and the longitudinally-movable bar I, adapted to operate the rake or loading device, substantially as described, of the connecting link or bar e', pivoted at one end to the pole or thills and at the opposite end to the bar I, whereby the latter may be operated when the pole or thills are at an angle therewith, substantially as set forth.

408,800. TELLURIAN. HENRY H. PHLEPS, De Funiak Springs, Fla. Filed Apr. 20, 1889. Serial No. 308,128. (No model.)

Claim.—1. The combination, with the shaft B, bearing the fixed

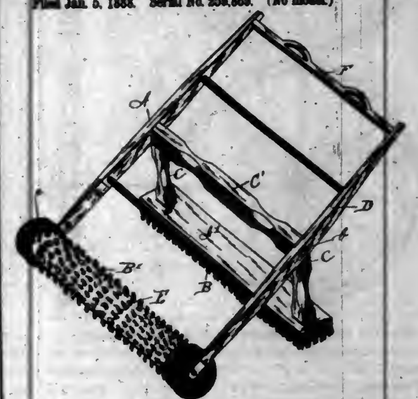
408,800.

gears H I, of the bar pivoted thereon, the earth and moon models mounted on geared supports borne by the bar, the shafts B' B", mounted also upon the bar, the gear I', detachably engaging the gear I and imparting motion to the shaft B", gearing transmitting the motion of said shaft to the earth-model support, and gearing engaging the gear H and imparting motion, through the shaft B', to the earth-model axis and to the moon-model support.

2. The combination, with the shaft B, bearing the fixed gears H I, of the bar pivoted upon said shaft, the earth and moon models mounted in geared supports upon the bar, the independently-revoluble shafts B' B", mounted also upon the bar, the gearing engaging the gear I and imparting motion, through the shaft B", to the earth-model support, gearing engaging the gear H and imparting motion, through the shaft B', to the earth-model axis, and the gear H^4, mounted upon the shaft B' and detachably engaging the geared moon-model support.

3. The combination, with the rotating moon-model support, of the jointed standard O thereon, the curved moon-model wire P, pivoted in the top of said standard and provided with the revoluble terminal ball Q, the vertical shaft M, concentric with said support and bearing the oblique earth-model axis, and the oblique disk V, eccentrically mounted upon the shaft M and receiving in its grooved edge said ball Q, whereby the rotation of said support and shaft may impart to said wire a bodily inward-and-outward movement and a distinct rocking motion upon its pivot, substantially as and for the purpose set forth.

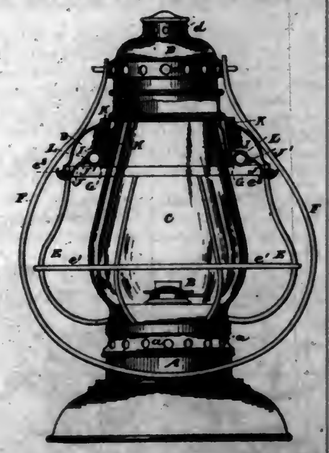
4. The combination of the base A and the fixed shaft B rising therefrom, the gears H I, fixed thereon, the sun-model mounted at one side of said shaft, the bar C, pivotally supported upon the shaft, the fixed pulley F, supported upon the bar and rotating said sun-model by pulley-and-belt connection, the earth and moon models mounted in suitable supports upon the opposite end of the bar, gearing engaging the gears H I and transmitting suitable motion to both sun and moon models, and the star L", supported from the base without the paths of the various models, substantially as and for the purpose set forth.



408,801. CHURN-MOTOR. STEPHEN GILES, Patten, Me., assignor of one-half to George W. Cooper, same place. Filed Feb. 23, 1889. Serial No. 301,585. (No model.)

Claim.—The combination, in a churn, of the cover provided with a central opening and a recess *b'*, the frame J, the vertical shaft carrying the pinion G and having an annular groove, the clamping-arms pivoted to the cover and engaging the annular groove of the vertical shaft, the flat springs F, secured in the recess *b'*, at the opposite ends thereof, and having their inner free ends arranged to engage the clamping-arms, the horizontal shaft I, capable of limited longitudinal movement and provided with an annular groove *i*, the gear-wheel H, fixed to the end of said shaft I, and the sliding latch L, having at its lower end a curved recess adapted to engage the annular groove of the shaft I, as set forth.

408,801.



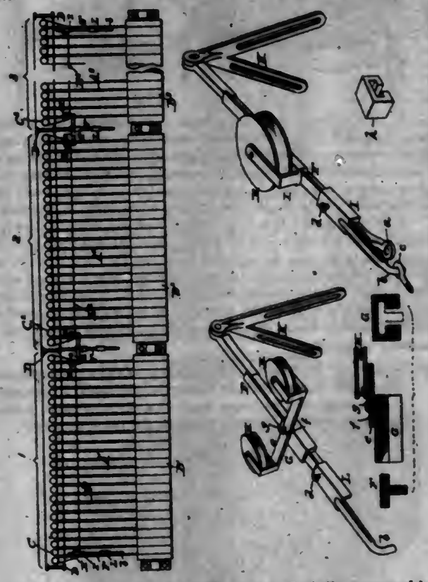
408,802. SCRUBBING-MACHINE. JOSEPH HERBERT, Lafayette, La. Filed Jan. 5, 1888. Serial No. 259,869. (No model.)

Claim.—As a new article of manufacture, the scrubbing device herein described, consisting of the bed-piece A, having scrubbing material B on its under side and provided on its upper face with standards C, the inclined frame D, supported on the standards, the handle F, and the hollow roll E, for containing suds, journaled in the lower end of the frame and formed with radial perforations leading into the interior thereof, in which is secured the scrubbing material, substantially as described.

408,803. SIGNAL-LANTERN. EDWIN F. HOPKINS, Oberlin, Ohio, assignor of three-fourths to Thad. H. Rowland and F. R. Brunson, same place. Filed Jan. 17, 1889. Serial No. 296,908. (No model.)

Claim.—1. In a signal-lantern, an open-ended tubular fabric made fast at the top to the inside of the lantern-cover and provided with an endless spring in its lower edge, whereby said fabric may be held up under the cover until a signal is needed.

2. The combination, with the tubular signal-fabric having an endless spring in the upper edge, of a lantern-cover having on the inside a downwardly-diverging tube H, around which the spring will hold said fabric, as set forth.



3. A lantern-cover having the downwardly-diverging tube H, open at bottom and perforated at top to cause a circulation of cold air through said tube and protect the fabric or screen from the heat, as specified.

4. In a signal-lantern, the hooks J, secured directly or indirectly to the spring L of the tubular fabric, in combination with a lantern-frame having the opposite curved non-meeting rods *d d*, separated by spaces *d' d'*, as and for the purpose set forth.

5. The combination, with the fabric I and horizontal rod *d'*, of the hooks J, rings J', and springs L, substantially as shown and described.

408,804. SPINDLE-DRIVING MECHANISM FOR SPINNING-MACHINES. CHARLES W. JONES, London, Ontario, Canada. Filed May 23, 1888. Serial No. 311,863. (No model.)

Brief.—The invention relates to the arrangement of the banding and to the construction and arrangement of the band tension devices.

Claim.—1. In combination with a series of spindles arranged in sections, end to end, a drum, a band for each section passing alternately about the drum and spindles, and tension devices connecting the bands of adjacent sections.

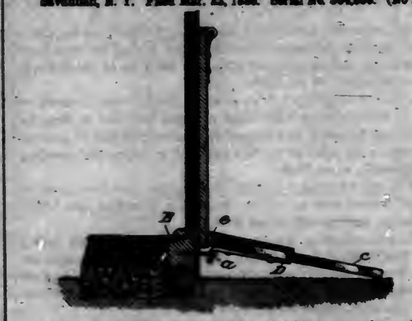
2. In combination with a series of spindles arranged in sections, end to end, a drum, a band for each section passing alternately about the drum and spindles, a loop formed in the band, and a series of tension devices, one between each two sections, acting upon the loops of adjacent sections.

3. In combination with a series of spindles arranged in sections, end to end, a drum, a band for each section passing alternately about the drum and spindles, and a tension device between each pair of sections acting upon the return-lines thereof.

4. In combination with a series of spindles arranged in sections, end to end, a drum, a band for each section passing alternately about the drum and spindles, a loop formed in said band, a tension device applied to the loops of adjacent sections, and a tension device applied to the loops of the end sections at their outer ends.

5. In combination with a series of spindles arranged in sections, end to end, a drum, a band for each section passing alternately about the drum and spindles and provided with a loop, and a wheel or pulley H at the ends of each section, about which the loop in the band passes, and yielding or movable supports for said wheels.

6. In combination with a series of spindles arranged in sections, end to end, a drum, a band for each section passing alternately about the spindles and drum and from one end spindle to the other, inclined supports arranged between the sections and at the outer ends of the end sections frames mounted and free to slide upon the supports, and wheels or pulleys carried by the frames and adapted to receive the return-line of the bands.



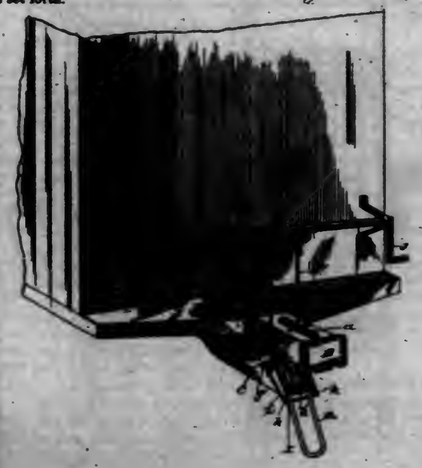
7. In combination with the inclined supporting-bar, the weighted block or frame mounted thereon and provided with the cross-bar, and the wheels at the ends of the cross-bar.

8. In combination with the inclined supporting-bar, the weighted block or frame mounted thereon, and a cross-bar pivoted thereto and provided with a wheel at each end.

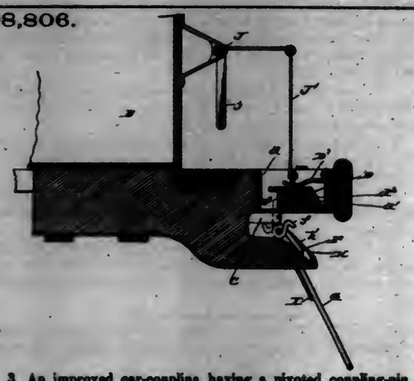
9. In combination with the inclined supporting-bar, the plate hinged to the upper end thereof, and the pulley-carrying block mounted on the bar.

10. In combination with the inclined supporting-bar, the plate hinged to the upper end thereof, an adjustable block at the lower end, a set-screw, and a pulley-carrying block, all arranged substantially as shown.

408,805. BRIDGEWAY. NELSON KENT and NICHOLAS C. VOORHIS, Savannah, N. Y. Filed Mar. 22, 1888. Serial No. 304,259. (No model.)



Claim.—In combination, the hinged bridgeway, substantially as described, with the bars-sill, the same being provided with hinges to connect with the bridgeway, and the interposed rolling or slide door extending below the bridgeway and between the same and the sill, as and for the purposes described.



408,806. CAR-COUPLING. SIMAN D. LATHAM, Little Rock, Ark. Filed Nov. 7, 1888. Serial No. 290,307. (No model.)

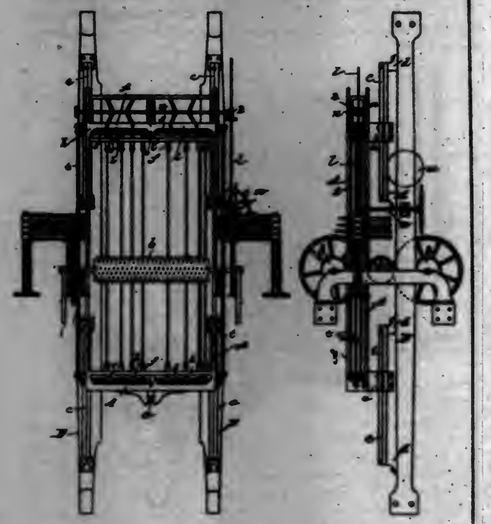
Claim.—1. In a car-coupling, the combination of the draw-head having an incline up which to direct the approaching link, and having such incline provided with grooves extended in the direction of its length and opening at the front or forward end of said incline, and the link pivoted at its rear end and having its side arms arranged to rest in said grooves, substantially as set forth.

2. In a car-coupling, the draw-head having its lower portion formed with a guide-incline and its upper portion extended in advance of such incline, forming a bumper, combined with the pivoted link, adjusting-ball, the coupling-pin, and the latch therefor, substantially as set forth.

408,806.

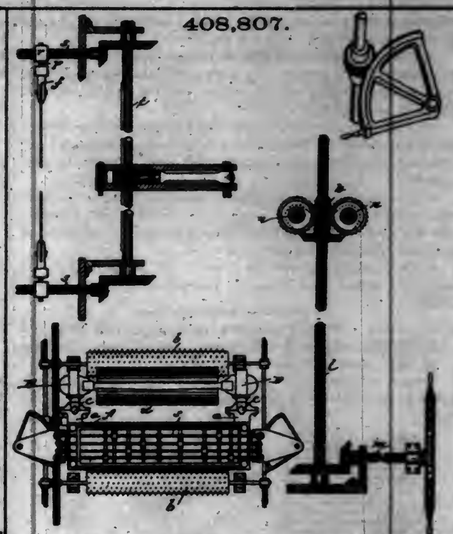
3. An improved car-coupling, having a pivoted coupling-pin, a latch for securing the same, and a link, and having its draw-head formed with an incline grooved to receive the arms of the link and the pin, substantially as set forth.

4. In a car-coupling, a draw-head A, formed with a recess or opening C, having its top wall slotted at *d* and extended to form the bumper E, and its lower wall formed with an inclined face H, grooved at *h* to receive the arms of the link and at *N* to receive the coupling-pin, substantially as set forth.



5. In a car-coupling, a pivoted coupling-pin bent from a rod of metal and formed with an eye to receive the pivot-bolt, and with a trip-extension, substantially as set forth.

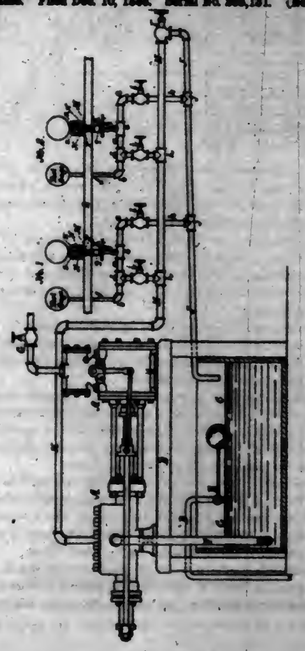
6. In a car-coupling, the combination of the draw-head having inclined face H, the link pivoted to the draw-head, the link-adjusting bail, the coupling-pin having a trip-extension, the pin-latch, the shaft J, and arms on said shaft connected with the link-adjusting bail and with the pin-latch, substantially as set forth.



408,807. RECIPROCATING GANG-SAW MILL. WILLIAM B. MANN, Bangor, Me. Filed Aug. 2, 1888. Serial No. 281,735. (No model.)

Claim.—1. In combination, the movable frame A, the saws, the supplemental frame supported to have a sliding movement in the main frame A, the said saws being supported by said supplemental frame to allow lateral movement thereon, means for moving the saws laterally, and means for moving the supplemental frame, substantially as described.

2. In combination, the reciprocating frame A, the saws carried thereby and supported to have lateral movement, the screw-rods for giving said lateral movement journaled in the frame of the machine, the blocks on said rods having loose or sliding connections with the saws, whereby said saws are allowed longitudinal movement for the adjustment of tension, and means for adjusting the tension of the saws, substantially as described.

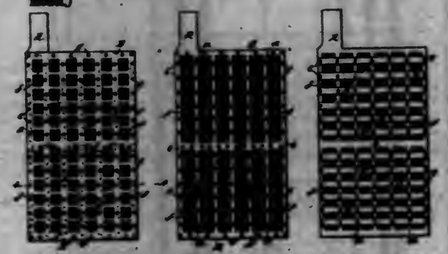


408,807.

3. In combination, the main frame A, the supplemental sliding frame supported thereby, the series of saws, the screw-shaft *n*, the toggle-arms thereon connected to the supplemental frame and the main frame, respectively, and means for rotating the shaft, whereby the whole series of saws may be adjusted simultaneously and evenly by the movement of the supplemental frame, substantially as described.

4. In combination, the reciprocating frame, the series of laterally-movable saws, the screw-rods for moving them, the screw-rod *n*, with connections to the saws for adjusting them longitudinally, a series of levers and wheels for operating all the said screw-rods, a series of connecting-shafts operated thereby and having pinion-connection with the said screw-shafts, whereby the saws may be adjusted both laterally and longitudinally during the reciprocation of the main frame A, substantially as described.

408,808. APPARATUS FOR GRADUATING AND TESTING PRESSURE-GAGES. ALBERT C. MEADY, Somerville, and CHARLES H. BOWDITCH, Everett, assignors to the Crosby Steam Gage and Valve Company, Boston, Mass. Filed Dec. 10, 1888. Serial No. 293,121. (No model.)



Claim.—1. In an apparatus for testing or graduating pressure-gages, the combination of a water-supply under pressure, a pressure-pipe leading therefrom and provided with connections for the gages to be graduated or tested, the relief-valve in the pressure-pipe, and the waste-pipe connected to the relief-valve, as set forth.

2. In an apparatus for testing or graduating pressure-gages, the combination of a water-supply under pressure, a pressure-pipe leading therefrom, the waste-pipe, and connections for the gages to be graduated or tested, each connection communicating both with the pressure-pipe and the waste-pipe, as set forth.

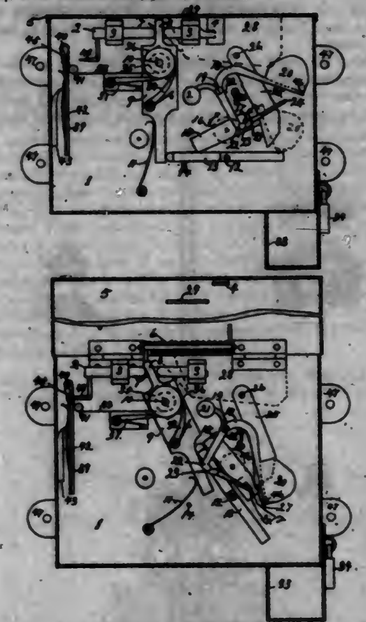
3. In an apparatus for testing or graduating pressure-gages, the combination of a water-supply under pressure, a pressure-pipe leading therefrom and provided with connections for the gages to be graduated or tested, each connections having a clamp for holding the gages, the relief-valve in the pressure-pipe, and the waste-pipe connected to the relief-valve, as set forth.

408,809. ELECTRODE FOR SECONDARY BATTERIES. ABRAHAM V. HERMANN, New York, N. Y., assignor of one-half to Henry A. Wilson, Ridgefield, N. J. Filed May 27, 1889. Serial No. 312,269. (No model.)

Claim.—1. The herein-described composite electrode for secondary batteries, consisting of outer plates B, provided with openings *d*, an inner frame A, having the ribs *a*, and the filaments or strips *f* between said ribs, substantially as described.

2. The herein-described composite electrode for secondary batteries, consisting of an inner frame and outer plate or plates, the latter consisting of a plurality of strips of metal united to the inner frame and suitably distanced from each other to provide openings to the inner frame, substantially as described.

408,810. TRUCK-BASKET. LESLEY M. HOUSE, Rochester, N. Y. Filed Apr. 27, 1889. Serial No. 308,996. (No model.)



Claim.—1. The combination, in a rectangular truck-basket, of a frame composed of twelve rigid rods united at the corners by three-way elbows, the lower rods having a suitable number of sockets formed in their upper sides and the upper rods having the same number of sockets formed in their lower sides, with the woof-rods *a b*, equal in number to the said sockets and inserted in the same, a portion of said woof-rods being of rigid material and the remainder being of a lighter material, and the warp or filling woven through said woof-rods around corner uprights A A A A, said uprights A A A A being socketed in the elbows E E E E and rigidly fastened into the same, substantially as shown and described.

2. In a truck-basket, the combination of the lower frame composed of the rods B B B B, rigidly connected together by the three-way elbows D D D D, with four uprights A A A A rigidly fastened into said elbows, the space between said uprights being filled with woven basket-work having woof-rods some of which are of metal and some of which are of lighter material, with the upper frame composed of the rods C C C C and the three-way elbows E E E E, said woof-rods being inserted into sockets formed in the rods of the lower frame and in the rods of the upper frame, substantially as shown and described.

3. As a new article of manufacture, a truck-basket having a skeleton frame composed of a lower frame formed of the rods B B B B, rigidly fastened into the three-way elbows D D D D, uprights A A A A, rigidly fastened into said elbows, and an upper frame composed of rigid rods C C C C, rigidly fastened into elbows E E E E, said elbows having a socket for the reception of said uprights A A A A, spaces between said uprights being filled with suitable woven basket-work, the same being fastened upon a suitable truck, substantially as shown and described.

4. In a truck-basket, the combination of the rectangular lower frame composed of the rods B B B B, rigidly connected together by the three-way elbows D D D D, with four uprights A A A A rigidly fastened into said elbows, and the upper frame composed of the rods C C C C, rigidly connected by the three-way elbows E E E E, said elbows having sockets into which are fastened the uprights A A A A, the spaces between said uprights being filled with suitable material to form the sides of the basket, for the purpose described.

408,811. COIN-CONTROLLED LOCKING AND REGISTERING MECHANISM. ANDREW J. KENEALEY, Denver, Colo., assignor to the Western Opera Glass Supply and Manufacturing Company. Filed Mar. 25, 1889. Serial No. 304,609. (No model.)

Claim.—1. A coin-actuated locking mechanism consisting of a bolt, a spring-acted lever tending to move it in one direction, a dog locking the lever against such movement, a lever for moving such dog, and a coin-actuated tilting lever locking the dog-actuating lever against movement, substantially as set forth.

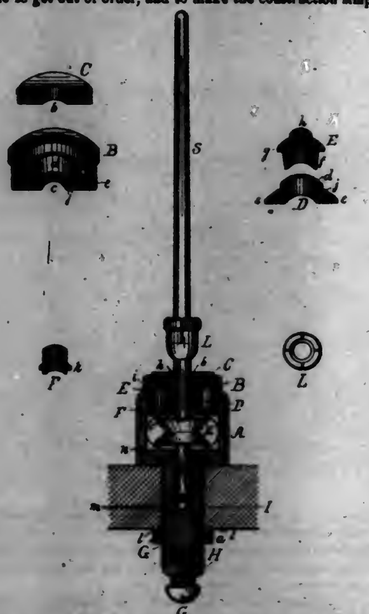
2. A coin-controlled locking mechanism consisting of a bolt, a lever for moving the bolt, a spring tending normally to move the bolt and its lever in one direction, a dog preventing such movement, a handled lever, as the lever 15, for releasing the dog, a coin-actuated tilting lever locking such lever against movement in one direction, and a pawl dropping in position to lock it in the other direction upon release of the locking mechanism and adapted to be removed from engagement therewith by an inserted key, substantially as set forth.

3. A coin-actuated locking mechanism comprising a locking-bolt, a spring-actuated lever tending normally to move the bolt in one direction, means for locking the lever against such movement, a coin-actuated tripping-lever for releasing the locking mechanism, and a pawl holding the locking mechanism in its released condition and adapted to be moved by an inserted key, substantially as set forth.

4. The combination of a coin-controlled locking mechanism, a stylus or marker reciprocated thereby, a ribbon of paper marked by the stylus or marker, and means, substantially as described, for moving the paper for a new impression at each operation of the locking mechanism, substantially as set forth.

5. A locking mechanism consisting of a lock-bolt 2, a lever 9, moving the bolt in either direction, a spring acting on the lever to throw it in one direction, and a pivoted dog locking the lever against movement in such direction and adapted to move it in the other direction, substantially as set forth.

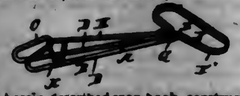
6. The combination of the locking-bolt 2, the lever 9, for actuating it, spring 11, dog 13, handled lever 15, lever 18, carrying a coin-receptacle and a counterbalance-weight, and a pawl 25, substantially as set forth.



7. The combination, with a coin-controlled locking mechanism, of a stylus 44, attached to a moving part thereof, a reel or drum for receiving a band or fillet of paper or other markable material, a ratchet 36, and the pawls 37 and 38, substantially as set forth.

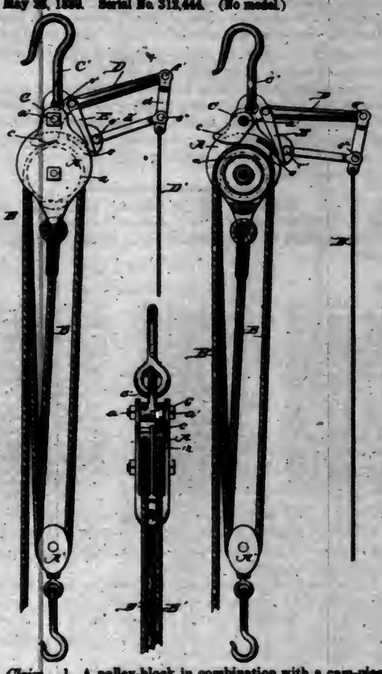
8. The combination of a locking-bolt 2, carrying a stylus 44, a lever 9, actuating the same, a paper reel or drum having a ratchet 36 and pawl 38 mounted on said lever, a pawl 37, a fixed platen or paper-bed 39, dog 13, handled lever 15, coin-controlled lever 18, and pawl 25, substantially as set forth.

9. The combination of the locking-bolt 2, lever 9, for actuating it, spring 11, acting thereon, dog 13, for acting thereon against the spring, and handled lever 15, for operating on the dog, substantially as set forth.



408,812. SPINNING-SPINDLE AND SUPPORT THEREFOR. CLARENCE A. PRATT, Fitchburg, Mass. Filed July 18, 1888. Serial No. 280,340. (No model.)

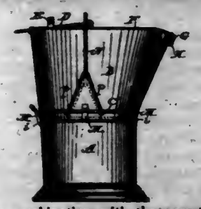
Brief.—The object of the invention is to furnish a spindle that may be run with little power and at high speed, to so construct the bearings that wear may be taken up readily and that the parts are not liable to get out of order, and to make the construction simple.



Claim.—The combination of the spindle S, bearing-sleeve E, movable vertically thereon and having horizontal flange *g* and downwardly-tapering bearing-surface *f*, the seat D, consisting of the upwardly-extending sleeve *d*, having tapering inner bearing-surface adapted to correspond with the bearing-sleeve E, oil-guard F, surrounding said spindle within said bearing, the cylindrical case supporting said seat and oil-guard and having an oil-chamber surrounding and communicating with said bearing-surfaces, adjustable nut C, forming the top of said case, a ball step-bearing I at the lower end of said spindle, step-support G, vertically adjustable by means of screw-threads formed thereon and on the interior of the bolster-shank, and a supporting-case A, carrying said bolster and step-bearing, substantially as and for the purpose herein specified.

408,813. SNAP-HOOK. LESLEY P. RILEY, Hills, Mo. Filed Mar. 19, 1888. Serial No. 303,268. (No model.)

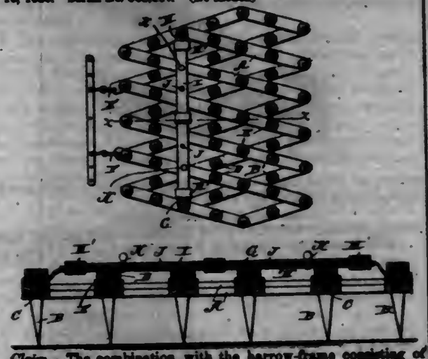
Claim.—The herein-described snap-hook, constructed of wire and comprising the shank provided with the eye E at its upper end and the hook C at its lower end, and the tongue H, having a substantially V-shaped bend inclining rearward and adapted to confine a ring in the hook C, substantially as described.



408,814. PULLEY-BLOCK. CHARLES T. SUMAR, Utica, N. Y. Filed May 28, 1888. Serial No. 312,444. (No model.)

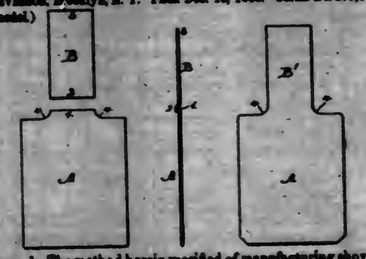
Claim.—1. A pulley-block in combination with a cam-piece pivotally connected to such block and having a cam on one side of such connection and an attaching device on the other placed obliquely to the line of pull, and a pawl pivoted to said cam-piece opposite to the cam and, adapted to engage a projection on said block, as and for the purpose specified.

2. A pulley-block in combination with a cam-piece pivoted to said block and having a cam and an attaching device arranged as shown and described, and an arm and pawl opposite to said cam, the free ends of said arm and pawl being connected by links pivoted thereto, substantially as and for the purpose specified.



408,815. ASH-SIFTER AND COAL-SCUTTLE. KATE R. SHEPARD, Saratoga Springs, N. Y. Filed Jan. 19, 1889. Serial No. 296,830. (No model.)

Claim.—1. The combination, with the open-topped coal-scuttle A, having flaring sides, of the ash-sifter B, provided with the fixed cover D, the hinged cover F, the handle E on said fixed cover, and the perforated bottom or screen C, and having flaring sides to conform to and closely fit within the top of the scuttle and cover the same with a tight joint, substantially in the manner and for the purpose herein set forth.



2. The combination, with the open-topped coal-scuttle A, having flaring sides, of the counterpart ash-sifter B, conforming to and fitting with a close joint within the open top of the scuttle and provided with the fixed cover D, the hinged cover F, the vertically-reciprocating bottom screen C, the lateral straps M, guiding the screen and limiting its play, and the handle N, projecting up through the fixed cover D, substantially in the manner and for the purpose herein set forth.

408,816. HARROW. LEWIS SMITH, Green Top, Mo. Filed Feb. 16, 1888. Serial No. 263,117. (No model.)

Claim.—The combination, with the harrow-frame consisting of bars connecting pivotally by means of the harrow-teeth, of the brace-bars pivoted at the outer ends of the harrow-frame and extending inwardly one above the other, and the supplementary brace-bar having loops encircling the pivoted brace-bars, all of the said brace-bars bars being provided with perforations, which may be brought into alignment to receive the securing pins or bolts, substantially as set forth.

408,817. METHOD OF MAKING SHOVELS, SCOOPS, &c. THOMAS F. STEVENSON, Brooklyn, N. Y. Filed Dec. 10, 1888. Serial No. 293,115. (No model.)

Claim.—1. The method herein specified of manufacturing shovels, spades, or scoops, consisting in cutting out a blank for the blade and another blank for the tubular socket or handle and welding the two parts together while in a flat condition, and then bending up the blade and the tubular socket or handle to shape between dies, substantially as set forth.

2. The method herein specified of manufacturing shovels, spades, or scoops, consisting in cutting out the sheet-metal blank for the blade with the lips 1 at one end of such blank, welding the end of the blank B upon the lip 1 and striking up the sheet-metal blanks to the form of the complete shovel, spade, or scoop within dies and bending the handle or socket portion into the form of a tube, substantially as set forth.

3. The method herein specified of manufacturing shovels and similar articles, consisting in cutting out a rough blank to form the blade and a second blank to form the socket or handle, welding the two parts together while in a flat condition, trimming off the edges of the blank to the proper shape with the rounded portions 4 at the junction of the blanks A and B, and striking up the blank to the shape of the shovel or similar article and bending the socket or handle to a tubular form, substantially as set forth.

408,818. CHURN. ALBERT L. STOUT, Armistead, Kans. Filed Aug. 16, 1887. Renewed June 11, 1889. Serial No. 313,880. (No model.)

Claim.—1. The combination, with the churn-body having inclined sides, the lid, the dasher, and the box C, secured to the lid and inclosing the dasher-operating mechanism, of the keys P, having the shanks *p* inserted through vertical openings in the box C, and provided at their lower ends with the cams R, adapted to engage the sides of

408,818.

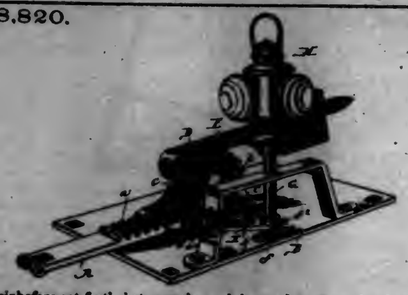
the churn, and the handles Q, mounted upon the upper ends of the shanks *p*, substantially as set forth.

2. The combination of the churn-body having inclined sides, the lid B, the box C, secured thereto, provided with the longitudinal slot D, and having the bearings E, and the openings F on opposite sides of the bearing, the shaft G, journaled in the bearings E and having the dasher-shank secured thereto, the gear-wheel G' on the shaft G, the rack-bar K, operating in ways in the box C and meshing with the gear-wheel G', the vertical arm L on the upper side of the rack-bar operating in the slot D, the horizontal arm M, projecting from one end of the box, the lever N, pivoted thereto, the connecting-rod O, connecting the upper end of the arm L to the lever N at an intermediate point thereof, and the keys P P, inserted through the openings F and having the cams R on their lower ends engaging the sides of the churn-body, and the handles Q, mounted on their upper ends, substantially as specified.

408,819. SHAFT-GEARING FOR VELOCIPEDS. MARCUS D. STRAIT, St. Louis, Mo. Filed Nov. 22, 1888. Serial No. 291,500. (No model.)

Claim.—1. In a shaft-coupling gearing, shaft-iron C', having projection C², and shaft-iron C³, both of said irons secured fixedly to shaft C and axle B, in combination with sleeve D and adjustable strap E, all constructed to operate substantially as described.

2. Sectional sleeve D, having suitable means to prevent end movement of adjustable strap E, substantially as shown, for the purpose specified.



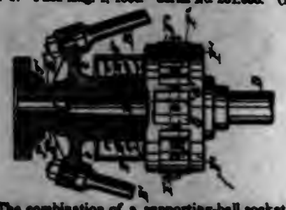
3. Strap E, susceptible of adjustment, having projections F and F', engaging brace H and G in the manner shown, said strap surrounding sleeve D, and turning back and forth by means of said projections in unison with the backward and forward movement of axle B, which also revolves within said strap, thereby imparting the proper universal movement to said axle in operating in conjunction with said strap, substantially as shown, for the purpose specified.

408,820. RAILWAY SWITCH-STAND. CHARLES ALKIRE, Chicago, Ill. Filed Mar. 26, 1888. Serial No. 268,161. (No model.)

Claim.—1. In a railway switch-stand, the combination of the gear D and a weighted lever connected therewith, and the sliding rack-bar arranged to engage with said gear, and provided with an arm which is connected with the signal device, so as to operate the same by a connection between the rack-bar and signal device, in contradistinction to a connection between the signal device and a gear upon the spindle of said gear that engages the rack-bar, substantially as described.

2. The combination of the rack-bar arranged to slide between the cheek-pieces C, the gear D, engaging the rack-bar and fixed upon a spindle having its bearing in said cheek-pieces, a weighted lever fixed upon one end of the spindle, and a connection, substantially as

408,820.



hereinbefore set forth, between the rack-bar and a rotary signal-rod, in contradistinction to a connection between the signal-rod and said spindle, as and for the purpose described.

408,821. JOURNAL-BOX FOR PLANING-MACHINES. HENRY F. ASTHEIMER, New York, assignor to the Glen Cove Machine Company, (Limited,) Brooklyn, N. Y. Filed Mar. 2, 1889. Serial No. 301,783. (No model.)

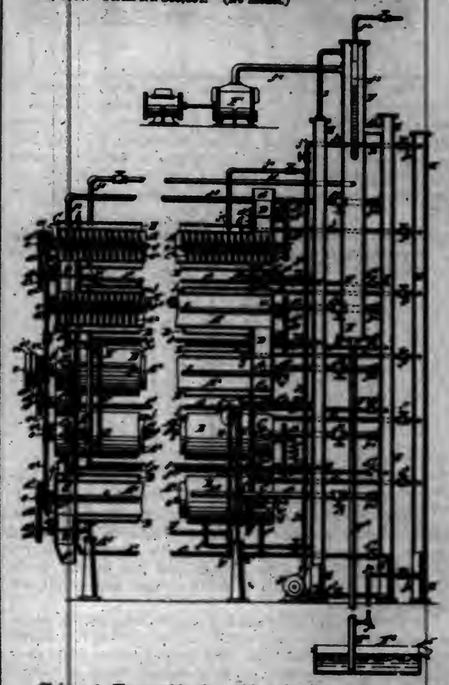
Claim.—The combination, with a shaft provided with projections of greater diameter than the shaft, of journal-boxes for said shaft provided with recesses for oil in which said projections rotate, and with other recesses near the ends of the journal-boxes with which the recesses first named communicate, bushings within the journal-boxes and surrounding the journals, said bushings being provided with grooves for receiving the oil and supplying it to the journals, substantially as specified.

408,822. CENTRIFUGAL MACHINE. JOHN P. BOETTIGER, Cold Springs, N. Y. Filed Aug. 1, 1888. Serial No. 281,633. (No model.)

Claim.—The combination of a supporting-ball socket, a suspension-sleeve provided at its upper end with a ball engaging said socket, with an interior bearing for the spindle, and with an exterior screw-thread at its lower end, a suspension-head provided with a tubular hub fitting over said sleeve and keyed thereto, a nut engaging the screw-threads of said sleeve and holding said head on the sleeve, a casing provided with a step-bearing, suspension-rods connected at their upper ends to said head and at their lower ends to said casing, a spindle turning at its lower end in said step-bearing and at its upper end in the bearing of said sleeve, and a basket on said spindle within said casing.

408,828. HEAD-REST FOR CHAIRS. THOMAS J. CARRUE, Baltimore, Md., assignor to the S. S. White Dental Manufacturing Company, Philadelphia, Pa. Filed May 2, 1889. Serial No. 309,263. (No model.)

Brief.—An adjustable head-rest consisting of a separable link having formed upon its ends ball-sockets, and adapted when brought together and secured by the central clamping-screw to hold ball-joints secured, respectively, to the seat-back extension and the head-rest.



Claim.—1. The combination of the head-rest, the supporting-rod, the balls carried, respectively, by the head-rest and the supporting-rod, the clamp-link provided with the end sockets and having the inwardly-projecting ends, and the clamp acting on the inwardly-projecting ends of the clamp-link between its sockets, substantially as set forth.

2. The combination, with the clamp-link consisting of the body and the end pieces jointed thereto and having the sockets at its opposite ends, of the clamp acting upon the inwardly-projecting ends of the end pieces, substantially as set forth.

408,828.

408,824. APPARATUS FOR DRYING STARCH-REFUSE, BREWERS' GRAINS, &c. FRANCIS M. F. CAZIN, New York, N. Y. Filed June 22, 1886. Serial No. 205,861. (No model.)

Claim.—1. The combination, with a plurality of closed drying-tubes severally provided with heating-jackets and with inlets and outlets for solid matter at opposite ends, of conveyers for moving solid matter through the tubes, a pipe for introducing heating-fluid from an outside source to the jacket of one tube, and a connection through which the hot vapors emanating from the contents of that tube are delivered to the jacket of the next tube in the series to serve as a heating agent therefor, substantially as herein described.

2. The combination, with two or more closed drying-tubes provided with heating-jackets and with inlets and outlets for solid matter at opposite ends, of conveyers for moving the drying-matter through said tubes, a pipe for supplying heating-fluid from an outside source to the jacket of one tube, and steam-jet exhausters, one for each drying-tube and each having a steam-supply pipe, a suction-pipe leading from the interior of one tube, and a delivery-pipe leading to the jacket of another tube, whereby the vapor emanating from the contents of one tube is withdrawn therefrom and delivered, together with the steam employed to work the exhauster, to the heating-jacket of another tube, substantially as herein described.

3. The combination, with a plurality of closed drying-tubes connected at the ends by bonnets or hoods to provide for the passage of solid matter from one to the other of them and severally provided with heating-jackets, of conveyers for moving the matter to be dried through the tubes, steam-jet exhausters, each having a steam-supply pipe, a suction-pipe leading from one drying-tube and a delivery-pipe leading to the jacket of the next tube in the series and each serving to withdraw from one tube the vapors emanating from its contents and to discharge such vapors to the heating-jacket of the next tube, and a condenser and an air-pump also connected with the several tubes for aiding in exhausting air and vapor therefrom, substantially as herein described.

4. The combination, with the jacketed drying-tubes, of bonnets C, connecting said tubes for the passage of solid matter from one to the other of them and constructed with the perforated partitions *c*, forming continuations of the drying-tubes, exhaust-pipes connected with the bonnet-spaces outside said partitions, conveyers working within said tubes and extending into the bonnets, and rotary valves D, each constructed with wings or bearing portions d^{a} and interposed pockets d^{b}, which are exposed to the two tubes alternately, substantially as herein described.

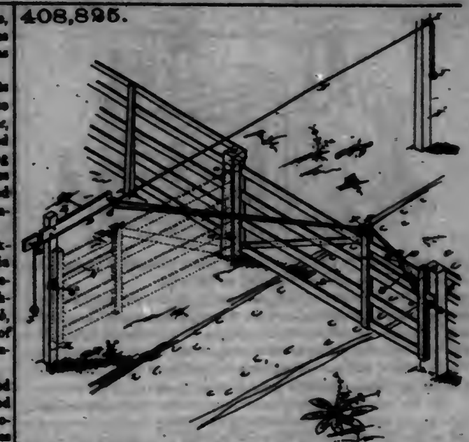
5. The combination, with the concentric drying-tubes A and jacket-tubes B, of the bonnet C, rotary valves fitting segmental seats in the bonnet and constructed with cavities in their peripheries for delivering solid matter from one to another of the drying-tubes without placing them in direct communication, and the expansion-plates *b*, whereby the bonnet and tubes are connected and which permits of unequal expansion of the parts without danger of leakage, substantially as herein described.

6. The combination, with a series of closed drying-tubes provided with heating-jackets and conveyers for moving matter to be dried through them in succession, of bonnets connecting the tubes, and rotary valves fitting seats in the bonnets and having peripheral cavities for delivering solid matter from one to another of the tubes, pipes for supplying steam or hot vapor to the jackets of certain of the tubes, and pipes and a pump for receiving and collecting the hot liquid of condensation from such jackets as receive steam or vapor and for supplying the said liquid to the jacket of one of the drying-tubes, substantially as described.

7. The combination, with a series of closed and jacketed drying-tubes connected, as described, by bonnets and valves and provided with conveyers, of pipes for supplying steam or vapor to the jackets of certain of the drying-tubes, exhausting apparatus for maintaining a pressure below the atmosphere in said tubes, the hot-water stand-pipe connected with the jackets, which are supplied with steam or vapor for receiving hot water of condensation from said jackets, and a pump and pipe whereby the hot water of condensation is delivered to the jacket of another of said tubes for heating the same, substantially as herein set forth.

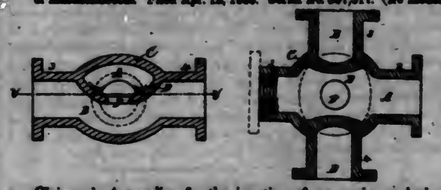
8. The combination, with a series of closed and jacketed drying-tubes connected by bonnets and valves, as described, and provided with conveyers, of a pipe for supplying steam to the jacket of one tube and steam-jet exhausters, each having a steam-supply pipe, a suction-pipe leading from one drying-tube and a discharge-pipe leading to the jacket of the next drying-tube in the series, whereby the vapors emanating from the contents of each tube are delivered to the jacket of the next tube in the series, and a condenser and air-pump also connected with the several tubes, substantially as herein set forth.

9. The combination, with a series of closed and jacketed drying-tubes connected by bonnets and valves, as described, and provided with conveyers, of a pipe for supplying steam to the jacket of one tube, steam-jet exhausters, each having a steam-supply pipe, a suction-pipe leading from one drying-tube of the series and a discharge-pipe leading to the jacket of the next drying-tube in the series, whereby the vapors from the contents of each tube are delivered to the jacket of the next tube in the series, and the surplus steam and water stand-pipe connected with the jackets of all the tubes and serving to equalize the pressure within them, substantially as herein described.



10. The combination, with a series of closed drying-tubes connected, as described, by bonnets or hoods and valves to deliver solid matter from one to another of them and provided with heating-jackets and conveyers, of the condenser having the air-pump connection f^{a}, and the vapor-collector G, connected with the condenser and connected by the pipes f^{c} with the drying-tubes, substantially as herein set forth.

11. The combination, with a series of closed drying-tubes connected, as described, by bonnets or hoods and valves to deliver solid matter from one to another of them and provided with heating-jackets and conveyers, of the condenser F and its air-pump connection f^{a}, the vapor-collector G, connected by pipes f^{c} with the several drying-tubes and also connected with the condenser, and the surplus-steam collector H, connected by branches with the several heating-jackets and also connected with the condenser, substantially as herein described.



408,825. GATE. DAVID C. CHADDOCK, Minerva, Ohio. Filed Mar. 25, 1889. Serial No. 304,740. (No model.)

Claim.—The combination of the gate A, hinged to the post B by the long hinge *c'* and the short hinge *c*, and provided with the latch *b'*, the catches *b* and b^{a}, the cords D and D', passing through the guide-eyes G, H, and I, and the weights J, attached to the free ends of the cords D and D', substantially as shown and described, and for the purpose set forth.

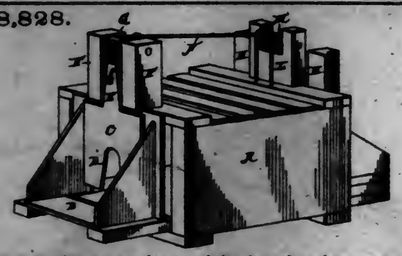
408,825.

408,826. CROSS FOR GAS MAINS OR PIPES. JAMES C. CONNOT, Pittsburg, Pa., assignor of one-half to the Union Water Meter Company, of Massachusetts. Filed Apr. 12, 1888. Serial No. 307,017. (No model.)

Claim.—1. A coupling for the junction of gas mains and pipes having a perforated partition in the interior thereof defining the respective passages from the several connecting branches at the position where said passages cross each other, as and for the purpose set forth.

2. The within-described cross for pipes or gas-distributing mains, consisting of the body or shell C, provided with the crossed passages A and B, separated from each other by a partition D, and an opening F, connecting said passages through the partition, all substantially as and for the purpose set forth.

408,827. HARNESS-SADDLE. CHARLES J. COOPER, Moline, Ill. Filed Apr. 4, 1888. Serial No. 305,947. (No model.)



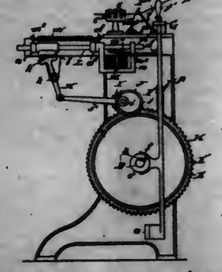
Claim.—1. The combination, in a harness-saddle, of a yoke provided toward its outer end with a stirrup, and a hinged plate having a hook adapted to enter through the aperture of the stirrup, and having also a curved portion to receive the transverse bar of the stirrup, whereby to form a free joint, and said curved portion being provided with shoulders to form stops to limit the outward movement of the parts at the joint, substantially as described.

2. In a harness-saddle, the combination, with a yoke having a stirrup toward its outer end, of a hinged plate having a hook adapted to pass through the aperture of the stirrup, and an upwardly curved or arched portion to receive the transverse bar thereof, whereby to form a free joint, and having also engaging shoulders to limit the outward movement of the yoke, and a jockey-plate extended beneath the hinged plate, and having an aperture at its forward end to receive the hook of the hinged plate, substantially as described.

408,828. HEN'S NEST OR COOP. PETER COLE, Garrett County, Md. Filed Mar. 12, 1888. Serial No. 302,997. (No model.)

Claim.—1. The combination, with the coop, of the swinging door at one end of the same, the sliding door at the other end thereof, the

408,828.

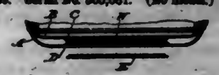


cord connecting the two doors, and the dog adapted to support the sliding door in an elevated position, as set forth.

2. The combination, with the coop, of an outwardly-swinging door at one end, a sliding door at the other end, a cord connecting the two doors, whereby when the swinging door is open the sliding door will be raised, the dog adapted to support the sliding door in its elevated position, and a vibrating lever controlling the said dog, so as to support and release the sliding door, as set forth.

3. The combination, with the coop, of the outwardly-swinging door at one end having the tongue E, the sliding door at the opposite end of the coop having a cleat provided with a projecting end K, the cord connecting the sliding door with the tongue E of the swinging door, the dog adapted to engage the projecting cleat K, and a lever controlling the said dog, as set forth.

4. The combination, with the coop, of the standards F at one end of the same, the pulley G, mounted between the upper ends of said standards, the bearing-plate L at the opposite end of the coop, the pulley M, mounted on said bearing-plate, the swinging door having the tongue E playing between the standards F, the standards H H, the sliding door mounted between and guided by said standards and having a cleat provided with a projecting end K, the cord passing over the pulleys G M and having its opposite ends secured to the sliding door and the end of the tongue E, the dog entering the path of the projecting end K of the cleat secured to the sliding door, and the vibrating lever controlling the said dog and provided with a weight at one end and a step at the other end, as set forth.



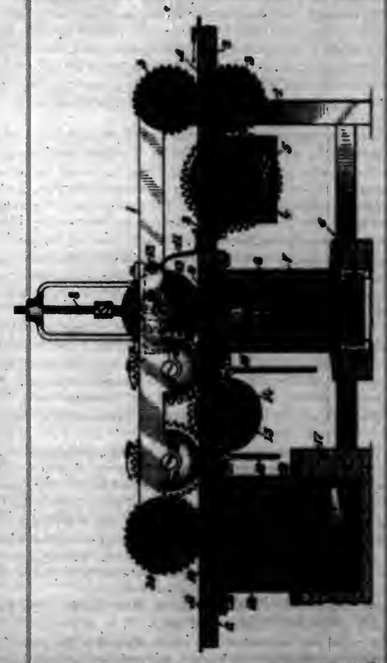
408,829. ELECTRIC STOP-MOTION FOR DRAWING-FRAMES, &c. VICTOR I. CORNOCK, Lowell, Mass. Filed Jan. 25, 1889. Serial No. 297,532. (No model.)

Claim.—1. In an electric stop-motion, an electric circuit containing a circuit-closer normally held open by the work, but automatically closing upon a failure of the work, in combination with a spring-actuated shifting-lever normally locked, a reciprocating bar, a carriage supported on said bar, but normally at rest, an electro-magnet arranged in said circuit, an armature-lever pivoted on said carriage and attracted by said magnet upon the closing of said circuit, and having a bent end adapted, when said armature is so attracted, to interpose between said bar and said lever and to be pushed by said bar against said lever and to draw said carriage with said bar and to unlock said lever, as and for the purpose specified.

2. In an electric stop-motion, an electric circuit containing a circuit-closer normally held open by the work, but automatically closing upon a failure of the work, and containing also a switch, in combination with a spring-actuated shifting-lever normally locked and closing said switch, a reciprocating bar, a carriage supported on said, bar but normally at rest, an electro-magnet arranged in said circuit, an armature lever pivoted on said carriage and attracted by said magnet upon the closing of said circuit, and having a bent end adapted, when said armature is so attracted, to interpose between said bar and said lever and to be pushed by said bar against said lever and to draw said carriage with said bar and to unlock said lever, as and for the purpose specified.

408,830. WATCH-CASE. JULES DUBOIS, Brooklyn, N. Y. Filed Mar. 28, 1889. Serial No. 305,081. (No model.)

Claim.—A watch having an inwardly-beveled ring secured centrally upon the outer face of its cap to form a retaining-seat for a photograph, an outer case covering the cap, having an opening therein to register with said seat and which is encircled by an inwardly-projecting bead or ring, and a covering-plate fitting accurately within said opening to close it, substantially in the manner and for the purpose herein set forth.



408,831. FAUCET AND FAUCET-BUSHING. CHARLES T. BRIGHAM, Lawrence, Mass. Filed Feb. 9, 1888. Serial No. 263,546. (No model.)

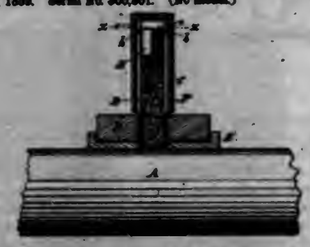
Claim.—1. The bushing B, conical shoulder *b'*, and perforations *b* therein, and the strainer *f*, surrounding the said shoulder, combined with a removable faucet, the cup-stopper D, having a flaring end within the strainer and closely fitting upon said shoulder, closing the outer ends of the said perforations, a packing interposed between the bushing and stopper, piston F, spring A, and screw-plug E, having its outer face flush with the outer face of the bushing when the faucet is withdrawn, substantially as and for the purposes set forth.

2. The combination, with a bushing having perforations adapted to be closed at each end by a cylindrical stopper and a screw-plug, respectively, of a strainer surrounding the inner end of said stopper and extended beyond the outer ends of said perforations, substantially as described.

408,832. MACHINE FOR TINNING COPPER SHEETS. DAVID EVANS, Ansonia, Conn., assignor of one-half to Rufus C. Alcott, same place. Filed Jan. 14, 1889. Serial No. 296,221. (No model.)

Claim.—1. In a machine of the character described, the combination, with mechanism for feeding the sheet, devices for applying the flux, and the calender-rolls, of the pot, means for heating the same, a pump connected with said pot, and a perforated conduit connected with the pot and extended contiguous to the face of the sheet, substantially as set forth.

2. The combination, with the pot, the pump arranged therein, and a distributing perforated conduit connected with the pump and extended adjacent to the line of feed of the sheet, of the swab-roll engaging the sheet after the operation of the pump, and a pair of calenders located behind the said swab and adapted to finish the sheet, substantially as described.



3. The combination, with the pot, the pump arranged therein, and the perforated conduit leading from the pump, of the swab-roll located behind the pump and its pot, and the calenders, the lower whereof runs in a pot of metal and is adapted in addition to its pressing function to apply to the sheet a supplemental coating of metal, substantially as set forth.

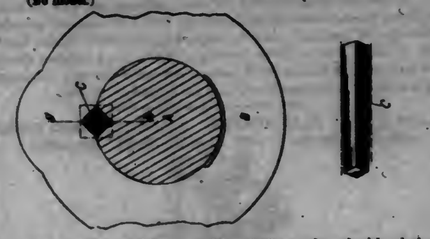
4. The combination, with the pot, the pump arranged in said pot, and the perforated pipe, of the swinging shield hung above the said pipe, and whereby the top of the sheet is protected as against the metal of the jet, substantially as set forth.

5. The combination, with the pot and the pump arranged therein and a perforated conduit connected to said pump, of the feeding-rolls and the flux-applying swab, the swab-roll located behind the pump, and the calender-rolls and the second metal pot, whereby the supplemental coating of metal is imparted to the sheet, substantially as set forth.

6. In a machine of the character described, the combination, with the devices for the feeding of the sheet, of the pot and means for melting its contents, a pump arranged in said pot at one end thereof, and a conduit-pipe having one extremity connected to said pump and extended across the machine parallel and contiguous to the face of the sheet, said pipe having at its nearest point to the sheet a series of perforations, whereby jets of molten metal may be projected against the sheet, substantially as specified.

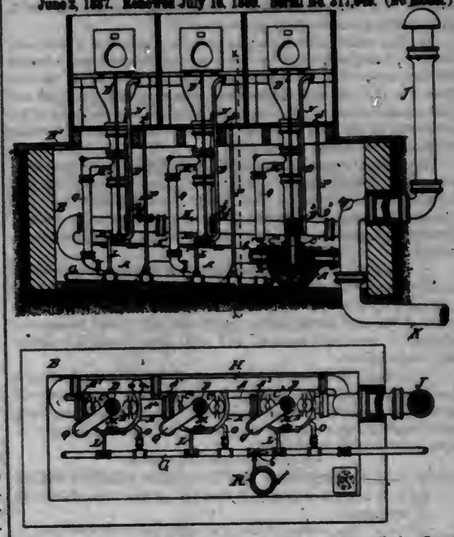
408,833. LUBRICATOR. WILLIAM J. FAHL, Brooklyn, N. Y. Filed Feb. 23, 1889. Serial No. 300,801. (No model.)

Claim.—In a lubricator, the combination, with a journal, of a bearing therefor, a shell secured to said bearing and adapted to receive a stick of lubricating material, said shell being provided with longitudinal slots, a weight within said shell adapted to rest upon the upper end of the stick of lubricating material, and provided with lugs or projections extending into said slots and a cap-piece inclosing said shell, substantially as specified.



408,834. SUSPENDER-BUCKLE. WESLEY T. PERRY, Bentonville, Ind. Filed Apr. 26, 1888. Serial No. 308,505. (No model.)

Claim.—1. As an improved article of manufacture, a buckle consisting of a frame having a hook on its lower side, the beak of said hook bent to form a supplemental hook, a tongue pivoted in the frame and a shortened loop or latch secured on the upper bar of the frame and adapted to engage the outer parts of the supplemental hook and lock the parts, substantially as set forth.



2. In a suspender-buckle, the combination, with the frame A, having eyes *a* on its sides and the center of the lower side bent downward, forming a double hook *a'* and *b* in one piece on its lower end, and the tongue C, pivoted in the frame, of the latch E, secured on the upper bar of the frame and inclined to hold the tongue in position and form a loop *c*, which engages and holds the outer hook *b* when the parts are adjusted, substantially as set forth.

408,835. KEYING WHEELS. HENRY GRAFTON, Chancery Lane, County of Middlesex, England. Filed Aug. 20, 1888. Serial No. 284,179. (No model.)

Claim.—The combination, with a shaft or axle and with a hub or boss, each having a key-seat, of a driven key having four acting sides and having draft upon those sides, those four acting sides fitting tightly between the sides of the seats and forming opposite dihedral angles which are met at their apexes by the circle of the shaft, each two opposite acting sides of the key being bisectable (in the direction of their width) by a common normal, as specified.

408,836. WATER-CLOSET. JOSEPH GUY, New York, N. Y. Filed June 2, 1887. Renewed July 16, 1889. Serial No. 317,649. (No model.)

Claim.—1. The trap-body provided with the inlet soil-pipe C, end openings $A' A^2$, and an uninterrupted passage in the trap-body above the seal between the two openings $A' A^2$, as hereinbefore set forth.

2. The trap-body provided with the inlet soil-pipe C and with end openings $A' A^2$, between which there is an uninterrupted passage above the seal, in combination with the ventilating-pipe and the back air-pipe H, connecting opening A' with the ventilating-pipe, and the sewer-pipe connected to the other opening A^2, all substantially as hereinbefore set forth.

3. A series of trap-bodies provided each with end openings $A' A^2$, through which they communicate and are connected together, and an uninterrupted passage throughout the whole series above the water seal, and soil-pipes for each trap, in combination with a ventilating-pipe communicating with one end of the said passage and a sewer-pipe communicating with the opposite end of said passage, substantially as and for the purposes hereinbefore set forth.

4. The trap-body having end openings $A' A^2$ and an uninterrupted passage between said opening above the seal, and the soil-pipe having its lower end within the trap slightly and gradually curved in the direction of the trap-outlet, as described, in combination with the flush-pipe located in the side of the trap-body below the soil-pipe, so that the jet discharged from it shall cut across the trap-body directly beneath the mouth of the soil-pipe, as hereinbefore set forth.

5. The trap-body provided with end openings $A' A^2$ and an uninterrupted passage between said openings above the seal, and the soil-pipe having its lower end within the trap slightly and gradually curved in the direction of the trap-outlet, as described, in combina-

tion with the flush-pipe and the overflow-pipe, arranged and located with respect to the soil-pipe as hereinbefore set forth.

6. The trap-body provided with end openings and with an uninterrupted passage between said openings above the seal, the soil-pipe entering said trap-body, and the covered hand-holes E D^2, the hand-hole D^2 being in the soil-pipe outside of and a short distance above the trap, and the hand-holes E being in the top of the trap and opening into the said passage therein, as hereinbefore set forth.

408,837. RAILROAD-SIGNAL. CHARLES T. HALLOWELL, Philadelphia, Pa. Filed Apr. 11, 1888. Serial No. 306,962. (No model.)

Claim.—1. A signal having a movable transparent signal-arm, stationary color-imparting material adapted to coincide with said arm, and a lantern attached to said arm, said lantern having a lamp adapted to illuminate said material and transmit the color thereof to the signal-arm, substantially as described.

2. In a signal, color-imparting material attached to a stationary holder, a swinging transparent signal arm or standard, and a lantern having a lamp which illuminates said material and transmits the color thereof to the arm, said lantern being connected with the signal-arm and movable over the color-imparting material, and the lamp of the lantern being pivotally supported with the lantern, the parts being combined substantially as described.

3. A signal consisting of a segment having pieces of transparent material of different colors, a pivoted arm provided at one end with a lantern having a swinging lamp therein, the said lantern having an opening adapted to coincide with either of said pieces, and a reflector opposite said opening, said parts being combined substantially as described.

4. In a signal, the segment having pieces of transparent material of different colors, a pivoted arm carrying a lantern, the latter having a swinging lamp therein and provided with an opening coinciding with either of the said pieces, and a guard secured to said lantern and adapted to cover said segment, said parts being combined substantially as described.

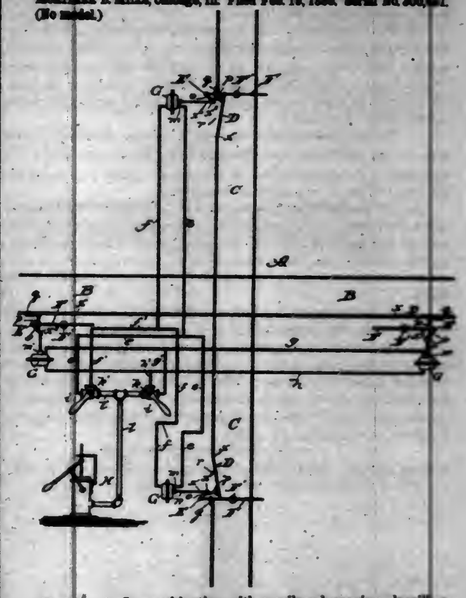
5. A signal consisting of a segment, the latter having bull's-eyes therein, and a pivoted arm having a lantern with a swinging lamp and an opening coinciding with either of said bull's-eyes, said arm being hollow and having a transparent side, the parts named being combined substantially as described.

408,838. PROCESS OF MANUFACTURING ASBESTUS SHEETS. HENRY W. JOHNS, New York, N. Y. Filed Nov. 16, 1886. Serial No. 219,071. (No specimens.)

Claim.—The process of manufacturing asbestus sheathing, or sheets containing asbestus and having a napped surface, consisting in pulping the material and forming the same into a layer or sheet, and then applying fibrous asbestus to the surface of the sheet while it is soft, and then pressing the superposed fibers into the pulp of the sheet, and then drying the sheet, substantially as set forth.

408,839. VEHICLE-AXLE. JAMES T. MILLER, Atlanta, Ga. Filed May 19, 1888. Serial No. 274,352. (No model.)

Claim.—1. As a new article of manufacture, an axle made of a single plate of regular thickness formed into a main channel-shaped portion A, with the integral conical spindle portions B B' at each end thereof, and a screw-threaded cylindrical portion at each of said spindle portions, for the purpose set forth, substantially as described.



2. As a new article of manufacture, an axle provided with conical hollow spindles, a removable bearing *g* in each spindle, and a retaining-ring *i* over each bearing portion, for the purposes set forth.

3. The combination of the axle A, integral spindles at each end thereof, the core *j* or blocks inside of said axle, and metallic hardened blocks at each end of the core *j*, for the purpose set forth, substantially as described.

4. The combination of the axle A, spindles B B', made integral therewith, the core *j* or blocks within said axle, block *l* at each end of said core, ears *m m* on said block, and adjusting-screws *n n*, passing through such ears, for the purpose set forth, substantially as described.

5. The combination of the axle A, integral spindles B B' at each end thereof and provided with lips *f f'*, the bearing-piece *g*, provided with a similar lip *h*, and the ring *i*, all combined and arranged substantially as and for the purpose set forth.

408,840. DERAILING MECHANISM FOR RAILROAD-CROSSINGS. MONTGOMERY B. MILLS, Chicago, Ill. Filed Feb. 19, 1889. Serial No. 300,491. (No model.)

Claim.—1. In combination with a railroad-crossing, derailing-sections D in a track at opposite sides of and beyond the crossing, horizontally-swinging arms F, connected with the derailing-sections, to extend across the track in the path of a passing train when the said sections are in their derailing positions, and longitudinally and laterally of the track when the derailing-sections are in their safety positions, whereby, when the arms are in their positions of extending laterally of the track, turning of the sections D to their derailing positions may be prevented by a train passing in the path of the horizontally-swinging arms, and means, substantially as described, for simultaneously actuating the derailing-sections and horizontally-swinging arms, substantially as set forth.

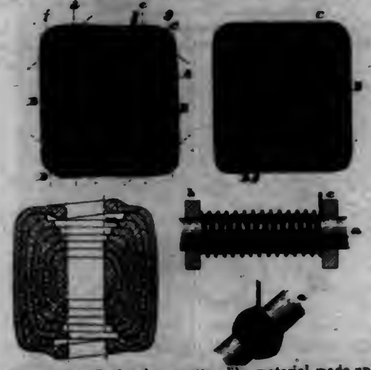
2. In combination with a railroad-crossing, derailing-sections D in each track at opposite sides of and beyond the crossing, horizontally-swinging arms F, connected with the derailing-sections, to extend across the tracks when the said sections are in their derailing positions and longitudinally and laterally of the tracks when the derailing-sections are in their safety positions, whereby, when the arms at opposite sides of the crossing on one track are in their positions of extending laterally of the said track, turning of the sections D to their derailing positions may be prevented by a train passing in the path of the horizontally-swinging arms, and means, substantially as described, for adjusting the derailing-sections and swinging arms of one track against the approach thereon of a train to the crossing and to prepare for and indicate to a train on another track the right of way over the crossing, substantially as set forth.

3. In combination with a railroad-crossing, pivotal derailing-sections D in each track at opposite sides of and beyond the crossing, vertical spindles E, supported laterally of the tracks, revolvable on their own axes, and each connected eccentrically with a derailing-section, a horizontal arm F, secured on each spindle, to revolve with it and be extended lengthwise of the track or across it in the path of a train, and means, substantially as described, for adjusting the derailing-sections and swinging arms of one track against the approach thereon of a train to the crossing, and to prepare for and indicate to a train on another track the right of way over the crossing, substantially as set forth.

4. A derailing mechanism for railroad-crossings, comprising, in combination with a railroad-crossing, pivotal derailing-sections D in each track at opposite sides of and beyond the crossing, vertical spindles E, revolvable on their own axes and carrying, to revolve with them, horizontal arms F, and each having a crank *o*, a link *p*, connecting the derailing-sections with the crank, a reciprocating rod *n*, connected with the said crank and link, and means, substantially as described, connected with the rod *n*, for reciprocating them to produce adjustment of the derailing-sections, and swinging arms to warn a train on one track against approaching the crossing, and to prepare for and indicate to a train on another track the right of way over the crossing, substantially as described.

408,841. TWINE PACKAGE. CHARLES P. MITCHELL, Boston, Mass. Filed June 1, 1888. Renewed Feb. 15, 1889. Serial No. 300,079. (No model.)

Brief.—The object of the invention is to improve the formation of packages of twine adapted for use in grain-binders in order to economize time and space and to prevent snarls.

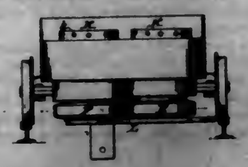


Claim.—1. A twine package made up of two balls wound upon an inner core which extends from one to the other, the entire package being composed of a continuous twine.

2. A twine package made up of an inner core extending lengthwise of the package and having wound about said core two series of spiral courses or layers, each series extending a portion of the length of said core, the entire package being composed of a continuous twine.

408,842. TWINE BALL. CHARLES P. MITCHELL, Boston, Mass. Filed Apr. 17, 1888. Serial No. 307,393. (No model.)

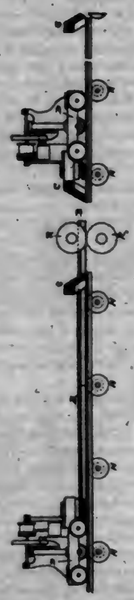
Brief.—The object of the invention is to prevent waste space in the ball and to permit unwinding from the inside without tangling.



Claim.—1. A ball of twine or other like material made up of a series of cylindrical layers of varying lengths, the outer of which are of less length than the inner ones and all wound spirally, and an outer or finishing covering of one or two layers wound about said cylindrical body in planes oblique to the axis of said cylinder.

2. A ball of twine or other like material the main body of which is in the form of a cylinder having frusto-conical ends, and having a finishing layer or covering wound in planes oblique to the axis of said cylinder and inclosing said frusto-conical ends, substantially as described.

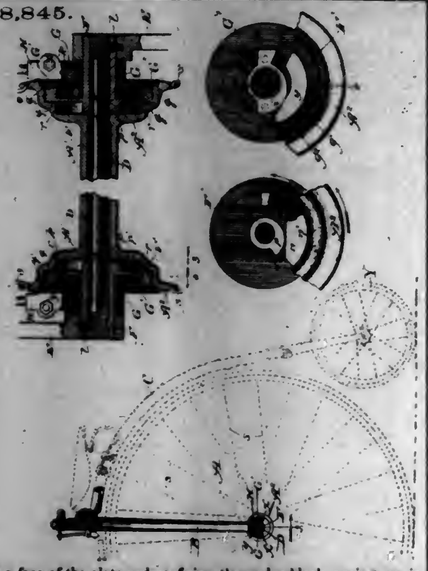
408,843. PROCESS OF ROLLING STEEL OR IRON. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Jan. 26, 1889. Serial No. 297,867. (No model.)



Claim.—An improved process of rolling metal, which consists in exerting a pressure or force upon the piece in the direction of the surface motion imparted by these rolls during the passage of the piece through the rolls.

408,843.

408,844. PROCESS OF ROLLING IRON OR STEEL. ARTHUR J. MOXHAM, Johnstown, Pa. Filed Jan. 26, 1889. Serial No. 297,868. (No model.)



Claim.—An improved process of rolling metal, which consists in exerting a pressure or force upon the piece opposite in direction to that of the surface motion imparted by the rolls during the passage of the piece through the rolls.

408,845. BICYCLE. CHARLES R. MCGLINCHEY, Chicago, Ill., assignor of one-half to John W. Dillon, same place. Filed May 28, 1889. Serial No. 312,203. (No model.)

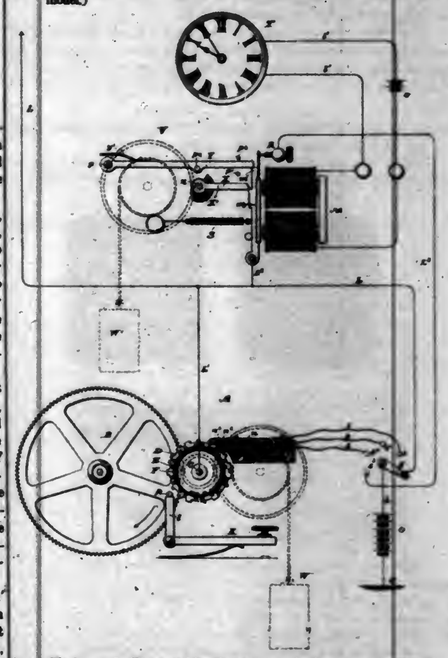
Claim.—1. The combination, with a wheel loosely supported on its shaft, of gripping mechanism comprising a plate F', rigidly secured to the shaft and carrying a wedge-block *s*, yieldingly connected with the plate to have a limited play on the face thereof, and a cam *p*, rigid

408,845.

on a face of the plate and confining the wedge-block against an internal peripheral surface of the wheel and operating by the rotation of the shaft in one direction to wedge the block and rotate the wheel and by the stoppage of the shaft to release its engagement with the wedge-block, substantially as described.

2. The combination, with a wheel loosely supported on its shaft, of a hub A' internal with the wheel and provided with a housing A^3, having an internal peripheral surface *r*, a plate F', rigidly secured to the shaft and provided on its face with a rigid cam *p*, surrounded by the surface *r*, a loose wedge-block *n*, interposed between the cam *p* and surface *r* and yieldingly held in place by a spring *m*, whereby rotation of the shaft in one direction causes the cam to wedge the block *n* and rotate the wheel and stoppage of the shaft releases the wheel by disengaging the cam and wedge-block, substantially as described.

3. In a bicycle, the combination, with the wheel A, pedals, front fork, and backbone, of gripping mechanism, substantially as described, between the pedal-crank and wheel, effecting by rotation of the pedal in the positive direction engagement thereof with the wheel to revolve the latter, and effecting by stoppage of the pedal's rotation release of the wheel, and gripping mechanism, substantially as described, between the front fork and pedal-crank and actuated by the rise of the backbone to produce engagement between the front fork and pedal-crank, whereby the wheel may revolve in the positive direction while the pedal is at rest, and a rise of the backbone will produce immediate engagement of the pedal-crank, substantially as and for the purpose set forth.



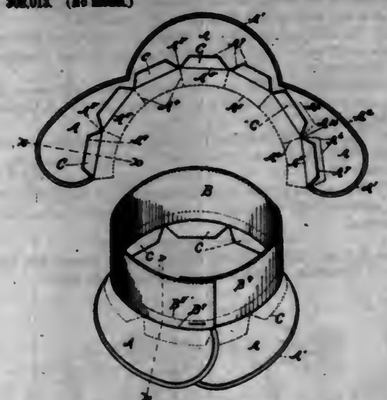
4. In a bicycle, the combination of a wheel A, having a hub A' integral with the wheel and provided with a housing at one or both ends, each housing A^3 having an internal peripheral surface *r*, a shaft D, provided with pedals E and on which the wheel is loosely supported, and a sleeve F, surrounding the shaft adjacent to each housing and rigidly secured thereto, and provided with a disk F' in the housing, and having a cam *p*, a loose wedge-block *n*, interposed between the cam *p* and adjacent surface *r*, and held in place by a spring *m*, whereby rotation of the shaft in one direction engages and rotates the wheel and stoppage of the shaft releases the wheel, substantially as described.

5. In a bicycle, the combination of a wheel A, having a hub A', a shaft D', having rigidly secured thereto the pedals E and on which the wheel is loosely supported, gripping mechanism, substantially as described, on the shaft, and effecting by the rotation of the shaft in the positive direction engagement thereof with the hub A^3 and by the stoppage of the rotation of the shaft release of the hub, and gripping mechanism, substantially as described, on the shaft, and with which the front fork is connected, and actuated by a rise of the backbone to produce gripping of the shaft, whereby the wheel may revolve in the positive direction while the pedals are at rest, and a rise of the backbone will effect immediate engagement of the pedal-crank, substantially as and for the purpose set forth.

6. In a bicycle, the combination, with the wheel A, supported on a shaft provided with pedals E, rigidly secured thereto, the backbone C, and front fork B, of a recessed disk F', rigid with the shaft, having an inner peripheral surface *k*, a plate G', to which the front fork is rigidly secured, loosely mounted on the shaft and carrying a wedge-block *g*, yieldingly connected with the plate to have limited play on the face thereof, and a cam *i'*, rigid on a face of the plate and confining the wedge-block against the surface *k* of the disk and actuated by a turning of the front fork in one direction to grip the disk, substantially as and for the purpose set forth.

7. In a bicycle, the combination, with the wheel A, loosely supported on a shaft D, provided with pedals, of a housing A^3 integral with the wheel and having an internal peripheral surface *r*, a disk F' within the housing, rigidly secured to the shaft, recessed on one side to afford an inner peripheral surface *k* and on its other side provided with a rigid cam *p'*, surrounded by the surface *r*, a loose wedge-block *n*, interposed between the cam *p* and surface *r* and held yieldingly by a spring *m*, and a plate G', to which the front fork is rigidly secured, loosely mounted on the shaft, and provided with a rigid cam *i'*, surrounded by the surface *k* of the disk F', a loose wedge-block *g*, interposed between the cam *i'* and surface *k* and yieldingly held by a spring *h*, the whole being constructed and arranged to operate substantially as and for the purpose set forth.

408,846. AUTOMATIC SIGNALING DEVICE FOR TIME-SERVICE. CHESTER H. POSH, Chicago, Ill., assignor to the Self Winding Clock Company, New York, N. Y. Filed May 3, 1889. Serial No. 309,429. (No model.)

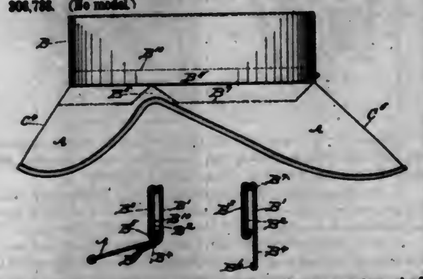


Claim.—1. The combination of a main line having secondary time-pieces included therein, the branch lines 1, 2, and 3, the disks D, E, and F, respectively connected with said branch lines, clock-work for revolving said disks, and the line L', connecting said disks with said main line.

2. The combination of a clock-work, the wheel B, forming a part thereof, the insulated disks D, E, and F, as described, the key K, for releasing said clock-work, and the lines 1, 2, and 3, and L', for connecting said devices with a telegraph-line.

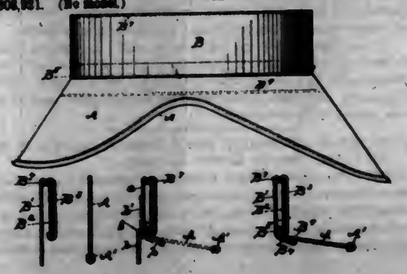
3. The combination of a main line of telegraph having secondary time-pieces included therein, the standard clock T, with its local circuit, and the relay devices, as described, consisting of a train of wheels and the levers X and Y, operating as described.

4. The combination of a main line, the switch S, the instrument A, for sending the preliminary signals for time-service, consisting of a train of wheels, of which the wheel B forms a part, the device for stopping and releasing said wheel, as the pin *p* and the key K, and the disks D, E, and F, operated by said train, the standard clock and its local circuit, the lines L^2 and L^3, and the relaying devices V, substantially as described.



408,847. CAPE-COLLAR. NOEL R. POWERS, Lansingburg, assignor to Wilbur, Miller & Wilbur, Troy, N. Y. Filed Mar. 6, 1889. Serial No. 302,013. (No model.)

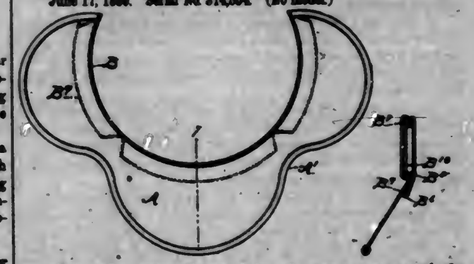
Claim.—1. In a cape-collar, the combination, with the collar proper, of a cape consisting of a ply of fabric having a series of retroverted sections integral with such ply ranged on a curved line along its inner edge and a line of stitching through such inner edge and the lower edge of the collar proper, substantially as described.



2. In a cape-collar, a cape consisting of a ply of fabric having a concaved inner edge and a series of retroverted sections integral with such ply ranged along such concaved edge, the several sections being connected with the ply at one edge by a fold forming part of the concaved inner edge and at their other edges by lines of stitching, substantially as described.

408,848. CAPE-COLLAR. NOEL R. POWERS, Lansingburg, assignor to Wilbur, Miller & Wilbur, Troy, N. Y. Filed Apr. 11, 1889. Serial No. 306,766. (No model.)

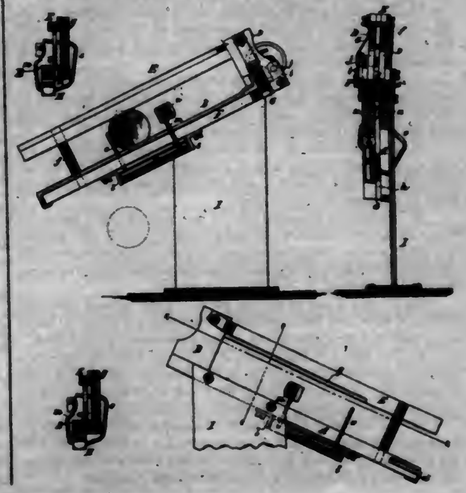
Claim.—A cape-collar consisting of the collar proper formed of a plurality of approximately straight-edge plies, one of which plies extends below the bottom edge of such collar proper, and the cape formed of a ply of fabric having its inner edge concaved or curved, all of said plies being fastened together by a line of stitching along the lower straight edge of the collar proper and the inner curved edge of the cape, the extended collar-ply lapping the cape and having its lapping portion notched and secured to the cape-body by a line of stitching along the edge of the lapping ply, substantially as described.



408,849. CAPE-COLLAR. NOEL R. POWERS, Lansingburg, assignor to Wilbur, Miller & Wilbur, Troy, N. Y. Filed Apr. 29, 1889. Serial No. 308,951. (No model.)

Claim.—1. In a cape-collar, the combination, with the collar part having an approximately-straight edge and the cape part having a concaved edge, such parts being secured together by a line of stitching along such edges, of a re-enforce strip having its longitudinal edges cut on the bias approximately straight and parallel with each other, secured to the collar part by a line of stitching along one of such edges and to the cape part by another line of stitching along the other of such edges.

2. A cape-collar consisting of the collar proper formed of a plurality of approximately straight edge plies, one of which plies extends below the bottom edge of such collar proper and is composed of two approximately straight edge strips of fabric united with each other along one edge, the strip forming the extended or cape-lapping portion of the ply being cut on the bias, and the cape formed of a ply of fabric having its inner edge concaved or curved, all of said plies being fastened together by a line of stitching along the lower straight edge of the collar proper and the inner curved edge of the cape, the extended collar-ply lapping the cape and having its lapping edge secured to the cape-body by a line of stitching along the edge of the lapping ply, substantially as described.



408,850. METHOD OF MAKING CAPE-COLLARS. NOEL R. POWERS, Lansingburg, assignor to Wilbur, Miller & Wilbur, Troy, N. Y. Filed June 17, 1889. Serial No. 314,554. (No model.)

Claim.—In a cape-collar consisting of a top part composed of a plurality of approximately straight edge plies, one of which extends below its lower edge, and a cape part having a concaved edge secured to the lower edge of the top part, the herein-described method of securing the extended ply to the cape part, which consists of inserting a line of stitching through the cape-lapping edge of the extended ply and the cape, and at the same time subjecting such edge to longitudinally-applied tension and the cape to transversely-applied tension, the direction-lines of tension force applied to the cape being angular to those of the tension force applied to the extended edge, substantially as described.

408,851. VENDING APPARATUS. PHILIPP REHER, Cologne, Prussia, Germany, assignor to John H. Volkmann, New York, N. Y. Filed Nov. 20, 1888. Serial No. 291,205. (No model.)

Claim.—1. In a coin-chute, the rail A, combined with the movable rail F, placed adjacent to the rail A, substantially as described.

408,851.

2. In a coin-chute, the rails A B, placed side by side, combined with the movable rail F, substantially as herein shown and described.

3. In a coin-chute, the rail A, combined with the movable rail F, placed adjacent to the rail A, and with the upper rail E, substantially as described.

4. In a coin-chute, the rails A B, placed side by side, combined with the lower movable rail F and with the upper rail E, substantially as described.

5. In a coin-chute, the rail A, combined with the movable rail F, placed adjacent to the rail A, and with the grooved upper rail E, having one side cut away, as at *g*, substantially as described.

6. In a coin-chute, the rails A B, placed side by side, combined with the movable rail F and with the grooved upper rail E, having one side cut away, as at *g*, substantially as described.

7. In a coin-chute, the rail A, combined with the movable rail F, placed adjacent to the rail A, and the pin *j*, carried by the rail F, substantially as described.

8. In a coin-chute, the rails A B, placed side by side, combined with the movable rail F and the pin *j*, carried by the rail F, substantially as described.

9. The rail A and the plates D D, rising from said rail and having a space between them, said plates acting as a guide for a coin, in combination with the movable rail F, and with the pin *j*, carried by the rail F and projecting into the space between the plates D D, substantially as described.

10. The rails A B, placed side by side and having a space *a* between them, and the plates D D, rising from the rails A B and having a space *c* between them aligned with the space *a*, in combination with the rail F, and with the pin *j*, carried by the rail F and projecting into the space *c*, substantially as described.

11. The rail A, and the plates D D, rising from said rail and having a space between them for the passage of a coin, in combination with the movable rail F, placed adjacent to the rail A, and the pin *j*, carried by the rail F, and with the upper rail E, substantially as described.

12. The rails A B, placed side by side and having a space *a* between them, and the plates D D, rising from the rails A B and having a space *c* between them aligned with the space *a*, in combination with the rail E and with the movable rail F, and pin *j*, carried by the rail F and projecting into the space *c*, substantially as described.

13. The rails A B, placed side by side and having a space *a* between them, combined with the movable rail F, projecting partially across the space *a* for a certain distance and having a tread *k* at its lower end, substantially as described.

14. The rails A B, placed side by side and having a space between them, combined with a movable rail F and an escapement arranged to operate upon a coin, substantially as and for the purpose set forth.

15. The combination of a rail A and a movable rail F with an escapement arranged to act upon a coin on said rails, substantially as and for the purpose set forth.

16. The rail A and the movable rail F, placed adjacent to the rail A, combined with the shaft H, journaled on the rail F, and with the arm *m*, carried by the shaft H, and the head *n* on the arm *m*, substantially as described.

17. The rails A B, placed side by side and having a space between them, combined with the movable rail F, shaft H, journaled on the rail F, and with the arm *m*, carried by the shaft H, and the head *n* on the arm *m*, substantially as described.

18. The rail A and the movable rail F, placed adjacent to the rail A, combined with the shaft H, journaled on the rail F, arm *m*, having head *n*, and the arm *o*, both said arms being carried by the shaft H, substantially as described.

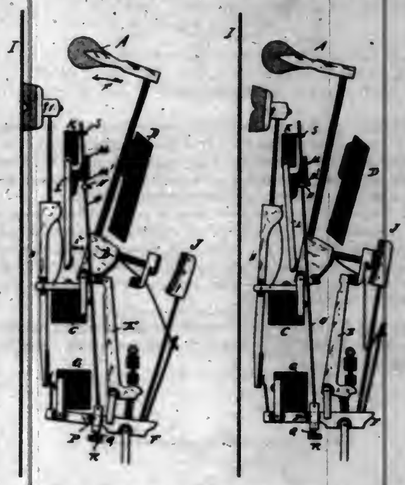
19. The rails A B, placed side by side and having a space between them, combined with the movable rail F, shaft H, journaled on the rail F, arm *m*, having head *n*, and the arm *o*, both said arms being carried by the shaft H, all arranged for operation substantially as herein shown and described.

20. The rail A and plates D D, having a space between them, and the rail E above the rail A, in combination with the movable rail F, pin *j*, shaft H, having arm *m*, and head *n*, substantially as described.

21. The rails A B and plates D D, arranged with the respective spaces *a c* between them, and the rail E above the rails A B, in combination with the movable rail F, pin *j*, and shaft H, having arm *m*, all arranged and operating substantially as herein shown and described.

22. The rails A B and plates D D, arranged with the spaces *a c* between them, and the rail E above the rails A B, in combination with the movable rail F, pin *j*, and shaft H, having arms *m o*, all arranged and operating substantially as herein shown and described.

23. The plates D D, having a space between them, and the rod d^3 and rail E, all arranged to permit the passage of a one-sized coin and to prevent the passage of a larger-sized coin, in combination with the rail A and movable rail F, substantially as described.



24. The rails A B, placed side by side, in combination with the movable rail F and with the spring G, for moving the rail F, substantially as described.

25. The rail A and the movable rail F, placed adjacent to the rail A, combined with the spring G, for moving the rail F, substantially as described.

26. The rails A B, placed side by side, in combination with the movable rail F and with the spring G and the rail E, substantially as described.

27. The rail A and the movable rail F, placed adjacent to the rail A, combined with the spring G and the upper rail E, substantially as described.

408,852. UPRIGHT-PIANO ACTION. ADOLPH RICHTER, New York, N. Y. Filed Jan. 25, 1889. Serial No. 297,536. (No model.)

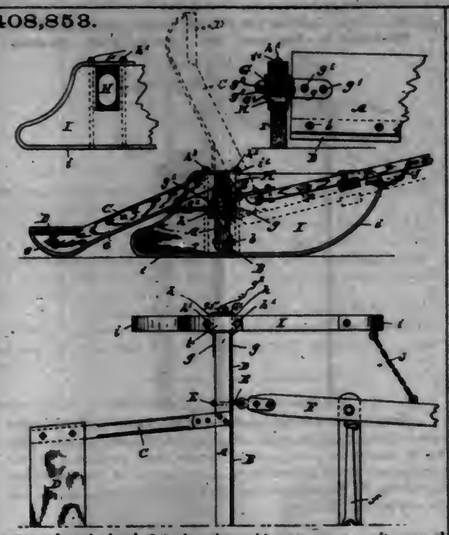
Claim.—1. In a piano-action, the combination, with a hammer and jack bed or lever, of a pivoted lever acting on the hammer and operated from the jack-lever, substantially as set forth.

2. In a piano-action, the combination, with a hammer and jack, of a pivoted lever adjacent to the hammer, and a rod operated from the jack-lever and acting on said lever, substantially as set forth.

3. In a piano-action, the combination, with a hammer and jack, of a lever pivoted adjacent to the hammer, and an adjustable rod connected with the jack-lever and serving to operate said lever, substantially as set forth.

4. In a piano-action, the combination, with a hammer and jack, of a lever pivoted adjacent to the hammer, a projection on said lever, and a rod connected with a jack-lever and acting on said projection, substantially as set forth.

5. In a piano-action, the combination, with a hammer and jack of a lever pivoted adjacent to the hammer, a lug on said lever, a rod acting on said lug, and an adjustable frame on the jack-lever, with which frame said rod is connected, substantially as set forth.



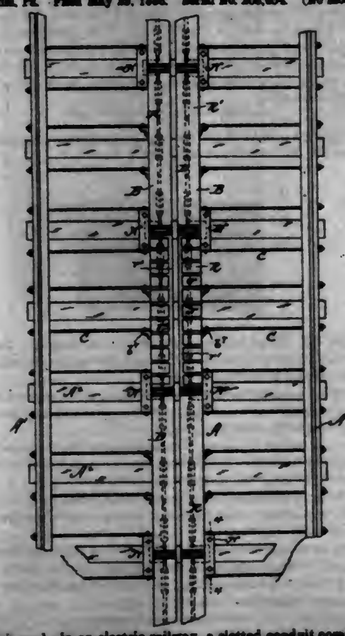
6. In a piano-action, the combination, with a hammer and jack, of a lever pivoted adjacent to the hammer, a lug on said hammer, a rod having a projection that can act on said lug, a frame mounted adjustably on the jack-lever, with which frame said rod is connected, and a screw for adjusting said frame, substantially as set forth.

7. In a piano-action, the combination, with a hammer and jack, of a lever pivoted adjacent to the hammer, a rod acting on said lever, a frame on the jack-lever, to which frame said rod is pivoted, a screw for adjusting said frame on the jack-lever, and a cogged head on said screw, substantially as set forth.

408,858. ICE-SCRAPER. JOHN B. ROBERTSON, Concord, N. H. Filed Jan. 7, 1889. Serial No. 295,868. (No model.)

Claim.—In an ice-scraper, a pair of sled-runners, an interposing scraper mounted at right angles therewith and capable of vertical and oscillatory motion therein, thill or pole connections located upon the forward side slightly above the plane of the axis of said scraper, and a suitable frame rigidly attached to said scraper and extending

408,858.



rearward to the level of the ice when said scraper assumes its normal position, substantially as and for the purpose specified.

408,854. ARTIFICIAL FUEL. RUDOLPH J. SCHNEPPE, Jersey City, N. J., assignor to Gustave Frank, New York, N. Y. Filed July 31, 1888. Serial No. 281,559. (No specimens.)

Claim.—The herein-described composition of matter designed or intended for fuel, the same consisting of granulated brick, coal-dust, and pitch, tar, or other analogous residuum, the whole mixed, in substantially the proportions specified, and compressed, as set forth.

408,855. ELECTRIC RAILWAY. WILLIAM M. SCHLEIDEWEIN, Philadelphia, Pa. Filed May 29, 1888. Serial No. 275,654. (No model.)

Claim.—1. In an electric railway, a slotted conduit composed of separate sections, each section composed of separate sides, and each side having a length of electrical conductors extending from end to end of the side, or nearly so, and flexible or yielding circuit-connections between the conductor-ends of succeeding sections, substantially as set forth.

2. As a new article of manufacture, an electric-railway slotted conduit side consisting of a beam or bar having a horizontal top flange on one side of the same, angle-iron F, secured to said flange, and a length of electric conductor secured to said beam below said flange and extending from end to end of the beam and having free ends for circuit-connections, substantially as set forth.

3. As a new article of manufacture, an electric-railway slotted conduit side consisting of a beam or bar having on one side a horizontal top flange, an edge flange depending from said top flange and extending from end to end of the beam, and an electric conductor secured to said beam below said horizontal flange and extending from end to end of the beam and having free ends for circuit-connections, substantially as set forth.

4. In an electric railway, a slotted conduit composed of separate sections each having separate side beams or bars, each having a separate length of electrical conductors of the same length as the conduit-sections and lateral braces for retaining each side beam in position, substantially as set forth.

5. A slotted conduit composed of sections and each section composed of separate side bars or beams having at their upper parts an inclosed gutter or channel G, located to one side of the slot of said sections, in combination with electric conductors located or inclosed within said gutters or channels, substantially as set forth.

6. A slotted conduit beam or side B, having top flange *b*, and angle-bar F, secured to under side of said flange, substantially as set forth.

7. A beam for slotted conduits, having top flange *b*, combined with bar E and angle-bar F, arranged to form a gutter beneath said flange, substantially as and for the purpose set forth.

8. A beam or side for slotted conduits, having top flange *b*, angle-bar F, to form a gutter beneath said flange, and end plates *f f*, to close the ends of said gutter or protect the ends of an electric conductor in the gutter, substantially as set forth.

9. A beam or side for a slotted conduit, having top flange *b*, provided on its under side with a gutter in which is secured a length of electrical conductor extending nearly from end to end of the beam and having bottom contact-surface and separate plates or blocks at each end of the conductor to protect its ends, substantially as set forth.

10. The combination, with a bar or beam having on one side top and bottom flanges, of an angle-bar extending the length of the beam and riveted thereto and a conductor secured to the angle-bar, substantially as set forth.

11. The combination, with a bar or beam having on its upper side a laterally-projecting flange and a depending lip or bar on said flange extending the length of the beam, of a conductor located between said lip and side of the beam, substantially as set forth.

12. A side or beam for a slotted conduit, having top flange *b*, in combination with angle-bar F, blocks *g*, having top and bottom countersunk screw-openings, and conductor D, substantially as set forth.

13. A slotted conduit-section having flanges *b*, angle-bars F, secured to said flanges, insulating-blocks *g*, secured to bars F, and conductors secured to the blocks, substantially as set forth.

14. A slotted conduit-section having separate lengths of electrical conductors secured to insulating-blocks, and the latter secured to the conduit, and rubber or elastic plates or pads inserted between the conductors and blocks and between the latter and conduit, substantially as set forth.

15. In an electric railway, a slotted conduit composed of separate sections, each composed of separate side beams or bars having approaching top flanges, each beam having a separate length of electrical conductor, and separate top plates for said beams or bars, substantially as set forth.

16. In an electric railway, a slotted conduit composed of separate sections having removable top plates R, provided with lengthwise ribs *r'* adjoining the slot between said plates, in combination with a contact-plow S, having a roller or wheeled carriage adapted to move along on ribs *r'*, substantially as set forth.

17. In combination with a slotted conduit having electrical conductors, a trolley or carriage having a slot bar or shank, a transverse bar loose upon said shank and having contacts with the conductors, and upwardly-acting pressure device on said shank below the cross-bar, substantially as set forth.

18. In combination with a slotted conduit, electrical conductors located in said conduit, a trolley or carriage traveling on the top of the conduit and having a slot bar or shank, a transverse bar loose upon said shank and having upward-pressure contacts with the conductors, and adjusting devices for regulating said pressure, substantially as set forth.

19. In an electric railway, a line of conductors, a contact-plow having a loose cross-bar provided with contacts, and upward-pressure devices located below the cross-bar, as set forth.

20. The combination, with a slotted conduit having top plates provided with ribs r' adjoining the slot of the conduit, of a trolley or carriage traveling on ribs r', and having a slot bar provided with an upwardly-acting spring t^3 and adjusting-nut t^3, and a loose cross-bar t', with contacts located above said spring, substantially as set forth.

21. A slotted conduit composed of separate sections placed end to end with a space between their ends, electrical conductors in said sections, and side couplings connecting the adjacent ends of adjoining sections to admit of their independent expansion and contraction, substantially as set forth.

22. A slotted conduit composed of sections laid end to end and separated from one another, and coupling boxes or traps N, having slotted sides and bolt-connections with the ends of adjoining conduit-sections or their sides to admit of their expansion and contraction, substantially as set forth.

23. In an electric railway, a slotted conduit composed of separate sections having end coupling boxes or traps N, loosely secured together so as to slide upon one another, separate loosely affixed or sliding electric conductor-sections for the conduit-sections, and free coupling wires or connections in boxes N and passing into the conduit-sections for completing the circuit between the conductors of adjoining conduit-sections, substantially as set forth.

24. In an electric railway, a slotted conduit composed of separate sections connected by boxes or traps N so as to slide upon each other, separate lengths of electric conductors loosely affixed to the conduit-sections so as to slide or move therein independently of the conduit-sections, and freely-supported couplings or bridges for the ends of the conductors, whereby said conductors and conduit-sections expand and contract independently of each other, substantially as set forth.

25. A slotted conduit composed of sections each of which has near its ends lateral openings l, lengths or sections of conductors in each section, loose or free coupling-wires l^2, passing through openings l for circuiting the conductors of adjoining conduit-sections, and boxes or traps N for said coupling-wires, substantially as set forth.

26. In an electric railway, a slotted conduit composed of separate sections, each section having separate lengths of electrical conductors and separate couplings for the conduit-sections, and separate electric couplings for the lengths of conductors to allow of independent expansibility of the conduit-sections and lengths of conductors, substantially as set forth.

27. The compound electric conductor D, composed of two superposed plates d d', of different metals, each having registering elongated openings and fastening devices therefor to allow for different ratios of expansibility, substantially as set forth.

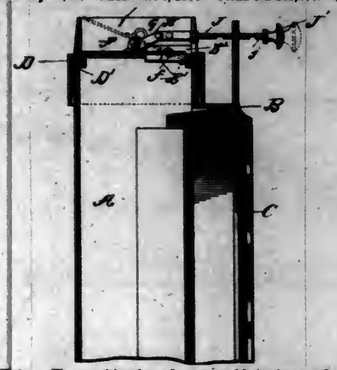
28. A compound electrical conductor composed of two superposed plates of different degrees of hardness and having elongated slots or openings and fastening devices to allow for the different ratios of expansibility, substantially as set forth.

29. A compound electrical conductor composed of two superposed plates of different degrees of hardness, and one of which has a groove in its lower or outer side for contact with a traveling current-collector, substantially as set forth.

30. A compound electrical conductor composed of a flat or smooth plate or bar of copper and a plate or bar of iron or steel having an under or outer contact side and both plates having elongated slots and connecting-bolts, substantially as set forth.

31. In combination with a support, the conductor-plates d and d', of different metals, having elongated slots and fastening devices to allow for different ratios of expansibility, substantially as set forth.

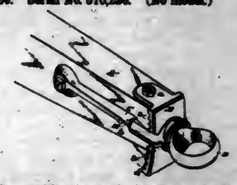
32. A slotted conduit having depending slot-flanges f and end plates l', for closing and protecting the ends of channels or ways formed by said flanges, substantially as set forth.



33. A slotted conduit having depending slot-flanges f and end plates l l', for closing and protecting the ends of the ways or channels between the sides of the conduit and flanges f, substantially as set forth.

34. In a slotted conduit composed of sections and coupling boxes or chambers N at the ends of the sections composed of end pieces n, secured to the conduit-sections and having slotted openings n^2 n^2, side plate n^3, top plate n^4, and fastening devices n^7 n^8 for said parts to allow the conduit-sections to expand and contract, substantially as set forth.

35. As a new article of manufacture, an electric-railway slotted-conduit side consisting of a beam or bar having adjacent to each end a lateral opening and on one side a horizontal top flange, and an electric conductor secured to said beam below said flange and extending from end to end of the beam and having end pieces passing through said openings for circuit-connections, substantially as set forth.



36. A slotted conduit composed of sections, each section composed of separate sides having a length of electric conductor, coupling-boxes N for said sides, and electric couplings or bridges for the ends of the conductor-lengths, whereby the sides of the conduit-sections expand and contract independently, substantially as set forth.

408,856. DAMPER FOR HOT-AIR FLUES. GEORGE W. BERWICK, Philadelphia, Pa. Filed June 6, 1888. Serial No. 276,900. (No model.)

Claim.—The combination of a removable register, a flue provided with a damper, said damper having journals, inverted sockets in the flue to receive the journals of the damper, and a detachable cap for securing one of the journals of the damper in one of the sockets and permitting the displacement thereof, substantially in the manner and for the purpose described.

408,857. PLOW-CLEVIS. WILLIAM R. BEFTON, Canton, Ohio. Filed May 10, 1889. Serial No. 310,226. (No model.)

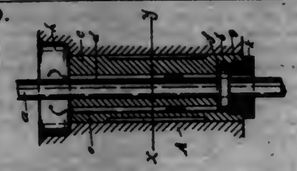
Claim.—The combination of the beam A, provided with the crown-head B, having the teeth b, the draft-link C, provided with the round aperture d and the heart-shaped aperture e, the locking-lever E, provided with the eccentric d', and the catch g, adapted to engage the rib A, and the legs f, adapted to engage the teeth b, substantially as and for the purpose specified.

408,858. BIAS CLOTH BAG. JOSEPH L. SETHOUS, Brooklyn, N. Y. Filed Dec. 29, 1888. Serial No. 294,956. (Model.)

Claim.—1. As an improved article of manufacture, a flat rectangular bag made from woven fabric and having the closing seams arranged obliques to the axis of the bag.

2. As an improved article of manufacture, a flat rectangular bag made from woven fabric and having the warp and weft of the fabric arranged bias to the axis of the bag.

3. As an improved article of manufacture, a flat rectangular bag made from woven fabric and having the seams arranged along the selvages of the fabric and oblique to the axis of the bag.



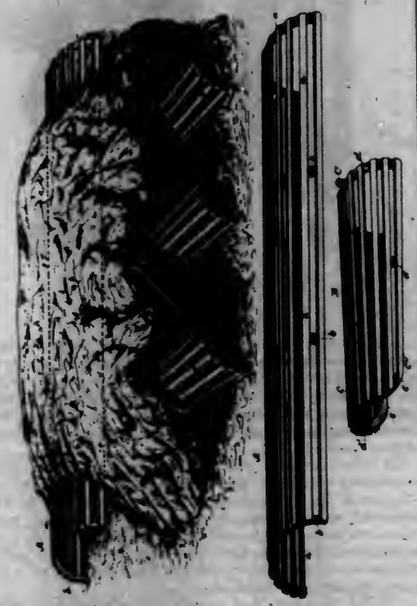
4. As an improved article of manufacture, a flat, seamed, rectangular bag made from woven fabric and having a raw bias edge about the mouth of the bag.

5. As an improved article of manufacture, a bag made from textile material having a seamless bottom formed by a fold of the fabric extending bias of the material, and having its sides closed by seams oblique to the longitudinal axis of the bag.

408,859. CENTRIFUGAL LUBRICATOR. PHILIP H. SHARPLES, West Chester, Pa. Filed Jan. 10, 1889. Serial No. 295,993. (No model.)

Claim.—1. The combination, with a rotary shaft provided with a collar, of a bearing having a recess for said collar and an oil-groove d entering the same, said recess closely surrounding the collar and

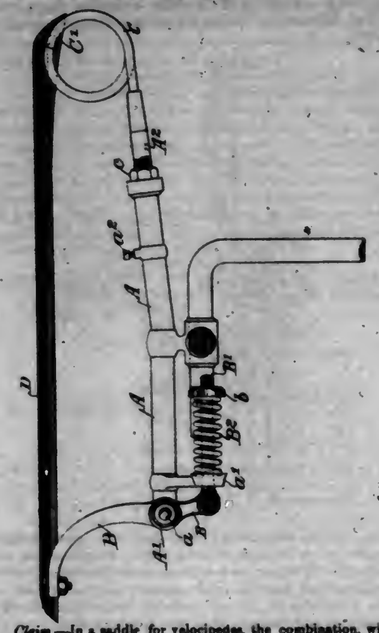
408,859.



extending inward toward the center of the shaft, substantially as and for the purpose set forth.

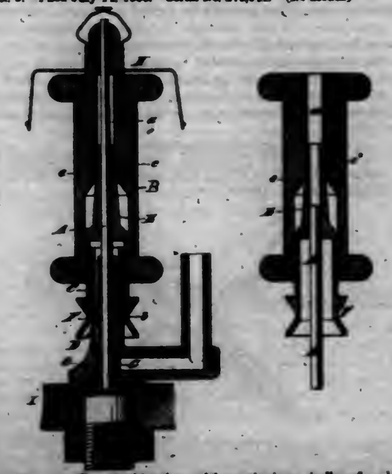
2. The combination, with a rotating shaft provided with a collar, of a bearing having a recess for said collar, an inlet-groove connecting said recess with an oil-receptacle, and an outlet from said recess at a greater distance from the center of the shaft also communicating with said receptacle, substantially as set forth.

3. In a centrifugal lubricating device for a collared shaft, a bearing having a recess for said collar and oilways entering said recess at different distances from the center of the shaft, substantially as set forth.



408,860. METHOD OF BURNING CLAY FOR BALLAST. JESSE STUBBS, Mount Pleasant, assignor to Charles R. Stubbs, Fairfield, Iowa. Filed July 5, 1889. Serial No. 316,540. (No model.)

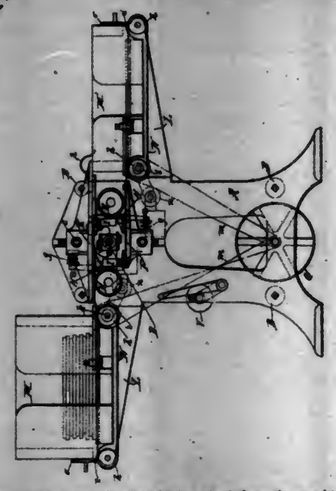
Claim.—1. The method of burning clay to produce the material herein described, which consists in forming an air or draft chamber on the ground in the open air, making a fire on, over, and about said chamber, covering the fire with a layer of clay, covering the clay with a layer of coal, and drawing the burning clay and coal, at required intervals of time, toward the sides, preparatory to further covering with layers of clay and coal, substantially as described.



2. The method herein described of producing from clay a hard conglomerate mass of igneous matter to be used, when reduced to particles of a proper size, in the construction of road-beds, pavements, railroad-ballast, and the like, which consists in forming a permanent arch-shaped draft or air chamber the full length of the kiln to be burned, making a fire on, over, and about said chamber, covering said fire with a layer of clay, covering said clay with a layer of coal, forming air or draft chambers laterally from the sides of said permanent chamber, drawing or raking a portion of the glowing mass of clay and coal from said permanent chamber onto said lateral chambers, covering said mass with layers of clay and coal at required intervals, and, as said mass increases in width from the rakings and additions applied thereto, extending said lateral air-chambers and covering them with a portion of the glowing mass and covering said mass with layers of clay and coal, substantially as described.

408,861. SADDLE FOR VELOCIPEDES. WILLIAM R. TURNER and JOHN ARNOTT, Coventry, County of Warwick, England. Filed Mar. 6, 1889. Serial No. 302,044. (No model.)

Claim.—In a saddle for velocipedes, the combination, with the seat D, of the saddle-bar A, provided with a cross-head A', levers B, rigidly secured near one of their ends to the rear portion of said seat and fulcrumed upon said cross-head, tension-rods B', pivotally connected to said levers below their fulcrums, coil-springs B^3, surrounding said tension-rods, legs a', extending laterally from the saddle-bar and through which said tension-rods pass, nuts b on the tension-rods near their outer ends, and a spring near the forward end of said seat and operating in conjunction with the springs B^3 to maintain the seat in a stretched condition, substantially as specified.



408,862. SPINDLE FOR SPINNING. JOSEPH R. TYRAR, Paterson, N. J. Filed July 14, 1888. Serial No. 279,941. (No model.)

Claim.—The combination, with a spinning-spindle, of a sleeve fast thereon and having the upper part of its exterior tapered upward for the support of a bobbin on that part only, and having below said tapered part an externally-cylindrical part larger than the tapered

upper part for the centering of the so-supported bobbin, substantially as herein described.

408,863. BLIND-SLAT-PLANING MACHINE. FRANK H. VAN HOUTEN, Matteawan, N. Y. Filed Oct. 23, 1886. Serial No. 283,990. (No model.)

Claim.—1. In a machine for planing blind-slats, the combination, with the top bed or frame, of a spring applied thereon at the end nearest the delivery-hopper, its free end projecting to strike and separate the slats as they leave the cutter, substantially as explained.

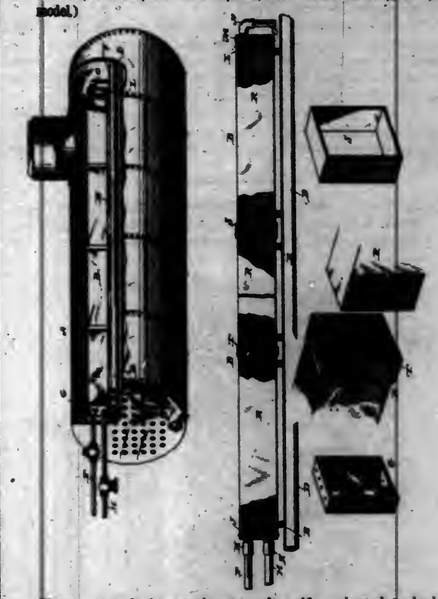
2. In a machine for planing blind-slats, in combination with a cutter-head and its knives, the adjustable bottom bed-plate and the delivery pressure-bars conforming in cross-section to the shape of the slat, substantially as shown, and for the purposes set forth.

3. In a machine for planing blind-slats, the combination, with a cutter-head and its knives, of the top and bottom bed-plates, each provided with a raised rib or guide upon its inner edge, said rib being about equal in height to half the thickness of the slat to be planed, substantially as shown, and for the purpose explained.

4. In a machine for planing blind-slats, the combination, with the bottom bed-plate having the guide-rib upon its inner edge, of the adjustable guide applied upon the outer edge, substantially as shown, and for the purposes set forth.

5. In a machine for planing blind-slats, the combination, with the bottom bed-plate, of the pressure-bar applied in connection therewith, the upper surface of said bed-plate and the under surface of said pressure-bar conforming in shape to the slat to be planed, and the two provided with guides, substantially as shown and described.

6. In a machine for planing blind-slats, the combination, with the cutter, the feed-rolls, and pressure-bars, of the two hoppers having the feeding chain belts, all arranged to operate substantially as shown and described.



408,864. SCREW-PROPELLER. MAX VOGELSANGS, Hoboken, N. J., assignor of one-half to John H. Bean, same place. Filed Mar. 6, 1889. Serial No. 302,166. (Model.)

Claim.—1. A screw-propeller the working-faces of which are arranged at an angle to the axis of the propeller and slightly concaved toward the obtusely-angled front or cutting edges of the blades, which latter are re-enforced at their rear sides by an inclined transverse ridge, and a longitudinal ridge extending from the inner end of the transverse ridge toward the hub and point of the blade, so as to form inclined guide-faces by which the water passing over the ridges is conducted off in a direction nearly parallel to the working-faces of the blades, substantially as set forth.

2. A screw-propeller having radial blades inclined to the axis of the propeller and obtuse-angled front or cutting edges, and inclined guide-faces formed at the rear sides of the blades by an inclined transverse ridge, and a longitudinal ridge that extends from the inner end of the transverse ridge toward the hub and the point of the blades, substantially as set forth.

408,865. FEED-WATER HEATER AND PURIFIER. GEORGE H. WATSON, St. Louis, Mo. Filed Apr. 16, 1889. Serial No. 307,490. (No model.)

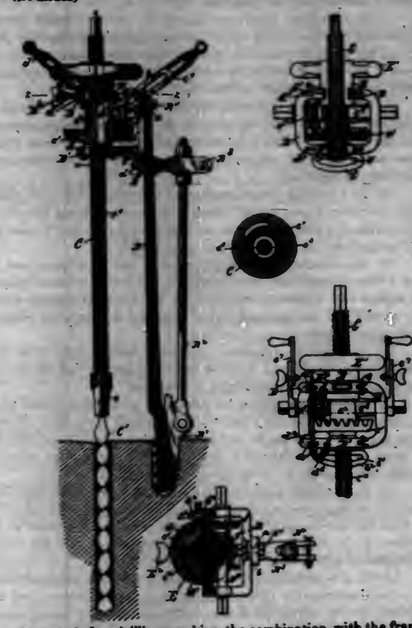
Claim.—1. A feed-water heater and purifier adapted to be located in a steam-boiler and provided with a feed-water inlet in the upper part of one end and a blow-off pipe in the lower part of the same end, through which to discharge the impurities from the heater, and in the other end of the heater an outlet above the boiler-flues, through which to discharge the heated and purified water, substantially as described.

2. The combination, with a steam-boiler and an interior feed-water heater and purifier, of a feed-pipe leading into the upper part of the heater and purifier at one end, a pipe connected with the upper part of the other end of the heater and purifier and extended downward in the boiler, a plate or deflector supported beneath the lower end of said pipe, and a blow-off pipe leading from the lower part of the heater and purifier at the end with which the feed-pipe is connected, substantially as described.

3. The combination, with a steam-boiler, of a feed-water heater and purifier located in the boiler above the flues, a feed-water pipe leading into the upper part of the heater and purifier at or near one end, an outlet-pipe leading from the upper part of the other end of the heater and purifier and extending below the normal water-line and discharging the heated and purified water from the heater into the boiler above the flues, and a blow-off pipe leading from the lower part of said heater and purifier at the end opposite the outlet into the boiler, through which to discharge the impurities from the heater and from the surface of the water in the boiler, substantially as described.

408,866. BEARING FOR SPINNING-SPINDLES. JOSEPH W. WATSON, Canton, Mass. Filed Jan. 10, 1889. Serial No. 296,981. (No model.)

Claim.—1. A bearing for spindles constructed of a soft, yielding, and elastic filamentous material, substantially as described.



2. A bearing for spindles constructed of soft, yielding, and elastic felt, substantially as described.

3. The combination, with a spindle and supports therefor, of a bearing formed of a soft, elastic, and yielding filamentous material interposed between them, substantially as described.

4. A step for spindles formed of a soft, yielding, and elastic filamentous material, substantially as described.

408,867. COAL OR ROCK DRILL. JOHN L. WILLIAMS and THOMAS H. WILLIAMS, Shenandoah, Pa. Filed Apr. 27, 1889. Serial No. 308,871. (No model.)

Claim.—1. In a drilling-machine, the combination, with the frame carrying the drill-operating mechanism and provided at one end with a lug having therein a long lateral slot, of a supporting-bar pivotally bolted to said frame at the opposite end thereof, a lug-piece provided with a bolt extending through said bar and the said lateral slot in the frame, a nut on said bolt to hold the same in said slot, a brace-rod seated at one end in said lug-piece, and a wedge carried by said rod at its opposite end, substantially as and for the purpose set forth.

2. In a drilling-machine, the combination, with the supporting-bar and frame carried thereby, of a rotatable drill-spindle externally threaded throughout its length and having bearings in boxes on said frame, and a feed-nut on said threaded spindle at and having loose bearing in one of said boxes, together with a set-screw working in said box and adapted to impinge upon said nut at its bearing therein, substantially as and for the purpose set forth.

3. In a drilling-machine, the combination, with the supporting-bar and frame carried thereby, of a rotatable drill-spindle externally threaded throughout its length and having bearings in boxes on said frame, a feed-nut on said threaded spindle at one of said boxes, and provided with an external circumferential groove at which it has bearing around said spindle in said box, a loose cap or section of said box, a leaf-spring on said nut in said bearing-groove therein, and a set-screw working in said loose box and adapted to impinge upon said spring and nut at its bearing therein, substantially as and for the purpose set forth.

4. In a drilling-machine, the combination, with the supporting-bar and frame carried thereby, of a rotatable drill-spindle externally threaded throughout its length and having bearings in boxes on said frame, a feed-nut composed of longitudinal sections mounted on said threaded spindle at one of said boxes, and provided with an external circumferential groove at which it has bearing around said spindle in said box, a loose cap or section of said box, and a set-screw working in said loose box and adapted to impinge upon said nut at its bearing therein, substantially as and for the purpose set forth.

5. In a drilling-machine, the combination, with the supporting-bar and frame carried thereby, of a rotatable drill-spindle externally threaded throughout its length, a feed-nut on said threaded spindle provided with an external circumferential groove, boxes on said frame in which said spindle and its feed-nut have bearings, each said box having a section thereof fixed on said frame and a section hinged at one end and detachably attachable at its opposite end to said fixed section, and a set-screw working in the box in which said feed-nut has bearing and adapted to impinge upon said nut therein, substantially as and for the purpose set forth.

6. In a drilling-machine, the combination, with the supporting-bar and frame carried thereby, of a drill-spindle externally threaded throughout its length and provided with an external longitudinally-extended groove or grooves, a feed-nut on said spindle, provided with an external circumferential groove, boxes on said frame in which said spindle and its nut have the described bearings, a set-screw working in the box, in which said nut has bearing, and adapted to impinge thereon therein, a gear on said spindle and feathered to said groove or grooves therein, and a pinion engaging said gear and mounted on a shaft having bearings in said frame and provided with actuating-cranks, substantially as for the purpose set forth.

408,868. MUSIC-RACK ATTACHMENT FOR UPRIGHT PIANOS. HENRY ZEDLER, New York, N. Y. Filed Mar. 9, 1889. Serial No. 302,959. (No model.)

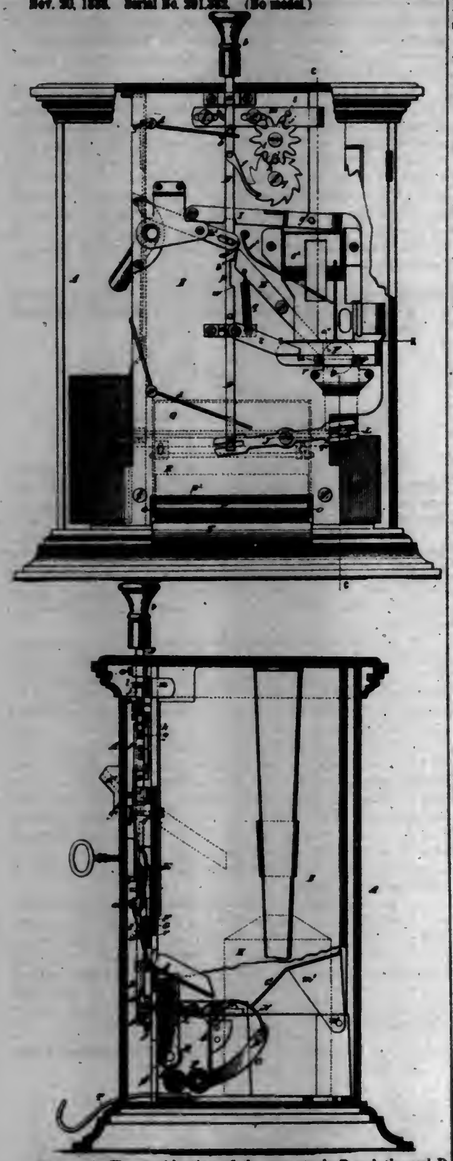
Claim.—1. The combination, with the front wall of an upright-piano case having an opening, of a sliding panel guided at the upper rear part of the front wall and of a main panel or rack fitting into said opening and hinged to said sliding panel, substantially as set forth.

2. The combination, with the front wall of an upright-piano case, said front wall having an oblong opening, of a sliding panel guided in ways at the upper rear part of the front wall, a rack hinged to said sliding panel and fitting into said opening, and an extensible hinged strap-connection between the front wall and the hinged rack, substantially as set forth.

3. The combination, with the front wall of an upright-piano case, said front wall having an opening, of a sliding panel guided in ways at the upper rear part of the front wall, stops at the lower end of said guideways for arresting said sliding panel, and a rack fitting into the opening of the front wall and hinged to the lower part of the sliding panel, substantially as set forth.

4. The combination, with the front wall of an upright-piano case, said front wall having an opening, of a sliding panel guided in ways at the upper rear part of said front wall, stops at the lower ends of said guideways, springs at the upper ends of said guideways, a rack hinged by curved brackets to the lower part of the sliding panel, a locking device connecting the lower end of the rack with the lower edge of the opening, and a spring attached to the front wall and adapted to press the rack forward when the locking device is released, substantially as set forth.

5. The combination, with the front wall of an upright-piano case, said front wall having a central opening, of guideways at the upper rear part of said front wall, a sliding panel guided in said ways, a rack hinged to the lower part of said sliding panel and made somewhat less in height than the opening in the front wall, and a locking device at the lower part of the rack and opening of the front wall, said locking device being locked or unlocked by lifting the rack in the opening of the front wall, substantially as set forth.



408,869. GAME APPARATUS. CARL P. M. ZELL, Chicago, Ill. Filed Apr. 24, 1889. Serial No. 308,408. (No model.)

Claim.—1. In a game, the combination, with a circular platform having a raised rim, and partitions along part of the rim forming compartments, inclined partitions on said platform near the center, a chute on the platform, a lip for receiving a ball on said chute, and a swinging figure adjacent to said lip, whereby when the figure strikes the ball resting on said lip the ball rolls through the chute upon the game-board, substantially as set forth.

2. In a game, the combination, with a platform having a raised rim, of partitions forming compartments along part of said rim on the top of the platform, an upright chute at that part of the platform opposite the compartments, a lip on said chute for holding a ball, and a swinging figure adapted to strike against said ball, substantially as set forth.

408,870. VENDING APPARATUS. THEODOR BUSSMANN, Gaggenau, Baden, Germany, assignor to John H. Voltmann, New York, N. Y. Filed Nov. 20, 1888. Serial No. 291,382. (No model.)

Claim.—1. The combination of the receptacle B and the rod D with the shaft M, and the roller P, connected with the shaft M and actuated thereby, substantially as described.

2. The combination of the receptacle B and the rod D, the lever J, shaft M, having a crank that engages the lever J, and roller P, connected with the shaft M and actuated thereby, substantially as described.

3. The receptacle B and the rod D, combined with the lever J, shaft M, having a crank engaging said lever, curved plate N on the the shaft M, arms O, and roller P, all arranged for operation substantially as described.

4. The receptacle B, having an opening p^3, and the rod D, combined with the lever J, shaft M, and cranks L, carried by the shaft M, and the plate Q, carried by the cranks L, substantially as described.

5. The receptacle B, having an opening p^3, and the rod D, combined with the lever J, cranks L, shaft M, carrying said cranks, and plate Q, having roller R, and the roller P connected with the shaft M, all arranged and operating substantially as herein shown and described.

6. In a vending apparatus, the rod D and roller R, combined with the shaft M and roller P, said rollers being connected with said shaft, so that when the roller R is raised the roller P will advance, substantially as described.

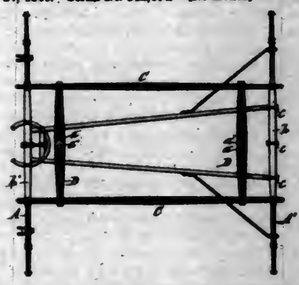
7. The receptacle B and rod D, combined with the lever J, crank L, shaft M, curved plate N, arms O, and roller P, and the pivoted plate P^1, substantially as described.

8. In a vending apparatus, the rod D, having a notch p, combined with the lever E, one end of which is adapted to enter the notch p, and the projecting screw v, situated near the opposite end of the lever E, the lever E and screw v being adapted to receive a coin between them, substantially as described.

9. In a vending apparatus, the rod D, having edge b^3 and cam a^3, combined with the lever E, adapted to engage said edge and cam, and the projecting screw v, situated near one end of the lever E, said lever and screw being adapted to receive a coin between them, substantially as described.

10. In a vending apparatus, the rod D, having notch p, combined with the lever E, one end of which is adapted to engage the rod D, and the bar F, and projecting screw v, carried by the bar F, near one end of the lever E, substantially as described.

11. In a vending apparatus, the rod D, having edges w and b^3, and a cam a^3, combined with the lever E, one end of which is adapted to engage said edges and cam, and the bar F, and projecting screws u v on said bar, and the spring q, all arranged for operation substantially as herein shown and described.



12. In a vending apparatus, the rod D, having a pin h^3, in combination with the lever I, adapted to be engaged by said pin h^3, and the slotted block d^3, substantially as described.

13. In a vending apparatus, the casing A, having a slotted block d^3, and the rod D, having a pin h^3, combined with the lever I, adapted to be engaged by the pin h^3, said lever having a projection g^3, adapted to come in line with the slot in the block d^3 to prevent the entry of a coin, substantially as herein shown and described.

14. In a vending apparatus, the rod D, having a pin o, combined with the sliding plate m, having pin n, to come in line with the pin o, to limit the movement of the rod D, and means, substantially as described, for moving the plate m, through connection with the rod D, substantially as described.

15. In a vending apparatus, the rod D, having a pin e and a dog f, in combination with the sliding plate m, having pins n l, and the toothed wheel g, having pin h, and the toothed wheel i, having tooth j, to engage the pin l, all arranged for operation substantially as herein shown and described.

408,871. SPRING-VEHICLE. EDWARD CLIFF, Hyack, N. Y. Filed May 27, 1889. Serial No. 312,194. (No model.)

Claim.—1. In combination with the body and its supporting cross-spring, a metal saddle-plate secured to the center of said spring and having a flat top surface, and a longitudinally-concaved bottom surface conformed to the top surface of the spring.

2. In combination with the side bars, the bowed leaf-springs D D, formed with broad central portions and tapered gradually from said central portions to the ends and terminated with shackle-eyes axially at right angles to the length of the spring, couplings connecting said shackle-eyes to the side bars, and the body mounted on the broad central portions of said springs, substantially as described and shown.

3. A leaf-spring formed concave transversely in its main portion and terminating with flat end portions, as set forth.

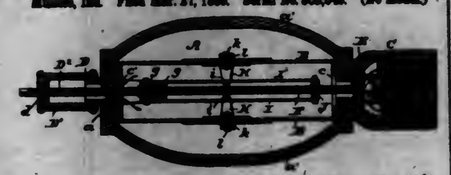
4. The combination of a leaf-spring formed concave transversely and a saddle seated on the concave side of said spring and formed convex correspondingly, as described and shown.

5. The combination of a bowed leaf-spring formed concave transversely and a saddle seated on the concave side of the spring and formed convex transversely and concave longitudinally to conform to the shape of the spring, substantially as described and shown.

6. A carriage cross-spring composed of a single leaf formed concavo convex in cross-section and placed with its concave side upward, a saddle seated on the concave side of the spring and having its under side formed convex correspondingly and its top formed straight, and a washer on the under side of the spring and formed with a correspondingly-concave top and straight bottom, and a bolt or rivet passing vertically through the aforesaid parts and uniting the same, as set forth and shown.

7. A carriage cross-spring composed of a single leaf formed concavo-convex in cross-section and tapered gradually in width from its central portion to the ends, substantially as described and shown.

8. In combination with the side bars, a steel cross-bar disposed with its flat sides horizontally and secured at opposite ends to the side bars, and a rigid bolster secured to the under side of the aforesaid cross-bar and extending lengthwise thereof to points in proximity to the side bars.



408,872. BOTTLE-STOPPER. JAMES R. CORBRAYE, Binghamton, N. Y. Filed Feb. 18, 1889. Serial No. 300,304. (No model.)

Claim.—1. A stopper for bottles and similar receptacles, consisting of bands E and F, connected together, the said band E having projecting legs or hooks with inclined under edges, in combination with a cover having upon its face a rubber stopper and upon the reverse side a bar adapted for engagement with said legs or hooks, for the purpose set forth.

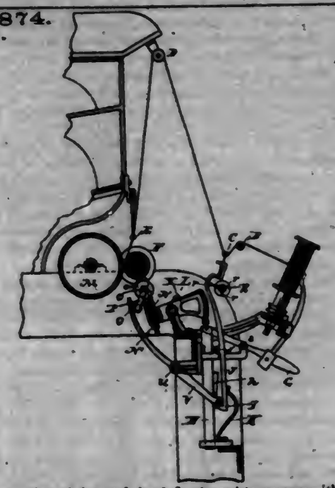
2. In a bottle-stopper, a band adapted to encircle the neck of the bottle and having hooks or legs formed with inclined under edges, in combination with a swing-cover carrying a stopper, and a bar fulcrumed on the upper surface of said swing cover and adapted to engage said legs or hooks, substantially as and for the purposes set forth.

408,873. GAS-PRESSURE REGULATOR. GEORGE W. CONKLIN, Muncie, Ind. Filed Mar. 27, 1889. Serial No. 305,042. (No model.)

Claim.—1. The combination, with a chamber, of a valve-rod, a pair of springs secured upon the valve-rod, and flexible disks secured to said springs, substantially as set forth.

2. The combination, with a chamber consisting of a ring and removable caps, of a valve-rod extending diametrically through the chamber and connected to the supply-valve, flat springs secured at their ends to said rod, and flexible disks secured to said springs and adapted to control the supply of gas, substantially as set forth.

3. The combination, with the chamber, of a valve-rod extending through the same, flat springs rigidly secured at their ends to said rod, flexible disks, and devices for securing the latter to said springs, substantially as set forth.



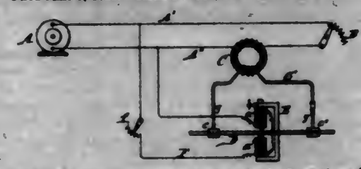
4. The combination, with a chamber consisting of a ring and removable caps, of a valve-rod provided with springs and flexible disks attached to said springs and secured in place by said removable caps, substantially as set forth.

5. In a gas-pressure regulator, the combination, with a chamber, of a valve-rod and a supply-valve secured thereto, an adjustable block located within the chamber, a pair of springs secured at one end to the valve-rod and at their other ends to the adjustable block, and flexible disks secured within said chamber and connected with the springs attached to the valve-rod, all constructed, arranged, and operating substantially as shown and described.

408,874. STOP MECHANISM FOR DOUBLING-MACHINES. ROSWELL DAWSON, Framingham, Mass. Filed Jan. 19, 1889. Serial No. 296,817. (No model.)

Claim.—1. The combination of drum M, frame X, adapted to carry a spool and connected with the weight H, weight H, provided

408,874.



with wedge-shaped detent A, latch I, adapted to engage with said detent, pivoted bar J, and detectors C, with shaft R, having the small bars r, substantially as described, and for the purposes set forth.

2. The combination of the drum M, frame X, adapted to carry a spool, and weight H, having wedge-shaped detent A, with the latch I, pivoted lever Q, roll O, provided with wedge o, tripping-arm P, and means for supporting roll O and adjusting it up and down, substantially as described, and for the purposes set forth.

3. In the stop-motion of a doubling mechanism, the drum M, the frame X, adapted to carry a spool, a rotatory trip O, having wedge o, also supported by said frame, and means for adjusting the spool and trip to and from each other in a right line, in combination with arm P, weight H, latch therefor, and means intermediate said arm and said latch for disengaging the latter from the weight, substantially as described, and for the purposes set forth.

408,875. METHOD OF ELECTRIC METAL-WORKING. ELIHU W. DEWEY, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed June 3, 1889. Serial No. 312,973. (No model.)

Claim.—1. The herein-described method of metal-working, consisting in creating electric stress or resistance in a continuous metal bar or blank by subjecting the blank at or near the part to be worked to magnetism and simultaneously therewith passing through the blank, including the said part, an electric current of sufficient volume to soften the said part, and then bending, shaping, or otherwise working or treating the part.

2. The herein-described method of metal-working, consisting in subjecting the blank at or near the part to be worked to the action of a magnetic field and simultaneously therewith subjecting a portion of the blank, including the said part, to the heating action of an electric current of sufficient volume to heat the said part, removing the source of magnetism when its effect is *nil*, and continuing to supply said current until the part is sufficiently softened, and then working or treating the said part as desired.

3. The method of metal-working, consisting in creating electric stress or resistance in a metal bar or blank connected in circuit by subjecting the part of a blank to be heated and worked or otherwise treated to magnetism and simultaneously therewith passing through said blank, including the said part, an electric current of suitable volume, and then working or treating the said part as desired.

4. The method of metal-working, consisting in subjecting the part of a blank to be worked or otherwise treated to a magnetic field and simultaneously therewith subjecting the blank, including the said part, to the heating action of an electric current of suitable volume flowing in a direction different from the direction of the lines of force in the said magnetic field, and then working or treating the said part as desired.

5. The method of metal-working, consisting in subjecting the part of a blank to be worked or otherwise treated to a magnetic field and simultaneously therewith subjecting the blank, including the said part, to the heating action of an electric current of suitable volume, having its direction at right angles, or substantially at right angles, to the direction of the lines of force in the said magnetic field, and then working or treating the said blank as desired.

6. The method of metal-working, consisting in subjecting the entire cross-section of a blank at or near the part to be heated and worked or otherwise treated to a magnetic field and simultaneously therewith subjecting the blank, including the said part, to the heating action of an electric current of suitable volume having its direction at right angles, or substantially at right angles, to the direction of the lines of force in the said magnetic field, and then working or treating the said blank as desired.

7. The method of metal-working, consisting in creating electric stress or resistance in A metal bar or blank by subjecting the entire cross-section of a blank to a magnetic field of uniform strength and simultaneously therewith passing through the blank, including the magnetized part, an electric current of sufficient volume to soften the said part, and then working or treating the part as desired.

8. The method of metal-working, consisting in connecting the blank to be heated and worked in a circuit by independent universally-movable connections, passing an electric current through the circuit of sufficient volume to heat or soften the blank, and then moving said connections and handling and working the blank as desired.

9. The method of metal-working, consisting in clamping, by independent universally-movable clamps, the bar or blank of metal at two points, leaving a section of the metal between the clamps, connecting the clamps by flexible low-resistance conductors with the source of heating-current, passing an electric current through the flexible conductors, clamps, and section of metal between them, so as to soften the metal, and then moving said clamps and handling and working or treating the blank as desired.

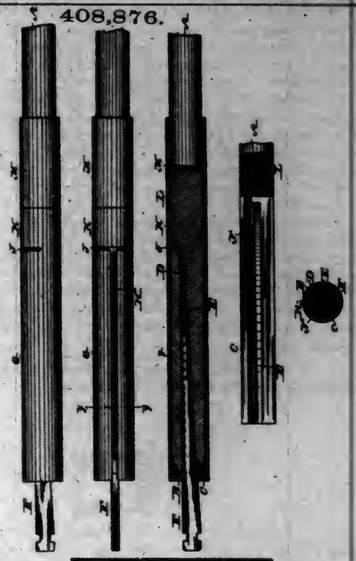
10. The method of metal-working, consisting in clamping the bar or blank of metal at two points, leaving a section of the metal between the clamps, flexibly connecting the clamps by flexible low-resistance conductors with the source of heating-current, subjecting the metal between the clamps to magnetism and simultaneously therewith passing an electric current through the flexible conductors, clamps, and section of metal between them, so as to soften the metal, and then handling and working or treating the blank as desired.

11. The method of metal-working, consisting in creating resistance to the electric current in a metal bar or blank at or near the part to be heated and worked, passing an electric current through the bar or blank of sufficient volume to soften the same at the part wherein the resistance is created, and then working the blank as desired.

12. The method of metal-working, consisting in flexibly connecting the bar or blank to be heated and worked in an electric circuit, creating resistance to the electric current in the bar or blank at or near the part to be heated and worked, and passing an electric current through the said bar or blank of sufficient volume to soften the same at the part wherein the resistance is created, and then handling and working the blank as desired.

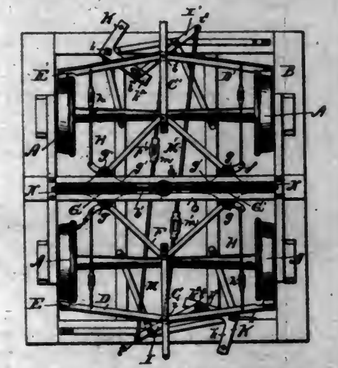
408,876. GRINDING-TOOL. HENRY J. DIETZ, Philadelphia, Pa. Filed June 6, 1888. Serial No. 276,219. (No model.)

Claim.—1. A mandrel having detached and fixed segments, a split sleeve encircling said segments, and a key which is movable between said segments, whereby the sleeve may be uniformly expanded, said parts being combined and operating substantially as described.



2. In a grinding-tool, substantially as described, the segments B C, having the parallel and oblique grooves D E, the latter receiving the key F, whereby the encircling sleeve G may be uniformly expanded, as stated.

3. In a grinding-tool, the segments B C, having the longitudinal grooves D E, respectively, the key F in said grooves, and the split sleeve G, embracing said segments, said parts being combined substantially as and for the purpose set forth.



4. In a grinding-tool, the segments B C, having the grooves D E, respectively, with key F therein, the split sleeve G, with collar K integral therewith, the said collar being interiorly screw-threaded and adapted to engage with a screw-threaded portion of one of the segments, said parts being combined substantially as described.

5. In a grinding-tool, the segments B C, with grooves D E, and tongue and groove N, respectively, the key F in said grooves D E, the sleeve G, with slots H and J, as described, and having the collar portion K interiorly screw-threaded and adapted to engage a threaded portion of the segment C, said parts being combined substantially as described.

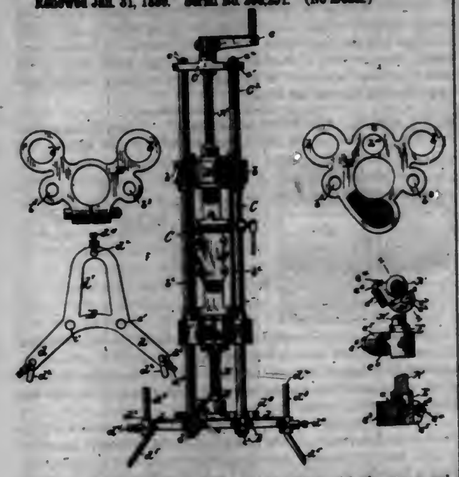
408,876.

408,877. CAR-BRAKE. GEORGE H. FLETCHER, Detroit, Mich. Filed Nov. 30, 1888. Serial No. 292,285. (No model.)

Claim.—1. In a car-brake mechanism, the combination, with the draw-bar and brake-beams having their inner ends pivoted to said draw-bar, of pivoted levers, each having its short arm linked to its corresponding brake-beam and each having its long arm engaged with the draw-bar, the construction being such that a pull upon the draft-bar will tilt said levers and draw the brake-shoes to their seats, substantially as described.

2. In a car-brake mechanism, the combination, with the draw-bar and brake-beams having their inner ends pivotally connected with said draw-bar, of pivoted levers, each having its short arm linked to its corresponding brake-beam and each having its long arm engaged with the draw-bar, the construction being such that a pull upon the draft-bar will tilt said levers and draw the brake-shoes to their seat, and, in connection with the above means, to retract the shoes to their initial position when the draft ceases, substantially as described.

3. In a car-brake, the combination, with the brake-beams, of levers having their short arms linked with their corresponding brake-beams and their long arms connected with the draft-bar or brake-rod, said levers fulcrumed to two plates adapted to slide laterally, the construction being such that a pull on the outer ends of the levers operates to draw in the plates and throw back the short arms of the levers, so that a tension is exerted directly on the brake-beams and the brakes set, substantially as described.



4. In a car-brake mechanism, the combination, with the brake-beams, of levers having their short arms linked with their corresponding brake-beams and their long arms connected with the draft-bar or brake-rod, said levers fulcrumed to two plates adapted to slide laterally, and springs adapted to return the plates to their normal position when the draft-power ceases, substantially as described.

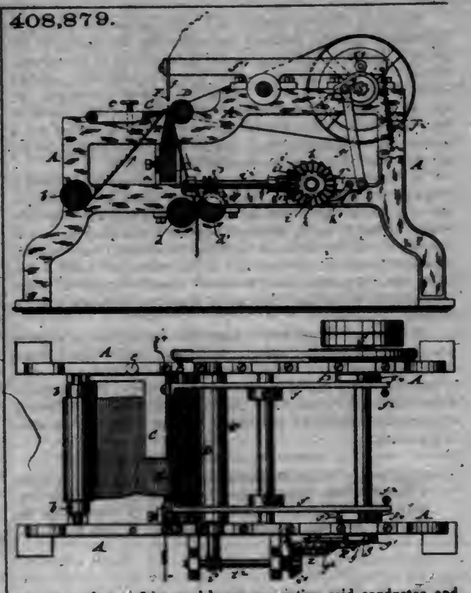
5. A car-brake consisting of a brake-beam divided midway between the wheels, the ends pivotally engaged to the draw-bar, and the opposite ends provided with shoes adapted to bear on the wheels, and two levers pivotally engaged at their outer ends to the draw-bar and fulcrumed to two plates adapted to move laterally, the short arms of said levers being connected by rods with the outer ends of the brake-beams, the construction being such that an outward movement of the draw bar operates to set the brakes, substantially as described.

6. In a car-brake, the combination, with the brake-beam, the levers F, plates G G', and rods H, of the levers F', fulcrumed to the opposite sides of the plates G G', the connecting-rods M M', and levers I I', whereby the brakes are simultaneously set on both sets of wheels, substantially as described.

7. A car-brake consisting of the combination, with the brake beams and shoes and the draw-bars, of the levers F F', rods H, plates G G', springs N, levers I I', rods M M', bell-crank levers K, and levers L, all arranged substantially as and for the purposes described.

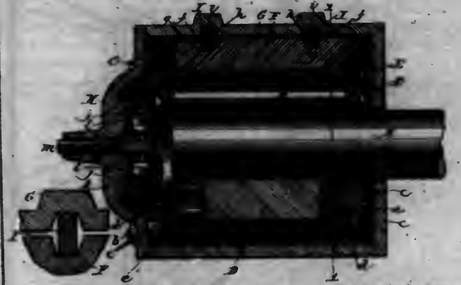
408,878. STEAM ROCK-DRILL. JOSEPH C. OTTEMAN, New York, N. Y., assignor to the Rand Drill Company, of New York. Filed Feb. 11, 1888. Renewed Jan. 31, 1889. Serial No. 298,251. (No model.)

Claim.—1. In a rock-drill, the combination, with the steam-cylinder A, and its piston and piston-rod A', the cylinder having described lugs *b b'* and being provided with feed-screw A^5, of two parallel guide-rods C C, carrying and traversed by said cylinder, and a yoke C', uniting said rods and giving bearing for said feed-screw, together with the horizontal standard D, composed of the radially and forwardly extended arms *d d* and the rearwardly-extended frame d', the two said guide-rods being mounted vertically on said standard, so that the piston-rod of the cylinder will reciprocate the drill-steel between the forward arms thereof, and said arms and frame of said standard being provided with supporting-legs d^3, substantially as and for the purpose set forth.



2. In a rock-drill, the combination, with the piston-rod, of a chuck E, having the external side lug e^3, the key *e*, working in a slot in the side wall of the chuck-body, together with a single clamping-bolt e^4, adapted to be seated in said side lug, and having the hooked head e^5, engaging said key, together with the nut e^6, all constructed and arranged to operate as and for the purpose set forth.

408,879. MACHINE FOR REMOVING WATER-HAIRS FROM PELTS, &c. ANTON HERBARTH, New York, N. Y. Filed Mar. 13, 1889. Serial No. 303,121. (No model.)



Claim.—1. The combination of a transverse knife-edged bar, means for intermittently feeding the pelt over said knife-edged bar, a guard-comb at one side of said knife-edged bar, a rotary brush at the opposite side of the same, and an intermittently-oscillating incandescent conductor located above the knife-edged bar, so as to burn off the projecting water-hairs when it is brought in contact therewith, substantially as set forth.

2. The combination of a transverse knife-edged bar, intermittently-actuated feed-rolls for moving the pelt over the edge of said bar, an adjustable guard-comb having a serrated edge at one side of said bar, a rotary brush at the other side of the same, an incandescent conductor, fulcrumed levers supporting said conductor, and mechanism for oscillating said levers and conductor, so as to cause it to approach to or recede from the edge of the pelt above the bar, substantially as set forth.

408,879.

408,880. CAR-AXLE BOX. HARLEY M. JOHNSON, Chicago, Ill. Filed Dec. 10, 1888. Serial No. 293,203. (No model.)

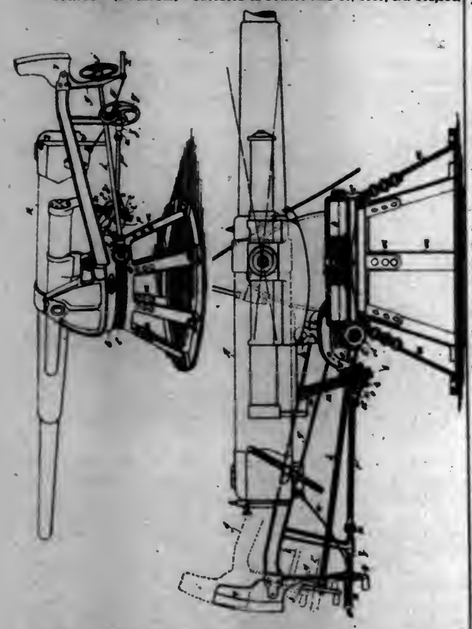
Claim.—1. The rollers D, having recesses in their ends, in combination with the rings B C, provided with studs *a b*, and the rollers *e*, substantially as and for the purposes specified.

2. The rollers D, having recesses in their ends, in combination with the rings B C, provided with studs *a b*, rollers *e*, and washers *d*, substantially as and for the purposes specified.

3. A journal-bearing, as F, provided with recesses or channels *f*, in combination with a casing, as G, provided with recesses or channels *h*, and rectangular pieces, as I, located in said channels, and having circular bearings, which permit a rocking movement of said pieces I, whereby if there be any transverse movement of the bearing F the tendency will be to return it to the normal position, substantially as and for the purposes specified.

4. In a journal-box, a casing, as G, and a cover, as H, in combination with a ring *j*, shafts *k*, rollers *l*, and shaft *m*, substantially as and for the purposes specified.

408,881. CLUTCH. WILLIS H. JOHNSON, Springfield, Ill., assignor, by direct and mesne assignments, of one-half to Harry L. Ide, same place. Filed Jan. 26, 1887. Renewed Sept. 20, 1887. Serial No. 250,368. (No model.)



Claim.—1. The combination, in a clutch mechanism, of two independently-rotatable members, one embracing the other, and one having a tapering recess in its circular surface closed by the adjacent surface of the other member, a roller located in said recess, a spring placed behind the roller, which spring bears against a stationary support at the wide end of the recess, and which constantly exerts its force to move the roller into the narrower part of the recess, and a movable part or shifter acting in front of the roller to force it toward the wider part of the recess, substantially as described.

2. The combination of the shaft, a collar secured to the shaft, a shell embracing the collar, a roller or rollers placed in a tapering recess in one of the clutch members between converging surfaces of the collar and shell, a spring arranged between a stationary support at the wide end of the recess and the rollers to constantly push the roller or rollers toward the narrower part of the recess, and a shifter provided with a projection which enters the recess in front of the rollers to force them toward the wider end of the recess, substantially as described.

3. The combination, with a shell and a collar, one of which is provided with a tapering recess in its circular surface that is closed by the adjacent surface of the opposing member, of a roller or rollers in the recess and a movable shifter provided with a rib O, fitted to slide in an inclined groove P in the recessed member of the clutch, substantially as described, and for the purpose of moving the roller in the recess.

408,882. TRAINING MECHANISM FOR ORDNANCE. ALFRED C. ROSSEEL, Paris, France, assignor to the Hotchkiss Ordnance Company, (Limited,) London, England. Filed Apr. 9, 1889. Serial No. 306,990. (No model.) Patented in France Jan. 16, 1889, No. 193,331.

Claim.—1. In a rapid-firing or other gun, the combination, with its carriage in two parts *a b*, of the worm-wheel *e* upon the lower part *a* of said carriage, the worm *d*, engaging therewith and secured to a shaft *c*, mounted in a frame suspended pivotally from the upper part *b* of said carriage, the hand-wheel *j*, shaft *k*, and connections for rotating said shaft *c*, substantially as described.

2. In a rapid-firing or other gun, the combination, with its carriage in two parts *a b*, of the worm-wheel *e* upon the lower part *a* of said carriage, the worm *d*, engaging therewith and secured to a shaft *c*, mounted in a frame *f*, suspended pivotally from the upper part of said carriage, bevel gear-wheels for rotating said shaft, the hand-wheel *j*, and shaft *k*, for operating said gear-wheels, and the directing-lever *g*, connected to the frame *f* to swing the same, substantially as described.

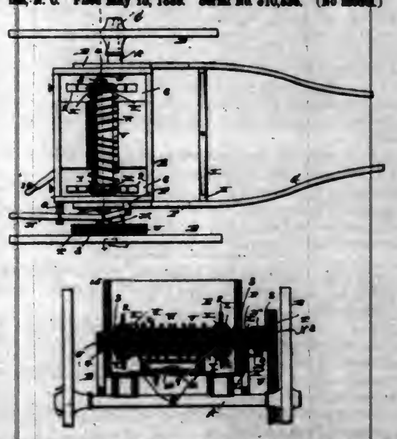
3. In a rapid-firing or other gun, the combination of the elevating-screw *m*, pivoted to the gun and working in a nut *o*, suspended from the gun-carriage, the worm-wheel *t* upon said nut, the worm *t'*, engaging therewith, the shafts *s* and *z*, connected to the rod *r* and carrying the worm and hand-wheel, respectively, and the hand-wheel *q*, for operating said shafts and rod, substantially as described.

408,883. DENTAL PLUGGER. SEBASTIEN LAGAVALIERE and CONSTANT DESROT, Philadelphia, Pa., assignors to the S. S. White Dental Manufacturing Company, same place. Filed Feb. 1, 1887. Serial No. 226,159. (No model.)

Claim.—1. The combination of the casing, the rotary spindle, a reciprocating hammer, its actuating-spring, and the reversely-inclined concentric cams upon the spindle, substantially as and for the purpose set forth.

2. The combination of the casing, the rotary spindle, a reciprocating hammer, its actuating-spring, and the concentric cam-ended tubes upon the spindle, the one tube being provided with a single cam and the other with duplicate cams inclined reversely to said single cam, substantially as and for the purpose set forth.

3. The combination of the casing, the reciprocating hammer, the spring acting to project the hammer, the slotted slide on the casing, provided with the finger-piece, and the stud fixed to the hammer, projecting through slots in the casing and slide and acted upon by the slide to prevent movement of the hammer by its spring, substantially as and for the purpose set forth.



408,884. STOVE-PIPE ATTACHMENT. JOSEPH R. LEACH, Roberts, Ill. Filed Apr. 19, 1889. Serial No. 307,719. (No model.)

Claim.—1. In a stove-pipe fastener, the encircling clasp consisting of a collar provided near its free ends with detents H H, and the retaining-bar arranged between the clasp and the stove-pipe and provided with notched or serrated edges to be engaged by the said detents, substantially as specified.

2. In a stove-pipe fastener, the clasp encircling the same and provided at its free ends with the detents H H, the set-screw engaging the free ends of the clasp, and the notched or serrated retaining-bar passing between the said detents and provided with a flange to engage the chimney, substantially as and for the purpose specified.

408,885. FERTILIZER-DISTRIBUTER. ENOCH P. LEWIS, Gastonia, N. C. Filed May 15, 1889. Serial No. 310,896. (No model.)

Claim.—1. In a fertilizer-distributer, the combination of the hopper, the transverse shaft having a spirally-flanged drum or cylinder, the feed-wheels at the ends of said shaft, the adjustable fingers or agitators mounted detachably in said feed-wheels, the slides arranged to regulate the sizes of the slots or escape-openings in the bottom of the hopper, and mechanism for transmitting motion to the transverse shaft from one of the supporting-wheels of the machine, substantially as set forth.

2. In a fertilizer-distributer, the combination, with the hopper having enlargements at either end, of the transverse shaft having a drum or cylinder provided with right and left hand spiral flanges, the feed-wheels composed of disks, the adjacent faces of which are provided with radial recesses, the flattened fingers or agitators having shanks, whereby they are adjustable in said recesses, means for tightening the said disks together, and means of transmitting motion to the transverse shaft from one of the supporting-wheels of the machine, substantially as set forth.

3. In a fertilizer-distributer, the combination of the hopper, a shaft arranged transversely in the same and having one end journaled in one of the sides of the hopper, a vertically-sliding box arranged in a slot in the other side of said hopper and forming a bearing for the opposite end of the transverse shaft, springs arranged to support the said vertically-sliding box, a clutch adjustable laterally upon the outer end of the transverse shaft and adapted to engage a clutch upon a pinion mounted loosely upon the outer end of said shaft, and a spur-wheel attached to one of the supporting-wheels of the machine and meshing with said pinion, substantially as set forth.

4. In a fertilizer-distributer, the combination of the hopper, the transverse shaft having one end journaled in a vertically-movable box, the spirally-flanged feed-drum and the feed-wheels mounted upon said shaft, the enlarged compartments in the ends of the hopper, having longitudinally-slotted bottoms, the transversely-movable slides arranged to regulate the sizes of said slots or escape-openings, and mechanism for operating said slides and for transmitting motion to the transverse shaft from one of the supporting-wheels of the machine, substantially as and for the purpose set forth.

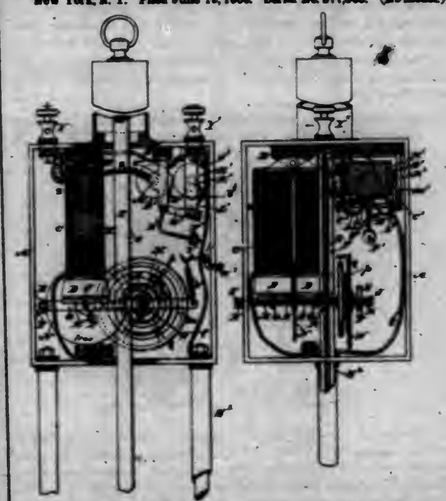
5. In a fertilizer-distributer, the combination, with the hopper and the dropping mechanism, of the feed-spouts connected flexibly to the under side of the hopper and provided at their lower ends with guard-plates having pointed ends which are bent or curved under the discharge ends of said spouts, so as to form shoes or runners, substantially as and for the purpose shown and specified.

6. In a fertilizer-distributer, the combination of the hopper having enlarged end compartments, the transverse shaft having one end journaled in a vertically-movable spring-supported box, the spirally-flanged feed-drum, the feed-wheels having adjustable fingers or agitators, the slides arranged to regulate the sizes of the escape-slots in the bottoms of the compartments of the hopper, the discharge-spouts connected flexibly to the under sides of said compartments and provided at their lower ends with rearwardly-turned guard-plates, and mechanism for transmitting motion to the feed-shaft from one of the supporting-wheels of the machine, all combined and operating substantially as and for the purpose herein set forth.

408,886. SEAL-LOCK. GERMAN W. LEWIS, Portsmouth, Va., assignor of two-thirds to Alexander P. Grice and Lorey C. Godwin, same place. Filed Nov. 6, 1888. Serial No. 290,116. (Model.)

Claim.—1. In a car seal-lock, the combination, with the base-plate having a stationary pin K to receive the seal-tag, of the revoluble disk mounted on the base-plate and capable of revolution in one direction only, the said disk covering the free end of the pin to prevent the removal of the seal-tag, and provided with a detent or projection adjacent to the latter, and the pawl-and-ratchet connection between the disk and the base-plate to prevent a reverse rotation of the former, substantially as specified.

2. In a car seal-lock, the combination, with the base-plate having a stationary pin K to receive a seal-tag, of the revoluble disk mounted on the base-plate and covering the free end of the said pin, and provided with a detent or projection, the tag extending under the disk adjacent to the detent or projection, and means to prevent the disk revolving in one direction, substantially as specified.



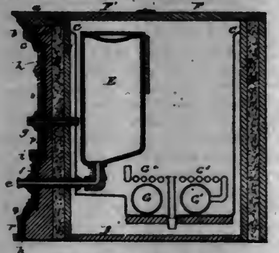
3. In a car seal-lock, the combination of the base-plate provided with a pin to engage a suitable seal-tag, the revoluble disk mounted on the base-plate over the free end of the pin K, and provided with an opening I, adapted to register with and expose the said pin, the disk being further provided with a detent or projection adjacent to the seal-tag to engage and thereby tear or disfigure the latter when the disk is turned, and the pawl-and-ratchet connection between the disk and the base-plate, substantially as specified.

4. In a car seal-lock, the combination of the base-plate provided with a square boss and having a pin K adjacent to one side of the boss to receive the seal-tag, which is provided with a perforation to engage the pin and a square end to bear against the boss, the revoluble disk mounted on the base-plate and provided with a peripheral flange L, fitting at its inner edge close to the base-plate, and a detent or projection N to bear against the edge of the said seal-tag, and the pawl-and-ratchet connection between the disk and the base-plate, substantially as specified.

5. In a car seal-lock, the combination, with the base-plate provided with a pin K, adapted to have a seal-tag engaged therewith and having an annular groove near its outer edge, of the revoluble disk mounted on the base-plate and provided with a detent or projection N, operating in the said groove, the boss on the inner side of the disk, projecting into a recess in the base-plate, and provided with ratchet-teeth or shoulders, and the gravity-pawl arranged in the said recess and engaging the teeth or shoulders, substantially as and for the purpose specified.

6. In a car seal-lock, the combination of the base-plate having a seal-tag fixed thereto, the revoluble disk mounted on the plate and provided with a detent or projection to engage the seal-tag, the pawl-and-ratchet connection between the disk and plate, and the ear on the disk extending over the hasp of the car-lock to prevent the disengagement of the latter, substantially as described.

408,887. ARC LAMP. JAMES A. LIGHTHIPE, Philadelphia, Pa., assignor to himself, George W. Bratton, same place, and Henry Hunse, New York, N. Y. Filed June 10, 1888. Serial No. 277,565. (No model.)

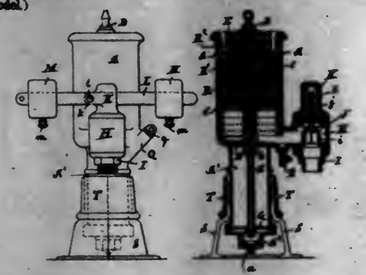


Claim.—1. An arc-light regulator having a carbon-carrier geared to a train of gearing attached to a pivoted frame carrying a rotating armature located in the magnetic field of a pivoted regulating electro-magnet, between the poles of which the rotating armature rotates, in combination with fixed armatures carried also by the frame and lying in the magnetic field of the regulating-magnet, substantially as described.

2. An arc-light regulator consisting of a carbon-carrier geared to a train of gearing carried on a pivoted frame, and also to a rotating armature located in the magnetic field of a regulating electro-magnet, with a fixed armature also attached to said frame and located in the magnetic field for establishing the arc, substantially as described.

3. In an arc-light regulator, the combination of a pivoted frame carrying a train of gear geared to a rack on the carbon-carrying rod, and a rotating armature located between the poles of a regulating-magnet, with a fixed armature attached to said frame, whereby the arc is established and regulated, substantially as described.

408,888. SODA-FOUNTAIN. JOHN G. LOW, Chelsea, Mass. Filed Aug. 29, 1888. Serial No. 284,054. (No model.)



Claim.—1. A soda-fountain composed of an ice-box B and an inclosing exterior casing A, separated from said ice-box by the space D, and a tile-facing attached to the exterior of said casing and composed of small tiles formed with closely-abutting edges and of approximately uniform thickness, each of said tiles carrying on its surface a part of a composite intaglio and relief design larger than itself, the lower belt tiles and panels and the ice-box and casing beneath the tile being perforated from front to back with holes for the passage of the draft and sirup tubes *g e*, substantially as and for the purpose described.

2. The combination of the casing A, formed with a plane surface on its interior and an irregular surface roughly conforming to the exterior surface of its incrusting tile, with the incrusting tile and with the cement between the casing A and the tile, and with a cornice *a a'*, which projects outward beyond the exterior surface of the next adjacent tile and inward beyond the inner surface of the casing A, substantially as described.

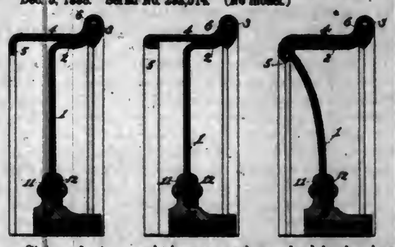
3. The combination of the ice-box B and inclosing-casing A of said ice-box, the height of which is less than the height of the ice-box, and cornice *a*, extending outward from the ice-box B over and beyond the top of the casing A, and the incrusting tile surface exterior to said casing A and fastened thereto by cement, and containing panel and belt tile perforated for the passage of the draft and sirup tubes *g e* through holes in said tile larger than the size of the tube, said tile-surface being modeled and glazed, substantially as and for the purposes described.

408,889. STEAM-PRESSURE OR DAMPER REGULATOR. JAMES J. LOWDEN, Boston, Mass. Filed Feb. 25, 1889. Serial No. 301,058. (No model.)

Claim.—1. A steam-pressure or damper regulator, consisting of an outer casing divided into two compartments, a piston in the upper compartment and a perforated disk in the lower compartment, a rod passing through the partition and connected at its upper end to the piston and at its lower end to the perforated disk, and a valve for controlling the admission of steam to the upper compartment, substantially as set forth.

2. In a pressure-regulator, an outer casing divided into two compartments A A' by a partition B and valve-box H, all cast in one piece, substantially as shown and described.

3. In a pressure-regulator, an outer casing divided into two compartments A A' by a partition B, and a valve-box H, all cast in one piece, in combination with the piston C, rod E, and perforated disk G, the cap I, having a valve-seat *i*, valve-box H, and cover K, substantially as and for the purposes set forth.



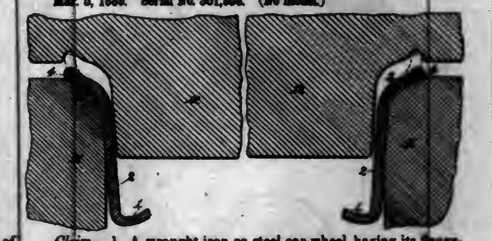
4. A steam-pressure or damper regulator, consisting of a cylinder, a piston working therein, a valve for controlling the admission of steam to said cylinder, a drip-cock between said valve and cylinder, a dash-pot, a perforated disk, and a rod connecting said disk with the piston, substantially as and for the purposes set forth.

5. In a steam-pressure or damper regulator, the combination of a cylinder, a hollow piston, and weights fitting inside the upper portion of said piston, with a valve for controlling the admission of steam to the said cylinder, and a drip-cock between the valve and cylinder, substantially as and for the purposes set forth.

6. In a steam-pressure or damper regulator, the combination of an outer casing forming a cylinder A and a dash-pot A', the piston C, rod E, perforated disk G, and weights R, with a weighted valve J, for controlling the admission of steam to the cylinder, a drip-cock P, between the valve and cylinder, an inlet Q, for supplying the dash-pot with fluid, and a bracket or support for the regulator divided in its center, substantially as shown and described.

7. In a steam-pressure or damper regulator, an outer casing divided into two compartments A A', the perforated disk G, rod E, and piston C, having a hole c^3, in combination with the cover A^3, valve-box H, and valve for regulating the admission of steam to the upper part of the cylinder, and a drip-cock P, substantially as shown and described.

408,890. CAR-WHEEL. HENRY F. MANN, Allegheny, Pa. Filed Dec. 3, 1888. Serial No. 292,514. (No model.)



Claim.—1. A wrought-iron or steel car-wheel having in combination a web provided with a supporting-shoulder, and a tread having its flange interlocked with a rim on the supporting-shoulder by a fold of metal, thereby forming a double re-enforced wheel-flange, substantially as set forth.

2. A wrought-iron or steel car-wheel having in combination a web provided with a supporting-shoulder, and a tread having a flange re-enforced by a fold of metal turned over a retaining-rim on the supporting-shoulder, substantially as set forth.

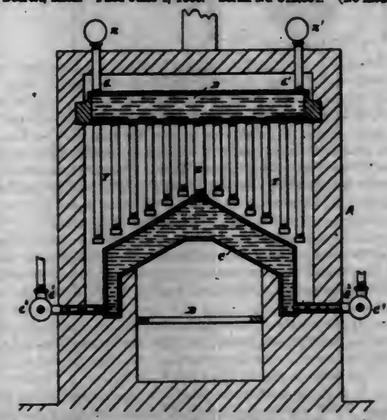
3. A wrought-iron or steel car-wheel having in combination a web provided with a supporting-shoulder, a tread having its flange interlocked with a rim on the supporting-shoulder by a fold of metal, and a supplemental web connected to the outer edge of the tread, substantially as set forth.

408,891. CAR-WHEEL. HENRY F. MANN, Allegheny, Pa. Filed Mar. 5, 1889. Serial No. 301,966. (No model.)

Claim.—1. A wrought-iron or steel car-wheel having its flange-edge upset, thereby forming a re-enforcing bead or enlargement bracing the flange as against the shocks or strains to which it is normally subjected, and increasing its edge bearing-surface, substantially as set forth.

2. A wrought-iron or steel car-wheel having, in combination, a web, a tread connected at its outer edge to the web, and a flange having its outer edge upset, thereby forming a thickened lip or bead along its edge for the purpose of re-enforcing the flange as against the shocks or strains to which it is normally subjected and increasing its bearing-surface, substantially as set forth.

408,892. RAIL-SUPPORT. HENRY T. MOODY, Newburyport, Mass., assignor to the Victor Manufacturing Company, same place. Filed Jan. 31, 1888. Serial No. 262,303. (No model.)



Claim.—1. A rail-support comprising the under section B, having the perforated ear *b*, arm b^3, perforated face-plate b^4, and the upper section C, having the perforated ear *c*, the arm c^3, and the extension or bearing plate c^4, the said face-plate b^4 being adapted to extend upon the outside of the rail and the bearing-plate c^4 upon the inside of the rail, substantially as described.

2. The combination, in a support for a hanger or other rail, of the section C, having the perforated ear *c*, the arm c^3, and the bearing-plate c^4, the section B, having the perforated ear *b*, the arm b^3, the face-plate b^4, wider than the bearing-plate c^4, and having two rivet or bolt holes, and the rails A A', the end of one of which is fastened directly to the face-plate b^4, and the end of the other of which is fastened to the face-plate b^4 and bearing-plate c^4, substantially as described.

3. In a rail-support, in combination with the rail, a bracket or hanger in two sections having means by which they are adapted to be secured to a stringer or wall, one of which sections has the inner bearing-plate or extension c^4, the other of which has the outer face-plate or extension b^4, and the two being separated from each other by a space of the thickness of the rail, to which it is secured by a rivet, bolt, or screw passing through the plates b^4 c^4, and the rail, substantially as described.

408,893. WATER-HEATER. THOMAS C. C. MOSAT and LEE BURT, Detroit, Mich. Filed June 1, 1888. Serial No. 312,391. (No model.)

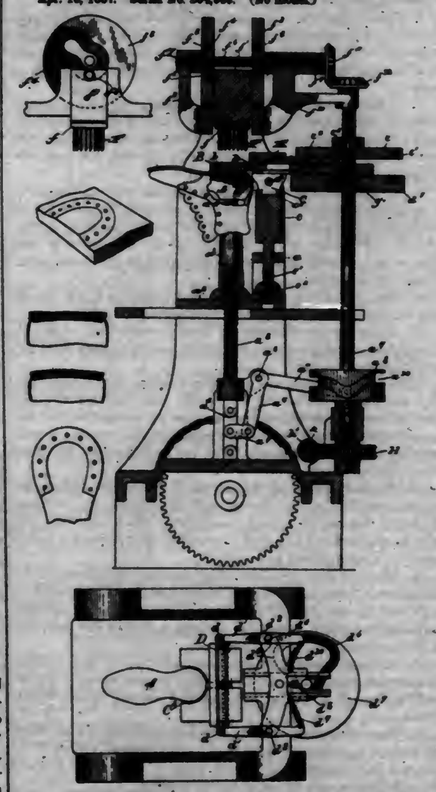
Claim.—1. In a hot-water heater, the combination, with an individual section C, extending across the combustion-chamber, of an individual water-chamber D, provided with outlets to the line-pipes and communicating with said section intermediate the extremities of said section, said section and communicating chamber independently removable from the heater, substantially as set forth.

2. In a hot-water heater, the combination, with an individual section C, extending across the combustion-chamber, of an individual water-chamber D, provided with drop-tubes and outlets to the line-pipes and communicating with said section intermediate the extremities of the section, said section and communicating chamber independently removable from the heater, substantially as set forth.

3. In a hot-water heater, the combination, with an individual section C, extending across the fuel-bed, of an individual water-chamber D, communicating therewith, the one provided with flanges to deflect the products of combustion, the other open at its sides to allow the passage of the products of combustion, substantially as set forth.

4. In a hot-water heater, the combination, with a series of individual sections C, of a series of individual water-chambers D, each communicating with a corresponding section, each section with its chamber separable from the remaining sections and chambers of the series, substantially as set forth.

5. In a hot-water heater, the combination, with a series of individual sections C, extending across the combustion-chamber, of a series of individual water-chambers D, each communicating independently with a corresponding section, said chambers provided with drop-tubes and outlet-pipes leading from the extremities of said chambers, substantially as set forth.



6. In a hot-water heater, the combination, with a series of individual sections C, of a series of individual water-chambers D, each communicating, respectively, with a corresponding section, outlet-pipes leading from said chambers, each chamber connecting with separate circuits, substantially as set forth.

408,894. ROPE ATTACHMENT. JOHN S. POWELL, Marshall, Tex. Filed Apr. 25, 1888. Serial No. 308,882. (No model.)

Claim.—The within-described improved article of manufacture, consisting of a rope attachment having an elliptical body or ferrule B, provided with thin rounded lips *b*; a thick base having spurs *c c*, a broad laterally-extended eye on one end, and a snap-hoop having its elongated bar *d'* held in said eye, forming a broad hinge-joint, as specified.

408,895. MACHINE FOR FEEDING AND ATTACHING RANDS TO BOOTS OR SHOES. FREDERICK F. RAYMOND, 24, Newton, Mass. Filed Apr. 16, 1887. Serial No. 234,969. (No model.)

Claim.—1. In a rand feeding and attaching machine, the combination, with a block or templet having a rand-forming surface, of a horizontally-movable rand carrier and former and a last or work-support for holding a boot or shoe with its outsole in approximate relation to said block or templet, substantially as described.

2. In a rand feeding and attaching machine, the combination of a templet having rand-forming surface and vertical apertures extending therethrough, the last or work-support for holding the heel end of the outsole on the boot or shoe in contact with the templet, a horizontal movable rand carrier and former for fitting the rand about the said forming-surface of the templet and on the surface of the outsole, and mechanism disposed above said parts for driving fastenings through the apertures in the templet into the rand, substantially as described.

3. In a rand feeding and attaching machine, a rand-feeding device, substantially as described, comprising two levers or arms mounted upon a block and adapted to be moved simultaneously, and the working or forming ends of which levers or arms are adapted to be moved away from each other, and which are arranged to draw or bear against the rand to move it into position about a former, as and for the purposes described.

4. The combination of the perforated rand former or templet B, adapted to bear against the outsole of a boot or shoe, a table having its edge extended about the edge of the heel end of the outsole and having its surface upon the same or substantially the same level as that of the outsole, a rand feeding and forming device comprising a flexible band or strap D, supported at each end by a yielding lever or arm, which lever or arm is provided with closing movements in relation to the former, as and for the purposes described.

5. The combination of the rand-carrier D, table C', rand-former b^3, levers d^3, slide d^5, springs d^9 d^{10}, and the cam d^7, having a cam-groove d^8, for moving the slide, as and for the purposes specified.

6. The combination of the rand-former, the last or work-support, and the rand-table C', having an opening C^3, for the reception of the heel end of the outsole of the boot or shoe, the said table being made in separate parts, provided with mechanism, substantially as described, for moving them toward and from each other, whereby the size of said opening may be varied, as and for the purposes specified.

7. The combination of the table C', made in two parts c^4 c^4, each of which has a horizontal movement upon the post C, with a device for moving said plates horizontally upon said post to vary the relation of their edges c^7 and c^8 in relation to each other, substantially as specified.

8. In a rand feeding and attaching machine, the combination of the table C', having a surface upon which the rand-carrier and rand are moved and an opening which receives the heel end of the outsole, with a post or support C and means for vertically adjusting said post, substantially as specified.

9. In a rand feeding and attaching machine, the combination of the perforated rand-former or templet, a vertically-movable last or work-support, a horizontally-movable rand carrier and fitter, a horizontally-reciprocating nail or fastening carrier mounted over said former or templet, and driving mechanism disposed above said parts, substantially as described.

10. The rand-former having the bearing-surfaces b' and the inclined forming-surface b^2, as and for the purposes described.

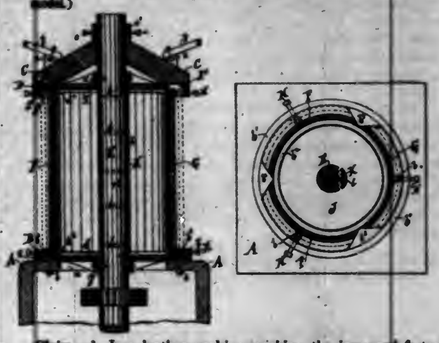
11. A combined rand-former and templet comprising a block B, having holes b, bearing-surfaces b', and the forming-surface b^2, as and for the purposes described.

12. In a rand feeding and attaching machine, the combination, with a rand-former and a rand carrier and fitter coacting with said former, of a movable sole-support adapted to be operated toward and away from the aforesaid parts simultaneously with the movements thereof by mechanism relatively timed and connected to the same, substantially as described.

13. The combination of the templet B, having the holes b, the head f', the block f, carried thereby and supporting a gang or group of drivers F, the cam f^6, having a cam-groove which receives a pin-carrier by said head, the shaft f^5, the vertical shaft a^5, and the bevel-gears f^{11} f^{12}, substantially as described.

14. In a rand feeding and attaching machine, the combination of the slide-head f', supporting a gang or group of drivers, having cam-pins f^8, with the two cams f^3 f^6, mounted upon the shaft f^5 and having cam-grooves which receive the cam-pins carried by said head and said shaft, substantially as described.

15. In a rand feeding and attaching machine, the combination, with a templet, of the rand carrier and fitter, the cam having a groove g', and the lever g^6, pivoted at g^5, substantially as and for the purpose set forth.



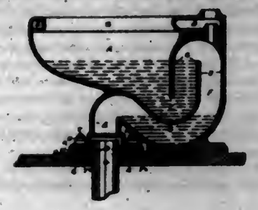
16. The combination, in a rand-attaching machine, of a movable work-support A, a templet B, having a rand-forming surface b^2, a nail-carrier E, a reciprocating gang or group of drivers, and a rand-feeder and fitter, as and for the purposes specified.

17. In a rand feeding and attaching machine, the combination of a movable work-support or last, a cam and suitable connecting devices for operating the same, a rand feeder and fitter having an operating-cam, a nail-carrier and its operating-cam, a gang or group of reciprocating drivers, and a drive-shaft to which said parts and their operating-cams are connected and simultaneously driven, substantially as described.

18. The combination, in a rand-attaching machine, of the work-support A, the cam a^9 upon the vertical shaft a^5, the toggle-head a^7, toggle a^4, and lever a^6, the templet B, having the rand-forming surface b^2 and holes b, the rand carrier and fitter, and the cam d^7, for operating the same, carried upon the vertical shaft a^5, the nail-carrier E and its cam e', carried by the vertical shaft a^5, the head F, the gang or group of drivers supported thereby, the cams f^3 f^6, for moving said head, their shaft f^5, the said vertical shaft a^5, and the bevel-gears f^{11} f^{12}, as and for the purposes described.

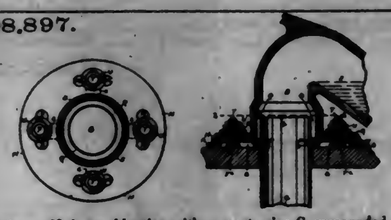
19. The herein-described method of forming rands and attaching them to outsoles, consisting in contacting the heel end of an outsole against a former, as set forth, to provide an exposed space between the parts, forming and firmly holding the rand on the exposed surface and securing the same to the outsole, as set forth.

408,896. LEATHER-WORKING MACHINE. William Seymeharpt, St. Louis, Mo. Filed May 14, 1888. Serial No. 310,705. (No model.)



Claim.—1. In a leather-working machine, the improved fastening device K, consisting of an elongated segmental piece of metal having the toothed face L to grip the hides, tenons k' k', and threaded apertures, with the long screws l l, &c., in combination with the central rotating shaft E, having the cut-out elongated slot between the points m m, the toothed face M in said slot to grip the hides, the mortises k^2 k^2 to receive the tenons k' k', and threaded apertures to receive the long screws l l, &c., by means of which the fastening device is adjusted to said shaft so as to clamp the hides, as and for the purpose set forth.

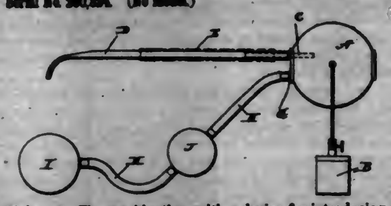
2. In a leather-working machine, the circular plates I and J having the rings i' and j', in combination with the central rotating shaft E, to which they are attached, respectively, at the places within the circular openings of the inner annular flange d^3 of upper ring D, and the inner annular flange b^3 of lower ring B, so as to form the top and bottom closures of the cylinder, and thus having the same alternating and reverse motion as the shaft upon which the hides are wound and rewound, thereby preventing the hard friction and rubbing of the hides, as and for the purpose set forth.



3. In a leather-working machine, the combination of the metal segments F F G and the long screws H H, &c., with the metal ring B, having the outer and inner annular flanges b' b^3 and triangular stops b^4, and the metal ring D, having the outer and inner annular flanges d' and d^3 and triangular stops d^4, by means of which said flanges and stops the metal segments F F G are prevented from being displaced by the crowding of the hides upon them, as and for the purpose set forth.

408,897. WASTE-PIPE CONNECTION. William Scott, Medford, Mass. Filed Apr. 22, 1889. Serial No. 308,182. (No model.)

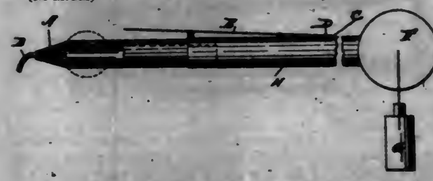
Claim.—1. A connection for the discharge-passage of an earthenware water-closet bowl and a water-pipe in continuation of said passage, composed of a flange N, about and integral with said discharge-passage, and a metal flange O, jointed and packed to said



408,897.

bowl-flange N, in combination with a waste-pipe G, surrounded and attached to said metal flange O and of a less diameter than and entered into the discharge-passage of the bowl, and having a space Q about it at its upper end open to the discharge-passage and at its lower end closed by the joint of said flanges, and means applied to said flanges for fastening them together, substantially as described, for the purpose specified.

2. A connection for the discharge-passage of an earthenware water-closet bowl and a waste-pipe in continuation of said passage, composed of a flange N, surrounding said discharge-passage, and a metal flange O, jointed and packed to said bowl-flange N and respectively having curved and radial slots R S, in combination with a waste-pipe G, surrounded by and attached to said metal flange O, and headed screw-bolts inserted in said slots and engaged with and held against turning by, but free to be moved lengthwise of, the slots of one of the flanges, and screw-nuts applied to said bolts, substantially as described, for the purpose specified.



408,898. APPARATUS FOR ALLAYING THE SENSIBILITY OF A TOOTH. Dexter M. Small, Providence, R. I. Filed Nov. 14, 1888. Serial No. 290,294. (No model.)

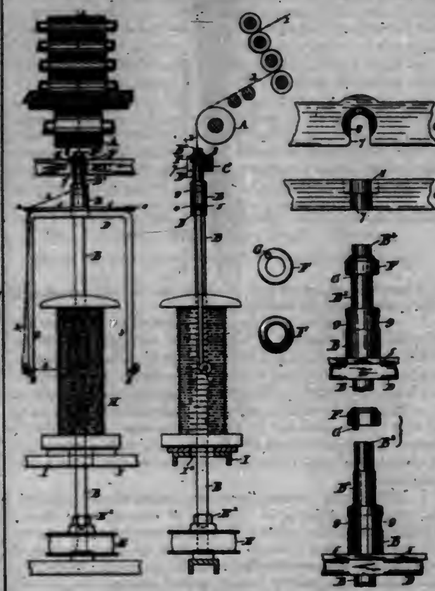
Claim.—1. The combination, with a device for introducing a jet of steam or heated air into the cavity of a tooth, of a shield E, near the orifice of the outlet-pipe, substantially as and for the purpose set forth.

2. The combination, with the reservoir or air-chamber of a dental tool or hand-instrument, having a short outlet-pipe D, for introducing a heated product into the cavity of a tooth for the purpose set forth, of a burner or diminutive heating apparatus constructed and arranged so as to be supported in connection therewith by the manipulating hand of the operator.

408,899. STEAM-CONDUIT FOR DENTAL SURGERY. Dexter M. Small, Providence, R. I. Filed Apr. 1, 1889. Serial No. 305,603. (No model.)

Claim.—1. The combination, with the conduit or outlet-pipe of a device for utilizing therapeutically a jet of steam, as set forth, of a short and comparatively-diminutive nozzle, free to turn radially independent thereof, substantially as and for the purpose set forth.

2. The combination, with the conduit or outlet-pipe of a device for utilizing therapeutically a jet of steam, as set forth, of an orifice or nozzle having its inner end, which is within the conduit, raised above or separated by a sharp angle from the inner walls thereof, so that the water produced by condensation of steam within the conduit shall not come in contact therewith.



3. The combination, with the conduit or outlet-pipe of a device for utilizing therapeutically a jet of steam, as set forth, of a receptacle for holding the water produced by condensation of steam within the conduit.

4. The combination, with a device for utilizing therapeutically a jet of steam, as set forth, of a pipe or conduit the outer section or end of which that contains the orifice or aperture for the nozzle is composed of non-conducting material, substantially as described.

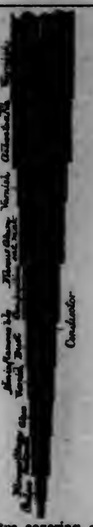
5. The combination, with the conduit or outlet-pipe of a device for utilizing therapeutically a jet of steam, as set forth, of a lever E, connected with a valve D and vent C, and arranged so as to be under the control of the operator's finger, substantially as and for the purpose set forth.

408,900. SPINNING-MACHINE. Prince Smith, Jr., and Joseph Lund, Keighley, County of York, England. Filed Apr. 2, 1888. Serial No. 305,085. (No model.) Patented in England May 3, 1887, No. 6,470.

Brief.—The object of the invention is to improve the running of the spindle and to facilitate doffing.

Claim.—1. In combination with a spindle, a loose collar F on its upper part, provided with a pin G and placed on a reduced part of the spindle and forming a bearing therefor, and a bar C, provided with a recess 8 and a slot 7, extending therefrom, as and for the purposes set forth.

2. In combination with a spindle having a reduced upper end and a loose collar thereon provided with a pin G, the top bearing C, having therein the slot 7 and the recess 8, all as shown and described.



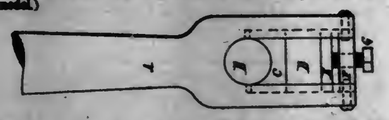
408,901. INSULATION FOR ELECTRIC CONDUCTORS. Charles T. Shenekon, St. Louis, Mo. Filed June 21, 1889. Serial No. 315,114. (No model.)

Claim.—1. An insulating-covering for electric conductors and other metallic substances, consisting of a coating of alum-saturated fiber secured to the article to be insulated by shellac, a coat of varnish upon said fiber, a powdered non-inflammable coating upon said varnish, a fibrous coating filled with a paste compound of a mineral substance or substances, a coating of dry alum-saturated fibrous material, an asbestus covering, and an outer coating of varnish, substantially as described.

2. An insulating-covering for electric conductors and other metallic substances, consisting of a coating of alum-saturated fibrous material secured to the article to be insulated by shellac, a coat of varnish upon said fibrous material, a powdered non-inflammable coating upon said varnish, a fibrous coating filled with a paste compound of a mineral substance or substances, a coating of dry alum-saturated fibrous material, a coating of gum and oil, an asbestus covering, and an outer coating of varnish, substantially as described.

3. An insulating-covering for electric conductors and other metallic substances, consisting of a coating of alum-saturated fibrous material secured to the article to be insulated by shellac or its equivalent, a coating of glue, a coat of varnish upon the glue when hardened, a coating of non-inflammable substance upon said varnish, a fibrous coating filled with a paste compound of a mineral substance or substances, a coating of dry alum-saturated fibrous material, a coat-

408,901.



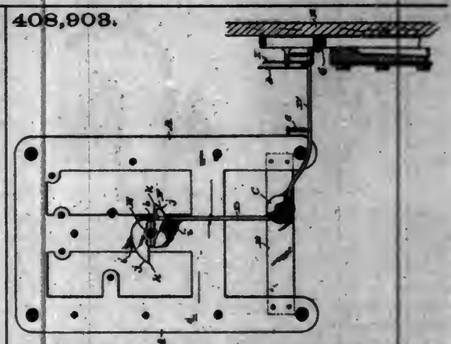
ing of gum and oil, an asbestus covering, and an outer coating of varnish, substantially as described.

4. An insulating-covering for electric conductors and other metallic substances, consisting of a coating of alum-saturated fibrous material secured to the article to be insulated by shellac or its equivalent, a coating of glue, a coat of varnish upon the glue when hardened, a non-inflammable coating consisting of a composition of powdered or ground glass, powdered alum, and ground asbestus, a fibrous coating filled with a paste compound of a mineral substance or substances, a coating of dry alum-saturated fibrous material, a coating of gum and oil, an asbestus covering, and an outer coating of varnish, substantially as described.

5. An insulating-covering for electric conductors and other metallic substances, consisting of a coating of alum-saturated fibrous material secured to the article to be insulated by shellac or its equivalent, a coating of glue, a coat of varnish upon the glue, a coating of non-inflammable substance or substances, a fibrous coating filled with a paste compound composed of litharge, ground asbestus, alum, and oil, a coating of dry alum-saturated fibrous material, a coating of gum and oil, an asbestus covering, and an outer coating of varnish, substantially as described.

408,902. AXLE-BEARING FOR BICYCLES. OLIVER L. SPAULDING, Jr., St. John's, Mich. Filed June 10, 1889. Serial No. 313,730. (No model.)

Claim.—1. A bearing or boxing for the axles of bicycles, velocipedes, and the like, consisting of an upper or stationary bearing, a lower or movable bearing, a cushion below said lower bearing, and means for keeping the cushion closely against the lower bearing, substantially as described.



2. A bearing or boxing for the axles of bicycles, velocipedes, and the like, consisting of the combination, with the standard, of a stationary bearing located above the axle, a movable bearing located below the axle, a cushion located below said lower bearing, and a set-screw for increasing or decreasing the tension on said cushion, all said parts engaged to said standard by groove-and-tenon engagements, substantially as described.

408,903. MUSICAL CLOCK. JOHN STRASSER, Kaukauna, Wis. Filed Feb. 19, 1889. Serial No. 300,434. (No model.)

Claim.—1. In a clock, the combination of the minute-post provided with a cam, a bell-crank lever arranged to have one arm thereof in contact with the cam, a music-box arranged to have its stop-lever in the path of the other arm of the bell-crank lever, and a spring cut-off secured to the music-box to be automatically interposed between the stop-lever and adjacent gear-wheel at a predetermined instant for a certain interval of time, substantially as set forth.

2. In a clock, the combination of the minute-post provided with a cam, another arm of the bell-crank lever arranged to have one arm

408,908.

thereof in contact with the cam, a music-box arranged to have its stop-lever in the path of the bell-crank lever, a spring cut-off secured to the music-box to be automatically interposed between the stop-lever and adjacent gear-wheel at a predetermined time, and a finger secured to the cut-off to come in the path of the clutch-pin uniting said gear-wheel and music-box cylinder, substantially as set forth.

3. In a clock, the combination of the minute-post provided with a cam, a bell-crank lever having longitudinally-adjustable arms and arranged to be actuated by the cam, and a music-box arranged to be set in motion by the joint action of said cam and bell-crank lever at predetermined intervals, substantially as set forth.

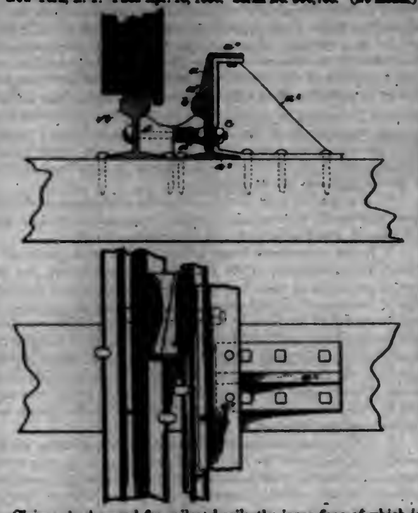
4. In a clock, the combination of the minute-post provided with a cam, a bell-crank lever actuated by the cam and having one of its arms arranged to actuate the stop-lever of a suitably positioned music-box, and a finger secured to said arm of the bell-crank lever to come in the path of the music-box fan for a predetermined interval of time, substantially as set forth.

5. In a clock, the combination of the minute-post provided with a cam, a bell-crank lever fulcrumed to a bearing on the main frame and arranged to be actuated by the cam, a music-box positioned to have its stop-lever actuated by the bell-crank lever, a finger on said lever arranged to come in the path of the music-box fan when the stop-lever is actuated, and a spring cut-off arranged on said music-box to interpose itself between said stop-lever and the adjacent gear-wheel at the same instant that said finger comes into position with relation to said fan, substantially as set forth.

408,904. INSECTICIDE. RICHARD M. STEPHENS, Denver, Colo., assignor to John M. Wilson, same place. Filed Apr. 26, 1889. Serial No. 308,901. (No specimens.)

Claim.—The composition of matter for use as a destroyer of vermin and insects herein described, consisting of turpentine, kerosene, water of ammonia, and carbolic acid, substantially as set forth.

408,905. REFRIGERATOR. FRANK C. H. STRASSBURGER, Chicago, Ill. Filed Feb. 6, 1889. Serial No. 298,935. (No model.)



Claim.—1. In a refrigerating apparatus, in combination with an ice-tank, a drip-water chamber having an air-eduction pipe one end of which is above and the other end is below the water-level of said chamber.

2. In a refrigerating apparatus, the combination, with an ice-tank, of a drip-chamber beneath said tank having in said chamber the drip-pipe H, with the air-pipe J arranged in said chamber, substantially as described, and the inlet air-pipe K located in the upper part of the ice-receptacle.

3. In a refrigerating apparatus, the combination, with the ice-tank A, of a drip-water chamber having the drip-pipe H, the air-pipe I, communicating with said drip-chamber, the air-pipe J, also communicating with said drip-chamber, and the air-inlet pipe K, communicating with the upper part of the ice-tank.

4. In a refrigerating apparatus having an ice-tank with air-inlets in its upper portion and a drip-water chamber having an air-outlet into the compartment to be cooled, the air-conduit I, communicating with the lower portion of the refrigerating apparatus, all constructed and arranged substantially as shown and described.

408,906. GUARD-RAIL FOR RAILWAYS. JOHN WATERHOUSE, New York, N. Y. Filed Apr. 10, 1889. Serial No. 306,702. (No model.)

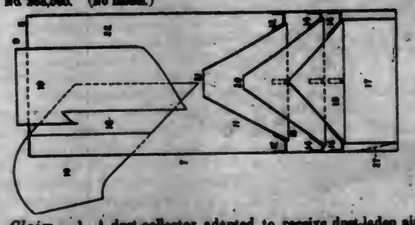
Claim.—1. A guard for railroad-rails, the inner face of which is provided with an outwardly-inclined portion and with a curved portion, substantially as described.

2. A guard for railroad-rails, the lower portion of the inner face of which is inclined at a greater angle than the upper portion, substantially as described.

3. A guard for railroad-rails, consisting of a permanent part provided with an inclined face and a recess below the same, and a removable part fitting in said recess and being provided with a curved face, substantially as described.

4. In a guard for railroad-rails, the combination, with a fixed portion provided with an inclined face, of a removable portion extending inwardly of said inclined face, and a strengthening and securing bracket fastened to the top of said permanent portion and along its base, substantially as described.

5. A guard for railroad-rails, consisting of a removable part adapted to sustain the greatest wear and a permanent supplemental part extending above the same, the said removable part being nearer the wheel of a passing car, substantially as described.



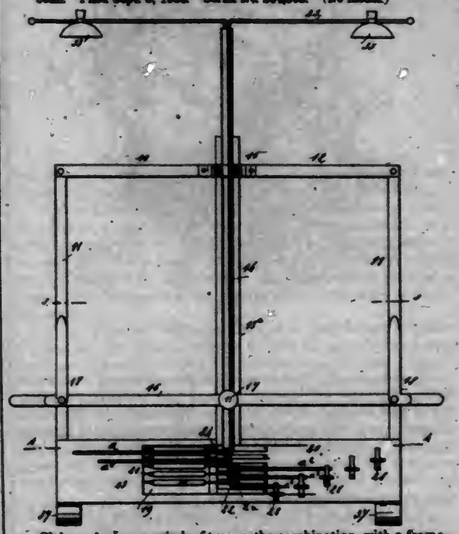
6. A guard for a railroad-rail, consisting of a permanent and a removable part, the said permanent part extending above the removable part and having a portion of its inner face inclined, substantially as described.

7. A guard for a railroad-rail, consisting of a permanent part provided with a recessed portion and a removable part, the said guard being held in place in proper relation to the rail by means of blocks, portions of which are inclined, substantially as described.

8. A guard for a railroad-rail, consisting of a permanent part provided with a recessed portion and a removable part, the said guard being held in place in proper relation to the rail by means of slotted blocks, portions of which are inclined, substantially as described.

9. A guard for a railroad-rail, consisting of a permanent part and a removable part, the said guard being held in position in proper relation to the rail by means of adjustable blocks, substantially as described.

408,907. DUST-COLLECTOR. JAMES A. WOODBURY, Winchester, and EDWARD P. WOODBURY, Boston, Mass. Filed May 20, 1889. Serial No. 311,565. (No model.)



Claim.—1. A dust-collector adapted to receive dust-laden air from a fan, provided with the collector-body having the inlet-spout 10, through which dust-laden air is forced, cylindrical base 17, between which and the collector-body is an outlet for the passage of the dust, and the tubular guard 9, located within the upper portion of the collector-body through which the purified air is forced, substantially as and for the purpose set forth.

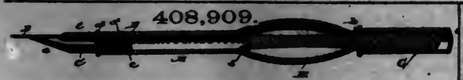
2. A dust-collector provided with an inlet-spout through which dust-laden air is forced, frustums 11 and 13 and cylindrical base 17, between which and the collector-body are outlets for the passage of the dust, and tubular guard 9, located within the upper portion of collector-body through which the purified air is forced, substantially as described.

3. A dust-collector provided with an inlet-spout through which the dust-laden air is forced, cylindrical base 17, between which and the collector-body is an outlet for the passage of the dust, and the tubular guard 9, located within the upper portion of the collector-body through which the purified air is forced, in combination with means of reducing the area of said dust-outlet, substantially as described.

4. A dust-collector provided with an inlet spout through which dust-laden air is forced, cylindrical base 17, between which and the collector-body are outlets for the passage of the dust, and tubular guard 9, located within the upper portion of the collector-body through which the purified air is forced, in combination with the U-shaped strips, as 23, as a means of fastening said cylindrical base to collector-body, for the purposes substantially as specified.

408,908. MUSIC-LEAF TURNER. GIANNI BETTINI, Stamford, Conn. Filed Sept. 5, 1888. Serial No. 284,502. (No model.)

Claim.—1. In a music-leaf turner, the combination, with a frame, a tube supported centrally above the said frame extending above the same, a series of leaf-turning rods of graduated lengths held to revolve in said tube, having the upper ends bent to form horizontal arms of essentially the same length and the lower ends bent to form equivalent arms of graded lengths, springs attached to the frame, and a connection between the lower arms of the leaf-turning rods and the springs, of a series of spring-actuated pivoted fingers having an inclined plane formed upon the upper surface, and a recess at the termination of the said inclined plane and rear portion of the said fingers, all combined to operate substantially as shown and described.

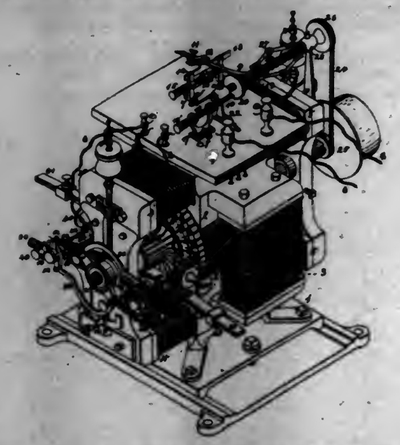


2. In a music-leaf turner, the combination, with a frame, of a rest-bar vertically adjustable upon the said frame, and a set-screw passing through said bar to an engagement with the frame, whereby the rest-bar may be adjusted to sheets of any size, as set forth.

3. In a music-leaf turner, the combination, with a frame, of a rest-bar held to slide upon the said frame, a set-screw passing through the bar to an engagement with the frame, and movable stops pivoted near the extremities of the rest-bar capable of bearing against the frame, all combined to operate substantially as shown and described.

408,909. FOUNTAIN-PEN. JOHN D. BRAY, Montreal, Quebec, Canada. Filed Jan. 25, 1889. Serial No. 297,596. (No model.)

Claim.—1. The combination, with a tubular pen-staff having an opening or aperture in rear of the finger-grasping portion and a compressible bulb communicating with the interior of the staff through



408,909.

said rear opening, for operation as described, of a plug or filling within said staff having a feed-duct through it out of line with its center, and a rotatable pen-holder provided with a forward feeding-extension and a feed-duct passing through its rear and socketed at its back in contiguity with the apertured plug in the staff to put its feed-duct in or out of line with the feed-duct in the plug, substantially as and for the purposes specified.

2. The combination, with the reservoir-tube A, having a rear aperture *a*, and the compressible bulb E, of the plug B, having a feed-duct *c* out of line with its center, the apertured elastic washer *f*, and the pen-holder C, fitted to screw within the forward end of the tubular reservoir and provided with a feeding-extension *e* and duct *d*, for operation in relation with the apertured washer and plug B, essentially as shown and described.

408,910. ELECTRO-DYNAMIC MACHINE. GEORGE F. CARD, Covington, Ky., assignor to the George F. Card Manufacturing Company, same place. Filed July 31, 1888. Serial No. 281,600. (No model.)

Claim.—1. In a governor for an electro-dynamic machine or motor, a driving-circuit having a normally-open loop of low resistance wound upon the field-magnet in contrary direction to the field's direct windings, one of said loop's terminals being attached to the vibrating member of a centrifugal regulator, (connected to the armature-shaft,) so as to be oscillated isochronously with varying speeds of the revolving armature between two opposing terminals of said loop, substantially as and for the purposes set forth.

2. In a governor for an electro-dynamic machine or motor, the described normally-open low-resistance loop wound differentially to and in shunt of the direct winding of the field-magnet, and one of whose rheophores has two terminals, between which is the single terminal of its other rheophore, said terminal being attached to the reciprocating member of a centrifugal regulator geared or belted to the armature, so as to automatically close said loop, and thereby neutralize the field magnetism at armature speeds, either above or below the prescribed range, substantially as set forth.

3. In a governor for an electro-dynamic machine or motor, the combination, with a field-magnet and armature wound in series with the driving-circuit, of a normally-open loop-circuit of low resistance wound upon the field-magnet in opposition to and in shunt of its direct winding, and having one of its rheophores attached to the reciprocating member of a centrifugal regulator, (driven from the armature-shaft,) so as to be automatically vibrated between the two terminals of its other rheophore, one of said terminals being adjustable relatively to the other, substantially as set forth.

4. In a governor for an electro-dynamic machine or motor, a low-resistance circuit which shunts and is wound in contrary directions to the direct winding of the field-magnet, and whose negative rheophore is attached to the reciprocating member of a centrifugal governor, so as to be automatically shifted by changing armature speeds between the two contact-pieces of its positive rheophore, one of said contact-pieces being adjustable and the other contact-piece yielding in direction of the path of vibration of said negative rheophore, substantially as and for the several purposes explained.

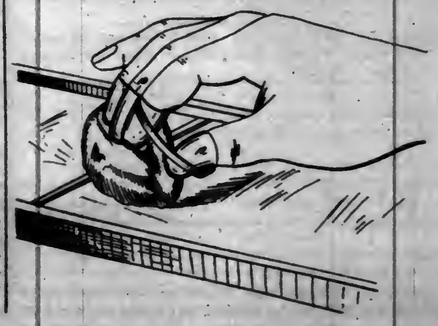
5. In a governor for an electro-dynamic machine or motor, the described combination of the low-resistance normally-open loop 7, so wound as when closed in the manner explained to short-circuit and oppose the direct windings of the field-magnet, one of the rheophores of said loop having a single terminal 20 attached to the vibrating member of a centrifugal regulator 27 isochronously oscillated with varying speeds of the armature-shaft, and provided with collapsing spring 29, the other rheophore of the said loop having two contact-pieces 9 10, located on opposite sides of and in the path of vibration of said single terminal, one of said contact-pieces being a brush 9, adjustable toward and from the other contact-piece, which piece is held normally toward said vibrating terminal by a spring 18, and has a retracting-handle 10', as set forth.

6. In a dynamo or an electric motor, the combination of the insulated thimbles 50, the insulated rotatable brush-shanks 38, the rotatable hoop 58, and the rod-and-spring connections 54 56.

7. In the commutator-brush holder of an electric generator or motor, the combination of the following elements, to wit: the support or bearer 34 35, capable of circumferential adjustment about the axis of rotation of the commutator and containing the insulated rotatable shanks 38 of the brush-clamps, said shanks being capable of independent vibration about their respective axes, and of being locked to any angular adjustment relatively to the bearer by means of binding-screws 49, the sectors 48, and the thimbles 50, said thimbles being on one side connected by springs 54 to said support, and on the other side by rods 56 to a rotatable hoop 58 thereupon, substantially as and for the purposes explained.

8. In the armature-core of an electro-dynamic machine, the described combination of the following elements, to wit: a series of imperforate conformably-embossed iron discuses magnetically insulated and mechanically united by cementing gaskets and confined between a pair of rings having correspondingly raised and depressed faces, and being attached to the armature-shaft.

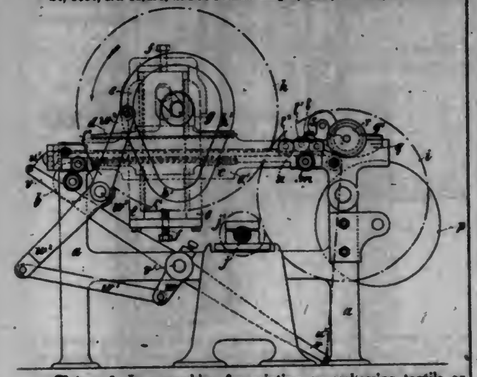
408,911. CAN OR BOX. ELIZAR C. CHAMPION and MATHEW VIBBOCK, Woonsocket, R. I. Filed June 20, 1889. Serial No. 314,906. (No model.)



Claim.—1. A box or can cover having an aperture in its top, in combination with a semi-rotatable measure having an opening in its bottom adapted to register with the opening in the cover, and also having a removable cap carrying a transparent top, substantially as specified.

2. A can or box cover having the stops *d e* and the opening C in its top, in combination with the plate D, having a depending arm I to engage the stops, the measure F, secured to said plate above the opening therein, and the removable top G, having a transparent top H, substantially as specified.

3. An improved article of manufacture, consisting of a can A, a cover having an opening in its top, and the lateral stops or lugs *d e*, the semi-rotatable plate on the cover having an arm to engage the stop-lugs, and also having an opening to register with the opening in the cover, the measure secured to the plate above the opening, and the removable cap having a transparent top, substantially as specified.



408,912. FINGER-GUARD. ERNEST H. CRESTERTON, Los Angeles, Cal. Filed Dec. 20, 1888. Serial No. 294,220. (No model.)

Claim.—1. The improved finger-guard consisting of the main metal pouch 10, adapted to receive the tips of two or more fingers, the independent metal thumb-pouch 12, and a flexible band 11, which is attached to said pouches at its respective ends and serves as the sole connection between them, as shown and described.

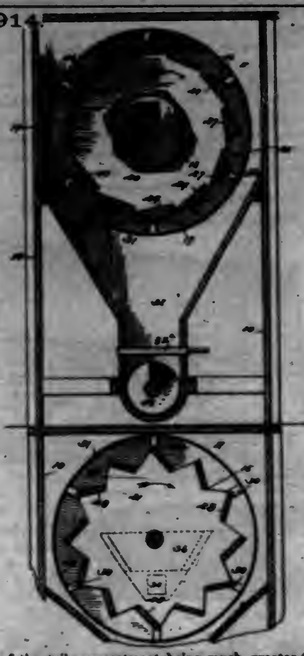
2. The combination, with a main finger-pouch, of a thumb pouch or stall and a metallic band, the band being connected to the finger-pouch at one end and to the thumb-pouch at the other, substantially as described.

408,913. MACHINE FOR PRINTING OR EMBOSSING FABRICS, &c. JAMES FARRER, Salford, County of Lancaster, England. Filed July 10, 1888. Serial No. 279,660. (No model.) Patented in England July 27, 1887, No. 10,631, and in France May 8, 1888, No. 190,488.

Claim.—1. In a machine for printing or embossing textile or other fabrics or materials, the combination, with a reciprocating carriage, tables carried by said carriage, one of which reciprocates vertically above the other, a printing-block supported by the upper or vertical table, and a cranked shaft journaled transversely of the machine and connected with the upper table, whereby as said shaft is rotated a compound reciprocating motion is imparted to said tables, as herein set forth.

2. In a machine for printing or embossing textile or other fabrics or materials, the combination, with a reciprocating carriage, tables carried by said carriage, one of which reciprocates vertically above the other, a printing-block supported by the upper or vertical table, a crank-shaft journaled transversely of the machine and connected with the upper table, inking-rolls, and means for connecting them with said shaft, a spur-wheel fixed on the latter and having a cam-groove in its face, an angle-lever fulcrumed centrally on the frame of the machine, and carrying at one end a roller that travels in the cam-groove, and connected at its other end with a shaft journaled transversely beneath the bed of the machine, as and for the purpose specified.

3. In a machine for printing or embossing textile and other fabrics or materials, the combination, with a reciprocating carriage, tables carried by said carriage, one of which reciprocates vertically above the other, a printing-block supported by the upper or vertical table, a spur-wheel having a cam-groove in its face fixed on said shaft, an angle-lever centrally fulcrumed on the frame of the machine and carrying a roller traveling in said groove, and a shaft journaled transversely beneath the frame of the machine, of a two-armed lever centrally fulcrumed on said shaft, lever and link connections between said lever and the angle-lever, and flexible connections between said lever and a series of reciprocable color-distributing rollers, substantially as and for the purpose herein set forth.

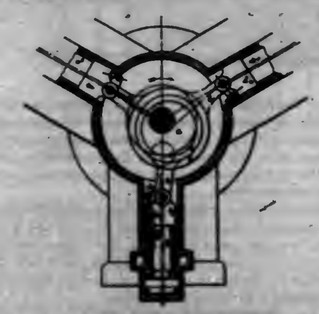


408,914. BOLTING-REEL. CYRUS T. HAMMA, Pittsburg, Pa. Filed Sept. 27, 1888. Serial No. 286,571. (No model.)

Claim.—1. In a flour-bolt, a reel provided with a circular series of longitudinally disposed and spaced buckets, each substantially wedge-shaped in cross-section and provided with a rib projecting from the carrying-surface of one bucket toward the narrow edge of the next, substantially as shown and described.

2. In a flour-bolt, a reel provided with a series of longitudinally disposed and spaced buckets, each substantially wedge-shaped in cross-section and provided with a rib projecting from the carrying-surface of one bucket toward the narrow edge of the next, the said buckets being removed from the inner surface of the cloth, and the ribs of the buckets forming a bridge intervening the said buckets, substantially as herein shown and described.

3. In a flour-bolt, a reel divided into compartments inclosed by longitudinally disposed and spaced buckets, the distance between the buckets of the tail compartment being much greater than between the buckets of the head compartment, substantially as described.

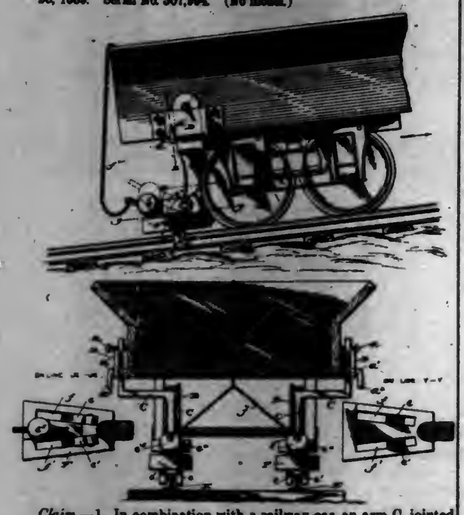


408,914

4. In a flour-bolt, the combination, with the head and tail disks and cover of a reel, which is divided into two compartments, of a series of spaced buckets encircling the head compartment, essentially wedge-shaped in cross-section and provided with longitudinal integral ribs, and flat buckets encircling the tail compartment, removed a greater distance apart than the head buckets, substantially as shown and described.

5. In a flour-bolt, the combination, with the head and tail disks of a reel, the cover, and a partition dividing the same into two compartments, of a series of spaced buckets encircling the head compartment within a cover and a distance therefrom, wedge-shaped in cross-section, provided with longitudinal ribs upon the inner edge of the widest face, flat buckets encircling the tail compartment, also within the cover, and rings supporting and retaining the cover a distance from the buckets, all combined to operate substantially as shown and described.

408,915. VALVE-GEAR FOR MULTIPLE-CYLINDER ENGINES. REIN. KAMLOWSKY, KARL GRAHN, and GOTTLOB KÖHNITZ, Berlin, Germany, assignors to Friedrich Karl Glaser, same place. Filed Oct. 22, 1888. Serial No. 288,732. (No model.)

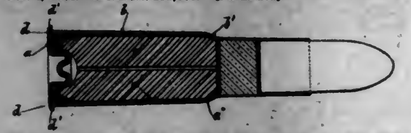


Claim.—1. In a valve-gear for multiple-cylinder engines, the combination, with the single eccentric *a*, the separate eccentric-rings *b c d*, mounted on the eccentric and provided with the rods b^1 c^1 d^1, having brackets b^2 c^2 d^2, the distributing-piston slide-valves b^3 c^3 d^3, connected to the rods b^1 c^1 d^1, the auxiliary slides b^4 c^4 d^4, and the rods

b^4 c^3 d^3, connected to the auxiliary slides and to the brackets, substantially as described.

2. In a valve-gear for multiple-cylinder engines, the eccentric *a*, eccentric-rings *b c d*, provided with the rods *b' c' d'*, having brackets b^3 c^3 d^3, the piston slide-valves b^3 c^3 d^3, connected to the rods *b' c' d'*, the auxiliary slides b^4 c^4 d^4, and the rods b^4 c^4 d^4, connected to the auxiliary slides and to the brackets, in combination with the working-piston B, provided with the exhaust-passage *k*, substantially as described, whereby a second exhaust of the working-fluid will automatically take place at the end of the stroke, as set forth.

408,916. CAR-BRAKE. JULIUS LAWITZKA, Peoria, Ill. Filed Apr. 20, 1889. Serial No. 307,994. (No model.)

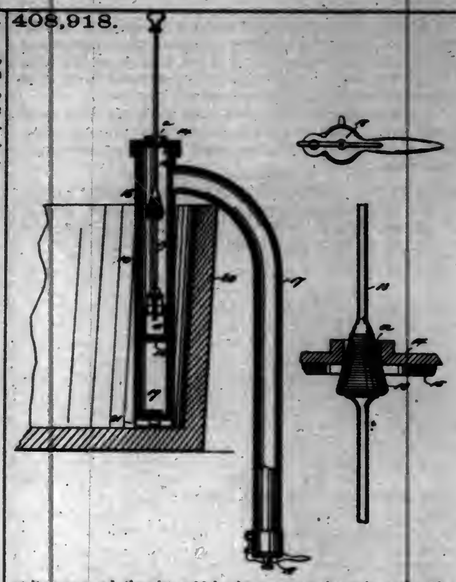


Claim.—1. In combination with a railway-car, an arm C, jointed to the car-body, arranged to act against the rear face of the wheel, and provided at the lower end with gravitating dogs to engage the rail.

2. In combination with a railway-car, the stop device consisting of the standard, its lower arm provided with converging slots, and the two gravitating dogs passing through said slots on opposite sides of the rail.

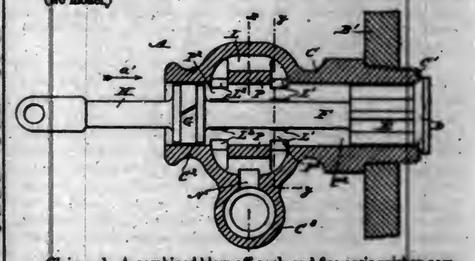
3. In combination with a car, the pendent arm C loosely jointed thereto, arranged to act against the face of the wheel, and provided with converging slots at the lower end, in combination with a weighted stirrup and two gravitating dogs independently pivoted to the stirrup and adapted to engage opposite sides of the rail.

408,917. METALLIC CARTRIDGE. ABRAHAM MARTIN, 177 Aston Lane, Witton, near Birmingham, County of Warwick, England. Filed Dec. 4, 1888. Serial No. 292,619. (No model.)



Claim.—1. The herein-described metallic cartridge, consisting of the case *b*, having the shoulder *b'* near the forward extremity, and the case *a* within the case *b*, upset inwardly at the front extremity at a^x in correspondence with the inner face of the shouldered portion of the case *b*, and having the closed base at its other extremity, substantially as shown and described.

2. The herein-described metallic cartridge, consisting of the case *b*, having the shoulder *b'* near one extremity and the seat *d'* at its other extremity, and the case *a* within the case *b* upset inwardly at one extremity, at a^x, in correspondence with the inner face of the shouldered portion of the case *b*, and having the base *d* at its other extremity, substantially as shown and described.



408,918. SIPHON. LEOPOLD MEYER, Ahnapee, Wis. Filed Mar. 7, 1889. Serial No. 302,963. (No model.)

Claim.—A siphon consisting in the long leg having a valve at its lower end, and a short leg 10, having an open frame 21 on its lower end, upward-opening valve 19 in its lower end, and an apertured cap

at its upper end, the piston 11 having an upward-opening valve 12, a stem 13 extending up through the apertured cap, and a packing-ring 16 on the stem between its ends and within the short leg, substantially as set forth.

408,919. BLOW-OFF COCK AND FIRE-EXTINGUISHER. LUCIUS B. MICHELL, Palestine, Tex. Filed June 15, 1889. Serial No. 314,345. (No model.)

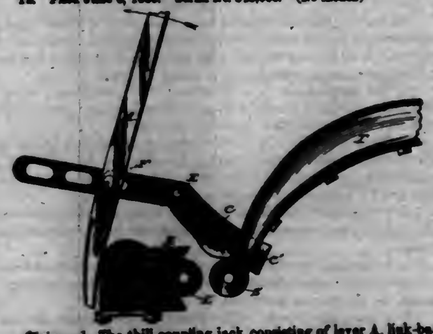
Claim.—1. A combined blow-off cock and fire-extinguisher comprising a valve-body having a central opening and an annular chamber connected by ports with the said central opening, said valve-body being secured to the lower end of the boiler, perforated pipes connected with the said annular chamber, a valve held on the inner end of the said valve-body, and a piston secured on the stem of the said valve and operating with the same, substantially as shown and described.

2. A combined blow-off cock and fire-extinguisher comprising a valve-body having a central opening and an annular chamber connected by ports with the said central opening, said valve-body being secured to the lower end of the boiler, perforated pipes connected with the said annular chamber, a valve held on the inner end of the said valve-body, a piston secured on the stem of the said valve and operating with the same, and means, substantially as described, for operating said valve and piston from the cab of the locomotive, as set forth.

3. A combined blow-off cock and fire-extinguisher comprising a valve-body having a central opening and an annular chamber connected by ports with the said central opening, said valve-body being secured to one end of the boiler, a valve held on the inner end of the said valve-body and adapted to open and close said central opening, a valve-stem carrying said valve, and a piston secured on the said valve-stem and held to slide in the said central opening, substantially as shown and described.

4. In a combined blow-off cock and fire-extinguisher, the combination, with a valve-body provided with a central opening and an annular chamber, which latter is connected by ports with the central opening, of a valve adapted to open and close the inner end of the

said valve-body, a valve-stem extending from the said valve through the said central opening, a piston secured on the said valve-stem and held to slide in the said central opening over one set of the said ports, and means, substantially as described, for opening the said piston and valve simultaneously, as set forth.

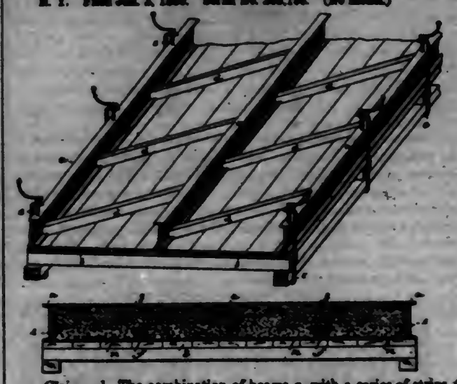


5. In a combined blow-off cock and fire-extinguisher, the combination, with a valve-body provided with a central opening and an annular chamber, which latter is connected by ports with the central opening, of a valve adapted to open and close the inner end of the said valve-body, a valve-stem extending from the said valve through the said central opening, a piston secured on the said valve-stem and held to slide in the said central opening over one set of the said ports, means, substantially as described, for opening the said piston and valve simultaneously, and perforated pipes connected with the said annular chamber, as set forth.

408,920. SASH-FASTENER. CHARLES H. MILLER and SAMUEL A. MCDONALD, Denton, Tex. Filed Mar. 26, 1889. Serial No. 304,694. (No model.)

Claim.—In a window-fastener, the combination, with an angle-bracket having an opening produced in its horizontal member wider at its top than at its bottom, and an essentially yoke shaped bar passed through the said opening, of a thumb-lever hinged to the vertical member of the bracket, extending over and parallel with the horizontal member of said bracket, and a lip integral with the under edge of the lever, concavo-convex in cross-section, and capable of entering the opening in the bracket and contacting with the inner or under face of the yoke-like bar, all combined for operation substantially as shown and described.

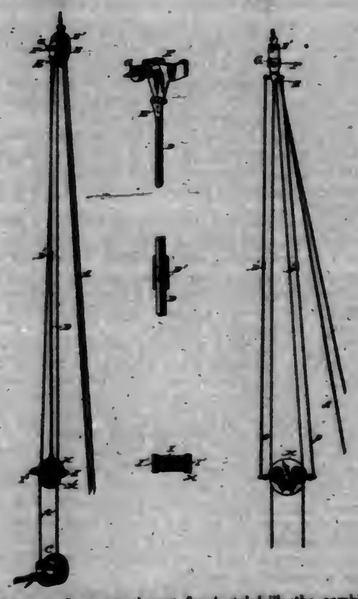
408,921. THILL-COUPLING JACK. JOHN H. MILLER, Lewistown, Pa. Filed June 8, 1889. Serial No. 313,606. (No model.)



Claim.—1. The thill-coupling jack consisting of lever A, link-bar B, having an adjustable connection with the lever, the clamp C, with foot C', and the dog D, the said dog and clamp being connected to the end of the link-bar upon a single axis of articulation, substantially as shown and described.

2. The combination of the lever A, with a headed stud F, link-bar B, with a series of elongated holes, the clamp C, with foot C', and the dog D, both dog and clamp being pivotally connected to the link-bar by the same axis of articulation, substantially as shown and described.

3. The combination of the lever A, link-bar B, pivotally connected thereto, the clamp C, having foot C' at one end and stud E at the other, and the dog D, the said dog and bar B being jointed or articulated upon the stud E, substantially as and for the purpose described.

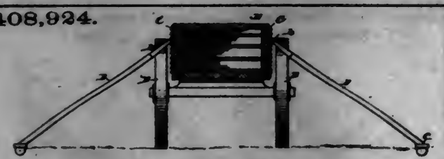


408,922. FIRE-PROOF CEILING. JOHN W. MACKENZIE, New York, N. Y. Filed Jan. 3, 1888. Serial No. 259,193. (No model.)

Claim.—1. The combination of beams *a*, with a series of strips *f* of crushed stone and cement between the beams, and with concrete *c*, inclosing strips *f* at the sides, substantially as specified.

2. The combination of I-beams *a*, with the oblique strips *f* of crushed stone and cement resting upon the lower flanges of the I-beams, and with the concrete *c* at the sides of strips *f*, and with a superposed layer *g* of ashes and a bottom layer *a* of gravel, substantially as specified.

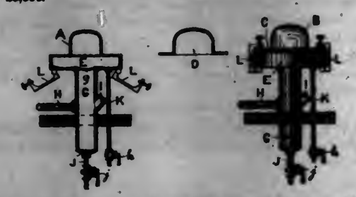
408,923. DENTAL-DRILL ATTACHMENT. JESSE H. MOYER and JESSE P. STARRELL, Temple, Tex. Filed Mar. 27, 1889. Serial No. 305,082. (No model.)



Claim.—1. In an attachment for dental drills, the combination, with the upper pulley B and the supporting pulley-frame B' of a drill, of a rod having hinged to its upper end the clip F, having the set-screw G, and having at its lower end the frame H and the wheel H', journaled in said frame, substantially as set forth.

2. In an attachment for dental drills, the combination, with the upper pulley B and the supporting pulley-frame B' of a drill, of a rod having hinged to its upper end the clip F, having the set-screw G, and having at its lower end the frame H, having the wheel H' and the side spools I, journaled within it, substantially as set forth.

408,924. ANCHOR FOR PORTABLE HAY-PRESSES. MILES MCCALLA, Milford, Iowa. Filed Oct. 20, 1888. Serial No. 288,264. (No model.)



408,924.

Claim.—The combination, with a hay-press or other machine, of the ratchet-plates C, secured to the sides of the frame of the press or machine, and the braces D, each provided with a foot *c*, for securing it to the ground, and with point *b*, for engaging the ratchet-plate, substantially as described, whereby the shifting movement of the frame produced by the draft on different sides will cause the points of the braces to alternately drop into engagement with the teeth of the plate, and thereby automatically take up the slack motion or shifting movement of the machine, as set forth.

408,925. METHOD OF TREATING HATS MADE FROM FELTED MATERIALS.

JOHN H. HEAVE, Rainow, near Macclesfield, County of Chester, England. Filed Oct. 15, 1883. Serial No. 308,136. (No model.) Patented in England Apr. 25, 1887, No. 5,966; in France Dec. 7, 1887, No. 187,445; in Belgium Dec. 7, 1887, No. 79,833; in Brazil May 9, 1888, No. 576; in Germany May 16, 1888, No. 45,860, and in Italy Aug. 8, 1888, No. 23,890.

Claim.—1. The process of treating hats during manufacture, which consists in subjecting the hat to the action of a highly-heated fluid under pressure while the hat or hat-body is tightly compressed or subjected to an independent pressure, either for the purpose of consolidating the texture of the material or of fastening the finish or polish, or for both purposes, substantially as described.

2. The process of treating hats during manufacture, which consists in tightly compressing the hat-body on a shape or block and subjecting the hat-body, when so compressed in a chest, chamber, or bath, to the penetrating action of a fluid—such as steam or boiling water—under pressure.

3. The improved method of finishing felt hats with a permanent gloss or brightness, which consists in subjecting the felt surface to the action of a rapidly-revolving abrasive surface, whereby the ends of the fibers are drawn outward beyond and laid upon the body of the felt, then tightly compressing the hat on a block or shape, and finally subjecting it to the action of a highly-heated fluid (steam or water) under pressure, substantially as described.

4. The improved method of finishing felt hats with a permanent gloss or brightness, consisting in first polishing the fibers of the hat by a rapidly-revolving velour or other means, then tightly compressing the hat on a block or shape, and finally subjecting the hat, when so compressed, to the action of a highly-heated fluid (steam or boiling water) under pressure to render the polish permanent.

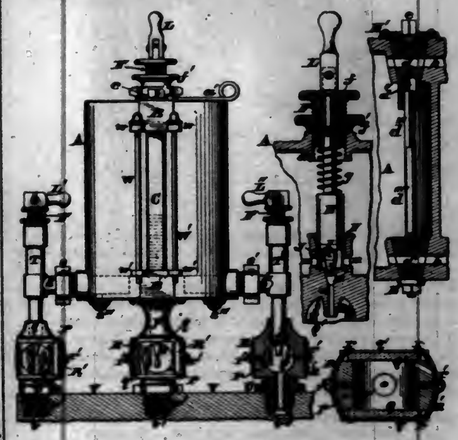
5. The improved method of finishing felt hats with a permanent gloss or brightness, which consists in subjecting the felt surface to the action of a rapidly-revolving abrasive surface, whereby the ends of the fibers are drawn outward beyond and laid upon the body of the felt, tightly compressing the hat on a block or shape, subjecting the hat, when so compressed, to the action of a highly-heated fluid (water or steam) under pressure, and finally polishing with a rapidly-revolving velour, substantially as described.

6. The improved method of finishing felt hats with a permanent gloss or brightness, consisting in first polishing the fibers of the hat by a rapidly-revolving velour or other means, tightly compressing the hat on a block or shape, subjecting the hat, when so compressed, to the action of a highly-heated fluid (steam or water) under pressure, and finally polishing with a rapidly-revolving velour, substantially as described.

7. The process or method of finishing felt hats with a permanent gloss or brightness, which consists in polishing the surface by application to a rapidly-revolving surface, compressing them on a block or shape, subjecting them to a bath of a highly-heated fluid (steam or water) under pressure, allowing them to stand and cool before removing them from the block, thoroughly drying them, velouring them with a rapidly-revolving velour, and finally hot-pressing them in a hydraulic or other hot press, all substantially as described.

408,926. DENTAL FILE.

CHARLES E. PALMER, New Haven, Conn. Filed May 13, 1889. Serial No. 310,622. (No model.)



Claim.—1. The herein-described dental file, consisting of a body A, with a flange C turned from one edge, the inner surface of the flange curved into the corresponding surface of the body, the said inner curved surface of the flange and the body cut to form a file cutting-surface throughout, substantially as described.

2. The herein-described file, consisting of the body A, the handle B, made as an integral part thereof, the body constructed with a longitudinal flange C upon one edge, the inner surface of the said flange curved into the adjacent surface of the body, the said inner curved surface of the flange and the body cut to form a continuous file cutting-surface throughout, substantially as described.

408,927. LUBRICATOR.

JAMES POWELL, Cincinnati, Ohio. Filed Mar. 23, 1889. Serial No. 304,567. (No model.)

Claim.—1. The combination, in a lubricator, of a self-closing valve-carrier, a valve proper flexibly coupled to said carrier, and a reservoir having a seat for said valve to close against, which seat has a discharge-passage, substantially as herein described.

2. The combination, in a lubricator, of the self-closing chambered valve-carrier H *h*, cap I *i*, attached thereto, plug J, valve *j*, collar K, spring *k*, and shank *k'*, as herein described.

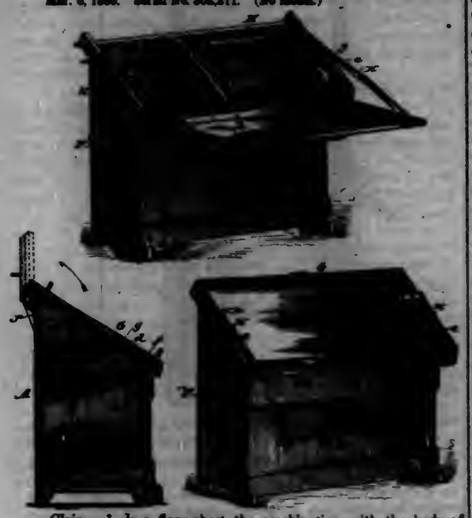
3. The combination, in a lubricator, of a reservoir having a screw-threaded neck *a*, seat *a'*, passage *o*, tension-nut F *f*, jam-nut *f'*, stem G, spring *g*, valve-carrier H, and lever L, said carrier having a valve flexibly coupled to it, for the purpose described.

4. A lubricator provided with one or more laterally-adjustable side pipes having independent discharge-nozzles, for the purpose described.

5. A lubricator provided with a central discharge-nozzle, and one or more laterally-adjustable side pipes having independent discharge-nozzles, for the purpose described.

6. A lubricator provided with a central discharge-nozzle, and one or more laterally-adjustable side pipes having independent discharge-nozzles housed within vertically-adjustable sight-chambers, for the purpose described.

7. The combination, in a lubricator, of laterally-adjustable side pipe S, valve-chamber T, discharge-nozzle *t*, sight-chamber P, and screw-threaded nipple U, for the purpose described.



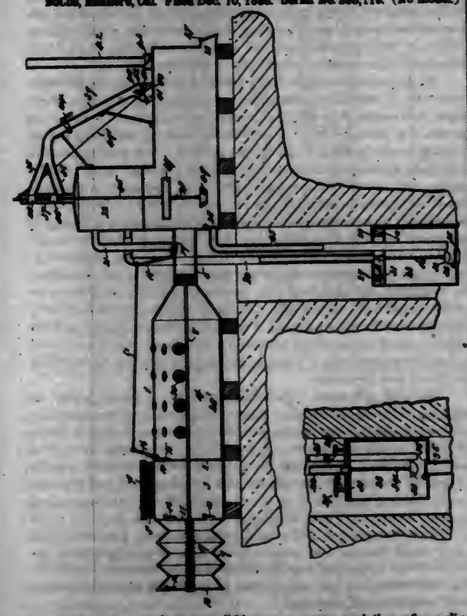
8. The combination, in a lubricator, of sight-chamber P, having flanges *q q'*, glasses Q Q', clips R *r* R' *r*, and screws *r'*, for the purpose described.

9. A lubricator provided with channels leading to the gage-tube sockets, and a pair of simultaneously-acting turning-plugs for closing said channels, substantially as herein described.

10. The combination, in a lubricator, of a reservoir having socket-channels *b b'*, turning-plugs D D', mortise *d''*, tenon *d'''*, and stem *d''''*, which stem projects from the lower plug D', as herein described.

408,928. FLOUR-CHEST.

BENJAMIN H. REINERT, Alma, Ill. Filed Mar. 6, 1889. Serial No. 302,211. (No model.)



Claim.—1. In a flour-chest, the combination, with the body of the chest, of strips pivoted to the chest, a board hinged to the free ends of the strips, and jointed links pivoted to the said strips and board, substantially as described.

2. In a flour-chest, the combination, with the body A of the chest having the cut-away portions *g* in its ends, of the strips *e*, pivoted to the body of the chest and provided with the projections or extensions *f*, the board *d*, hinged to the free ends of the strips, and the jointed links H, pivoted to the said strips and board, substantially as herein shown and described.

3. In a flour-chest, the combination, with the body of a chest provided with opposite and spaced lugs, of a cover working between the said lugs and provided with a cleat on its under surface, substantially as described.

408,929. SOLAR WATER-LIFTING APPARATUS.

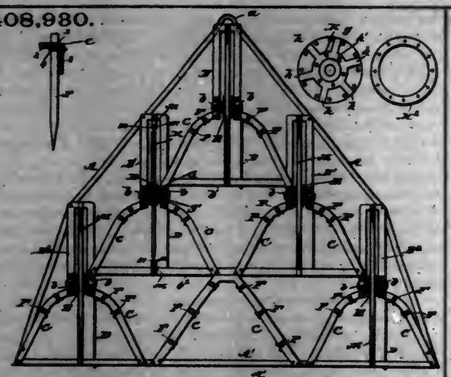
ALVA L. REYNOLDS, Bisbee, Cal. Filed Dec. 10, 1888. Serial No. 293,119. (No model.)

Claim.—1. A solar water-lifting apparatus consisting of a cylinder having a heating-chamber provided with lenses, a piston-cylinder, a chamber behind the heating-chamber with weighted bellows on its top, spring-actuated bellows behind said second chamber with valves opening therein, a piston connected to the spring-actuated bellows, a catch arranged in piston-cylinder to engage the piston and connected with a valve opening from the second chamber into heating-chamber, a condensing-chamber, a tube leading from piston-cylinder to condensing-chamber having a discharge-outlet and valve, a pressure-breaking receptacle or receptacles having air-valves opening outwardly and connected with a weighted float, suction-tubes connecting the condensing-chamber with the pressure-breaking receptacle, one of which is closed at its upper end by an upwardly-lifting valve and the other at its lower end by a valve on the float, and a suction-pipe extending downward from pressure-breaking chamber and having an upwardly-lifting valve at its mouth in said chamber, substantially as described.

2. In a solar water-lifting apparatus, substantially as described, a pressure-breaking receptacle consisting of a chamber provided with suction-tubes leading to a condensing or vacuum chamber, a weighted float with a valve for closing one of the suction-tubes, and an outwardly-opening valve at the upper end of the other suction-tube, outwardly-opening valves closing air-openings in the receptacle, and a suction-tube extending downward from the receptacle having an inlet stop-valve at its mouth, substantially as described.

3. In a solar water-lifting apparatus, a cylinder having a heating-chamber provided with lenses, a piston-cylinder, a chamber behind the heating-chamber with weighted bellows on its top opening into the second chamber, spring-actuated bellows behind said second chamber with valves opening into the latter, a piston connected to the spring-actuated bellows, a catch arranged in piston-cylinder to engage the piston and connected with a valve opening from the second chamber into the heating-chamber, a condensing-chamber, a tube leading from piston-cylinder to condensing-chamber, having a discharge-outlet and outwardly-opening valve, and a tube leading downwardly from the condensing-chamber and having a valve at its upper end opening inwardly into the condensing-chamber, substantially as described.

4. In a solar water-lifting apparatus, a condensing-chamber having in its lower portion a water-discharge outlet and outwardly-opening valve, a water-inlet pipe extending downward and with a valve at its upper end opening inwardly into the condensing-chamber, a vertical tube on the top of the condensing-chamber opening into the latter and containing a vertical rod, with valves and a weighted float on the lower end of the vertical rod, an air-tube with a stop-cock and a flaring open mouth at its lower end located above a lamp on the top of the condensing-chamber, and branch tubes at its upper end connecting with the vertical tube and alternately opened and closed by the valves therein, a connection between the vertical rod and wick of the lamp for raising and lowering the wick, and a second vertical tube with upwardly-opening valve located on the top of the condensing-chamber for the escape of air, substantially as shown and described.



5. A solar water-lifting apparatus consisting of a heating-chamber provided with lenses and a reflecting-lining, a piston-cylinder, a chamber behind the heating-chamber with weighted bellows on its top opening into the second chamber, spring-actuated bellows behind said second chamber with valves opening therein, a piston connected to the spring-actuated bellows, a catch arranged in piston-cylinder to engage the piston and connected with a valve opening from the second chamber into heating-chamber, a condensing-chamber, a tube leading from piston-cylinder to condensing-chamber having discharge outlet and valve, a vertical tube on the top of condensing-chamber opening into the same and containing valves, and a piston-rod with a weighted float at its lower end located in the condensing-chamber, a burner on the top of condensing-chamber having a connection between it and the vertical piston-rod for controlling the flame of the burner, a tube with a flaring mouth at its lower end located over the burner and connected by branch tubes at its upper end with the vertical tube containing piston rod and valves, the latter alternately opening and closing the branch tubes, a second vertical tube on the top of condensing-chamber with an upwardly-opening air-valve, and pressure-breaking receptacle consisting of a chamber provided with suction-tubes leading to the condensing-chamber and containing a weighted float with a valve for closing one of the suction-tubes, and a valve at the upper end of the other suction-tube opening into the condensing-chamber, outwardly-opening valves closing air-inlet openings in the receptacle, and a suction-tube extending downward from the receptacle and having a stop-valve at its upper end opening into the receptacle, substantially as shown and described.

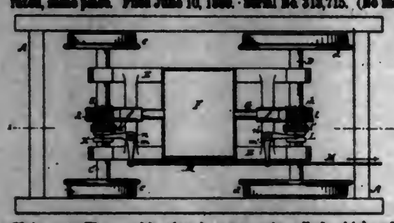
408,930. HARROW.

SAMUEL ROTHCHILD, Pendleton, Oreg. Filed Nov. 27, 1888. Serial No. 292,096. (No model.)

Claim.—1. The combination of the bar A, the wheel-frames connected at their forward ends with the bar A, and the tooth-carrying

408,930.

bars C, secured to the rear ends of the wheel-frames and forming braces therefor, substantially as set forth.



2. In a harrow, the combination, substantially as described, of an outer frame bar or bars, the wheel-frames arranged within said frame bar or bars and suitably secured, brace-bars extended between the forward wheel-frames and those in rear thereof and between the rear wheel-frames and the frame bars, and the wheels in said wheel-frames, all substantially as and for the purposes specified.

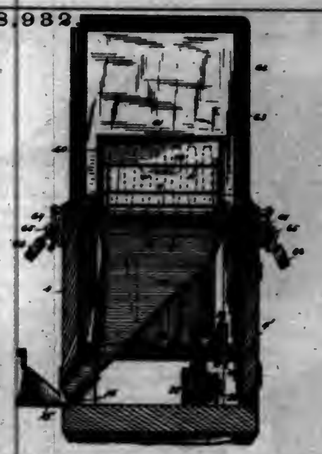
3. In a harrow, substantially as described, the combination of the wheel-frames and bars connected with and diverging from the open rear ends of said frames, whereby to prevent no obstruction to the upward movement of the teeth when clogged by rubbish, &c., substantially as set forth.

4. The improved protector for the toothed wheels, consisting of the tire I, of angle-iron, the ring J, and fastenings, substantially as set forth.

5. The combination, with the wheel having its teeth pointed, of the angle-iron tire I, the ring J, having inclined or beveled face *j*, the staples L, and the pins L', all substantially as set forth.

408,931. DRIVING-GEAR FOR CARS. EDWARD SAMUEL, Philadelphia, Pa., assignor to William Wharton, Jr., and Company, Incorporated, same place. Filed June 10, 1889. Serial No. 313,715. (No model.)

Claim.—1. The combination, in a power-impelled vehicle, of two or more axles, a motor-shaft, and mechanism whereby said shaft may be connected to or disconnected from either axle, the traction-wheels of one axle differing in diameter from those of the other axle or axles, whereby with a constant speed of motor-shaft different rates of propulsion of the vehicle may be maintained, substantially as specified.



2. The combination, in a power-impelled vehicle, of the axles, a single motor-shaft common to all of the axles, and mechanism whereby said shaft may be connected to or disconnected from either of said axles, the traction-wheels of one axle differing in diameter from those of the other axle or axles, whereby with a constant speed of motor-shaft different rates of propulsion of the vehicle may be maintained, substantially as specified.

408,932. AUTOMATIC CIGAR-SELLING MACHINE. PETER SCHNEIDER, Brooklyn, N. Y. Filed Nov. 24, 1888. Serial No. 291,777. (No model.)

Claim.—1. An automatic cigar-selling machine consisting of a chute for the passage of a coin, an electrical contact-maker to be operated by the coin, an electric circuit, an electro-magnet in the electric circuit, a traveling band with spaced apertures and having its ends wound on rollers, a frame for holding vertically cigars resting on end on the traveling band, a mechanism for operating the traveling band, and a tripping device connected with the armature of the electro-magnet for intermittently holding and releasing the mechanism for operating the traveling band, substantially as shown and described.

2. In a selling-machine, the combination, with an apertured band

408,932.

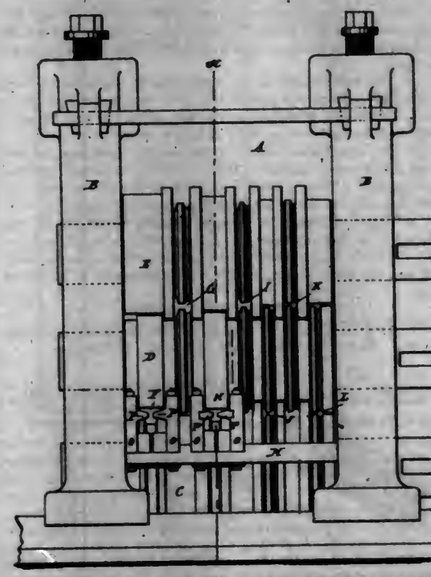
mounted to form the bottom of a goods-receptacle, of a band-advancing mechanism, a band take-up device, a tripping mechanism, and a coin-chute leading to said tripping mechanism, substantially as shown and described.

3. In a selling-machine, the combination, with an apertured band forming the bottom of a goods-receptacle and rollers on which said band is wound, of a band take-up mechanism connected with one roller, a band-advancing mechanism connected with another roller, a tripping mechanism, and a coin-chute leading to the tripping mechanism, substantially as shown and described.

4. In a selling-machine, the combination, with an apertured band forming the bottom of a goods-receptacle, of a band-advancing mechanism, a band take-up mechanism, a trip-lever connected with the band take-up mechanism, an armature on said lever, an electro-magnet, a battery, current-wires connecting the battery and electro-magnet, a lever in the circuit normally breaking the same, and a coin-chute discharging on said lever, substantially as shown and described.

5. An automatic cigar-selling machine consisting of a casing having an opening in its top, an apertured band mounted to extend across the opening, a frame mounted over the opening for holding cigars vertically with their lower ends resting on the apertured band, a chute for the passage of cigars mounted beneath the opening and leading to the outside of casing, a covering extending over the top of the casing and disclosing its top, a band-advancing mechanism, a band take-up device, a tripping mechanism, and a coin-chute leading to said tripping mechanism, substantially as shown and described.

6. An automatic cigar-selling machine comprising the following elements: a chute for the reception and passage of a coin to a receptacle, a contact-maker with a tripping-lever having one end projecting across the passage-way of the chute for making and breaking an electric circuit by the action of a coin on the lever in passing through the chute, electric-circuit wires leading from a battery to the contact-maker and to an electro-magnet having an armature, a traveling band with spaced apertures having its ends wound on rollers, a frame for holding cigars arranged therein in vertical position and resting on the traveling band, a cigar-delivery chute located beneath the traveling band and cigar-holding frame, a train of gearing connected to one of the traveling-band rollers and normally held in locked position by a tripping-rod connected with the armature of the electro-magnet and intermittently moved into and out of engagement therewith by the action of the electro-magnet, a train of gearing connected with the other roller of the traveling band, and a spring-actuated drum having a cord connected with a drum in the train of gearing, substantially as shown and described.



7. In an automatic cigar-selling machine, a casing having an opening in its top, a traveling band with spaced apertures extending across the opening and having its ends wound upon rollers, a frame mounted on the top of the casing and over the opening for holding cigars in vertical position on the traveling band, a train of gearing connected with one of the rollers of the traveling band and intermittently released and locked by a rod connected with the armature of an electro-magnet, a train of gearing connected with the other roller of the traveling band, and a spring-actuated drum connected by a cord wound thereon with a drum in the train of gearing and by the action of the spring and a spring-actuated drum operating the traveling band when the first-named train of gearing is released, substantially as shown and described.

8. In a coin-operating machine, a chute, a contact-maker having

a lever projecting into the passage-way of the chute and adapted to be tilted by a coin passing through the chute, electrical circuit-wires leading from a battery to the contact-maker and to an electro-magnet, and a tripping-rod for holding and releasing an operating mechanism connected to and operated by the armature of the electro-magnet, substantially as shown and described.

9. In an automatic cigar-selling machine, the casing 4, mounted on a suitable support and having the opening 6 in its top, the wire frame 10, mounted on the top of casing 4, over the opening 6, a cigar-delivery chute 13, mounted beneath the opening 6 and projecting through the side of casing 4, a traveling band 7, with spaced apertures 12, extending between opening 6 and the top of chute 13, over rollers 8, and having its ends wound about rollers 9 and 9' in casing 4, a train of gearing connected with the roller 9 and having a gear-wheel 22, terminating the gearing, with stop-pins 31, a chute 54 on the top of casing 4, with branch chutes 55 and 56, the opening of chute 54 into branch chute 56 having ledges 59, a tilting lever 47, projecting across chute 54, an electrical contact-maker consisting of lever 43, mounted on posts 42 on plate 41, secured to the top of casing 4, and having a counter-weighted arm rested upon a weighted arm 46' of lever 47, a contact-plate 46, normally out of contact with lever 43 and supported by a spring 45, mounted on an insulating-block 44 on plate 41, circuit-wires 5, leading from batteries 3 to spring 45 and plate 41, an electro-magnet 23, located in the circuit formed by wires 5, an armature 24, mounted on one end of a lever 25 and normally held out of engagement with the poles 23' of electro-magnet 23 by a coiled spring 27, attached to bracket 28, with a sliding tripping-pin 29, hinged to lever 25 and normally engaging a pin 31 on wheel 22, a train of gearing 32, connected with roller 9' and having a drum 36, and a spring-actuated drum 35, connected by a rope 36' with drum 36 and having its ends wound on drums 35 and 36, substantially as shown and described.

408,933. MACHINE FOR REDUCING RAILS. WILLIAM SUBELL and THEODORE G. WOLF, Scranton, Pa. Filed July 9, 1888. Serial No. 316,992. (No model.)

Claim.—1. In a machine for reducing rails, the combination, with rollers, of guards and side guides held on the said guards, and both leading to the rollers, substantially as shown and described.

2. In a machine for reducing rails, the combination, with guards leading to the rollers, of side guides held on the said guards and conforming closely to the shape of the rail, substantially as shown and described.

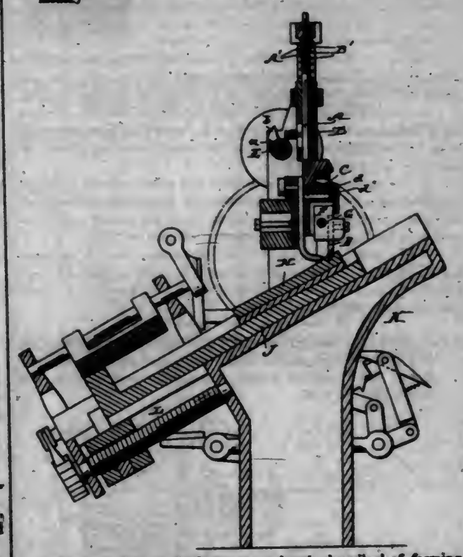
408,934. CAP. HERMAN SHEWARD, New York, N. Y. Filed Feb. 1, 1889. Serial No. 298,302. (No model.)

Claim.—As an improved article of manufacture, an article of head-wear having the material constituting the body extending in one continuous piece below the lower edge of the body to form ear-flaps, the said extension being turned up within the crown when not

408,934.

in use and having in its front portion a cut or slit 13, to the edges of which the stiffening of the visor is secured, as specified.

408,935. CLIP FOR SILVER-WARE CASES. HENRY SEMMET and WILLIAM SEMMET, Bayonne, N. J. Filed May 11, 1889. Serial No. 310,360. (No model.)



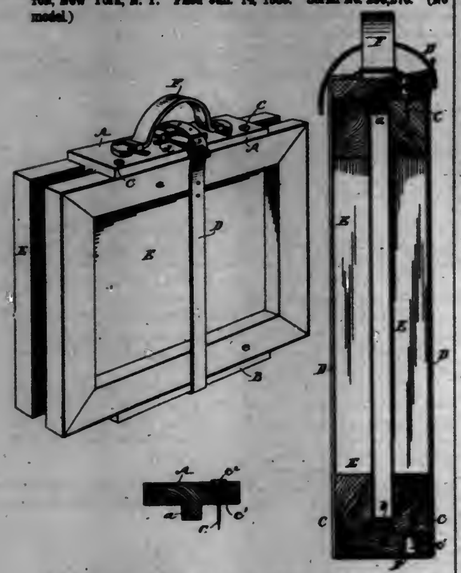
Claim.—1. The combination, with a block, of spring-strips bent to U form and having long and short legs, and a means for clamping the long legs to the side faces of the block, substantially as described.

2. The combination, with strips bent to form legs *a* and *b*, of a block and a clamping-bolt, substantially as described.

3. The combination, with a block, of strips formed with long and short legs, the long legs of the strips fitting against the side faces of the block, while the short legs overlap the upper face of the block, and a clamping-bolt, substantially as described.

4. The combination, with a block, of strips formed with long and short legs, the long legs resting against the side faces of the block and the short legs overlapping the upper face of the block, a clamping-bolt, a nut that is engaged by the bolt, and a washer through which the bolt passes, substantially as described.

408,936. METHOD OF FORMING TEETH OF RASPS. PHILIP S. STOKES, Freehold, N. J. Filed Mar. 16, 1889. Serial No. 303,503. (No model.)

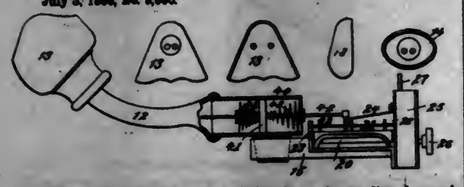


Claim.—1. The method or process herein described of forming teeth on rasp-blanks by machinery, which consists in starting the point by an initial blow delivered upon the punch and then lifting the body of the tooth by a subsequent blow or a series of blows, substantially as described.

2. The method or process herein described of forming teeth on rasp-blanks, which consists in starting the point by an initial blow delivered upon the punch and then forming the body of the tooth by a subsequent blow or series of blows, the punch being at the same time swung back at the top, substantially as and for the purposes set forth.

3. The process of forming the teeth upon rasp-blanks, which consists in starting the point of each tooth by an initial blow delivered upon the punch, the blow being accurately gaged to the same force or power for each tooth, and then lifting the body of each tooth by a subsequent blow or series of blows on the punch, this or these subsequent blows being also accurately gaged to the same force or power for each tooth, whereby the teeth of the rasp are made uniform, substantially as described.

408,937. ARTIST'S WET-CANVAS CARRIER. FREDERICK D. SUTTON, New York, N. Y. Filed Jan. 14, 1889. Serial No. 296,276. (No model.)



Claim.—1. The combination, in an artist's wet-canvas carrier, of opposing clamp-plates having spacing-strips for separating two canvases, and a strap or binding device, substantially as herein set forth.

2. The combination, in an artist's wet-canvas carrier, of opposing clamp-plates having spacing-strips for separating two canvases, a strap or binding device, and a handle at one of the clamp-plates, substantially as herein set forth.

3. The combination, in an artist's wet-canvas carrier, of opposing clamp-plates having spacing-strips for separating two canvases, said plates provided with pins entering one of the canvas-frames, and a strap or binding device, substantially as herein set forth.

4. The combination, in an artist's wet-canvas carrier, of opposing clamp-plates A B, provided, respectively, with spacing-strips *a b*, pins C, set into the plates, a binding-strap D, and a handle F, arranged and operating substantially as herein set forth.

408,938. APPARATUS FOR RECORDING THE RESPIRATIONS OF THE BODY. KHURSHED M. TATA, Havaret, near Bombay, India. Filed Oct. 16, 1888. Serial No. 288,236. (No model.) Patented in England July 3, 1888, No. 9,660.

Claim.—1. An instrument for indicating and recording the respirations of the body, comprising a tube provided with a mouth or nose piece, a vibratory body connected to the tube and adapted to be operated by the breath of the patient, a needle connected to and operated by the said vibratory body, and a strip of paper traveling under the end of the needle, substantially as described.

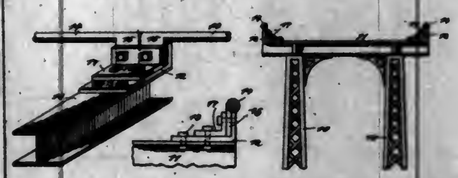
2. An instrument for indicating and recording the respirations of the body, comprising a tube provided with a mouth or nose piece, a vibratory body connected to the tube adapted to be operated by the breath of the patient, a needle connected to the vibratory body and operated thereby, a strip of paper under the end of the needle, and rollers between which the strip of paper travels, substantially as described.

3. An instrument for indicating the respirations of the body, comprising a tube provided with a mouth-piece, a needle held to slide in bearings in the tube, a diaphragm secured to the needle, and springs surrounding the needle on opposite sides of the diaphragm, substantially as herein shown and described.

4. An instrument for indicating and recording the respirations of the body, comprising a tube having a mouth or nose piece, a needle sliding in bearings in the tube and projecting from one end of the same, a diaphragm secured on the needle, springs on opposite sides of the diaphragm and surrounding the needle, and paper-feeding mechanism arranged for feeding a strip of paper under the end of the needle, substantially as described.

5. In an instrument for indicating and recording the respirations of the body, the tube 40, having the mouth or nose section 12 attached thereto, the needle 42, sliding in bearings in the tube 40, the diaphragm 41, secured on the needle, and the springs 43 on opposite sides of the diaphragm, in combination with the section 15, secured to the tube 40, the paper-feeding rollers 20 and 22, mounted on the said section 15, and the spring 24, for holding the upper roller in contact with the lower roller, substantially as herein shown and described.

408,939. OYSTER-OPENING IMPLEMENT. GEORGE W. TREDWELL, Sag Harbor, N. Y. Filed May 4, 1889. Serial No. 309,568. (No model.)



Claim.—1. An oyster-opening implement consisting of two pivoted levers forming a handle and two pincher-like jaws and a knife or blade held detachably to one of the jaws, substantially as herein set forth.

2. The combination, in an oyster-opening implement, of two pivoted levers forming a handle and two pincher-like jaws and a knife or blade held detachably to one jaw, which has projections or teeth next the blade, substantially as herein set forth.

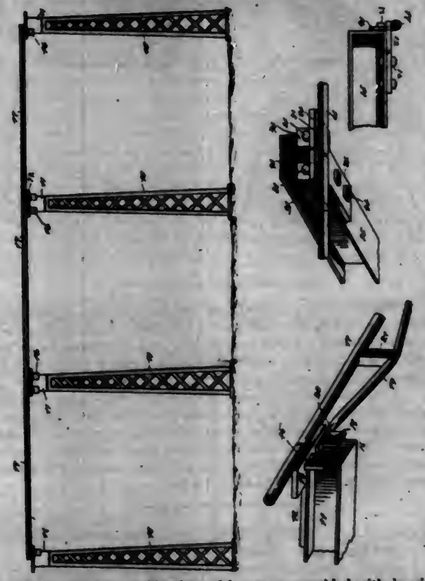
3. The combination, in an oyster-opening implement, of two levers A B, pivoted together at D and providing a handle and two jaws *a b*, and a blade C, held detachably to the jaw *a*, which has teeth E E next the blade, substantially as herein set forth.

4. The combination, in an oyster-opening implement, of two levers A B, pivoted together at D and providing a handle and two jaws *a b*, and a blade C, held to the jaw *a*, said jaw *a* having teeth E E, and the jaw *b* having teeth *c c c*, substantially as herein set forth.

408,940. FISH-PLATE AND JOINT. JOHN H. VALLEY, Jersey City, N. J. Filed Jan. 26, 1889. Serial No. 297,518. (No model.)

Claim.—1. The combination, with two fish-plates, each provided with an essentially vertical and a horizontal member, the horizontal members of which plates are connected, of a rail provided with a downwardly-extending lug integral with the inner face held between the vertical members of the fish-plates, and a bolt or equivalent device passed through the said vertical members and through the said lug, substantially as shown and described.

2. The combination, with two fish-plates, each provided with an essentially vertical and a horizontal member, the horizontal member of one plate being secured to the corresponding member of the other plate, of a rail provided with a downwardly-extending lug integral with the inner face of a length equivalent to the height of the vertical member of the lower plate, and a bolt or other equivalent fastening device passed through the vertical members of the plates and through the said lug, substantially as shown and described, whereby the lug is clamped between the plates and given a bearing upon both



the vertical and horizontal members of the under plate, substantially as shown and described, as and for the purposes specified.

3. The combination, with two fish-plates, each provided with an essentially vertical and a horizontal member, the horizontal member of one plate being secured to the corresponding member of the other plate, of a rail provided with a downwardly-extending lug integral with the inner face of a length equivalent to the height of the vertical member of the lower plate, and a bolt or equivalent device passed through the vertical members of the plates and through the said lug, substantially as shown and described, whereby the lug is clamped between the plates and given a bearing upon both the vertical and horizontal members of the under plate, substantially as and for the purpose specified.

4. The combination, with a fish-plate having a horizontal and vertical member, of a rail having a downwardly-extending lug formed integrally with it and arranged eccentric to its axis, and means for securing the parts together as shown, whereby the body of the rail overhangs and rests upon the vertical member of the plate and its lug bears upon the horizontal member of said plate, as specified.

5. The combination, with two angle fish-plates secured one upon the other, of a rail provided with a downwardly-extending integral lug upon the inner face entered between the vertical members of the said plates, and a bolt passed through the said vertical members and through the said lug, substantially as shown and described.

408,941. ELEVATED RAILROAD. JOHN H. VALLEY, Jersey City, N. J. Filed Jan. 26, 1889. Serial No. 297,519. (No model.)

Claim.—1. The combination, with a plate provided with longitudinal spaced slots near one end, of a rail provided with an essentially perpendicular lug integral with the inner face thereof, which lug is passed downward through one of the slots in the plate, substantially as and for the purpose specified.

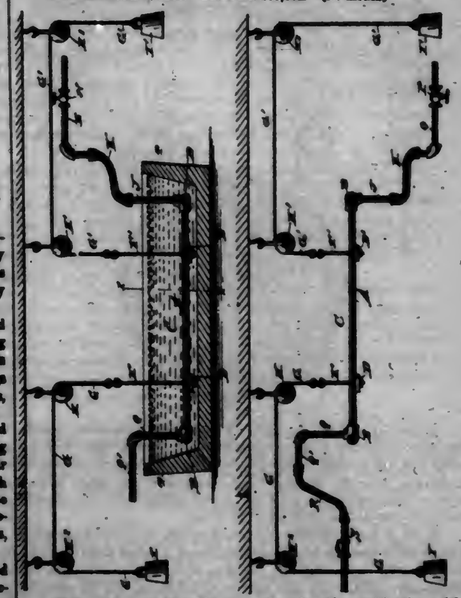
2. The combination, with a support and a plate extending beyond the support, provided with spaced longitudinal slots in the projecting end, of rail-sections provided at or near their extremities with an essentially perpendicular lug integral with the inner face, said lugs adapted to be passed downward through the slots in the said plates, substantially as shown and described.

3. The combination, with a support and a plate extending beyond the support, provided with spaced longitudinal slots in the projecting end attached to the said support, of rail-sections provided at or near their extremities with an essentially perpendicular lug integral with the inner face, said lugs adapted to be passed downward through the slots in the said plates, and means, substantially as shown and described, for securing the rail-lugs to the support below the plates, substantially as shown and described.

4. The combination, with a support and a T-plate rigidly secured to the same, provided with longitudinal spaced slots in the head-section, which head-section extends beyond the end of the support, of rail-sections provided with an essentially perpendicular lug integral with the inner face, passed through the said slots and secured to the ends of the supports, substantially as shown and described, whereby the front of the rail is made to rest upon the upper surface of the plate, and the front of the rail is also brought in vertical alignment with the outer end face of the plate, substantially as shown and described.

5. The combination, with a support, and a T-plate secured to the said support, having slots produced in the head-section, which head-section projects beyond the end of the support, of rail-sections provided with essentially perpendicular lugs integral with the inner face, passed downward through the slots in the plate, a truss of essentially even length with the rail-sections, having slotted ends to receive the rail-lugs below the T-plate, and bolts or other equivalent device for securing the rail-lugs to the end of the support below the truss extremity, substantially as shown and described, whereby the rail is strengthened at the center and the projecting end of the T-plate is supported, as set forth.

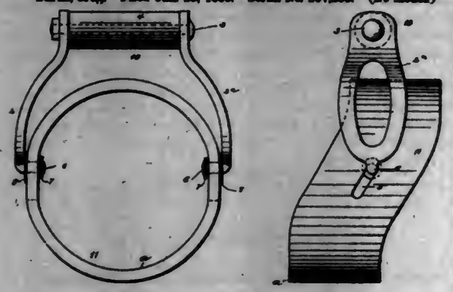
408,942. BRAKE FOR WHEELED VEHICLES. JOHN H. VALLEY, Jersey City, N. J. Filed Jan. 26, 1889. Serial No. 297,520. (No model.)



Claim.—1. The combination, with the carriage having a fixed abutment and a wheel arranged beneath the latter, of a conical brake-shoe which is arranged between them and slides lengthwise of said carriage, as shown and described.

2. The combination, with a carriage and peripherally-grooved wheels for supporting it upon a rail, and a brake-rod which extends lengthwise of the carriage and has a conical free end that works between the wheel and a fixed portion of the carriage, of a brake-lever pivoted to the carriage and connected with the brake-rod, as shown and described, to operate as specified.

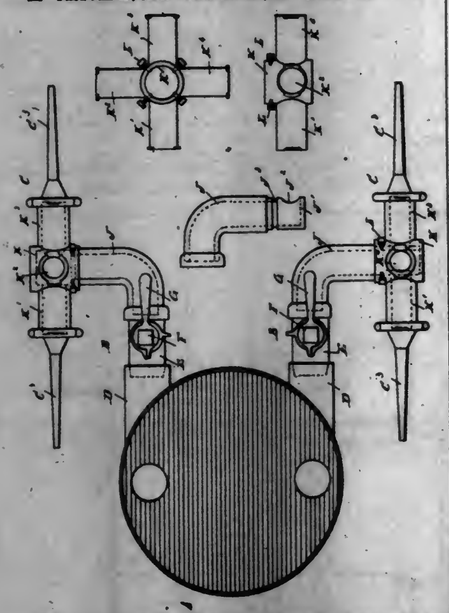
3. The combination, with a carriage and its two wheels arranged in line beneath fixed portions of the same, of a brake-lever pivoted between the wheels, and two brake-rods attached to the lever and having conical free ends which rest and slide on said wheels lengthwise of the carriage, as shown and described, whereby the lever operates both rods simultaneously in opposite directions for simultaneously applying or letting off the brakes, as specified.



408,948. DEVICE FOR COOLING MILK. JOHN W. WAGNER, Darien, Wis. Filed Jan. 7, 1889. Serial No. 296,672. (No model.)

Claim.—In a combined heater and cooler, the combination, with the coil of pipe C, provided with the clip-plates D D, the pipes J Q,

secured to the ends of the coil, and the flexible pipe K, connected to the pipe J, of the pulleys H H' H² H³, arranged above the coil, the rods F F', connected to the clip-plates, the ropes G G', secured to the said rods and passing over the pulleys, and the weights I I' on the ends of the ropes, substantially as herein shown and described.

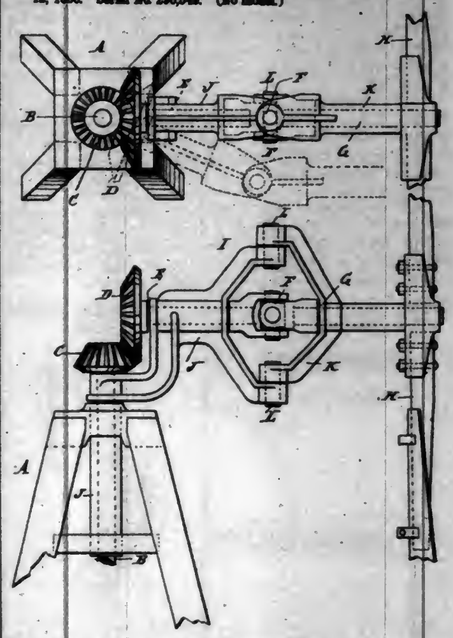


408,944. REVERSIBLE SAFETY-STIRRUP. JACOB G. WELCOME, Burns, Oreg. Filed Jan. 23, 1889. Serial No. 297,253. (No model.)

Claim.—1. The combination, with a yoke, of a ring or bow formed with diagonal slots in its opposite sides, said slots being adapted to receive the studs or projections carried by the yoke-arms and forming a stirrup, substantially as shown and described.

2. The combination, with a yoke 10, of a ring or bow 11, the body of which extends beyond the tread, the sides of the ring being provided with diagonal slots 5, adapted to receive the studs or projections 6, carried by the arms of the yoke, and forming a stirrup, substantially as shown and described.

408,945. SAUSAGE-STUFFER. FREDERICK W. WILDER, Chicago, Ill. Filed Jan. 28, 1889. Serial No. 297,818. (No model.)



Claim.—1. An attachment for sausage-stuffing machines, consisting in a pipe having a lateral opening and an annular groove at its outer end, and a rotary nozzle-carrier formed of a central collar having screws projecting through it into said groove, and radial hollow arms or tubes registering with said lateral opening when the nozzle-carrier is rotated, substantially as set forth.

2. In a sausage-stuffer, the combination, with the outlet-pipe having a side opening, of a nozzle comprising a hollow cross mounted to turn on the said outlet-pipe, the arms of the said cross registering alternately with the said side opening, and a funnel held on each of the said cross-arms, substantially as shown and described.

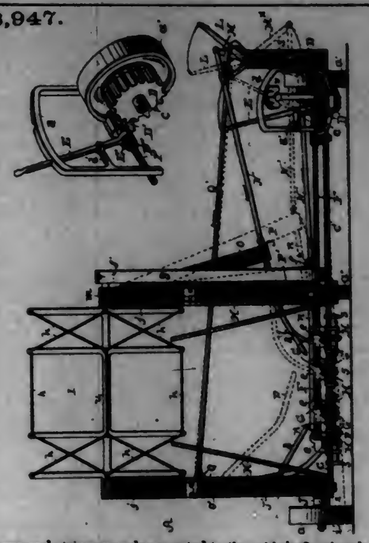
3. A sausage-stuffing machine consisting in the cylinder A, provided with an outlet B, comprising a pipe D, secured to the bottom of the vessel, and a short pipe E, having a valve F, and the pipe J, connected with the outer end of the pipe F and provided at its outer end with a lateral opening and a rotary nozzle-carrier having a series of detachable nozzles C², substantially as set forth.

408,946. WINDMILL. ROLLIN WORMLEY, Newark, Ill. Filed Nov. 12, 1888. Serial No. 290,549. (No model.)

Claim.—1. In a windmill, the combination, with a wind-wheel frame mounted to turn and made in two parts hinged together, of a wind-wheel shaft mounted to turn in the said wind-wheel frame, and also made in two parts universally jointed together in line with the frame-joint, substantially as shown and described.

2. In a windmill, the combination, with a wind-wheel, of a wind-wheel shaft mounted to turn and made in two parts universally jointed together, a wind-wheel frame mounted to swing and made in two parts hinged together in line with the universal joint, and means, substantially as described, for transmitting the rotary motion of the wind-wheel shaft to the power-shaft, as set forth.

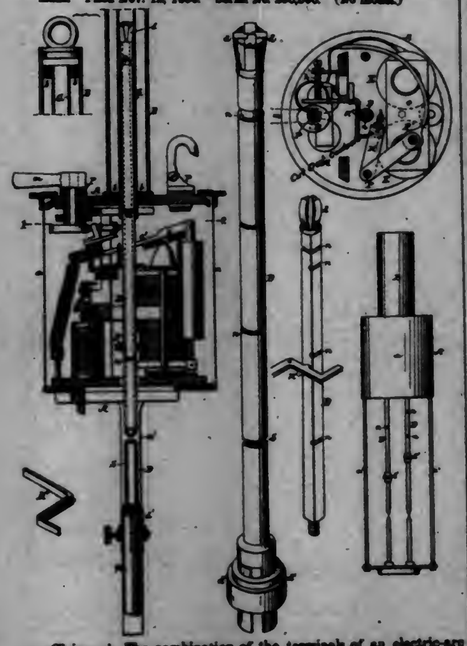
408,947. CORN-HARVESTER. JOHN ARMSTRONG, Vine Creek, Kans. Filed Mar. 9, 1889. Serial No. 302,633. (No model.)



Claim.—1. A corn-harvester having the reel consisting of opposite middle bars and end bars, the middle bars having the connections between outer ends of the same extending at right angles therewith and parallel with the axis and the connections between the outer ends of the middle bars and the outer ends of the end bars crossing each other, substantially as specified.

2. The combination of the stalk-receiving arms with their head or cross-bar suspended by pivoted bars, the strippers connected to a pivoted bail, the additional stalk-receiving arms having their shaft supported upon the carrying-frame, and the hand-lever fixed to a shaft connected by rods and bell-cranks to said strippers and both of said series of stalk-receiving arms, substantially as specified.

3. In a corn-harvester, the combination of the horizontal receiving-arms secured to a head which is suspended by swinging bars, the carved strippers secured to a swinging bail, and the operating-lever provided with a shaft having oppositely-extending arms, which are respectively connected to the bail and the head of the receiving-arms, substantially as specified.



4. In a corn-harvester, the receiving-arms having a head P, which is carried by swinging bars, the strippers affixed to a swinging bail, and the shaft provided with lateral oppositely-extending arms, which are connected to the bail and the head P, whereby the said receiving-arms and strippers are simultaneously operated in opposite directions, in combination with additional receiving-arms suspended opposite to said arms and strippers and connected to the said shaft, whereby they swing in the same direction as the strippers, substantially as specified.

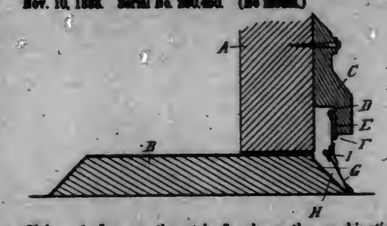
408,947.

5. In a corn-harvester, the combination, with the supporting-frame having front uprights *j j* and rear uprights *j' j'*, of the longitudinal shafts *o'* and *m*, journaled in said uprights on opposite sides and in rear of the cutters, a series of swinging receiving-arms suspended from the shaft *m* and connected to an operating-shaft, a series of receiving-arms *p*, suspended from the shaft *o'* and connected to said operating-shaft, whereby the opposite series of receiving-arms move simultaneously in opposite directions, and the swinging strippers suspended from the shaft *m* and connected to the said operating-shaft to move simultaneously in the same direction as the arms *p*, substantially as specified.

408,948. ELECTRIC-ARC LAMP. WILLIAM H. BARKER, Lawrence, Kans. Filed Nov. 12, 1888. Serial No. 290,590. (No model.)

Claim.—1. The combination of the terminals of an electric-arc lamp with a cut-out having contacts one in connection with one terminal and the other with the other terminal, and the positive-carbon-carrying rod having at intervals, corresponding with the lengths of time the carbon is to burn, means, substantially as described, for closing the cut-out.

2. The combination of the terminals of an electric-arc lamp with a cut-out having contacts one in connection with one terminal and the other with the other terminal, and the carbon-carrying rod having at intervals notches into which the movable part of the cut-out can enter to automatically cut out the lamp, substantially as set forth.



3. The combination of the terminals of an electric-arc lamp with a cut-out having contacts one in connection with one terminal and the other with the other terminal, and a carbon-carrying rod having at intervals on one side notches into which the movable part of the cut-out can enter to short-circuit the lamp, substantially as specified.

4. The positive-carbon-carrying rod of an arc-lamp having an insulating-cover.

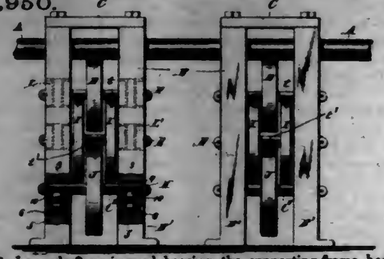
5. The combination of the terminals of an electric arc lamp with a cut-out having contacts and a carbon-carrying rod having an insulating-cover with notches at intervals, into which the movable part of the cut-out can enter to short-circuit the lamp, substantially as specified.

6. The combination of the frame of an arc lamp having a conductor-tube with the movable carbon-carrying rod having a contact-brush at its upper end and having on its main body an insulating-cover.

408,949. WEATHER-STRIP. JOHN BOSSHARD, Lima, Ohio. Filed Nov. 10, 1888. Serial No. 290,450. (No model.)

Claim.—1. In a weather-strip for doors, the combination, with the door and door-sill, of two tilting slats, one carried by the door and normally inclined from its vertical position, and the other being located on the outer inclined face of the door-sill and provided with an arm projecting into the path of the tilting slat carried by the door, the tilting slats co-operating to form a lap-joint, substantially as and for the purpose described.

2. In a weather-strip for doors, the combination, with the door and door-sill, of the molding C, provided with the recess D, the tilting slat E, hinged to the lower edge of said molding and being normally inclined by the action of its gravity, the tilting slat G, hinged or pivotally secured at its lower edge and projecting upwardly upon the outer inclined face of the door-sill, and the arm I, projecting into the path of the tilting slat E, the parts being arranged to operate substantially as and for the purpose described.



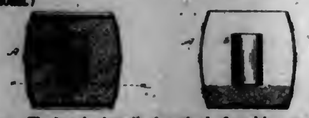
3. In a weather-strip for doors, the combination, with the door, of the molding C, provided with the recess D, the tilting slat E, hinged to the lower edge of said molding and projecting partly within said recess and partly below the molding and normally inclined by the action of its gravity, the door-sill B, provided with the recess H, the tilting slat G, adapted to fold within said recess, and the arm I on that tilting slat projecting within the path of the tilting slat E, substantially as and for the purpose described.

4. In a weather-strip, the combination, with the door and door-sill, of two tilting slats, one carried by the door, and the other being located upon the sill of the door and provided with an arm projecting into the path of the tilting slat carried by the door, said tilting slats being normally inclined from the vertical position and adapted to be inclined to a substantially vertical position and form a lap-joint, substantially as and for the purpose described.

408,950. ANTI-FRICTION BEARING. WILLIAM C. BURTON and ELBERT M. GUERNSEY, Kansas City, Mo. Assignors of one-tenth to Frank Ridgeway, of same place. Filed May 14, 1888. Serial No. 310,714. (No model.)

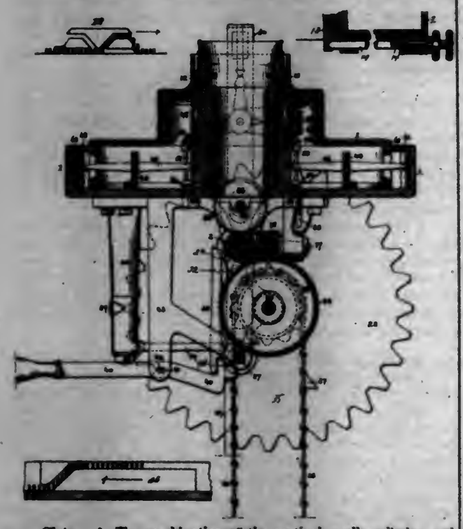
Claim.—1. The anti-friction bearing comprising the side pieces having the rectangular recesses, the boxes in said recesses having the vertical grooves at their ends and carrying the anti-friction rolls, the shafts *d d'*, supported on said anti-friction rolls and having the anti-friction wheels D I J, respectively, the guides or plates *e* in the vertical grooves at one end of the boxes and fitting in one end of the recesses, and the set-screws in the side pieces and having their inner ends bearing in the grooves of the boxes at the ends opposite the said plates *e*, substantially as described.

408,950.



2. In a shaft or journal bearing, the supporting-frame having boxes containing anti-frictional rolls and which boxes are held between a guide fitting in a groove at one end and by a set-screw bearing in a groove at the opposite end of the box, substantially as specified.

3. The improved shaft or journal bearing consisting of a frame having boxes containing anti-frictional rolls and anti-frictional wheels, said boxes also having anti-frictional rolls resting against the ends of the shafts of said wheels, substantially as specified.



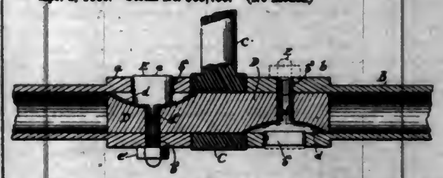
4. In a shaft or journal bearing, the supporting-frame having a series of anti-frictional wheels, and slots or passages for the main shaft, and a series of journal-boxes supporting the shafts of said wheels, the shaft of the uppermost wheel resting upon the peripheries of the wheels next below, but at a point in rear of the shaft of the latter wheels, substantially as specified.

408,951. PROCESS OF PACKING ROOFING COMPOSITION. CORNELIUS S. BUSHNELL, New Haven, Conn., assignor to the Everlasting Roofing Company, same place. Filed Nov. 5, 1888. Serial No. 289,951. (No model.)

Claim.—The herein-described method of packing composition for roofing and other purposes for shipment, which consists in placing the base material in the shipping-case, introducing therein a tubular jacket to form a chamber surrounded by said base material, then pouring the ingredients with which the base is to be mixed into said chamber while heated and in a semi-liquid condition, then, before the ingredients have completely set, removing the jacket, leaving the said ingredients in the chamber, the walls of which are the base material with which the ingredients are to be mixed, substantially as described.

408,952. CIRCULAR-KNITTING MACHINE. WALTER D. BUTZ, Norristown, Pa. Filed Oct. 15, 1888. Serial No. 288,115. (No model.)

Claim.—1. The combination of the vertical needle-cylinder and its needles, the cam-cylinder and its cams for operating the needles radiating levers acting upon the needles to lower and raise them in the vertical grooves of the needle-cylinder into and out of operative position, segmental cams for operating the radiating levers, and means for intermittently moving said cams and operating the cam-cylinder, substantially as specified.



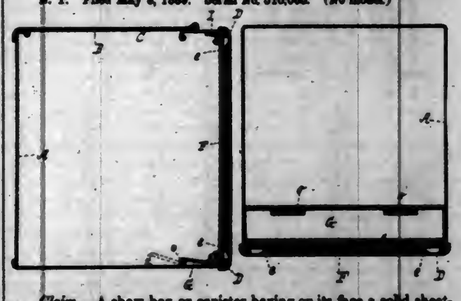
2. The combination of the needle-cylinder and its needles, the cam-cylinder and its cams for actuating the needles, means for operating said cam-cylinder, radiating levers for acting upon the needles to throw them into and out of operative position, segmental cams for acting on said levers, a vibrating lever having duplex pawls, and racks carried by the lever-operating cams and acted on by said pawls, said racks having high teeth for effecting the automatic shifting of the pawls, substantially as specified.

3. The combination of the needle-cylinder and its needles, the cam-cylinder having cams for acting on said needles, means for operating said cam-cylinder, radiating levers acting on the needles to throw them into and out of operative position, segmental cams for operating said levers, pawl-and-rack mechanism for operating said cams, and a rotating disk having cams for acting on the pawls to throw them into operative and inoperative position, all substantially specified.

4. The combination of the needle-cylinder and its needles, the cam-cylinder having cams for acting on said needles, means for operating said cam-cylinder, a supplementary cam-cylinder acting on a portion of the needles, a bolt for locking the main cam-cylinder and the supplementary cam-cylinder together, a cam for holding said bolt in the locking position, lifters for acting on the bolt to move it into the locking position, cams for operating said lifters, and means for actuating said cams, substantially as specified.

5. The combination of the driving-shaft of the machine having outer fast pulleys and intermediate loose pulleys, the duplex belt-shifter, a lever for operating said belt-shifter, a notched disk for acting on said lever, and means for intermittently moving said disk, all substantially as specified.

408,953. SHAFT-COUPLING. JOHN CHIVILL, Chicago, Ill., assignor to the Webster & Comstock Manufacturing Company, same place. Filed Apr. 2, 1889. Serial No. 305,733. (No model.)



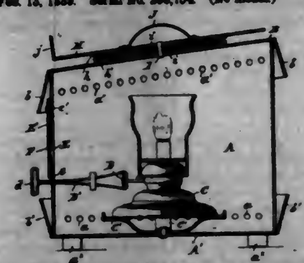
Claim.—1. In a shaft-coupling, the combination, with hollow shafts having longitudinal slots and bores, respectively, in their meeting ends, of an intervening hanger arranged between said ends, a coupling-shaft having longitudinal slots and bores to conform to the respective positions of the slots and bores in said hollow shafts, and bolts having flat heads adapted to fit within said slots and bores, substantially as shown and described.

2. The combination of a hanger, bored and slotted shafts A B, bored and slotted coupling-shaft D, and bolts E E, having elongated flattened heads, substantially as shown and described.

3. In a shaft-coupling, the combination of a hanger, hollow shafts provided with slots b^3 and bores b^4, a coupling-shaft having slots d d and bores d' d', and bolts E E, having flattened heads adapted to fit within said slots, substantially as shown and described.

408,954. BOX OR CANISTER. STEPHEN R. CORNELL, Brooklyn, N. Y. Filed May 8, 1889. Serial No. 310,063. (No model.)

Claim.—A show box or canister having on its face a solid sheet-metal frame with inwardly-inclined inner edges, each left free to preserve its elasticity, combined with a glass face-plate bearing against said inclined edges of the face-frame, and with elastic back-stops on the inside of the top and bottom of the box bearing against said glass plate to fasten the same, each of said stops extending the width of the box, and one being hinged to swing toward and from the glass plate, substantially as and for the purpose described.



408,955. CLOCK-PENDULUM. WALTER D. DAVIES, Brooklyn, N. Y. Filed Mar. 27, 1889. Serial No. 304,963. (Model.)

Claim.—1. The combination, with a pendulum, of a rotating figure or body having its axis of rotation horizontal and at right angles to the balance of oscillation of the pendulum, substantially as herein described.

2. The combination, with a pendulum, of a rotary spindle or arbor supported in the pendulum, with its axis at right angles to the balance of oscillation of the pendulum, a figure or body mounted on said spindle or arbor, a ratchet-wheel fast on said spindle or arbor, and a pawl pivoted to the pendulum and engaging with said ratchet-wheel, substantially as and for the purpose herein set forth.

408,956. FOOT-WARMER. HELSEY H. DAWSON, Oak Hill, Kans. Filed Feb. 13, 1889. Serial No. 299,754. (No model.)

Claim.—1. In a foot-warmer, the combination, with an inclosing-box, of a lamp provided with a regulator, and a removable spring-clip engaging with said regulator and projecting through an aperture in the side of the box, substantially as and for the purpose set forth.

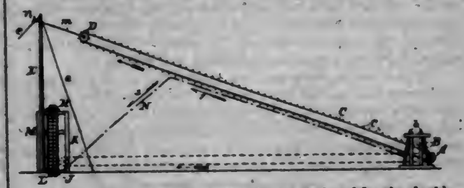
2. In a foot-warmer, the combination, with an inclosing-box, of a lamp provided with a regulator, a removable clip secured to said regulator, a hand-hole in the side of the box, having a notch in its edge for the clip to project through, and a cover for the said hand-hole, pivoted to the box and provided with a window, substantially as and for the purpose set forth.

3. In a foot-warmer, the combination, with an inclosing-box, of a lamp, a removable cover for the box above the lamp, a series of plates secured to the cover, and washers interposed between said plates and forming air-spaces between them, substantially as and for the purpose set forth.

408,957. APPARATUS FOR CONVEYING COAL AND DISCHARGING THE SAME IN PILES. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Naugatuck, Conn. Filed Oct. 20, 1887. Serial No. 252,847. (No model.)

Claim.—1. An apparatus for piling up or building storage-heaps of coal and other analogous materials, composed of the following-named instrumentalities, viz: first, an endless chain provided with flights *c* and arranged obliquely to the surface on which the pile is to be built; second, the chain-wheels over which said chain is headed and by means of one of which it is driven; third, some suitable means for supporting the lower one of said chain-wheels in close proximity to the point at which the material to be built up into a storage-heap is to be supplied and for supporting the other one at a much higher elevation, and, fourth, means for imparting power to one of the said chain-wheels, these several instrumentalities being arranged and operating together as specified, so that the coal or other material continuously supplied to the ground-surface at the vicinity of the lowermost portion of the obliquely-arranged flighted chain will be

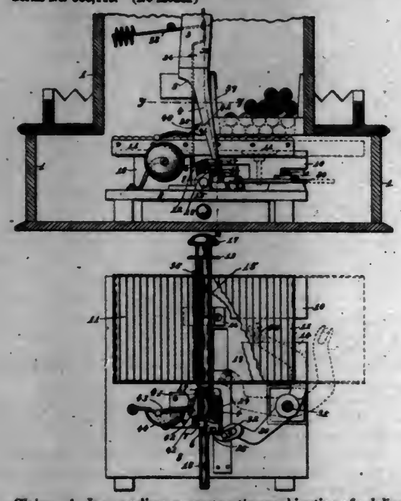
408,957.



carried along by the flights of said chain and accumulated or built up into a pyramidal heap, substantially as hereinbefore set forth.

2. In combination with the suspended endless-chain conveyer, an aerial or suspended idler or idlers for supporting the upper run of the chain, and suitable cables, with which the ends of the shaft or shafts of such idler or idlers are connected and by which they are properly supported at a suitable elevation, all substantially in the manner and for the purpose hereinbefore set forth.

3. In an apparatus for amassing or piling up coal, composed, essentially, of an endless flighted chain mounted on suitable wheels, with one end of its double run in close proximity to the ground at the point or source of supply of the material and its other end supported at a much higher elevation, and suitable means for maintaining the uppermost end of said flighted chain in its designed position, the combination, with said obliquely-arranged flighted chain, of a drive-wheel which is located at the uppermost end thereof, a supporting pole or frame E, on which is supported the shaft of said drive-wheel, and a drive belt or chain which extends from the wheel on said shaft obliquely downward in an opposite direction to that in which runs from said wheel the flighted chain, and which has its lowermost portion connected with the drive-wheel of a suitable engine, all in such manner, as described, that the draft-strain of the said drive-belt directly counteracts the draft-strain of the coal-piling flighted chain.



408,958. CHAIN CONVEYER FOR FORMING AND REMOVING PILES OF COAL. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Naugatuck, Conn. Filed Dec. 26, 1887. Serial No. 258,854. (No model.)

Claim.—In an apparatus or contrivance designed for the double purpose of forming or making and also removing a storage-pile of coal or other like material, the combination, with the obliquely-arranged endless chain or cable provided with flights *c*, driven in only one direction of travel and vertically adjustable at its highermost portion only, the chain-wheels over which said chain is headed and by means of one of which it is driven, some suitable means for supporting the lower one of said chain-wheels in proximity to a point to which the material to be built up into a storage-heap is to be supplied and for supporting the other one at a much higher elevation, and means for imparting power to one of said chain-wheels, of a

transversely-arranged ordinary trough conveyer located in a plane about coincident with that in which may lie the base of the pile of material to be removed, and in such relationship to the perimeter of the base of the pile and to the said obliquely-arranged, adjustable, and flighted chain or cable as to receive and carry off the material of the accumulated pile as fast as fed to it by the action of the said obliquely-arranged flighted chain or cable, the said combination being and operating in substantially the manner hereinbefore set forth.

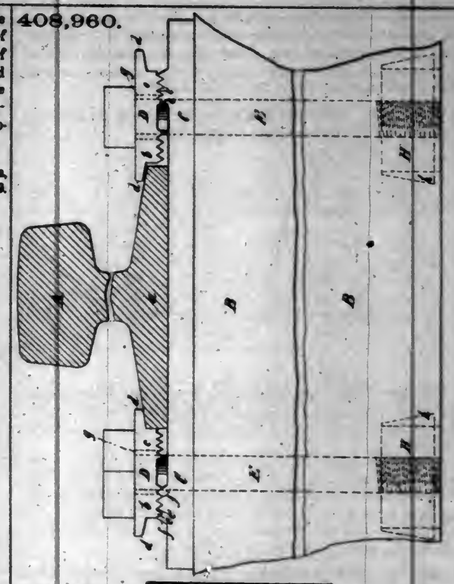
408,959. **VENDING APPARATUS.** WILLIAM C. DOUBLEDAY, Lima, Ohio, assignor to Bertha C. Doubleday, same place. Filed Feb. 16, 1889. Serial No. 300,119. (No model.)

Claim.—1. In a vending apparatus, the combination of a delivery-slide, a carrier, and a lever arranged out of the path of and connected with said carrier, and the slide for moving the carrier at right angles to and simultaneously with the movement of the slide, substantially as described.

2. In a vending apparatus, the combination of a delivery-slide, a carrier, and a lever fulcrumed at an intermediate point of its length and arranged out of the path of the slide and carrier, said lever being connected at its ends to the slide and carrier, substantially as described.

3. In a vending apparatus, the combination of a delivery-slide, a carrier, and a lever arranged laterally of the slide and carrier and connected at its extremities by a pin-and-slot connection with the slide and carrier, substantially as and for the purpose described.

4. In a vending apparatus, the combination of a carrier-rod having a delivery-slide fixed thereto, a coin-holder rigid with said rod and projecting laterally thereof, a fixed guide in which said carrier-rod operates, and a coin-tube fixed to the guide, substantially as described, for the purpose set forth.



5. In a vending apparatus, the combination of the fixed guides, a vertical coin-tube fixed to one of the guides, an endwise-movable carrier-rod working in said guides and carrying a delivery-slide, a coin-holder rigid with said rod and projecting laterally thereof to clear the rear guide and align with the coin-tube, and a coinway arranged above said coin-tube, substantially as described.

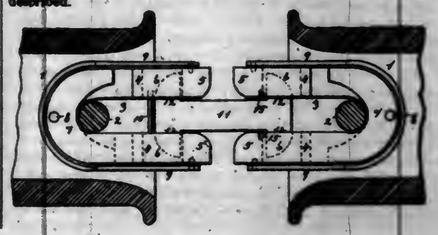
6. In a vending apparatus, the combination of the fixed guide, a coin-tube fixed to said head, a carrier-rod carrying the delivery-slide and working in the guide, a coin-holder rigid with the carrier-rod and projecting laterally thereof and having the raised shoulder, and a detent pivoted to the head of the guide and adapted to engage with the shoulder of the coin-holder, substantially as described.

408,960. **RAILWAY-TIE PLATE.** PLEMMON H. DUDLEY, New York, N. Y. Filed Apr. 4, 1889. Serial No. 305,992. (No model.)

Claim.—The combination, with a railway-rail, of a tie, a tie-plate provided upon its upper side near its ends with projections and intermediate grooves or recesses, and reversible securing devices provided upon their under sides and near opposite ends with projections and intermediate grooves or recesses adapted to engage the projections and grooves or recesses upon the tie-plate, the projections upon one of the sides of the securing devices being arranged farther inward from the edges of the securing devices than those upon the other side, substantially as specified.

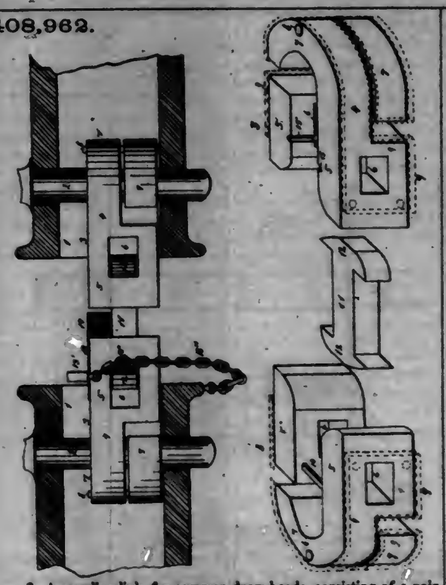
408,960.

408,961. **CARRIAGE-POLE CRAB.** JAMES G. ENGLISH, New Haven, Conn. Filed June 17, 1889. Serial No. 314,614. (No model.)



Claim.—1. A carriage-pole crab consisting of the socket A and arms B B, projecting therefrom, the said socket adapted to set onto and oscillated upon the end of the pole, the inner surface of the socket and the surface of the pole upon which the socket oscillates, the one constructed with an annular groove *a*, having a longitudinal opening *b* into it, and the other provided with a stud *d*, corresponding to said groove and adapted to enter said groove through the said opening, the said opening and stud being at substantially opposite points when the crab is on the pole, substantially as specified.

2. The combination of the socket A, having laterally-projecting arms B B, with the metal tip D, adapted to be attached to the end of a carriage-pole, the exterior surface of said tip of a shape corresponding to the inner surface of the socket, and upon which tip the socket with its arms may oscillate, the socket and tip being the one constructed with an annular groove *a*, having a longitudinal opening *b* into it, and the other with a corresponding stud *d*, substantially as and for the purpose described.



408,962. **CAR-COUPLING LINK.** CHARLES W. FISHBURN, Janesville, Wis. Filed June 6, 1888. Serial No. 312,688. (No model.)

Claim.—1. An automatically-coupling link for common draw-heads, consisting of two pairs of spring-actuated jaws, and a coupling-bar adapted to have its shouldered ends engaged by said jaws, substantially as described.

2. In combination with two common draw-heads and coupling-pins, a link composed of two pairs of spring-actuated jaws, a coupling-bar having its shouldered ends engaged by said jaws, one of said pairs of jaws having a transverse pin near their outer ends, substantially as described.

408,962.

3. A coupling-link for common draw-heads, consisting of a pair of spring-actuated jaws having a transverse pin near their outer ends, a pair of opposite spring-actuated jaws, and a coupling-bar having its shouldered ends engaged by said jaws, substantially as described.

4. An automatically-coupling link for common draw-heads, consisting of two pairs of jaws having recesses in their inner sides of their outer portions and hooked inner ends pivoted together, springs secured to the sides of said jaws, and a coupling-bar having its shouldered ends engaged by the recesses of said jaws, substantially as described.

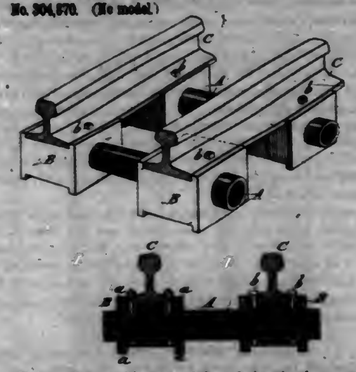
5. An automatically-coupling link for common draw-heads, consisting of a pair of jaws 4, having broad side portions 5, formed with holes or recesses 6, and hook-shaped rear ends curved in opposite directions and pivoted together by a pin 8, a similar pair of jaws having a transverse pin 10 secured to the inner side of one jaw, springs 9 secured to the broad side portions of said pairs of jaws and bearing against their hooked ends, and a coupling-bar having shouldered cross-heads at its ends for engaging the recesses of said jaws, substantially as described.

6. In combination with two common draw-heads and coupling-pins, and a link secured in said draw-heads by said pins and composed of two pairs of spring-actuated jaws having recesses in their inner sides and having notches in the inner sides of one pair of jaws and of a bar having two cross-heads engaging the recesses of said jaws, a piece or bar 13, having a cross-head 14 at one end, formed with a curved forward edge and adapted to bear with its inner end in one pair of jaws and to enter between and spread apart the opposite pair of jaws and to engage the notches of said jaws with the ends of its cross-head, substantially as described.

7. In combination with two common draw-heads and coupling-pins, and a link secured in said draw-heads by said pins and composed of two pairs of spring-actuated jaws having recesses in their inner sides and having notches in the inner sides of one pair of jaws, and of a bar having two cross-heads engaging the recesses of said jaws, a piece or bar 13, having a cross-head 14 at one end and formed with a curved forward edge, and a cross-bar 15' at the other end, and a chain attached to said piece or bar and to the car, said piece or bar being adapted to rest between one pair of jaws to bear against the draw-head with its cross-bar, to enter between and spread apart the opposite pair of jaws and to engage the notches of said jaws, substantially as described.

408,963. **LIGHT FOR STOVE-DOORS.** JOHN T. FLEMERSHEIT, Baltimore, Md., assignor of one-half to Samuel B. Sexton, Jr., same place. Filed Feb. 16, 1889. Serial No. 300,144. (No model.)

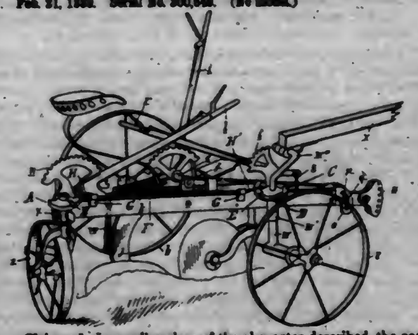
Claim.—1. As a new article, a sheet of mica having affixed to its outside surface a colored glass jewel, substantially as and for the purpose specified.



408,963.

2. In combination with a sheet of mica, a glass jewel placed against its outer side and a ring which surrounds the said jewel, having prongs which pass through slits in the said sheet and are turned radially inward, substantially as and for the purpose specified.

408,964. **METALLIC RAILWAY-TIE.** WALTER T. FORBES, Atlanta, and ROBERT C. KIER, Augusta, Ga. Filed Mar. 30, 1889. Serial No. 304,870. (No model.)



Claim.—The combination of the tubular tie, the reversible chair, the rails supported by said chair, and the bolts passing through the rail-base and chair into the tie for the purpose of securing the several parts together, substantially as and for the purpose set forth.

408,965. **FERRULE FOR UMBRELLAS AND CANES.** JOHN A. FREEMAN, Newark, N. J., assignor to the Celluloid Novelty Company, of New York. Filed Apr. 25, 1889. Serial No. 308,506. (No model.)

Claim.—As a new article of manufacture, a tip or ferrule composed of a cap of celluloid or similar pyroxyline material with a metal slug embedded therein, as and for the purposes set forth.

408,966. **SULKY-PLOW.** AUGUSTUS I. GALE, Albion, Mich. Filed Feb. 21, 1889. Serial No. 300,849. (No model.)

Claim.—1. In a sulky-plow of the character described, the combination, with the plow-frame and the plow-beam supported thereon, of the front and rear guides provided therefor on the plow-frame, and in which the front and rear ends of said plow-beam are vertically and independently adjustable, and the vertical slots in the front guide into which lateral projections of the plow-beam engage, substantially as described.

2. In a sulky-plow of the character described, the combination,

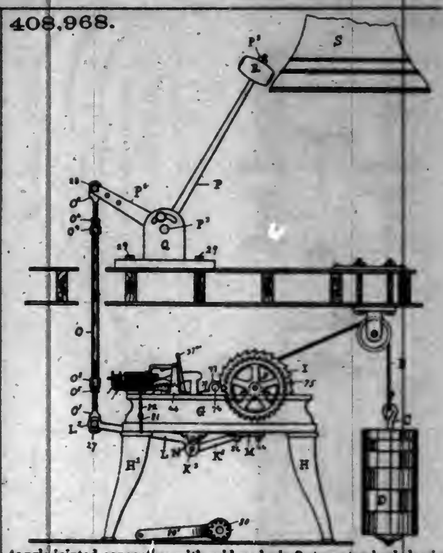
with the plow-frame and the plow-beam supported thereon, of the front and rear guides provided therefor on the plow-frame, and in which the front and rear ends of said plow-beam are vertically and independently adjustable, the vertical slots in said front guide in which a transverse pin or equivalent lateral offset on the plow-beam engages, and a draft attachment applied to the front end of said plow-beam, substantially as described.

3. In a sulky-plow of the character described, the combination of the parts *a*, *b*, and *c* of the plow-frame, the vertically-adjustable plow-beam *j*, the rear guide *k* of the plow-beam, the front guide *o* of the plow-beam, provided with the slots *p*, the transverse pin *q* of the plow-beam engaging therein, and the adjusting devices applied to the front and rear ends of the plow-beam, substantially as described.

4. In a sulky-plow of the character described, the combination, with the front guide-wheel controlled by the pole, of a rear supporting caster-wheel with the locking device controlled by the front guide-wheel and consisting of the notched disks mounted on the vertical shafts or pintles of said wheels and the rock-shaft extending between and provided with the rock-arms resting loosely upon and adapted to engage with the notches of said disks, substantially as described.

5. In a sulky-plow of the character described, the combination, with the front guide-wheel *v*, controlled by the guide-pole, of the caster-wheel *z*, the disks A and C, secured to the vertical shafts or pintles on which the said wheels are adapted to turn, the notches B and D, formed, respectively, in said disks, the inclines E on the notch D, and the rock-shaft F, provided with the rock-arms H and H', resting loosely upon and adapted to engage into these notches, substantially as and for the purpose described.

6. In a sulky-plow, the combination, with the front guide-wheel controlled by the guide-pole, the caster-wheel, and the disks C and A on the shafts or pintles of said wheels, and formed upon their upper faces with notches, as shown, of the rock-shaft F, journaled in bearings G and having its ends bent to form the rock-arms H H', which rest loosely upon the tops of said disks and adapted to engage the notches therein, substantially as shown and described.



408,967. TABLE-LEAF SUPPORT. JOEL G. GARRETSON, Buffalo, N. Y. Filed Oct. 26, 1886. Serial No. 217,276. (No model.)

Claim.—In a table-leaf support, the combination, with the arm *f*, provided with branches *g g*, and a locking-bolt H, attached to the arm *f*, of the arm *f''*, pivoted to the branches *g g* and provided with an extension I, having a curved lower edge i^2, whereby the locking-bolt is moved out of the way of the lower arm *f''* in unfolding the arms, substantially as set forth.

408,968. ELECTRO-MECHANICAL BELL-STRIKING MACHINE. THOMAS F. GAYNOR, Louisville, Ky., assignor to the Gaynor Electric Company, same place. Filed June 6, 1889. Serial No. 313,398. (No model.)

Claim.—1. In an electro-mechanical bell-striking machine, the combination of a main shaft having a winding-drum provided with a ratchet-wheel, a pallet-wheel provided with pivots carrying pawls adapted to engage with the teeth of said ratchet-wheel, and springs to keep said pawls engaged with said ratchet-wheel teeth, two pallets pivoted at one end to a main lever, the free ends of said pallets being adapted to engage with the teeth of said pallet-wheel and being provided with spurs, a pallet-rest adapted to support said spurs and guide said pallets against the teeth of said pallet-wheel, a main-lever shaft provided with bearings, a quadrant-shaped main lever pivoted upon said main-lever shaft and being provided with a pivot-hole at its free end, and having two stop projections and a rock-shaft restoring-stud, two pawls adapted to engage with said main-lever stop projections, a tripping-lever adapted to trip said pawls, being provided with a restoring tail-piece and a spring-stud, a tripping-lever mainspring, a mainspring-lever provided with a mainspring-stud and pivoted at one end and provided with a link-arm, a bracket having bearings in which said mainspring-lever is pivoted, links connecting said tripping-lever to the arm of said spring-lever, a trigger-lever pivoted upon a stud in said spring-lever bracket and having a notch adapted to engage with the end of said tripping-lever, a trigger-lever spring connected with said trigger-lever and a stud in said spring-lever bracket, a rock-shaft provided with two journals and having thereon a cam, a restoring-lever, an escapement-lever provided with an escapement-pin at its free end and a limiting-lever, an adjustable tension-spring having a

toggle-jointed connection with said rock-shaft, two standards having bearings for the journals of said rock-shaft, an electro-magnet provided with screws for adjustment and support, an armature-carrier having escapement-pallets and an armature, a winding-gear fitted upon the main shaft of the machine, a winding-pinion provided with a crank-handle, and a pinion-stud which is secured to the bed of the machine, so as to support said pinion in gear with said winding-gear, all of which are mounted upon a suitable bed provided with legs, substantially as described.

2. In an electro-mechanical bell-striking machine provided with a winding-drum shaft, a winding-drum, a pallet-wheel, a main lever, and pallets pivoted thereto and adapted to engage with the teeth of said pallet-wheel, the combination of a quadrant-shaped extension to said main lever having stop projections thereon, two pawls adapted to engage with said stop projections, a pivoted tripping-lever provided with a mainspring, a pivot-shaft upon which said pawls and tripping-lever are pivoted, and a trigger-lever adapted to engage with the end of said tripping-lever and provided with a spring, substantially as described.

3. In an electro-mechanical bell-striking machine provided with a winding-drum shaft, a winding-drum, a pallet-wheel, a main lever, and pallets pivoted thereto and adapted to engage in said pallet-wheel, the combination of an arc-shaped extension to said main lever carrying a restoring-lever stud, a restoring-lever pivoted upon said stud and being provided with a restoring-pin at its free end, a guide-lever pivoted at one end and carrying said restoring-pin, a tripping-lever pivoted at one end and provided with a restoring tail-piece, a shaft upon which said guide-lever and tripping-lever are pivoted, and a pivoted trigger-lever provided with a notch adapted to engage with the end of said tripping-lever and having a spring, substantially as specified.

4. In an electro-mechanical bell-striking machine provided with a winding-drum shaft, a winding-drum, a pallet-wheel, a main lever, and pallets pivoted thereto and adapted to engage in said pallet-wheel, the combination therewith of a quadrant-shaped main-lever extension having stop projections thereon and a rock-shaft restoring-pin, two pivoted pawls adapted to engage with said stop projections, a pivoted tripping-lever provided with a mainspring-pin and a mainspring, a pivoted trigger-lever having a notch adapted to engage with the end of said tripping-lever and being provided with a spring, a rock-shaft provided with a cam adapted to release said trigger-lever from its engagement with said tripping-lever, and being provided with an escapement-lever carrying an escapement-pin adapted to engage with the escapement-pallets on the free end of an armature-carrier of an electro-magnet, and being provided with a toggle-jointed connection to an adjustable tension-spring, and being provided with a limiting-lever adapted to limit its rotation, and being provided with a restoring-lever, which, by coming in contact with a restoring-lever stud in said quadrant-extension of said main lever, restores the rock-shaft mechanism to its normal position, substantially as specified.

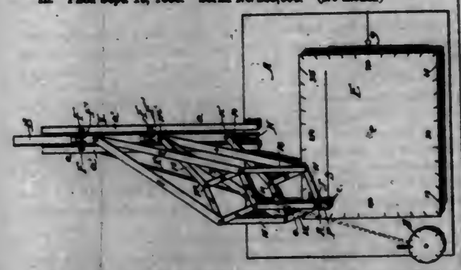
5. In an electro-mechanical bell-striking machine having a rock-shaft provided with a cam adapted to release the trigger mechanism of said machine, the combination, with said rock-shaft, of an adjustable tension-spring having a toggle-jointed connection therewith, substantially as specified.

6. In an electro-mechanical bell-striking machine having a main lever provided with stop mechanism adapted to be tripped by means of a pivoted tripping-lever, the combination, with said tripping-lever, of a spiral spring connected with the free end of said tripping-lever by means of a spring-pin, and a mainspring-lever, which is also connected to said mainspring by means of a pin, said spring being pivoted at one end and having an arm projecting from its pivot-shaft, which is linked by means of links and pins to the tripping-lever, substantially as described.

7. In an electro-mechanical bell-striking machine provided with a main-lever stop mechanism, a quadrant-shaped main lever provided with stop projections by which it is adapted to be locked in its normal position by said stop mechanism, substantially as specified.

8. In an electro-mechanical bell-striking machine having a main lever provided with stop mechanism, and having a tripping-lever adapted to release said main lever, and having a main spring-lever connected with said tripping-lever, the combination of said main-spring-lever with a lug having a hole therein, and a pin adapted to fit in said hole for the purpose of preventing the premature operation of the machine by an unexpected signal sent through the electro-magnet while the machine is being wound up, substantially as specified.

408,969. ROAD-CART. EPHAM H. GIBB, Indianapolis, Ind. Filed Jan. 18, 1889. Serial No. 296,751. (No model.)



Claim.—1. A foldable foot-rest for road-carts, its sides composed of flexible bands or straps, slats secured across and fastened to the same, the forward end of these straps secured near or to the cross-bar, the rear end adjustably fastened beneath the driver's seat, with means for securing the same at any desired height, substantially shown and described.

2. An adjustable and flexible foot-rest for road-carts, comprising the side straps 1 1, central strap 2, connected by cross-slats, the front ends of the side straps connected to the cross-bar, and the forward end of the central strap connected to the foot-rest, the rear ends of all these straps connected beneath the seat within easy reach of the driver's hands, with means for adjusting and securing such straps at any desired height, substantially as shown and described.

3. In combination with a road-cart, the flexible and foldable foot-rest for the driver, composed of two or more flexible straps, their forward ends adjustably connected at or near the shaft cross-bar, their opposite ends connected at the sides or beneath the driver's seat, a series of slats riveted to such strap and forming a rest for the feet, the whole adapted to be drawn up beneath the seat, out of the way of the driver's feet, substantially as shown and described.

408,970. DRAFTING-BOARD. EPHRAIM A. HALDEMAN, Chicago, Ill. Filed Sept. 16, 1888. Serial No. 285,096. (No model.)

Claim.—1. A drafting-board E, either circular or square, divided on its outer edge by the degrees of the circle and pivoted at its center to and in combination with a frame or table A, having an arm *a* extending from one side, to which is fitted a carriage B, to which is attached by means of anti-friction pivots the carrier *c*, and connected by rack I, pinion J, geared wheels K K, and shaft K' to dial-plate D, substantially as and for the purpose specified.

2. The combination of a frame or table A, extension *a*, carriage B, anti-friction pen and pencil carrier *c*, dial D, connected by shaft and beveled gearing to pinion J, acting on rack I, attached to lower part of carriage B, substantially as and for the purpose specified.

3. The combination of pen and pencil carrier *c*, composed of the arms 1 2 3 4, carrying, respectively, the parallelograms of links 5 6 7 8 and 9 10 11 12, connected at their converging points by radial links 13 14, auxiliary links 15 16, and carrying-beam *c*, all pivoted and supported by carriage B, and in combination with board E, substantially as and for the purpose specified.

4. The combination, in a drafting-machine, of the carrier *c*, holding a pen or pencil and moving same to and fro over a drawing-board divided on its outer edges with the degrees of the circle, pivoted at its center and in connection with an indicator *g*, substantially as and for the purpose specified.

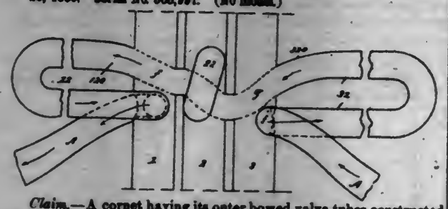
5. In a drafting-machine, a revolving dial D, divided on its outer edge into the numerical parts of 12, representing feet and inches, or into any multiple of 100, to represent the metric system of measurement, connected by shaft and gearing to rack-and-pinion motion on carriage B, substantially as and for the purpose specified.

408,971. AIR-GUN. CLARENCE J. HAMILTON, Plymouth, Mich., assignor of one-half to Roswell L. Root, same place. Filed Feb. 26, 1889. Serial No. 301,208. (No model.)

Claim.—1. The combination, with the actuating-spring and mechanism of a spring air-gun, of a tension-lever pivotally secured on top of the gunstock and extending over the top of the false barrel and forming a cap over the rear end and top of the barrel, substantially as described.

2. The combination, with the actuating-spring and mechanism of a spring air-gun, of a tension-lever pivotally secured on top of the gunstock and forming a cap over the rear end and top of the barrel, the ears V, formed in said lever, and the spring-wire link Q, detachably engaging in the said ears, substantially as described.

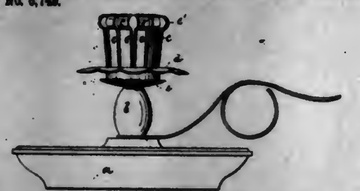
3. The combination, with the actuating-spring and mechanism of a spring air-gun, of a tension-lever pivotally secured on top of the gunstock and forming a cap over the rear end and top of the barrel, and the turned-up notched extremity of said lever to form a hind sight, substantially as described.



4. In a spring air-gun, the combination of the stock A, provided with the trigger-housing B, provided with the bed-plate B, the false barrel E, secured thereto and containing the spring-actuating mechanism of the gun, the breech-block F, secured in said barrel and eccentrically apertured, the true barrel secured in that aperture, and the tension-lever R, pivotally secured to the gunstock and forming a cap over the rear end and top of the false barrel, substantially as described.

5. The combination, with the spring-actuating mechanism of a spring air-gun, of the abutment M, through which the tension-rod of said mechanism works, provided with the heel O and the rearwardly-extending slotted shank N, through which the tension-rod of said mechanism passes, and the fixed abutment P' of the gunstock, substantially as described.

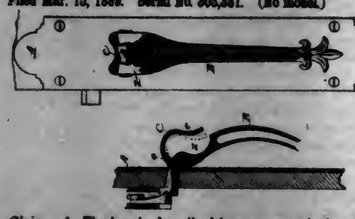
6. The combination, with the spring-actuating mechanism of a spring air-gun, of the trigger W, pivotally secured in the housing of the trigger, and the detent X, engaging the tension-rod and engaging at one end in a socket formed in the trigger and at the other end in the housing of the trigger, substantially as described.



7. The combination, in a spring air-gun, of the stock A, provided with the trigger-housing B, the trigger W, pivotally secured therein, the detent X, actuated by said trigger, the false barrel E, secured to the housing of the trigger, the true barrel eccentrically secured with its rear end in the breech-block in the front end of the false barrel, the piston H, the coil-spring K, the tension-rod I, the hook J of the tension-rod provided with the nose J', the link Q, the abutment M N, and the tension-lever R, the parts being arranged to operate substantially as described.

408,972. CORNET. JOHN HERALD, Springfield, Mass. Filed Mar. 20, 1888. Serial No. 303,997. (No model.)

Claim.—A cornet having its outer bowed valve-tubes constructed each with one of its ends at and about its junction with its respective case, inclined in about the same angular direction with relation to the axis of said case as is the respective passage formed through the valve-piston, and with which passage said inclined tube end connects, substantially as and for the purpose described.



408,973. CANDLESTICK. JULIUS HELLER, Teplitz, Austria-Hungary. Filed Apr. 19, 1889. Serial No. 307,903. (No model.) Patented in Belgium May 31, 1888, No. 81,837; in Italy July 28, 1888, XXII, 23,594; in France Aug. 27, 1888, No. 192,622, and in England Jan. 15, 1889, No. 6,749.

Claim.—1. The combination of spring-arms *c*, arranged to form a truncated conical split socket, with the sliding collar *d*, and with stop-plate *e*, substantially as specified.

2. The combination of spring-arms *c*, bent first outwardly and then inwardly to form shoulders c', and lugs c^2, with the sliding collar *d* and stop-plate *e*, substantially as specified.

408,974. DOOR-LATCH HANDLE. HENRY HOFFMAN, Jr., South Norwalk, Conn., assignor to the Norwalk Lock Company, same place. Filed Mar. 15, 1889. Serial No. 303,381. (No model.)

Claim.—1. The herein-described improvement in door-latch handles, consisting of a face-plate and a handle attached thereto, combined with a thumb-piece hinged directly in the upper end of the handle and forming in appearance a continuation of the handle, the tail of the thumb-piece extending through the plate, substantially as described.

2. The combination of the latch-plate A, the handle B, attached to the plate, and the thumb-piece C, hinged directly to the upper end of the handle and outside the plate, the handle recessed below the thumb-piece, and the thumb-piece projecting from the upper end of the handle and curved downward in front of the said recess, substantially as described.

3. The latch-handle B, adapted for attachment to the door, combined with the thumb-piece C, hinged directly to the upper end of the handle and so that the pivot of the thumb-piece will be outside the surface of the door, the tail of the thumb-piece extending rearward from the handle, substantially as described.

408,975. SUSPENSION DEVICE FOR LAMPS. WILLIAM C. HOMAN, Meriden, Conn., assignor to the Edward Miller & Company, same place. Filed Mar. 25, 1889. Serial No. 304,662. (No model.)

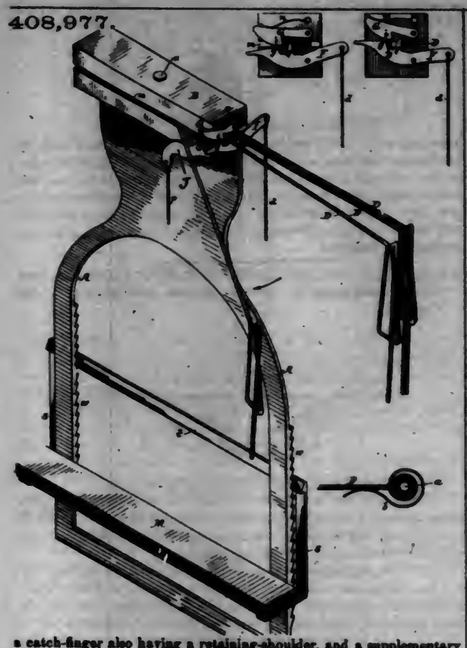
Claim.—1. In a suspension device for lamps and like articles, the combination of a frame, a vertical stationary spindle in said frame, a spring-drum arranged upon said spindle, one end of the spring engaged with the drum and the other with the spindle, the spindle extending through the drum, screw-threaded at its upper end, a disk-spring around said spindle and so as to bear upon the drum, a nut screw-threaded corresponding to the end of the spindle and adapted to bear upon the said disk-spring, the nut constructed as a part of a suspending loop, the loop open above the end of the spindle, and a dog hung in the end of the spindle so as to swing in a vertical plane through the open spindle and adapted to engage said nut, substantially as described.

2. The combination of a frame, a vertical spindle stationary in said frame, a spring-drum arranged on said spindle, one end of the spring fixed to the spindle and the other to the drum, a disk-spring arranged around the spindle and so as to bear upon the end of the drum, the upper end of the spindle screw-threaded, a nut screw-threaded corresponding to the end of the spindle and adapted to bear upon said disk-spring, a suspending loop made as a part of said nut, the periphery of the said nut constructed with one or more notches, and a dog hung in the upper end of the spindle above the nut and so as to swing in a vertical plane within the hanging loop, the dog constructed with a nose adapted to engage a notch in the said nut, substantially as described.

3. The combination of the frame A, the spindle B, stationary in said frame, spring-drum *b*, arranged upon said spindle, the disk-spring *b'*, corrugated radially and arranged around said spindle and adapted to bear upon the end of the drum, the spindle extending through said spring and screw-threaded, and a nut H, having a loop E as a part thereof and extending above the said spindle, with a dog I hung in the upper end of said spindle and so as to swing in a vertical plane within the said loop and adapted to engage said nut, substantially as described.

408,976. THILL-COUPLING. HENRY J. ILER, Ansonia, Conn., assignor of one-half to R. A. Manville, same place. Filed June 4, 1888. Serial No. 313,040. (No model.)

Claim.—1. The herein-described anti-rattling device for thill-couplings, consisting of the india-rubber block G, combined with the U-shaped spring H, the headed bolt L, extending through the block downward and through the curve of the said spring H, and a nut N, having cavities diametrically across its face corresponding to the curve of the said spring, substantially as described.



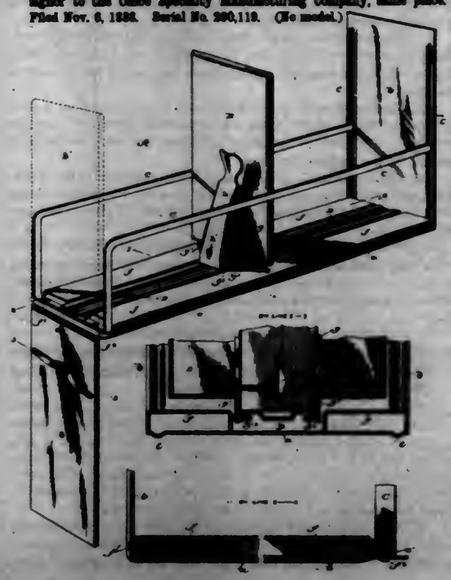
2. The combination of the india-rubber block G, the bolt L, having a head M extending longitudinally across the said block G and of concave shape upon its under side, with the U-shaped spring H and the nut N, the said nut having cavities diametrically across its face corresponding to the curve of the spring H, substantially as and for the purpose described.

408,977. MUSIC-LEAF TURNER. WILLIAM R. JACKSON, Philadelphia, Pa. Filed Mar. 29, 1888. Serial No. 305,217. (No model.)

Claim.—1. In a music-leaf turner, the combination of the fixed frame and a series of spring-actuated leaf-turning arms hung thereto with escapement mechanism comprising a lever with separating-finger and retaining-shoulder and a catch-finger also having a retaining-shoulder, substantially as specified.

2. In a music-leaf turner, the combination of the fixed frame and a series of leaf-turning arms hung thereto with escapement mechanism comprising a lever with separating-finger and retaining-shoulder,

408,977.



a catch-finger also having a retaining-shoulder, and a supplementary lever acting on the combined separating and retaining lever, substantially as specified.

3. The combination of the fixed frame and its spring-actuated retaining-fingers, the vertical rack at the rear of the frame, a shelf in front of the frame, and a catch-bar connected to said shelf and engaging with the rack at the rear of the frame, substantially as specified.

4. The combination of the fixed frame having spring-actuated leaf-turning arms and vertical rack at the rear, a supporting-shelf having arms bearing against the outer edges of the frame, and a catch-bar carried by said arms and engaging with the rack at the rear of the frame, substantially as specified.

408,978. FILE-BOX. MAJOR R. JEWELL, Rochester, N. Y., assignor to the Office Specialty Manufacturing Company, same place. Filed Nov. 6, 1888. Serial No. 290,119. (No model.)

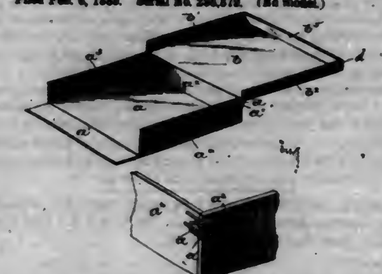
Claim.—1. As an improvement in the construction of sheet-metal file-boxes, the box or receptacle having the sheet-metal base-plate, in combination with the rail or guide D for the clamping device and the side plates *f*, rising flush with the guide, said guide and side plates secured upon the base-plate, substantially as described.

2. As an improvement in the construction of sheet-metal file-boxes, the combination of the sheet-metal base-plate with the two flanged plates *f*, secured longitudinally thereon along its opposite edges.

3. As an improvement in sheet-metal file-boxes, the sheet-metal base-plate, in combination with the central rail or guide mounted thereon, the follower mounted on said rail, and the two flanged metal plates *f*, secured upon the base-plate along its opposite edges.

4. In a metallic file-box, the flat base-plate, in combination with the longitudinal sheet-metal guide-rail depressed at the middle and raised at the edges, a follower, and a clamping device connecting the follower with the rail.

5. A sheet-metal file-box having its base composed of a single sheet of metal *a*, thickened and stiffened by two longitudinal strips of metal *f*, having downwardly-extending flanges at their edges and secured at their ends rigidly to the base-plate.



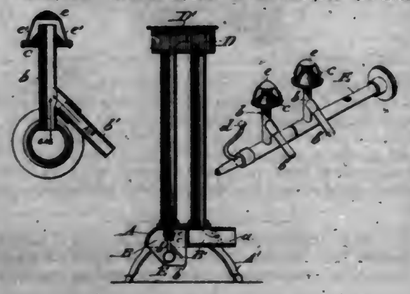
6. In a sheet-metal file-box, the side bars C C and the cross member *c'*, integral therewith, in combination with the base-plate *a*, the plates *f*, and the rivets connecting said parts, as shown.

7. The plate *g*, for connecting the follower to the guide-rail, formed of a single sheet of metal cut and bent and shown to present the portions *g f g*^{4}.

8. The locking-lever *h*, cut and bent from a single sheet of metal, as described and shown, and presenting the stiffening-flanges along its edges and the lip at its lower end.

9. The file-box having the side bars and the hinged end, in combination with the locking-bar b^3 and its rotary spindle attached to the end piece, as shown.

408,979. FILE-BOX. MAJOR R. JEWELL, Rochester, N. Y., assignor to the Office Specialty Manufacturing Company, same place. Filed Feb. 6, 1889. Serial No. 299,579. (No model.)

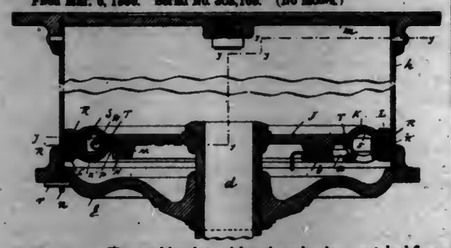


Claim.—1. A knockdown box for the filing of papers and for similar purposes, consisting of a series of flat sections hinged together at their edges and provided at their corners with metallic fastening devices adapted to be bent and interlocked.

2. The herein-described box, consisting of the bottom sheet and the side walls hinged thereto, the top sheet and the edge strips hinged thereto, and the metallic fastening devices *d* and *d'*, applied at the corners and adapted to be interlocked, as described, to hold the box in operative position.

3. As an improvement in knockdown boxes, the metallic staples *d* and *d'*, applied to the adjacent sides of the box and adapted to be bent and interlocked, substantially as described.

408,980. GAS-HEATER. JONATHAN JOHNSON and EDMUND H. PACKER, Lowell, Mass. Filed Jan. 26, 1889. Serial No. 297,855. (No model.)

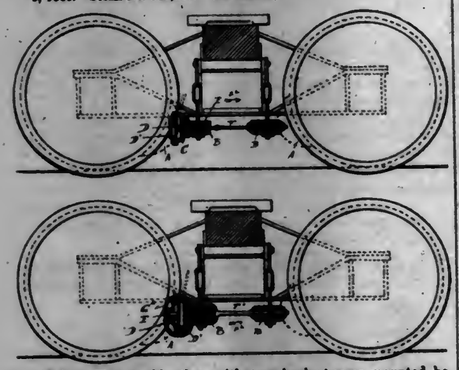


Claim.—1. As an improvement in gas-heaters, the combination of the radiating-pipes, the rotatable pipe E, supported beneath said radiating-pipes, the burners carried by said rotatable pipe, and the deflectors fixed over the orifices of the burners, substantially as and for the purpose set forth.

2. As an improvement in gas-heaters, the radiating-pipes, in combination with the rotatable pipe E, supported beneath the mouths of the said radiating-pipes, the burners carried by said rotatable pipe and the supply-pipe *b'*, for carrying air to the base of the burner, substantially as and for the purpose set forth.

3. As an improvement in a gas-heater, the radiating-pipes, in combination with the rotatable pipe E, supported beneath the mouths of the said radiating-pipes, the burners carried by the rotatable pipe, the deflectors fixed over the orifices of the burners, and the air-supply pipe leading to the base of the burner, for the purpose specified.

408,981. PACKING FOR PISTONS. LOUIS P. LAWRENCE, Passaic, N. J., assignor to the Lawrence Railway Brake Company, New York, N. Y. Filed Mar. 6, 1888. Serial No. 302,169. (No model.)

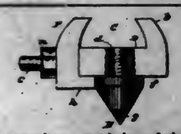


Claim.—1. The combination, with a piston having a notched flange on one face, of a notched ring engaging said flange, a packing-ring between the piston and the notched ring, and a spring-bolt for locking the notched ring in place, substantially as set forth.

2. The combination, with a piston provided in one face with an annular groove a short distance back of the edge and forming a lip along the said edge, of a ring held on the piston, and also provided with an annular groove forming a lip, and a packing-ring held between said lips, substantially as set forth.

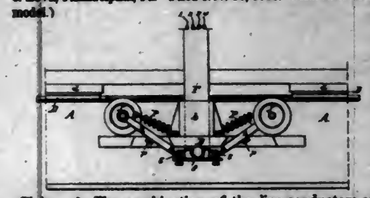
3. The combination, with a piston having an annular groove in one face a short distance from the rim, of a ring held on the piston and having a like annular groove, a packing-ring held between said piston and ring, an expansion-ring resting against said packing-ring and having its ends overlapped, and a spring between said overlapped ends of the expansion-ring, substantially as set forth.

408,982. CAR-BRAKE. LOUIS P. LAWRENCE, Passaic, N. J., assignor to the Lawrence Railway Brake Company, New York, N. Y. Filed May 9, 1888. Serial No. 310,105. (No model.)



Claim.—The combination, with two brake-beams mounted between two pairs of wheels, and also mounted to move from each other when pressing the brake-shoes against the wheel-rims, of a brake-cylinder secured on the inner edge of one brake-beam, a piston in said cylinder mounted to move while operating toward the inner edge of the brake-beam to which the cylinder is secured, and a rod or bar connecting said piston with the other brake-beam, substantially as set forth.

408,983. REMOVABLE HORSESHOE-CALK. JOHN R. LESUEUR, Hendersville, Tenn. Filed Mar. 17, 1888. Serial No. 267,551. (No model.)



Claim.—The herein-described device for securing removable

408,983.

horseshoe-calks to horseshoes, consisting of the perforated plate D, having the curvilinear end or clip projecting therefrom at right angles at one end and a screw-rod projecting from the opposite end, the curved metal plate or clip F, having the central perforation and lateral lower projection, and a nut for clamping said plates to the shoe, said lateral projection forming a lock for said removable calk, substantially as described.

408,984. CONTACT-CARRIER FOR ELECTRIC RAILWAYS. JOHN C. LOVE, Philadelphia, Pa. Filed Nov. 30, 1888. Serial No. 292,196. (No model.)

Claim.—1. The combination of the line-conductors of an electrical railway, a contact-carrier block, arms pivoted to the under side of said block and carrying contact-wheels, and pull-springs to press the said wheels against the line-conductors.

2. The combination of the conduit of an electrical railway having line-conductors, with a carrying-bar to be suspended from a car, a contact-carrying block thereon, and pull-springs to press the contacts against the line-conductors, substantially as described.

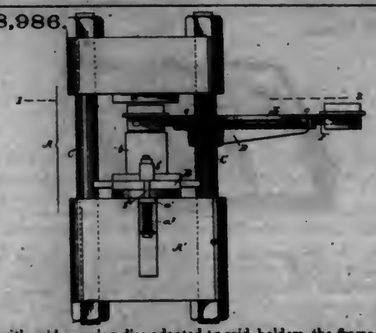
408,985. LATHE-CHUCK. CHARLES R. MEAD, Oneida, N. Y. Filed May 16, 1889. Serial No. 311,013. (No model.)

Claim.—1. A jaw for a chuck having the bearing or biting surface c^3, pivot-points or trunnions c, and crank-arms c', substantially as and for the purpose specified.

2. The combination of the chuck-head, jaws pivoted to the chuck-head, an annular rotatable ring for engaging said jaws, and revolving to adjust and clamp the same, substantially as and for the purpose specified.

3. The combination of the chuck-head, the covering-plate B, jaws pivoted to said head and plate, and a rotatable sleeve for engaging said jaws, and revolving to adjust and clamp the same, substantially as and for the purpose described.

4. The combination of the chuck-head, jaws pivoted to the chuck-head, and crank-arms provided upon the jaws, and the rotatable sleeve for engaging said jaws, and revolving to adjust and clamp the same, substantially as and for the purpose specified.



5. The combination of the chuck-head, jaws pivoted to the chuck-head, and crank-arms provided upon the jaws, the rotatable sleeve, slots or cut-outs provided in the sleeve, and a screw for engaging said disk and rotating the same, substantially as and for the purpose specified.

408,986. APPARATUS FOR FILLING SECONDARY-BATTERY PLATES. HENRY G. MORRIS and PEDRO G. SALOM, Philadelphia, Pa. Filed May 2, 1889. Serial No. 309,278. (No model.)

Claim.—1. In a machine for compressing powdered active material into supporting-grids, the combination of a rotatable table having a series of holders thereon, with grid-carrying dies adapted to said holders and with a press having a plunger and platen, the rotating frame being so hung in respect to the plunger and platen of the press that as the frame is rotated the grid-carrying bars will be passed between said plunger and platen, substantially as described.

2. The combination of the frame of the press having upright bolts with a frame secured to one of said bolts, an annular frame supported by and free to turn on said fixed frame and having a series of hold-

408,986.

ers, with grid-carrying dies adapted to said holders, the frame being so hung in respect to the plunger and platen of the press that the grids can be fed one by one between said platen and plunger, substantially as described.

3. The combination of the press, a grid-carrying die, and a frame movable on said die and serving to aid in supporting the grid above the surface of the die, substantially as specified.

4. The combination of the grid-carrying die, the supporting-frame for the grid, springs under said supporting-frame, and adjustable bolts for adjusting the height of said frame in respect to the face of the die, substantially as described.

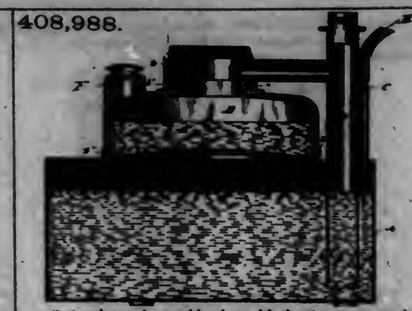
5. The combination of the press, the grid-carrying die, the movable frame thereon, and a second frame adapted to rest upon the grid and serve as a gage for the material deposited thereon, substantially as specified.

6. The combination of the grid-carrying die and the movable frame thereon, the grid having a hinged frame adapted to fit over the grid, and having a flange forming a gage, substantially as and for the purpose set forth.

7. The combination of the press, the rotatable frame and its holder, and a grid-carrying die having flanges supported on said holders, but free to rise therefrom under the action of the press, substantially as described.

8. The combination of the grid-carrying die and its yielding frame with an upper die having a like yielding frame, substantially as specified.

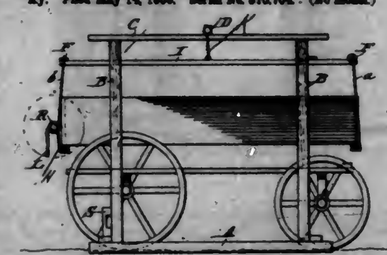
408,987. DUST-COLLECTOR. ORVILLE M. MORSE, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Sept. 2, 1887. Serial No. 248,584. (No model.)



Claim.—1. The combination, with the separating-chamber having a dust-discharge opening and provided at one end with an exit-passage for the purified air, of a supply-spout and a spiral passage connecting said spout with the separating-chamber and surrounding the air-exit passage, substantially as set forth.

2. The combination, with the tapering separating-chamber provided at its large end with an exit-passage for the purified air and at its small end with a dust-discharge opening, of a supply-spout and a spiral passage connecting said spout with the large end of the tapering chamber and surrounding the air-exit passage, substantially as set forth.

408,988. STREET-LAMP. WILLIAM G. OLIVER, Waupun, Wis. Filed Dec. 12, 1888. Serial No. 293,293. (No model.)



Claim.—1. In a street-lamp, the combination, with the storage-reservoir, of a transparent burner-supply bowl mounted directly thereon, a supply-pipe projected into the reservoir and rigidly secured thereto, said pipe being extended upward and communicating with the interior of the bowl and rigidly secured thereto, and an air-pipe projected into the upper part of the reservoir, whereby to force oil into the bowl, substantially as described.

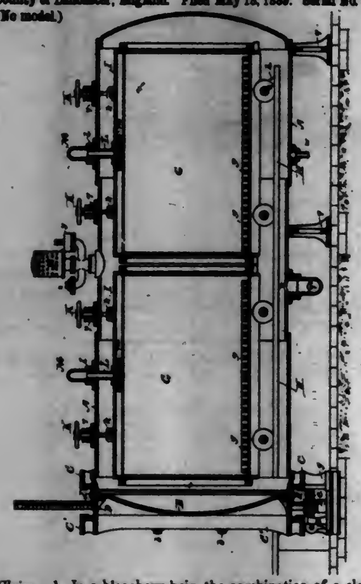
408,988.

2. In a lamp, the combination, with the storage-reservoir having a flange extended from the top wall thereof, of a transparent burner-supply bowl adapted to seat itself against said flange and a connecting-pipe securing said reservoirs together, substantially as described.

408,989. HOISTING APPARATUS. CORNELIUS R. PAYNE, Nebo, Ky. Filed May 14, 1889. Serial No. 310,704. (No model.)

Claim.—1. As an improvement in hoisting apparatus, the combination of the portable frame, the freely-swinging lever I, connected with said frame by flexible connections K, the rods *a a*, and hooks at one end of said lever for attaching it to the weight to be raised, a suitable windlass or roller R, connected with the other end of the said lever by ropes, the crank L, movably attached to said roller so that it can be turned to have its handle engage with one of the hooks H to stop the revolution of roller when desired, and the hooks H, forming the bearings of said roller and for attaching it to the weight to be raised.

2. As an improvement in hoisting apparatus, the combination of the portable frame, the freely-swinging lever I, connected with said frame by flexible connections K, the rods *a a*, and hooks at one end of said lever for attaching it to the weight to be raised, the roller R, connected with the other end of said lever by ropes *b*, the crank L, movably attached to said roller so that it can be turned and have its handle *b* engage with one of the hooks H, for the purpose set forth, the bar J, movably carried in the cleats S, and the hooks H, forming bearings for the roller and for attaching it to the said bar, substantially as and for the purpose specified.



408,990. HOLDBACK-SNAP. WILLIAM REDPOINT, Hagle, Ill. Filed May 11, 1889. Serial No. 310,476. (No model.)

Claim.—1. The combination of a hollow standard, a lever fulcrumed thereon and having its short arm arranged across the passage or chamber in said standard, and a spring housed within the chamber of the standard and arranged to exert its pressure against the short arm of the lever, which arm confines the spring in place and conceals it from view, substantially as described.

2. The combination of a hollow standard having the integral ears at one end and a base-plate at its other end, an arm or lever having one end fitted between and pivoted to said ears and arranged across the chamber of said standard, a follower fitted in said hollow standard and bearing against the short arm of the lever, and a coiled spring bearing against the follower, substantially as and for the purpose described.

408,991. BLEACHERY-KEIR. SYDNEY A. RUDDIN, Manchester, County of Lancaster, England. Filed May 15, 1889. Serial No. 311,221. (No model.)

Claim.—1. In a bleachery-keir, the combination of a closed car or receptacle provided with a cover having a liquid-inlet through it, which is connected with the discharge-pipe of a pump, and liquid-outlets at the bottom of said car, with an enveloping steam-tight chamber connected at the bottom with the suction-pipe of said pump, whereby liquor may be circulated under pressure through material placed in said car, substantially as described.

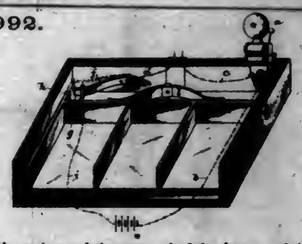
2. In a bleachery-keir, the combination of a steam-tight enveloping-chamber and a closed car or receptacle having discharge-openings at the bottom and a liquid-inlet at the top, which is connected with a pump to deliver liquor within said car and force it through the material contained therein, substantially as described.

3. In a bleachery-keir, the combination, with an enveloping steam-tight chamber, of a closed car or receptacle having liquid-discharge openings at the bottom, and an adjustable cover therefor provided with a liquid-induction pipe and suspended within said chamber above the car, substantially as described.

4. In a bleachery-keir, the combination of an enveloping steam-tight chamber, a closed car to contain fabric, and an adjustable cover for said car suspended above it within the chamber and provided with an inlet-pipe having a sliding connection with a liquor-supply pipe, substantially as described.

5. In combination with a liquid-circulating pump for a bleachery-keir, a liquid heating and distributing chamber interposed between said pump and keir and having the discharge-outlet from the pump near the top of said chamber, and the outlets of the supply-pipes for the keir near the bottom thereof, substantially as described, and for the purpose specified.

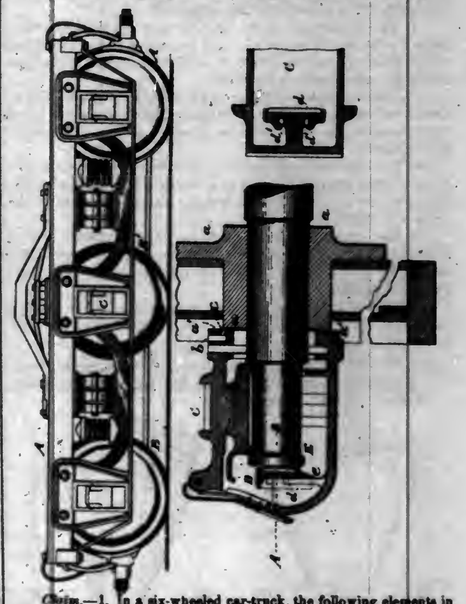
6. In combination with a liquor-circulating pump for a bleachery-keir, an intermediate liquor-distributing chamber having the discharge-outlet from the pump, near the top thereof, and a puppet-valve to cover said outlet, having its stem projecting without the chamber, in the manner substantially as described.



7. In combination with a bleachery-keir, a door provided with a compressible bearing upon the side next to the keir and supported upon vertical screw-rods engaging therewith at each side, and an independent adjustable frame to force the door to its seat when it has been lowered to the position requisite to cover the opening into the keir, substantially as described.

8. In combination with a steaming or boiling tank, a door supported and operated by vertical screw-rods engaging therewith at each side, and an independent adjustable open frame, by which the door, when in a position to cover the filling-opening in the tank, may be forced to a steam-tight bearing therewith, substantially as described.

408,992. ALARM. JOHN M. SCHMIDT, Saginaw, Mich. Filed Sept. 13, 1888. Serial No. 285,333. (No model.)



Claim.—The combination, with the cabinet and the post *g* therein

408,992.

between the spring and the rear end of the drawer, of the flat spring secured at one end with its other end normally in contact with said post, electrical connections, substantially as described, between said spring and post and the bell, and the sliding drawer formed with extension *h*, adapted to contact with the free end of the spring and move it away from the post when the drawer is closed, and the spring *l*, acting on the rear end of the drawer to force it outward, substantially as shown and described, and for the purpose specified.

408,993. SIX-WHEELED CAR-TRUCK. WALTER A. SCOTT, St. Paul, Minn. Filed May 16, 1889. Serial No. 310,976. (No model.)

Claim.—1. In a six-wheeled car-truck, the following elements in combination: a frame, end wheels flanged in the ordinary manner, a central pair of flat wheels having hubs with outer-turned faces, central axle-boxes having their backs trued or faced and provided with end stop-wedges, the spaces between the outer face of each hub of the central pair of wheels and the back of each central box and between the end of the axle and the stop-wedge of each central box being each reduced to the minimum—say one-sixteenth of an inch—each central axle-box being provided with a recess and a channel for the supply of oil between the hub and box, substantially as set forth.

2. An axle-box having its back made extra heavy and provided with an oil-recess *b* and a communicating channel *c*, substantially as set forth.

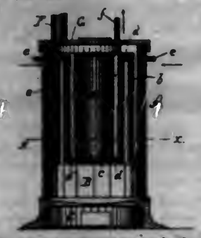
3. An axle-box provided with a fixed stand *e*, cast as a part thereof, combined with a stop-wedge D, having soft-metal filling *d* and grooves *d'*, which fit over the fixed stand *e*, substantially as set forth.

408,994. WHEELBARROW. CHARLES W. STANBAUGH and VALENTINE L. HEY, Canton, Ohio. Filed Feb. 14, 1889. Serial No. 299,857. (No model.)

Claim.—1. In a wheelbarrow, the wheel E, adapted to move under and receive the weight of the load independent of its axle, substantially as and for the purpose set forth.

2. The combination of the bars or handles A, the inclined curved bars C, bent to hold the axle *a* at either end of said bars, and the wheel E, substantially as and for the purpose set forth.

408,994.



3. The combination of the wheel E and its axle *a*, the inclined bars C, and means for locking the wheel E at either end of the inclined bars C, substantially as and for the purpose set forth.

4. The combination of the plate or disk F, provided with the lugs *h* the retaining-bar *f* and the inclined bars C, and the wheel E, substantially as and for the purpose set forth.

5. The combination of the bars or handles A, the pins *b*, provided with the feathers *c* and the ribs *d*, the inclined bars C, and the wheel E, substantially as and for the purpose set forth.

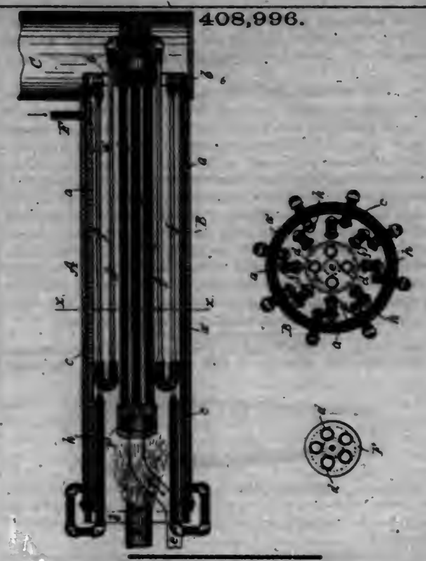
6. The combination of the inclined bars C and means for locking the wheel E at either end of the inclined bars C, substantially as and for the purpose set forth.

408,995. STEAM-GENERATOR. THOMAS L. STURTEVANT and THOMAS J. STURTEVANT, Framingham, Mass. Filed Nov. 12, 1888. Serial No. 290,570. (No model.)

Claim.—1. A steam-generator composed of a number of steam-generating sections connected in series, each section being composed of two tubes—one within the other—with their adjacent ends united to form a closed steam-chamber, interconnecting pipes at the opposite extremities of the sections which unite the adjacent sections, and a common fluid-supply and steam-discharge, all substantially as herein set forth and described.

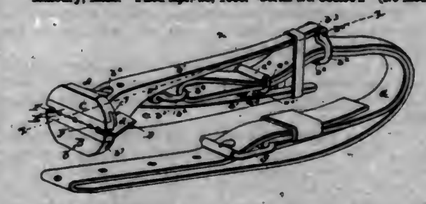
2. In combination with a suitable shell, its fire-pot, co-operating flue, and ash-chamber, an interconnected series of concentrically arranged steam-generating sections within said shell and the common fluid-supply and steam-discharge, each section being composed of two tubes contiguous at various points—one within the other—the adjacent ends being united to form a closed annular chamber therebetween and having a supply and discharge at opposite ends, substantially as herein specified.

3. In combination with an inclosing-shell or water-jacket, a fire-pot B, with its co-operating flue F, the steam-generators E, arranged in sections which are connected in series united by tubes *d d* to insure water-circulation, each section being composed of two tubes *b c*—one within the other, and fastened together at their adjacent ends, the interior periphery of one and the exterior periphery of the other noncontiguous—and a common fluid-supply *e* and steam-discharge *f*, substantially as for purposes herein set forth.



4. In a steam-generator, the combination, with a fire-pot B and its flue F, of the series of steam-generating sections E, arranged in sections which are connected in series, constructed and united as set forth, the water-jacket A, which incloses said sections and fire-pot, and a common fluid-supply *e* and steam-discharge *f*, substantially as stated.

408,996. STEAM-BOILER. THOMAS L. STURTEVANT, Framingham, Mass. Filed Apr. 23, 1889. Serial No. 308,086. (No model.)



Claim.—1. A boiler for steam-generating purposes composed of an exterior shell, a series of cylindrical tubes centrally of its bore, a group of flattened tubes circular in cross-section at their extremities, and between said shell and the inner tubes the smoke-flue at one end and the heating agency at the opposite end of said boiler, with means for supplying water and discharging steam, substantially as and for purposes herein set forth.

2. In a steam-boiler, the double-tube element B, the central group of tubes *d d*, the unions F G, in which said tubes terminate, combined with the flattened tubes *f f*, circular at their extremities, and the tubes *h h*, by which the union G is united with the element B, the water-supply pipe E, steam-discharge *c*, and a suitable heating agent, substantially as specified.

408,996.

408,997. DEVICE FOR STRETCHING WIRES. STEPHEN TAFT, Millbury, Mass. Filed Apr. 25, 1889. Serial No. 308,504. (No model.)

Claim.—1. The combination, with the nippers having their shanks provided with registering openings, of the pivotal bolt provided with a flattened nearly-rectangular head, the lower edge of which rests against and is supported by a shoulder on the inner surface of the lower jaw of the nippers, said pivotal bolt having its shank provided with a long cut-away portion or rabbet, substantially as set forth.

2. The combination, with the nippers A, composed of the pivoted sections B C, the section B having loops b^4 attached to its shank, respectively, near the upper and lower ends thereof, and the section C having the similar loop c^4 attached to its shank at a point between the loops b^4, and the spring H, attached at the upper end to the shank of the section B and at its lower end to the shank of the section C, of the strap G, passing, as described, through said loops and having the buckle *g* at one end, and the series of perforations *g'* for the tongue of said buckle extending inward from the opposite end, substantially as specified.

3. The combination, with the strap G, of the nippers A, composed of the sections B and C, each composed of a shank and a flattened laterally-extended jaw, which jaws incline slightly outward from their meeting edges, the pivot-pin D, having a flattened head and an extended and rabbeted shank, the loops b^4, attached to the shank of the section B, the loop c^4, attached to the shank of the section C, the detachable dogs E E, provided with the longitudinal grooves F, and the transverse notches *f f* in their meeting edges, and the curved plate-closing spring H, substantially as specified.

4. The combination, with nippers provided with shanks, the shank of the upper nipper passing through a slot in the lower shank, of a curved flat-plate spring disposed between the same, said spring having its forward end bent under and secured to a curved shoulder in the slotted shank, substantially as set forth.

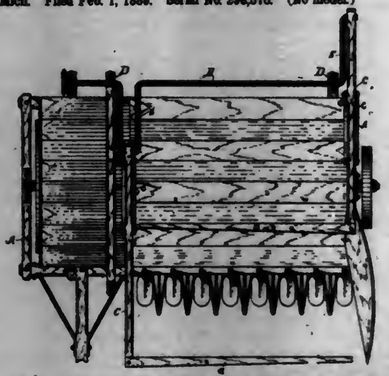
5. The combination of the nippers composed of two opposing sections and suitable shanks, the lower shank passing through a slot in the upper shank, the latter being formed or provided at opposite points of its length with depending perforated lugs, metal loops having the ears thereof perforated, said perforations registering with the perforations in the lugs, the transverse bars of said loops being provided with anti-friction sleeves, the screws for attaching said loops to the

legs, the perforated lug formed or provided upon the lower shank, the lower loop provided with an anti-friction sleeve, and the strap passing over the anti-friction sleeves of the loops, substantially as set forth.

6. The combination of the nippers composed of two opposing sections and suitable shanks, the lower shank passing through a slot in the upper shank, the latter being formed or provided at opposite points of its length with depending perforated lugs, metal loops having the ears thereof perforated, said perforations registering with the perforations in the lugs, the transverse bars of said loops being provided with anti-friction sleeves, the screws for attaching said loops to the legs, the perforated notched lug formed or provided upon the lower shank, the curved flat-spring plate disposed between the two jaws of the nippers, said spring having its forward end bent under and secured to a curved shoulder in the slotted shank, and having its rear end passing into the notched lug upon the lower shank, the lower loop provided with an anti-friction sleeve, and the strap passing over the anti-friction sleeves of the loops, substantially as set forth.

408,998. PHONOGRAM-CYLINDER. WILMER R. TATTERSALL, Springfield, Ohio. Filed Apr. 26, 1889. Serial No. 308,735. (No model.)

Claim.—1. A phonographic cylinder having a portion of its exterior coated with a suitable recording-surface and an index-field at or near one end thereof free from the recording-surface, substantially as described.

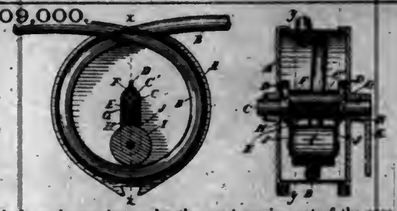


2. A phonographic cylinder having a recording-surface, an index-field at the end thereof, and a circumferential rib or ribs, substantially as and for the purpose specified.

3. The herein-described phonographic cylinder, constructed in the form of a truncated cone and having an index-field at or near the end thereof, substantially as described.

4. The herein-described phonographic cylinder, constructed in the form of a truncated cone and having an index-field at one or both ends and circumferential ribs, substantially as and for the purpose described.

5. As a new article of manufacture, the herein-described phonographic cylinder, constructed of paper or other suitable substance, formed into a hollow truncated cone, and having a portion of its exterior coated with a suitable recording-surface, leaving an index-field at one or both ends, and having circumferential ribs at or near its ends, substantially as and for the purpose specified.



408,999. HARVESTER-REEL. CHARLES D. TOWER, Galesburg, Mich. Filed Feb. 1, 1889. Serial No. 298,370. (No model.)

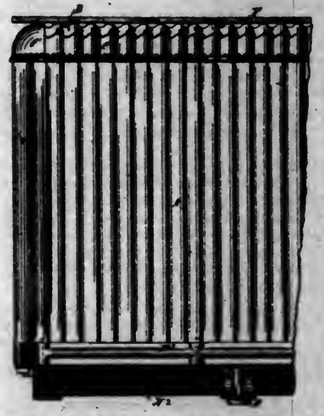
Claim.—The combination of the platform, the crank-shaft having bearing-supports on said platform, and having a crank at or near each end, which cranks are thrown out in opposite directions from the shaft, the right-angled arms, one pivoted to each of said cranks, and their forward angles extending toward each other and lapping one by the other in plan view, and the upright oscillating standards pivoted at their lower ends to the platform and at their upper ends to the right-angled arms, substantially as set forth.

409,000. SURGICAL PUMP FOR TRANSFUSION OF BLOOD. EUGENE R. ALLEN, Grand Rapids, Mich. Filed Apr. 27, 1889. Serial No. 308,806. (No model.)

Claim.—1. In a surgeon's pump of the class described, the combination of a cylindrical case, an elastic tube coiled within the case

with the ends crossing each other and passing out of the case near its longitudinal center, a shaft having a cam, a pressure-roller mounted upon the shaft, and a crank to revolve the shaft, said cam automatically forcing the roller upon and withdrawing it from the elastic tube by the rotation of the crank-shaft, substantially as described.

2. In a surgeon's pump, the combination of a cylindrical case, an elastic tube coiled within the case, a pressure-roller adapted to give continuous moving pressure upon said tube, a frame supporting said pressure-roller and provided with a stop, as H, a supporting-shaft provided with a pin, as D, to engage the stop H and revolve the frame, roller, and cam together, and the cam C, adapted to press the roller in contact with the tube, substantially as described.



409,001. COVERED ELASTIC ENDLESS BAND. JOHN AINWORTH, Dudleyville, Mass. Filed May 11, 1881. Serial No. 33,027. (No model.)

Claim.—1. An extensible band composed of an endless elastic core and a seamless endless flexible covering formed thereon of continuous threads, substantially as and for the purpose set forth.

2. An improved article of manufacture, an elastic endless band formed of two or more parallel elastic endless strands, each having an extensible, flexible, seamless, and endless covering formed upon it, such separately-covered strands being united laterally into one endless elastic covered band, substantially as set forth.

409,002. RAILWAY-CAR. DAVID L. BARNES, Chicago, Ill., assignor to Alexander J. Leith, New York, N. Y., and William R. Stirling, Chicago, Ill. Filed Apr. 9, 1889. Serial No. 306,557. (No model.)

Claim.—1. A metallic car, a metallic cornice intermediate between the sides and the roof and attached to both, and corrugated to fit the corrugations of the side and the roof, substantially as described.

2. The metallic cornice C, herein described, corrugated to fit the corrugations of the side, and provided with an external lip D, substantially as and for the purposes described.

3. The combination of the side posts G with a longitudinal side sill projecting outward and serving as a base for said side posts, substantially as described.

4. The truss-rod struts V, made of pressed steel, attached to the sills and braced by piece X, extending in a downwardly direction upon the side of the car inward and attached to the side sill, the intermediate sill, and the center sill, thereby preventing the failure of the sills under a heavy load and acting as a lateral brace as well as a strut on the side sills, substantially as described.

5. The lateral brace X, of pressed steel, in combination with

three longitudinal sills, to each of which it is attached, and the truss-rod struts V, for supporting the sills, substantially as described.

6. The combination of the center plate with the stiffening angle-irons Y, substantially as described.

7. The pressed-steel body-bolster R, longitudinally corrugated intermediate the side and center sills, substantially as described.

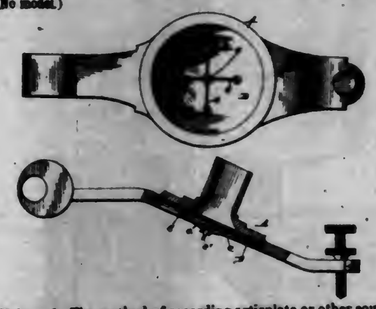
8. The combination of the corrugated pressed-steel body-bolster R with the top member W, forming a complete truss, substantially as described.

9. The combination, with the sills N' N², of longitudinal wooden stringers G, serving as stiffeners therefor and for the attachment of the flooring, substantially as described.

10. The combination of the corrugated sides A A' and the corner-cap P, fitting the said corrugations and covering the ends of said pieces A A', substantially as described.

11. The combination of the interlocking corner-posts G G' with the corrugated sides and ends fitting the same, substantially as described.

12. The combination of the vertical posts G G with a clamp N³, surrounding the same and holding the posts upon the lower support, substantially as described.



13. The combination of the post G, provided with flanges, the stripe H, locking said flanges, and the corrugated side A, fitting the post, substantially as described.

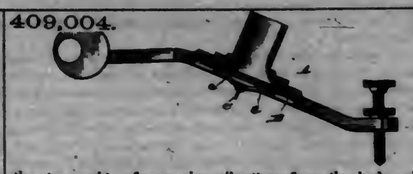
14. The hollow post G, provided with a wood filler attached thereto, in combination with the beam J, nailed to the lining of the post G, substantially as described.

15. The combination of the roof B, cornice C, and intermediate water-shed E, substantially as described.

16. The combination of a side post G, a carling K, fitting the same, and likewise fitting the corrugations of the corrugated roof, substantially as described.

409,003. METHOD OF RECORDING AND REPRODUCING SOUNDS. CLARKE BETTINI, New York, N. Y. Filed Apr. 11, 1889. Serial No. 306,912. (No model.)

Claim.—1. The method of recording articulate or other sound or sounds, which consists in setting up vibrations in a body, taking the vibrations from the body at several points or places, communicating them by independent conductors to a common point or place, and causing a record to be made from this common point or place.



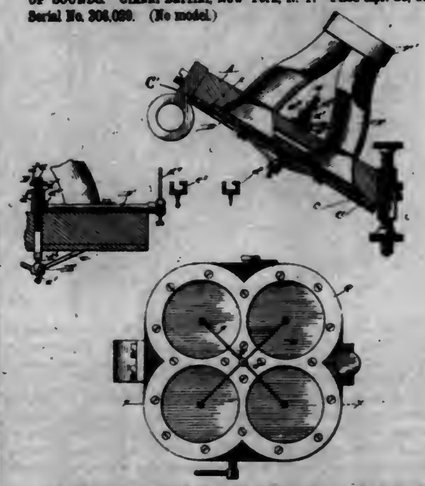
2. The method of reproducing articulate or other sound or sounds, which consists in causing a record of vibrations to act at a single point or place and from this point or place communicating vibrations by independent conductors to several points on a vibratory body.

3. The method of recording and reproducing articulate or other sound or sounds, which consists in taking vibrations off a vibratory body at several points or places, communicating them to a common or central point or place by independent conductors, causing a record to be made from this common point or place, and then causing this record to act at the common or central point or place, communicating vibrations to a vibratory body at several points or places.

409,004. APPARATUS FOR THE RECORD AND REPRODUCTION OF SOUNDS. CLARKE BETTINI, New York, N. Y. Filed Apr. 13, 1889. Serial No. 307,067. (No model.)

Claim.—1. In a device for recording and reproducing, or for recording alone or reproducing alone, articulate or other sound or sounds, the following instrumentalities in combination, namely: a body capable of vibration and two or more independent conductors attached

thereto capable of conveying vibrations from the body, said conductors connecting with a unitary or functionally-single part or focus designed to make a record, substantially as described.



2. In an apparatus for recording and reproducing, or for recording alone or reproducing alone, articulate or other sound or sounds, the following instrumentalities in combination: a body capable of vibration, two or more conductors attached to different parts of the body and capable of conveying vibrations therefrom, said conductors connecting with a functionally-single part or focus capable of making a record, and a yielding substance properly situated in relation to the single part to enable a record to be made upon such single part, substantially as described.

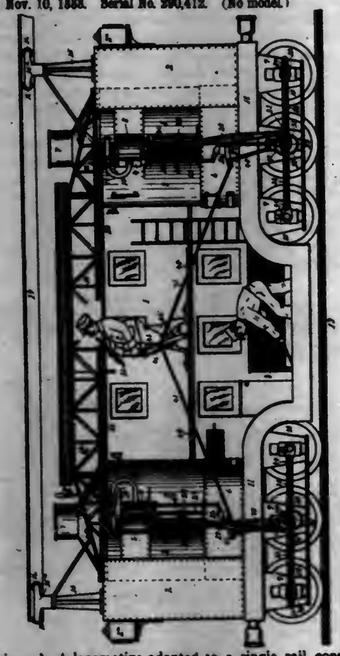
3. In a device for recording and reproducing, or for recording alone or reproducing alone, articulate or other sound or sounds, the following instrumentalities in combination, namely: a diaphragm capable of vibration, two or more rigid conductors suitably attached to the diaphragm and converging to a common or central point or focus, and a projection with or without a wheel designed to make a record on a soft or yielding substance and to traverse this or any other suitable record, substantially as described.

4. In a device for recording and reproducing, or for recording alone or reproducing alone, articulate or other sound or sounds, the following instrumentalities in combination, namely: a diaphragm capable of vibration, two or more angular conductors suitably applied thereto capable of conveying vibrations from said diaphragm, the conductors connecting with a unitary part or focus, and a projection with or without a wheel attached to this part and designed to make a record and traverse this or other suitable record, substantially as described.

5. In a device for recording and reproducing, or for recording alone or reproducing alone, articulate or other sound or sounds, the following instrumentalities in combination, to wit: a frame containing a single chamber, a diaphragm or other body capable of vibration forming one side of said chamber, two or more conductors capable of conducting vibrations attached to the diaphragm and converging to a unitary point or focus, a projection attached to this point, and a tube or tubes forming an inlet or an outlet for the chamber.

409,005. APPARATUS FOR THE RECORD AND REPRODUCTION OF SOUNDS. CLARKE BETTINI, New York, N. Y. Filed Apr. 20, 1889. Serial No. 308,089. (No model.)

Claim.—1. An apparatus for recording and reproducing articulate and other sound or sounds, comprising a diaphragm or other body capable of vibration, and having different parts thereof under a separate uniform tension, and a vibration-conductor consisting of a body having a common or central point or place, at which point is placed a projection designed to make a record, and arms or projections ex-



tending from the central point and bearing upon each of the divisions of the diaphragm.

2. An apparatus for recording and reproducing articulate and other sound or sounds, comprising a diaphragm or other body capable of vibration, having different divisions or parts thereof under separate uniform tension, two or more resonant chambers arranged in communication with a vibrating body, and a vibration-conductor comprising arms or projections, one or more of which bear upon each of the divisions of the diaphragm, and which converge to a common or central point, and a projection attached at this common or central point and designed to make a record, or to pass over a record already made, substantially as described.

3. An apparatus for recording and reproducing articulate and other sound or sounds, comprising a diaphragm or other body having different parts or divisions thereof under separate and uniform tension, two or more resonant chambers communicating with the diaphragm or other vibrating body, and a tube or tubes forming an inlet or an outlet from the chambers, and a vibration-conductor comprising arms or projections, one or more of which bear upon each division of the diaphragm or other vibrating body, and converge to a common or central point, and a projection attached at this point, substantially as described.

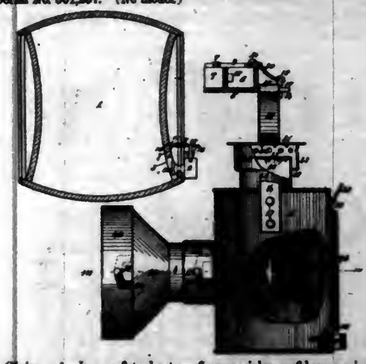
4. An apparatus for recording and reproducing articulate and other sound or sounds, comprising a diaphragm or other body capable of vibration, a vibration-conductor comprising arms or projections bearing upon or attached to the diaphragm, and an adjustable pin or projection from the frame containing the diaphragm, capable of movement to bring it in contact with or away from the vibration-conductor.

409,006. LOCOMOTIVE. ERRI M. BOYNTON, West Newbury, Mass. Filed Nov. 10, 1888. Serial No. 290,412. (No model.)

Claim.—1. A locomotive adapted to a single rail, consisting of suitable frame-work, a set of drivers at each end, and an independent boiler, steam-chests, steam-cylinders, and connecting mechanism, placed directly over each set of drivers.

2. A locomotive adapted to a single rail, consisting of suitable frame-work, sets of drivers at each end, boilers, steam-chests, steam-cylinders, connecting mechanism, valve-gears, and reversing mechanism, and operating-rods extending from said valve-gears and reversing mechanism to a cab located midway between said boilers, so that both sets of mechanism may be controlled by a single movement.

3. A locomotive adapted to a single rail, consisting of suitable frame-work, independent sets of drivers at opposite ends, and independent furnaces, boilers, steam-chests, steam-cylinders, connecting mechanism, &c., located over said sets of drivers, and a cab located midway the locomotives and having a platform for the engineer located midway its height.



4. A locomotive adapted to a single rail, consisting of suitable frame-work, sets of drivers at opposite ends, independent sets of furnaces over said drivers, a pair of boilers over each furnace placed tandem, independent steam-chests, steam-cylinders for each boiler, cross-heads, connecting-rods by which the power developed in the cylinders is transmitted to the drivers, steam-pipes 18, and operating-rods 20, curved and united as shown, whereby all of the valves are opened and closed by a single movement.

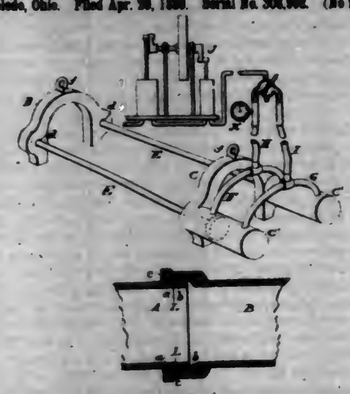
5. In a locomotive adapted to a single rail, suitable frame-work, boilers at each end, drivers, steam-chests, steam-cylinders, cross-heads, and connecting-rods, in combination with steam-pipes 18, valves 19, having spindles provided with pinions, and operating-rods 20, curved and united as shown, and having racks at their ends engaging said pinions, as and for the purpose set forth.

6. In a locomotive adapted to a single rail, the sets of drivers at opposite ends, one driver in each set having eccentrics 33, the usual eccentric straps and rods, and parallel rods connecting the drivers in each set, in combination with links 37, to which the eccentric-rods are connected, valve-stems 35, bell-crank levers connected to the valve-stems and to the links, and reversing-rods 41, curved and united as shown, whereby the two sets of drivers may be reversed by a single movement.

7. In a locomotive adapted to a single rail, sets of drivers at the opposite ends, and furnaces and drivers over each set of drivers, vertically-acting connecting-rods and valve-gear and reversing mechanism of ordinary construction, in combination with operating-rods 20 and reversing-rods 41, arranged as shown, and extending into the cab, so that a single movement will control the valve mechanism in each steam-chest and another movement the reversing mechanism of each set of drivers.

409,007. SAFETY-LANTERN FOR VARNISHERS OF BREWERS' VATS. WILLIAM BEBBLER, St. Louis, Mo. Filed Feb. 26, 1889. Serial No. 301,257. (No model.)

Claim.—1. In a safety-lantern for varnishers of brewers' vats, the combination of the suspensory tubular hanger, from which the lantern is suspended, the adjustable pivoted screw-attacher of said hanger, and the stay-lug 12, that projects longitudinally from the head of said screw-attacher and engages in the slot 13 on the rear side of said tubular suspensory hanger to steady the head of the screw in its intermediate position, substantially as described, and for the purpose set forth.



2. In a safety-lantern for varnishers of brewers' vats, the combination of the suspensory tubular hanger provided with the elongated slot 8, the said hanger also provided with an opening partially around the same for the adjustable traversing of its screw-attacher, the adjustable screw-attacher 7, the pivot-pin that surmounts the head of said screw and is seated and works in the slot 8, and the stay-lug 12, that projects from the rear of said screw-head and engages in the slot 13 in the rear side of the tubular suspensory hanger, substantially as described, and for the purpose set forth.

3. In a safety-lantern for varnishers of brewers' vats, the combination of the suspensory tubular hanger, the pivoted adjustable screw-attacher, the lug 14, that projects from the outer end of said hanger, the suspended lantern, the bail 16, by which said lantern is suspended, and the loop 15 at the summit of said bail, that is seated on the lug 14 of said suspensory hanger, substantially as and for the purpose set forth.

4. In a safety-lantern for varnishers of brewers' vats, the combination of the suspensory hanger, the adjustable pivoted screw-attacher 7, the lantern suspended from said hanger, the flange-collar 32 around the open illuminating-space in front of said lantern, the stay-pins 33, that project from said collar, the illuminating-tube 4, the telescopic collar 34, provided with bayonet-joint angle-slots that engage on the stay-pins 33, to secure the illuminating-tube to the collar, the flaring flange 37, the ring-collar 38 in front of said flange, the stay-pins 39, that project from said ring-collar, the cap-ring 40, that telescopes on the collar 38, the said ring provided with bayonet-joint angle-slots that engage on the stay-pins 39, and the inwardly-projecting flange 41 on said ring, substantially as described, and for the purpose set forth.

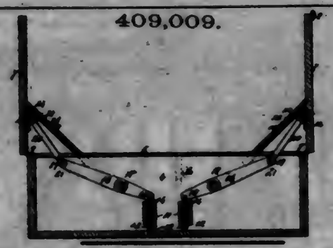
5. In a safety-lantern for varnishers of brewers' vats, the combination of the suspensory and adjustable tubular hanger, from which the lantern is suspended, the adjustable pivoted screw-attacher, the flange-collar 32 around the illuminating-outlet in front of the lantern, the illuminating-tube 4 and its attaching telescopic collar, the bayonet-joint by which said telescopic collar is attached to said flange-collar, the minor glass disk 36, seated between the flange-collar and illuminating-tube, the flaring collar 37, and ring-collar 38 at the forward end of the illuminating-tube, the cap-collar 40, that telescopes on the collar 38, the bayonet-joint that secures said telescopic collar to the collar on which it is seated, the inwardly-flanged rim on said telescopic collar, and the major glass disk 42, that is seated between said flange-rim of the telescopic collar and the collar 38, on which it is seated, substantially as described, and for the purpose set forth.

409,008. LAYING SUBMARINE PIPES. GEORGE H. BRAYNARD, Toledo, Ohio. Filed Apr. 20, 1889. Serial No. 308,002. (No model.)

Claim.—1. In combination with pipe A, having shoulder *a*, pipe B, having shoulder *b*, and groove *c*, gasket L, seated in said groove, yoke C, provided with cylinders C' C', yoke D, rods E, extending through openings in the yokes and provided with pistons within the cylinders, and a pipe H, connecting the cylinders with a pressure-chamber, all substantially as described.

2. The herein-described jack for use in joining submarine pipes, consisting of yokes C D, the former provided with cylinders C' C', rods E E, each provided at one end with a piston and at the other end with a nut or shoulder, and a pipe communicating with the cylinders and adapted to deliver thereto a fluid under pressure.

3. In combination with a jack substantially such as described and shown for connecting pipes under water, a supply-pipe for delivering a fluid thereto under pressure, and a pressure-gage serving to show the pressure applied to or by the jack, substantially as and for the purpose set forth.



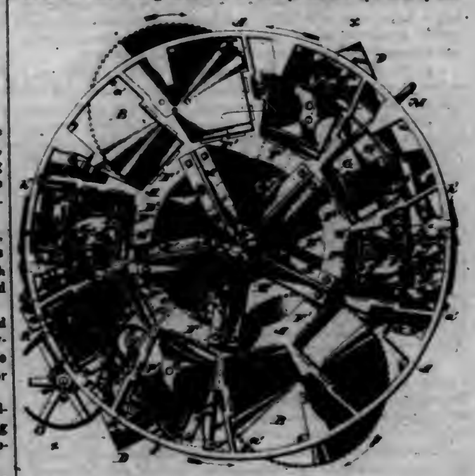
4. In combination with yokes C D, the former provided with cylinders C' C', pistons arranged within said cylinders, rods E, extending from the pistons to yokes D, and pipes H I, communicating with opposite ends of the cylinders and with a pressure-chamber.

5. The herein-described joint for submarine pipe, consisting of a spigot end having shoulder *a*, bell end having shoulder *b* and groove *c*, and gasket L, seated in said groove and adapted to be spread to fill the joint by compression between the shoulders *a* and *b*.

409,009. SHOW-CASE. JOHN BUCKHARDT, Alton, Ill. Filed Mar. 19, 1888. Serial No. 303,336. (No model.)

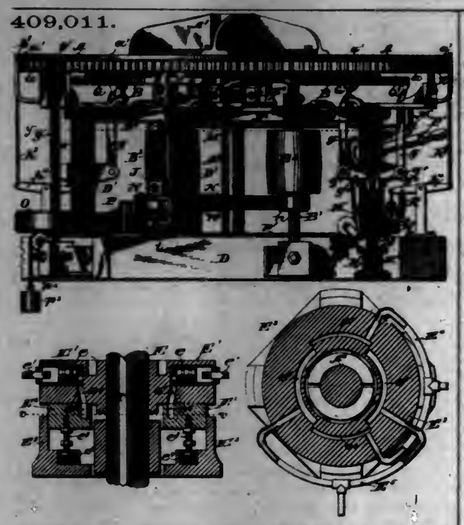
Claim.—In a show-case, the combination of the case with its folding lids, the spring-chamber 5, the spring snap-catch 26, the push-pin that operates said catch, the spiral springs 11, the fulcrum-levers 16, the pins on which said levers fulcrum, the toggle-links 20, the means of connection of said spiral springs to the bottom of the case and to the fulcrum-levers, the pivot-pins that connect said fulcrum-levers to the toggle-links, the brackets 23, and pivot-pins 24, that secure the toggle-links to the folding lids, substantially as described, and for the purpose set forth.

409,009.



409,010. DOOR-KNOB. CROMWELL O. CASE, New Britain, Conn., assignor to P. & F. Corbin, same place. Filed May 16, 1889. Serial No. 310,993. (No model.)

Claim.—The herein-described door-knob, consisting of an ordinary half-shell A and knob-shank B, and the cap part C of the shell, provided with the internal flange 4 and ordinary external flange 3, and an annular space between said flanges, into which the edge of the half-shell A sets, substantially as described, and for the purpose specified.



409,011. SHINGLE-SAWING MACHINE. FRANK CHALLOUPKA, Omro, Wis. Filed Apr. 30, 1888. Serial No. 272,267. (No model.)

Claim.—1. In a shingle-sawing machine, the combination, with a saw and a shingle-bolt carrier provided with dogs for holding said shingle-bolts when operated upon by the saw, of a cylinder, a piston working therein and connected with one of said dogs, and an automatic valve controlling the action of said piston and operated by the

409,011.

movement of said shingle-bolt carrier, substantially as and for the purposes set forth.

2. In a shingle-sawing machine, the combination of a saw and a rotary carrier having shingle-bolt receptacles provided with dogs, cylinders movable with said carrier, pistons working in said cylinders and connected one with a dog of each receptacle, and a valve controlling the admission and eduction of the motive medium to said cylinders, substantially as and for the purposes set forth.

3. In a shingle-sawing machine, the combination, with a saw and a rotary shingle-bolt carrier provided with dogs, of cylinders movable with said carrier, pistons working in said cylinders and connected one with a dog in each receptacle of said carrier, and a central valve connecting in rotation each of said cylinders with the induction and eduction passages, substantially as and for the purposes set forth.

4. In a shingle-machine, the combination, with a saw and a rotary carrier provided with dogs, of a central cylinder-block provided with cylinders and revoluble with said carrier, and a valve-block concentric therewith, provided with induction and eduction ports arranged to register in rotation with induction and eduction passages in said cylinder-block to each of said cylinders, substantially as and for the purposes set forth.

5. In a shingle-sawing machine, the combination, with a saw and a rotary carrier having shingle-bolt receptacles provided with dogs, of a cylinder-block revoluble concentrically therewith and provided with radiating cylinders, pistons working with said cylinders and connected one with a dog in each receptacle of said carrier, a fixed valve-block provided with alternating concentric induction and eduction ports arranged to register in rotation with passages in said cylinder-block to said cylinders, and supply and exhaust connections communicating, respectively, with said induction and eduction ports, substantially as and for the purposes set forth.

6. In a shingle-sawing machine, the combination, with a saw and a rotary shingle-bolt carrier provided with dogs, of cylinders and a block formed with a valve-face, and passages leading to said cylinders and connected and movable with said carrier, pistons working in said cylinders and each connected with one of said dogs, a valve-block provided with induction and eduction ports arranged to register with the passages leading to said cylinders, and a yielding or elastic support holding said valve-block snugly against the face working therewith, substantially as and for the purposes set forth.

7. In a shingle-sawing machine, the combination of a saw and rotary shingle-bolt carrier provided with dogs, cylinders provided with pistons connected with said dogs, a block revoluble with said carrier and formed with a valve-face and passages connecting it with said cylinders, and a vertically-adjustable valve-block having supply and exhaust-connections and ports registering with the passages in said rotary block, substantially as and for the purposes set forth.

8. In a shingle-sawing machine, the combination, with a saw and a rotary shingle-bolt carrier provided with dogs, of cylinders provided with pistons connected with said dogs, a valve-block supported upon adjusting-screws and elastic bearings and provided with ports, and a rotary block working with said valve-block and formed with passages which register with the ports therein and communicate with said cylinders, substantially as and for the purposes set forth.

9. In a shingle-sawing machine, the combination, with one or more saws, of shingle-bolt ways having a movable section, a carrier arranged to move the shingle-bolts thereon, a cylinder, a piston working therein and connected with said movable section, a valve connected with the cylinder, actuating mechanism connected with said valve, and a spur on said carrier arranged to engage and operate said valve-actuating mechanism, substantially as and for the purposes set forth.

10. In a shingle-sawing machine, the combination, with one or more saws, of shingle-bolt supporting-ways having movable sections and a carrier arranged to move said shingle-bolts thereon, two cylinders placed in the same axial line, a piston-rod connected with said movable section and provided with two pistons, one working in each of said cylinders and one acting to cushion the movement of the other, and a valve connected with the cylinder of the actuating-piston, substantially as and for the purposes set forth.

11. In a shingle-sawing machine, the combination, with one or more saws, of openings for the reception of shingle-bolts, curved ways located under said openings and having a movable section, a cylinder, a piston working therein and connected with said movable section, a valve connected with said cylinder, a spring holding said valve in its normal position, actuating mechanism connected with said valve, and pins or spurs connected with said carrier and arranged to be moved separately into range with said valve-actuating mechanism, substantially as and for the purposes set forth.

12. In a shingle-sawing machine, the combination of one or more saws, a rotary carrier having a number of openings for the reception of shingle-bolts, curved ways located below said openings and having sections outwardly movable from a line between and parallel with said ways, rock-shafts provided with standards carrying said sections and with crank-arms, a cylinder, a piston working therein and connected with said crank-arms, a valve in connection with said cylinder, held in its normal position by a spring, a lever fulcrumed to a fixed support adjacent to the periphery of said carrier and connected with said valve, pins or spurs inserted in the rim of said carrier and arranged to be moved separately into range with said lever, and an inclined wing arranged to move said pins after they escape said lever out of range therewith, substantially as and for the purposes set forth.

13. In a shingle-sawing machine, the combination of one or more saws, a rotary carrier having a number of openings for the reception of shingle-bolts, curved ways underneath said openings, having a movable section, mechanism connected with said movable section and arranged to carry the same out of position, so as to drop the bolt or spalt resting thereon, a lever fulcrumed to a fixed support adjacent to said carrier and connected with said mechanism, and a movable pin or spur connected with said carrier and arranged to be moved into range with said lever, substantially as and for the purposes set forth.

14. In a shingle-sawing machine, the combination, with a rotary carrier provided with receptacles for a number of shingle-bolts, of spalt-dropping mechanism, a piston connected therewith and arranged to operate the same, a cylinder in which said piston works, a valve controlling the admission of the actuating medium to said cylinder, and trips applied to said bolt-carrier—one for each of the several bolt-receptacles—and arranged under the control of the operator to shift the valve at the proper time to discharge the spalt from either receptacle in said bolt-carrier, substantially as and for the purposes set forth.

15. In a shingle-sawing machine, the combination, with spalt-dropping mechanism, of an actuating-piston connected therewith and a check-piston attached to the same piston-rod, substantially as and for the purposes set forth.

16. In a shingle-sawing machine, the combination, with the shingle-bolt carrier and spalt-dropping mechanism, of a cylinder, a piston working therein and connected with said spalt-dropping mechanism, a valve controlling the admission of the actuating medium to said cylinder, valve-shifting mechanism, and a retractile trip on said carrier arranged, when moved into position by the operator, to engage and operate said valve-shifting mechanism, substantially as and for the purposes set forth.

17. In a shingle-machine, the combination of a rotary carrier having a number of shingle-bolt-receiving openings, ways underneath said openings, having laterally-movable sections, spalt-dropping mechanism connected with said sections, an actuating-piston connected with said mechanism, a valve controlling the movement of said piston, a lever fulcrumed to a fixed support adjacent to said rotary carrier, and movable spurs connected with said carrier and arranged to be moved separately by the operator into range with said lever, substantially as and for the purposes set forth.

18. In a shingle-machine, the combination of a rotary carrier having a number of shingle-bolt-receiving openings, ways underneath said openings, having laterally-movable sections, spalt-dropping mechanism connected with said sections, an actuating-piston connected with said mechanism, a valve controlling the movement of said piston, valve-actuating mechanism, movable spurs connected with said carrier and arranged to be severally moved by the operator into position to engage and operate said valve-actuating mechanism, and a device for automatically returning said spurs to their normal position, substantially as and for the purposes set forth.

19. In a shingle-sawing machine, the combination, with a rotary bolt-carrier, two saws, and two tilting tables set normally to tilt the bolts alternately in opposite directions, of an actuating-piston connected with one of said tilting tables, a valve controlling the movement of said piston, valve-actuating mechanism arranged to be engaged and operated by said bolt-carrier, and a shifting device under the control of the operator, by which said valve-shifting mechanism is set at will in position to be engaged by said bolt-carrier, substantially as and for the purposes set forth.

20. In a shingle-sawing machine, the combination, with a shingle-bolt carrier and a tilting table, of an actuating-piston connected with said tilting table, a valve controlling the action of said piston, and valve-actuating mechanism arranged to be engaged and operated by said bolt-carrier, substantially as and for the purposes set forth.

21. In a shingle-sawing machine, the combination, with a rotary shingle-bolt carrier and a tilting table, of an actuating-piston connected with said tilting table, a valve controlling the action of said piston, a cam connected with the valve-stem, and pins or projections attached to the cam-shaft and arranged to be engaged by a lug on said rotary carrier, substantially as and for the purposes set forth.

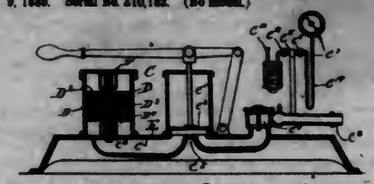
22. In a shingle-sawing machine, the combination, with a rotary shingle-bolt carrier, of a tilting table supported upon the upper end of a tipping-bar, a slide connected with the lower end of said tipping-bar, and a way for said slide capable of angular adjustment, substantially as and for the purposes set forth.

23. In a shingle-sawing machine, the combination, with a rotary shingle-bolt carrier, of a tilting table mounted upon the upper end of a tipping-bar which rests at the lower end in an oscillatory step, a slide connected with the lower end of said tipping-bar, a supporting-way for said slide, capable of angular adjustment, a lever in which said step is pivoted, and a support to which said lever is fulcrumed, capable of angular adjustment, substantially as and for the purposes set forth.

24. In a shingle-sawing machine, the combination, with a rotary shingle-bolt carrier, a tilting table mounted upon the upper end of a tipping-bar which has a jointed connection at its upper end with the frame of the machine and rests at its lower end in an oscillatory step, a slide connected with the lower end of said tipping bar, a guideway for said slide, capable of angular adjustment, a lever in which said step is pivoted, a cylinder, a piston working therein and connected with said tipping-bar, and a support carrying said step lever and cylinder, capable of angular adjustment, substantially as and for the purposes set forth.

25. In a shingle-sawing machine, the combination of a rotary bolt-carrier having a circular series of lugs, a tilting table, an actuating-piston connected therewith, a valve controlling the action of said piston, a cam engaging the valve-stem, and a disk on said cam-shaft, provided with pairs of pins or teeth arranged to be engaged by the lugs on said rotary carrier, substantially as and for the purposes set forth.

26. In a shingle-sawing machine, the combination of a rotary bolt-carrier provided with a number of bolt-receptacles and a like number of lugs, two or more tilting tables, actuating-pistons connected therewith, valves controlling the movement of said pistons, valve-actuating cams, disks mounted on the cam-shafts and provided with pairs of pins which are arranged to be engaged singly or in pairs by the lugs on said carrier, and a hand-operated device arranged to turn either of said disks, so as to bring a pair of pins into range of said lugs, substantially as and for the purposes set forth.



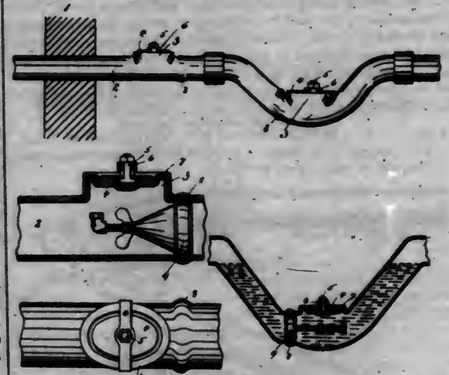
27. In a shingle-sawing machine, the combination of a rotary carrier having a number of bolt-receptacles and a like number of lugs, two or more tilting tables alternating with a like number of saws and set normally at opposite inclinations, tipping mechanism connected with said tilting tables, rotary disks connected with said tipping mechanism and provided with pairs of pins which are arranged to be engaged by the lugs on said rotary carrier, and a shifting device arranged to turn either of said disks, so as to bring a pair of pins into range with the lugs on said carrier, substantially as and for the purposes set forth.

28. In a shingle-sawing machine, the combination, with a saw and a rotary carrier having a number of bolt-receptacles each provided with a movable dog, of cylinders, an automatic valve connecting said cylinders in rotation with supply and exhaust, single-acting pistons connected with said dogs and working in said cylinders, and springs connected with said dogs and acting in opposition to said pistons, substantially as and for the purposes set forth.

409,012. ORNAMENTATION OF WALLS. MELVIN B. CUSHEE, Grand Rapids, Mich. Filed June 11, 1888. Serial No. 313,969. (No model.)

Claim.—The composition herein described, consisting of gypsum, glue, and a fatty matter, substantially as described.

409,013. APPARATUS FOR TESTING AND DISINFECTING DRAIN OR SOIL PIPES. WILLIAM S. CLARK, Philadelphia, Pa. Filed May 9, 1888. Serial No. 310,182. (No model.)



Claim.—1. A fumigating-vessel having a spring-supported air-inlet valve opening downward in the top, a removable perforated support for combustible fumigating material, and an outlet-tube at the base connected and combined with the inlet-valve of an air-forcing pump, constructed and arranged to operate substantially as set forth.

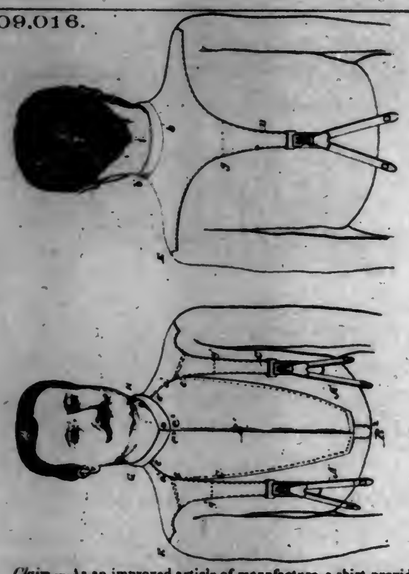
2. The combination of the air-pump C with the bed-plate E, and the fumigating-vessel D, containing the removably-attached pump, inlet-valve C^{13}, and air-inlet valve D', said fumigating-vessel being detachably connected to the bed-plate E, substantially as shown and described.

3. The combination of the air-pump C, supported by the bed-plate E, which is provided with the valve C^4, with the vessel D, provided with the pump-inlet spring-valve C^{13}, the manometer C^7, siphon-seal C^{14}, and siphon-gage C^{16}, provided with the cocks C^{11} and C^{12}, substantially as shown and described, and for the purpose set forth.

409,014. DRAIN AND SOIL PIPE. WILLIAM S. CLARK, Philadelphia, Pa. Filed May 9, 1888. Serial No. 310,183. (No model.)

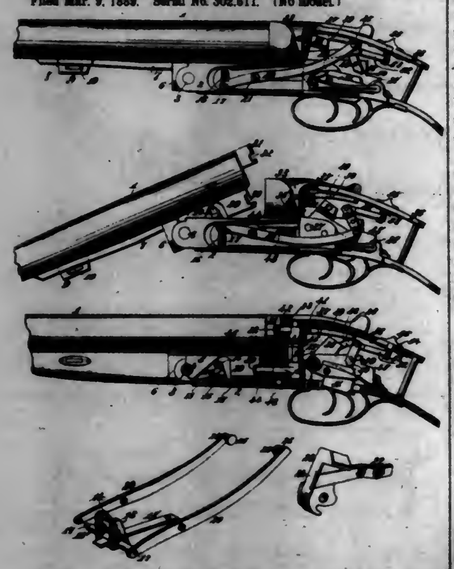
Claim.—1. In a drain and soil pipe, the combination of the annular expanded portion thereof, formed contiguous to a hand-hole in the said pipe, with an expansible stopper adapted to fit into the said expanded portion, substantially as shown and described, and for the purpose set forth.

2. A drain and soil pipe having the expansion 8 formed therein, and constructed with an elliptic hand-hole, and provided with the plate 4, bolt 5, bridge 6, and gasket 7, in combination with the expansible stopper 9, substantially as shown, and for the purpose specified.



409,015. ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed Apr. 24, 1888. Serial No. 308,416. (No model.)

Claim.—The process of welding metals which consists in placing them in an air-tight chamber, exhausting the air therefrom, and then fusing the metals by electricity, substantially as described.



409,016. SHIRT. MAX OSHEE, New York, N. Y. Filed Nov. 14, 1888. Serial No. 290,921. (No model.)

409,016.

Claim.—As an improved article of manufacture, a shirt provided with the yoke B, having front and back tags C C and D, said yoke extending entirely across the shoulders and having the semicircular neck portion *a a*, said yoke being secured at its outer edge to the shirt-body from shoulder to shoulder and at its inner edge, at the back, to the neckband and to the upper edge of the bosom, and also part way down the edge of each tag, so as to leave only the ends thereof free, substantially as shown and described.

409,017. BREECH-LOADING GUN. HARRY COMSTOCK, Fulton, N. Y., assignor to the Hunter & Comstock Arms Company, same place. Filed Mar. 9, 1889. Serial No. 302,611. (No model.)

Claim.—1. In a concealed-hammer gun, the combination, with a slotted frame, of barrels pivoted thereon and provided with a lug, a loop or yoke engaging the lug and having a shaft extending through slots in the frame, the pivoted cocking-levers connected with and operated by the shaft of the loop or yoke, and strikers arranged adjacent to the rear ends of the cocking-levers and cocked by the latter, substantially as described.

2. In a concealed-hammer gun, the combination, with a slotted frame, of pivoted barrels having a hooked lug, a loop or yoke arranged in the slotted frame engaging the hooked lug and having a shaft at its lower portion extending through slots in the frame, the pivoted cocking-levers pivoted on the frame and connected at their front ends with the shaft of the loop or yoke, and strikers pivoted in the rear part of the frame and having rearwardly-projecting tangs acted on by the rear ends of the cocking-levers to cock the strikers, substantially as described.

3. In a concealed-hammer gun, the combination, with a slotted frame and barrels pivoted thereon and having a lug, of a loop or yoke engaging the lug and having a shaft extending through slots in the frame in rear of the barrel-pivots, the cocking-levers pivoted to the frame and having their front ends connected with the shaft of the loop or yoke and their rear ends provided with lateral studs, and strikers pivoted in the rear part of the frame and having rearwardly-extending tangs on which the studs on the cocking-levers rest, substantially as described.

4. In a concealed-hammer gun, the combination, with a slotted frame and barrels pivoted thereon and having a hook in rear of the barrel-pivot, of a loop or yoke arranged in the frame engaging the hook and having a shaft extending through slots in the frame, the strikers pivoted in the rear part of the frame and having rearward-projecting tangs, and cocking-levers pivoted to the frame, connected at their front ends with the shaft of the loop or yoke, and having studs at their rear ends provided with circular heads overlapping the faces of the striker-tangs, substantially as described.

5. In a concealed-hammer gun, the combination, with a frame and barrels pivoted thereon and having a hook in rear of the barrel-pivot, of a loop or yoke engaging the hook and having a shaft, the strikers pivoted in the rear part of the frame and having rearward-projecting tangs, and the cocking-levers composed of flat steel plates fulcrumed on the opposite faces of the frame, connected with the shaft of the loop or yoke, and having studs at their rear ends provided with heads overlapping one side of the striker-tangs, while the cocking-levers lie on the opposite side thereof, substantially as described.

6. In a hammerless gun, the combination, with a spring-actuated post journaled in the rear of the breech-piece and operated by the top lever, of barrels pivoted on the frame and provided with two central lugs, one projecting to the rear and having a locking-recess and the other depending from below and having a similar locking-recess, and a stop-bolt lying in a seat in the rear end of a central groove in the bridge-piece and thrown upward by a spring, the post being provided with a locking-cam normally lying in the rear end of the groove in the breech-piece and having a heavier locking-cam normally lying in the rear end of the central slot of the frame, whereby, upon closing the breech, the rearwardly-projecting lug on the pivoted barrels enters the central groove in the breech-piece, driving down the stop-bolt, releasing the lug pressing against it, and thereby enabling the spring-actuated post to throw both locking-cams into the locking-recesses of the respective lugs on the barrels as the breech sinks to place.

7. In a concealed-hammer gun, the combination, with a slotted frame and barrels pivoted thereon and provided in rear of the pivot with a lug, of a loop or yoke engaging the lug and having a flattened shaft extending through slots in the frame, a flat spring acting at one end upon the flattened part of said shaft and detachably secured to the frame at its other end, cocking-levers fulcrumed on the frame and connected at their front ends with the shaft of the loop or yoke, and strikers pivoted in the rear part of the frame and having rearward-projecting tangs acted on by the rear ends of the cocking-levers, substantially as described.

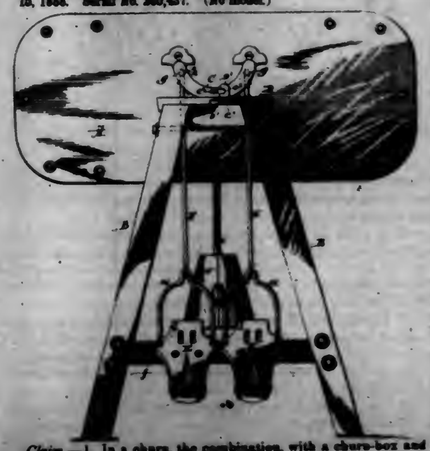
8. In a hammerless gun, the combination, with the tripping-plates of the triggers, of a cam-lever straddling and pivoted to a plate on the frame between the tripping-plates, said levers having eccentric or cam surfaces overhanging the tripping-plates, and a push-button adjustable on the central top piece of the frame and having a drop-plate lying in a slot in the top piece and connected to the free end of the cam-lever, substantially as described.

409,018. AXLE-LUBRICATOR. EDWARD S. COYLE, Ballston, N. Y. Filed Feb. 16, 1888. Serial No. 264,257. (No model.)

Claim.—1. The combination of the axle provided with the shoulder S and the two screw-threaded portions, and which is reduced in size between the two screw-threaded portions, with the perforated thimble D, internally screw-threaded at each of its ends, so as to screw on the axle, the nut C and screw B, and an oil-passage F made through the axle and to connect with the oil-chamber formed by the thimble, substantially as shown.

2. The combination of the axle having the central portion of the spindle uniformly reduced in size and provided with an oil-passage F, which extends from beyond the shoulder S at its outer end, with the perforated thimble D and nut C, the oil-chamber being formed inside of the thimble by the reduced portion of the spindle alone, substantially as described.

409,019. STARCHING-MACHINE. JAMES G. CRAWFORD, Boston, Mass. Filed May 28, 1888. Serial No. 275,262. (No model.)



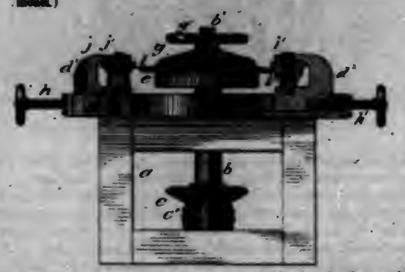
Claim.—1. The combination of a starch-box, a plunger therein, a rod *d*, affixed to the plunger, fixed guides for said rod, shoulders or stops affixed to the rod, a sleeve adapted to move on said rod between said shoulders, a spring interposed between said sleeve and one of said shoulders, and means for reciprocating said sleeve, as set forth.

2. The combination of the starch-box, the plunger *b* therein, having a rod *d*, the roll mounted in fixed bearings over said box, the driving-shaft *l*, having the fast pulley *m* and the idle-pulley *m'*, a connection between said shaft and the rod *d*, whereby said rod and plunger are reciprocated, the loose pulley *r* on said shaft, having the sprocket-wheel *s* attached to its hub, a sprocket-wheel *u*, attached to the roll *v*, the chain *t*, connecting the wheels *u s*, the movable loose roll *w*, and means, substantially as described, whereby said roll may be held in operative relation to the roll *v*, as set forth.

3. The combination of the starch-box, the plunger *b* therein, having a rod *d*, the roll *v*, mounted in fixed bearings over said box, the driving-shaft *l*, having the fast pulley *m* and the idle-pulley *m'*, a connection between said shaft and the rod *d*, whereby said rod and plunger are reciprocated, the loose pulley *r* on said shaft, having the sprocket-wheel *s* attached to its hub, a sprocket-wheel *u*, attached to the roll *v*, the chain *t*, connecting the wheels *u s*, the movable loose roll *w*, means, substantially as described, for moving the roll toward and from the roll *v*, and the indicator *p'*, attached to the driving-shaft *l*, whereby the position of the plunger is indicated, as set forth.

409,020. CHURN. JAMES M. CURTIS, Louisville, Ky. Filed Sept. 15, 1888. Serial No. 285,437. (No model.)

Claim.—1. In a churn, the combination, with a churn-box and a supporting-frame, of two rockers secured at their ends to the box, with their curved faces resting on the supporting-frame, a movable block adapted to engage a projection carried by the churn-box for locking the latter against movement, connecting-rods attached to the churn-body, and treadles connected to the lower ends of the connecting-rods, substantially as set forth.



2. In a churn, the combination, with a churn-box and a supporting-frame, of two rockers secured at their ends to the box, with their curved faces resting on the supporting-frame, a movable locking-block mounted in the frame and adapted to engage a projection on one of the rockers for locking the churn-body in a horizontal position, connecting-rods attached to one of the rockers at or approximately at the opposite ends thereof, and treadles attached to said connecting-rods, substantially as set forth.

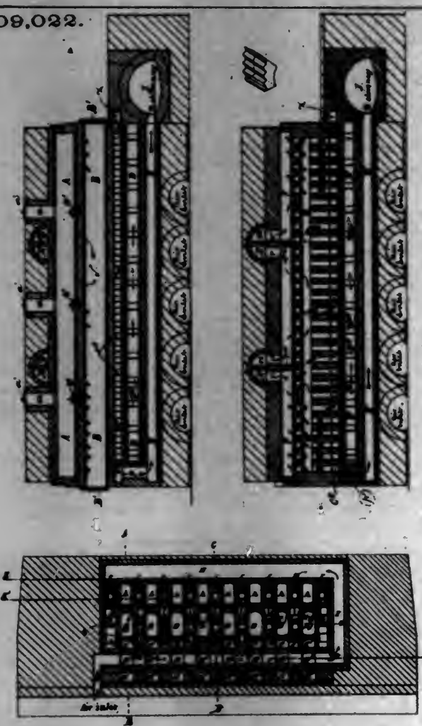
3. In a churn, the combination, with a supporting-frame having track-plates thereon, and a churn-box having rockers, the latter having teeth adapted to register with indentations in the track-plate, of the connecting-rods attached at or near the ends of one of said rockers, a device for locking one of the rockers to the supporting-frame, and treadles connected to the lower ends of the connecting-rods, substantially as set forth.

4. In a churn, the combination, with a supporting-frame and a churn-box having a weight depending from the bottom thereof, rockers secured to the sides of the box, with their curved faces resting on the supporting-frame, and a movable block adapted to engage a projection carried by the churn-box for locking the latter against movement, of rods attached to the churn-box near the ends of one of the rockers, and treadles attached to the lower ends of the rods, substantially as set forth.

5. The combination, with a churn-box that is made to rock endwise on rockers and track-plates, of a rocker having a projecting lug, a slotted and recessed track-plate, and a locking-block which is adapted to slide in the slot of the track-plate and is also slotted to engage the lug of the rocker, substantially as set forth.

409,021. MACHINE FOR FLANGING BOILER-HEADS. ISAAC B. DAVIS, Hartford, Conn. Filed Jan. 6, 1888. Serial No. 260,269. (No model.)

Claim.—1. In a machine for forming boiler-heads, the combination, with a rotary shaft, a form attached thereto, and a clamp for securing a blank to one face of the form, of laterally-adjustable rolls arranged to rotate in the same plane as the form, one of said rolls being constructed with an annular projection and the other roll constructed with an overhanging edge, substantially as set forth.



2. In a machine for forming boiler-heads, the combination, with a rotary shaft, a form attached thereto, and a clamping device for securing a blank to one side of the form, of two laterally-adjustable rolls located on opposite sides of the form and arranged to rotate in the same plane therewith, one of said rolls being cylindrical and provided with an overhanging edge and the other roll made tapering and provided with an irregular-curved surface, substantially as set forth.

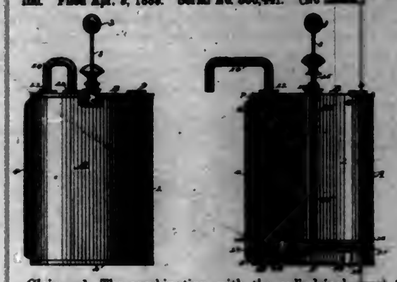
3. In combination with a rotary shaft bearing a form and a clamp device, whereby a disk-shaped boiler-head blank is held between the form and the clamping-disk, the base bearing the reciprocating carriages, the reciprocating carriages arranged on diametrically-opposite sides of the shaft and form the carriage-feeding devices, and the forming-rolls borne in said carriages, one of the said rolls being conical and having an annular curved projection and the other and opposite roll having the cylindrical working-surface placed parallel to the plane of the annular rim of the form, and having the curved edge overhanging the cylindrical body of the roll, all substantially as described.

409,022. FURNACE FOR THE DESICCATION, INCINERATION, AND CARBONIZATION OF PRECIPITANTS, &c., RESULTING FROM SLUDGE, &c. RICHARD DE SALISBURY, 71 St. Mary Street, Cardiff, County of Glamorgan, England. Filed Sept. 26, 1887. Serial No. 250,736. (No model.) Patented in England Feb. 24, 1886, No. 2,721.

Claim.—1. A refuse-furnace having an upper chamber formed with charging-openings, the lower chamber, the charging-openings connecting the chambers, the air-flue in the wall of the upper chamber, the gas-flue in the wall of the lower chamber, the openings con-

409,022.

necting the air and gas flues, and the air and gas openings connecting the lower chamber with the gas-flue, substantially as described.



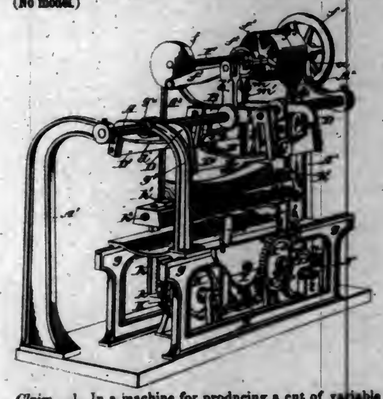
2. A refuse-furnace having an upper chamber formed with charging-openings, the lower chamber, the charging-openings connecting the chambers, the air-flue in the wall of the upper chamber, the gas-flue in the wall of the lower chamber, the openings connecting the air and gas flues, the air and gas openings connecting the lower chamber with the gas-flue, the vertical gas-flues, the top gas-flue, the lower gas-flue, the intermediate air-flue, the vertical air-flues, the top air-flues, and the openings connecting the top air-flues with the air-flue in the wall of the upper chamber.

3. A refuse-furnace having an upper chamber formed with charging-openings, the lower chamber, the charging-openings connecting the chambers, the air-flue in the wall of the upper chamber, the gas-flue in the wall of the lower chamber, the openings connecting the air and gas flues, the air and gas openings connecting the lower chamber with the gas-flue, the vertical gas-flues, the top gas-flue, the lower gas-flue, the intermediate air-flue, the vertical air-flues, the top air-flues, the openings connecting the top air-flues with the air-flue in the wall of the upper chamber, and the main flue, with which the lower gas-flue connects, substantially as described.

4. A refuse-furnace having upper chambers A A, formed with charging-openings *a*, the lower chambers B B, the charging-openings *c*, connecting the upper and lower chambers, the horizontal air-flue F in the wall between the upper chambers, the horizontal gas-flue G and vertical gas-flues H in the wall between the lower chambers, the openings *d*, connecting the horizontal air-flue with the horizontal gas-flue, and the openings *e* and *f*, connecting the lower chambers with the horizontal gas-flue, substantially as described.

5. A refuse-furnace having the upper chambers A A, the lower chambers B B, the horizontal air-flue F in the wall between the upper chambers, the horizontal gas-flue G and the vertical gas-flues H in the wall between the lower chambers, the openings *d*, connecting the horizontal air-flue with the horizontal gas-flue, the openings *e* and *f*, connecting the lower chambers with the horizontal gas-flue, the top flues C and C′ beneath the lower chambers, the bottom flues E E′, the intermediate air-flues D D′ between the top and bottom gas-flues, the vertical air-flues K K′, the top air-flues N, the openings *r*, connecting the top air-flue with the horizontal air-flue, and the openings *p p′*, connecting the top flues C C′ with the bottom flues E E′, and the main flue J, substantially as described.

409,023. MEASURING-VESSEL. ABRAHAM DE WITT, Bluffton, Ind. Filed Apr. 2, 1889. Serial No. 305,441. (No model.)



Claim.—1. The combination, with the cylindrical vessel A, provided with the ports at its top and bottom, the tube 4, opening into the said ports, and the interior pipe 7 on the upper port, of the cover B, provided with a drip-hole and nozzle-seat, the swiveled nozzle in the cover, and the valved piston, substantially as described.

2. The combination of the cylindrical vessel A, provided with the pipe 7 at its upper end, and the semicircular shell or tube secured on the outer face of the vessel and opening into the vessel at its bottom and into the pipe at its top, the cover provided with a drip-hole and nozzle-seat, the swiveled nozzle on the cover, and a valved piston provided with a piston-rod having graduations of measure marked thereon, substantially as described, and for the purpose specified.

3. The combination, with the vessel A, provided with a vertically-arranged exterior discharge-tube opening into the vessel at the top and bottom, and an interior vertical pipe opening into the said tube, a reciprocating piston and cover, of the swiveled nozzle arranged to connect with the interior pipe of the vessel at its swiveled end and to turn and set in a drip-hole in the cover with its free end, substantially as described.

409,024. MACHINE FOR CUTTING CURVED SURFACES. SAMUEL M. DIXON, Milwaukee, Wis. Filed Oct. 23, 1888. Serial No. 288,949. (No model.)

Claim.—1. In a machine for producing a cut of variable curvature, the combination of a flexible saw or cutter and means of changing its curvature while it is making a cut, substantially as and for the purposes set forth.

2. In a machine for producing a cut of variable curvature, the combination of a flexible cutter, holders supporting the cutter on opposite sides of the work, and mechanism connected with and arranged to change the distance between said holders while the cutter is in operation, substantially as and for the purposes set forth.

3. In a machine for producing a cut of variable curvature, a flexible cutter, means for changing its curvature while in operation, and a pattern arranged to change the direction of the cut transversely to the direction of the stroke of the cutter, substantially as and for the purposes set forth.

4. In a machine for producing cuts of variable curvature, a flexible cutter, means for changing the curvature of said cutter when the same is in operation, feeding mechanism, and mechanism for changing the position and inclination of the cutter with reference to the line of feed, substantially as and for the purposes set forth.

5. In a machine for producing a cut of irregular or variable curvature the combination of a flexible cutter, feeding mechanism,

saw-holding devices and guides arranged to change the curvature of the cutter, and a pattern arranged to change the position of the saw, whereby its curvature is changed and at the same time the line of its cut in the direction of the feed is determined, substantially as and for the purposes set forth.

6. In a machine for producing a cut of irregular or variable curvature, the combination, with a vibratory saw-frame provided with inclined guide-arms, saw-holding blocks held to said arms, a flexible saw secured to said blocks, and mechanism arranged to move said blocks lengthwise of said arms, whereby the curvature of the saw is changed, substantially as and for the purposes set forth.

7. In a machine for producing a cut of irregular or variable curvature, the combination of a vibratory saw-frame, a flexible saw held in said frame, and a pattern arranged to move said saw while the same is in operation toward or from the center on which said frame vibrates, substantially as and for the purposes set forth.

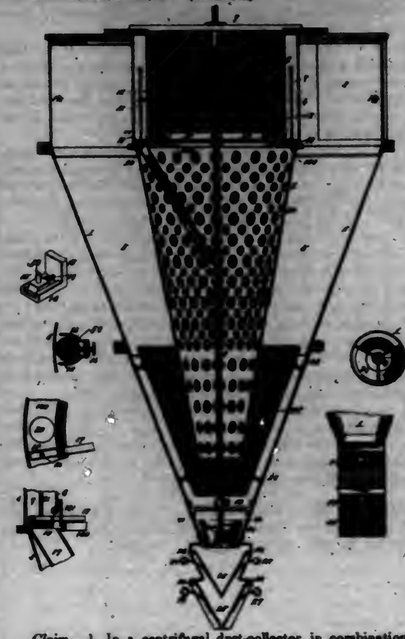
8. In a machine for producing a cut of irregular or variable curvature, the combination of a vibratory saw-frame having slotted arms, saw-holding blocks held and capable of turning in said arms, a saw secured to said blocks, and curved patterns engaging with said blocks and arranged to move and turn the same in said arms in conformity with the curvature of the cut to be produced, substantially as and for the purposes set forth.

9. In a machine for producing a cut of irregular or variable curvature, the combination, with a vibratory saw-frame having movable saw-holding blocks, of means for moving said blocks toward or away from each other, and a flexible saw secured at the ends in cylinders which have bearings and are capable of turning in said blocks, substantially as and for the purposes set forth.

10. In a machine for producing a cut of irregular or variable curvature, the combination of a vibrating saw-frame having inclined slotted arms, saw-holding blocks journaled in and movable lengthwise of said arms, a flexible saw secured at the ends in cylinders which are held and are capable of turning in transverse holes in said blocks, and curved patterns working longitudinally through transverse openings in said blocks, substantially as and for the purposes set forth.

11. In a machine for producing a cut of irregular or variable curvature, a fixed shaft, a vibrating saw-frame mounted thereon and having inclined arms, saw-holding blocks carried by and movable lengthwise of said arms, a flexible saw secured at the ends to said blocks, vibrating cross-heads mounted on said shaft on opposite sides of said saw-frame, patterns attached to said cross-heads and movable lengthwise in engagement with said blocks, and a carriage movable parallel with said shaft and connected with said cross-heads, substantially as and for the purposes set forth.

12. In a machine for producing a cut of irregular or variable curvature, the combination of a flexible saw or cutter, means for changing the curvature of said saw while the same is in operation, a carriage movable on suitable ways, chain-wheels carrying parallel chains, and a cross-shaft attached to said chains and connected with and movable lengthwise of an arm attached to said carriage perpendicular to its line of travel, substantially as and for the purposes set forth.



13. In a machine for producing a cut of irregular or variable curvature, the combination of a vibrating saw-frame having inclined arms, a flexible saw having sliding connections with said arms, a carriage capable of rectilinear movement transversely to the stroke of said saw, mechanism for feeding said carriage and curved patterns connected with said carriage and saw-frame so as to partake of the movements of each, and also connected with the ends of the saw so as to move the same lengthwise of the inclined arms of the saw-frame, and thereby produce a greater or less curvature of the saw, substantially as and for the purposes set forth.

14. In a machine for producing a cut of irregular or variable curvature, a vibrating saw adjustably held therein, guides arranged to change the curvature of the saw while the same is in operation, a work-support, feeding mechanism for moving said support transversely to the stroke of the saw, and mechanism for moving said support transversely to the feed toward and from the plane of the saw, substantially as and for the purposes set forth.

15. In a machine for producing a cut of irregular or variable curvature, the combination of a vibrating saw-frame having inclined arms, a flexible saw held at the ends in blocks so as to turn therein on axes transverse to its blade, said blocks being attached to and movable lengthwise of said inclined arms and capable of turning, a carriage movable transversely to the saw, and curved patterns connected and movable with said carriage and saw-frame and provided with flanged edges which engage with undercut grooves in said saw-holding blocks, substantially as and for the purposes set forth.

16. In a machine for producing a cut of irregular or variable curvature, the combination of a flexible saw or cutter, a work-support, mechanism for moving the same past the saw, a pattern which determines the direction of the cut in the line of the feed, and mechanism arranged to increase or diminish the curvature of the saw in the direction of its stroke, according to the curvature of the cut in the line of feed, substantially as and for the purposes set forth.

409,025. DUST-COLLECTOR. ROBERT I. DOWNTON, St. Louis, Mo., assignor of one-half to James W. S. Downton, same place. Filed Jan. 2, 1889. Serial No. 295,116. (No model.)

Claim.—1. In a centrifugal dust-collector, in combination with an outer casing having a tangential inlet, a screen and wall forming a dead-air chamber, against which the flour or dust is deposited under the action created by the inlet being tangential, substantially as set forth.

2. In a centrifugal dust-collector, in combination with an outer casing having a tangential inlet, a screen and wall forming a dead-air chamber, against which the flour or dust is deposited under the action created by the inlet being tangential, and brushes for forcing the flour or dust into the dead-air chamber, substantially as set forth.

3. In a dust-collector, in combination with an outer casing having a tangential inlet, a screen and wall forming a dead-air chamber against which the flour or dust is deposited under the action created by the inlet being tangential, and brushes rotating on their axes bearing against the inner face of the dead-air chamber and forcing the material through the meshes, substantially as set forth.

4. In a dust-collector, the combination of an outer casing having a tangential inlet, a wall and screen forming a dead-air chamber, a central shaft, and incased brushes on the shaft bearing against the screen and forcing the material through the meshes, substantially as set forth.

5. In a centrifugal dust-collector, the combination, with the concentric outer casing, a wall and a screen forming a dead-air chamber in the outer part of the machine, of a central shaft and adjustable brushes carried by the shaft and moving over said perforated wall, said outer casing having a tangential inlet, substantially as set forth.

6. In a centrifugal dust-collector, the combination of an outer casing provided with an inlet and with an outlet for purified air, a wall and screen forming an annular dead-air chamber located in the upper part of said casing and surrounding said air-outlet, a trough forming the bottom of the dead-air chamber, a delivery-spout and scrapers, said casing having a tangential inlet, whereby the dust is separated from the air and passes through said screen, substantially as set forth.

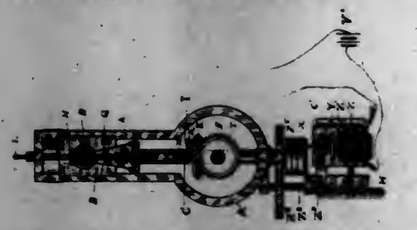
7. In a dust-collector, the combination of an outer casing having a tangential inlet and an outlet, an inner casing forming a vent-flue, and brushes, the lower end of said vent-flue being perforated and the upper end having a wall and screen forming a dead-air chamber, substantially as set forth.

8. In a dust-collector, the combination of an outer casing having a tangential inlet and an outlet, an inner casing forming a vent-flue,

and incased brushes, the lower end of said flue being perforated and the upper end having a wall and screen forming a dead-air chamber, substantially as set forth.

9. In a centrifugal dust-collector, the combination, with an outer casing having a tangential inlet, an inner casing forming a vent-flue, and a screen forming an annular dead-air chamber surrounding said flue, a trough forming the bottom of the dead-air chamber, a delivery-spout, and scrapers, substantially as set forth.

10. In a centrifugal dust-collector, the combination of an outer casing having a tangential inlet, an inner casing forming a vent-flue, a screen forming, in connection with said inner casing, an annular dead-air chamber, a trough forming the bottom of the dead-air chamber, a delivery-spout, a shaft, arms on the shaft, and scrapers on the arms, substantially as set forth.



11. In a centrifugal dust-collector, the combination of an outer cylinder having a tangential inlet, an inner casing forming a vent-flue, a screen forming in connection therewith a dead-air chamber, a trough forming the bottom of the dead-air chamber, a delivery-spout, scrapers, and arms 21, for the purpose specified, substantially as set forth.

12. In a centrifugal dust-collector, the combination of an outer casing having a tangential inlet, an inner casing forming a vent-flue, a wall and screen forming a dead-air chamber, a trough forming the bottom of the dead-air chamber, a central shaft, arms on the shaft, scrapers on the arms, and a shield 101, substantially as set forth.

13. In a dust-collector, the combination of an outer casing having a tangential inlet, an inner casing forming a vent-flue, a screen forming, in connection with said inner casing, a dead-air chamber, incased cleaning-brushes, and means for adjusting the brushes, consisting of dovetailed blocks and set-screws, substantially as set forth.

14. In a dust-collector, the combination of the outer casing having a tangential inlet, an inner casing forming a vent-flue, a screen forming, in connection with said inner casing, a dead-air chamber for catching the dust, and rotary brushes 12, having suitable journals and arranged within the vent-flue, substantially as set forth.

409,026. ENGRAVING-MACHINE. William S. Eaton, Sag Harbor, assignor to the Fahys Watch Case Company, New York, N. Y. Filed Feb. 26, 1889. Serial No. 301,266. (No model.)

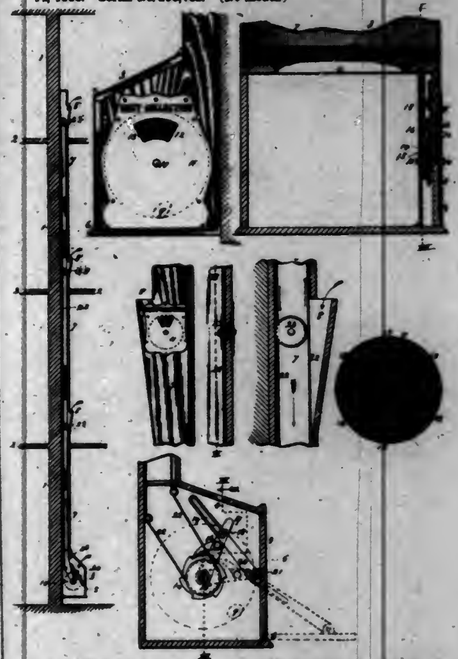
Claim.—1. In an engraving-machine, an engraving-tool operated by means of an electrical current and a model or pattern arranged to make and break the circuit, but lying outside of and not forming part of said circuit.

2. In an engraving-machine, an engraving-tool operated through the medium of an electrical current, in combination with suitable contact-points and a model or pattern arranged to make and break the contact, but lying outside of the circuit.

3. In an engraving-machine, the engraving-tool or burin attached to and forming part of an armature, in combination with said armature, an electro-magnet, means, substantially as shown and described, for making and breaking the current, and a pattern or model formed of non-conducting material.

4. In an engraving-machine, the combination of a pattern or model formed of non-conducting material, a stylus or tracer arranged to move over the face of the model, suitable contact-points, arranged substantially as shown and described, and an electro-magnet having an armature provided with an engraving-tool, all arranged as and for the purposes set forth.

5. In an engraving-machine, the combination of a rotating pattern or model formed of non-conducting material, an overhanging arm having a lever provided with a stylus or tracer for following the configurations upon the pattern, a make-and-break contact adapted to be opened and closed by the vertical movements of the tracer upon the pattern, and an engraving-tool operated through the medium of the electrical current, substantially as shown and described.



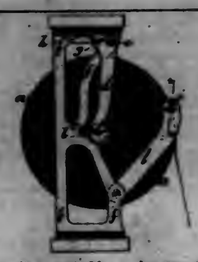
6. In an engraving-machine, the combination of a pattern or model rotating in a horizontal plane, an arm vertically adjustable in relation to said pattern, a lever hung in said arm provided with a stylus or tracer, a second lever arranged to be operated by the vertical movement of the stylus so as to make and break the contact, and an engraving-tool adapted to be operated by the make and break of the electrical current.

7. In an engraving-machine, the combination of a pattern or model suitably mounted and adapted to rotate, an arm extending over and above the said pattern or model, a tracer or stylus pivotally supported in the arm, two contact-points adapted to be opened and closed by the movement of the stylus, an electrical circuit, an electro-magnet, and a vibrating lever carrying an armature and an engraving-tool.

8. In an engraving-machine, the combination of a horizontally-turning model or pattern, an arm, a lever pivoted in said arm and carrying a stylus or tracer, a second lever also pivoted in this arm and provided with a contact-point, a spring-bar attached to the arm and provided with the other contact-point, and an engraving-tool operated by the opening and closing of the circuit.

9. In an engraving-machine, the combination of a horizontally-rotating model or pattern, an arm carrying a stylus vertically adjustable relatively to the pattern, a lever carrying a contact-point insulated therefrom and adapted to be operated by the vertical movement of the stylus, an elastic arm carrying a glass globe or cylinder and the other contact-point with the electrical conductors, an electro-magnet, and the armature, all arranged substantially as and for the purposes set forth.

409,027. LETTER-BOX. Leo Ehrlich, St. Louis, Mo. Filed Nov. 14, 1888. Serial No. 290,782. (No model.)



Claim.—1. The combination, with a letter-box, of a chute leading to the box and indicators upon the box, and chute operated by movement of the door of the letter-box, substantially as and for the purpose set forth.

2. The combination, with a letter-box and a chute leading thereto, of the indicator 9, indicator-shaft 10, carrying a ratchet-wheel, a lever carrying a pawl acting on the ratchet-wheel, a link connecting the lever with the door, a sheave on the indicator-shaft, and a belt connecting this sheave with sheaves on the shaft of a rotary indicator upon the chute, substantially as set forth.

3. The combination, with a letter-box and chute leading to the box, of rotary disks in the walls of the box and chute, plates outside the disks, having apertures 12 to expose parts of the disks, carrying-marks indicating the time of making the next collection, a belt connecting the shafts of the indicators, a ratchet-wheel upon the shaft of the indicator upon the box, a lever carrying a pawl acting on the ratchet-wheel, and a link connecting the door of the box with the pawl-lever, substantially as and for the purpose set forth.

409,028. ROLL-PAPER HOLDER AND CUTTER. Leo Ehrlich, St. Louis, Mo., assignor to the American Roll Paper Company, same place. Filed Dec. 3, 1887. Renewed Mar. 30, 1889. Serial No. 305,170. (No model.)

409,028.

Claim.—1. In a roll-paper holder and cutter, the combination of pivoted arms projecting in a downward direction and supporting the roll of paper, a knife, and springs resting on the arms, substantially as and for the purpose set forth.

2. In a roll-paper holder and cutter, the combination, with a framing, of a paper-roll *a*, arms pivoted to the framing on the machine and supporting the paper-roll, springs *h*, and a stationary knife or cutter, substantially as described.

3. In a roll-paper holder and cutter, the combination, with a framing, of paper-roll *a*, axle *b*, hangers *d*, hinged to the framing of the machine, springs *h*, and stationary knife or cutter, substantially as described.

4. In a roll-paper holder and cutter, the combination, with a framing, of paper-roll *a*, axle *b*, hangers *d*, hinged to the framing of the machine and having ears or lugs *g*, springs *h*, and a stationary knife or cutter; substantially as described.

5. In a roll-paper holder and cutter, the cutter *i*, formed with notches *j* and turned ends *i'*, and brackets *l*, having slots *k*, substantially as described.

409,029. COMBINED TOBACCO AND MATCH CASE. Francis R. Elliott, Miles, Wash. Filed Mar. 30, 1889. Serial No. 305,342. (No model.)

Claim.—1. The combination, with a case composed of a single blank cut into shape and folded to form a large and a small compartment, one wall of the smaller compartment being shorter than the other wall of said compartment, of a cover composed of three leaves, two of said leaves being adapted to produce the sides of the cover for the larger compartment, and the third leaf forming a continuation of the short wall of the smaller compartment and a cover for said compartment, substantially as set forth.

2. In a combined tobacco and match safe, the combination, with a tobacco-compartment and a narrow pocket shorter than the receptacle and adjacent to the latter, of a removable cover composed of three leaves, two to enter the receptacle and one longer one to enter the pocket, and a tongue on the cover, whereby the latter is easily removed, substantially as set forth.

409,030. SASH-CORD FASTENER. Robert Fagan, New Britain, Conn., assignor to P. & F. Corbin, same place. Filed May 9, 1889. Serial No. 310,196. (No model.)

Claim.—The herein-described sash-cord iron, consisting of a semi-cylindrical shell of metal having a mush-cord perforation extending transversely through the summit, and a prong or prongs at the edge of said perforation formed by a portion of the metal that is displaced to form said perforation, substantially as described, and for the purpose specified.

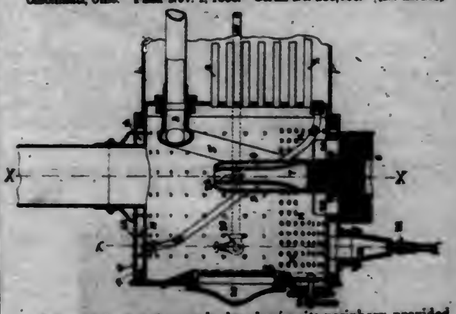
409,031. VALVE. Dominico Ferrarris, Dallas, Tex. Filed Jan. 26, 1889. Serial No. 297,690. (No model.)

Claim.—The improved valve herein described, the same comprising the casing A, having a horizontal passage B, reduced at its central point, as at F, and a vertical bore E, intersecting said reduced portion F above the point of intersection to its lower end and being

409,031.

screw-threaded its entire length, a stem I, having a tapered lower portion, the entire stem being screw-threaded to engage the threads in the bore, and a plug H, removably inserted in the lower end of the bore, substantially as described.

409,032. HAY-RAKE. Leander W. Freeman, Liberty, Ind. Filed Mar. 14, 1888. Serial No. 303,379. (No model.)



Claim.—1. A rake-head composed of two sections of uniform dimensions separated by packing-blocks interposed between the extremities of the sections and serving to receive the hitching-rod attachment, and teeth secured centrally at proper intervals between said sections, substantially as described.

2. A rake-head composed of two sections of uniform dimensions separated by packing-blocks interposed, respectively, between the extremities and centrally between the extremities of the sections, and straight teeth secured centrally at proper intervals between said sections, substantially as described.

3. A revolving rake-head consisting of two sections separated at their ends by packing-blocks, teeth secured centrally at proper intervals between said sections, a packing-block secured centrally between the extremities of the sections, and a collar connected with said central block for the attachment of a dumping mechanism, substantially as described.

4. A revolving rake-head comprising the sections 1 and 2, teeth 3, secured by nuts and bolts, the end packing-blocks 6, and a packing-block 8 and collar 9, for attachment of a dumping mechanism, substantially as described.

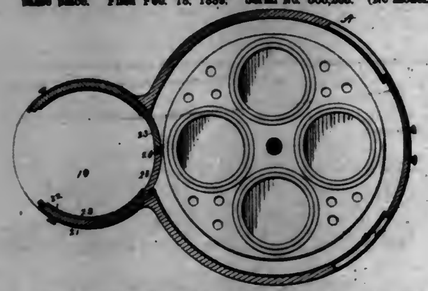
409,033. SMOKE-BOX FOR LOCOMOTIVES. Frederick Gandy, Cincinnati, Ohio. Filed Nov. 1, 1888. Serial No. 289,709. (No model.)

Claim.—A locomotive smoke-box having its periphery provided with air-inlets, through which air is admitted to assist in the combustion of cinders, said smoke-box provided with two concentric exhaust-pipes communicating with the engine-cylinders and having separate and independent nozzles which terminate in open mouths on the same horizontal plane, whereby a uniform draft is maintained, substantially as described.

409,034. SEAL-LOCK. Robert W. Gillespie, St. Louis, Mo. Filed Aug. 1, 1888. Serial No. 281,618. (No model.)

Claim.—1. In a seal-lock, the U-shaped spring locking-pin, the double prong at the locking end of said pin, the barbed points on the

409,034.



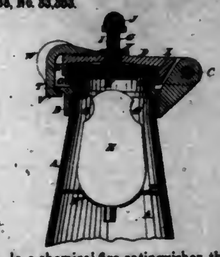
ends of said prongs beveled on their under sides and arranged for engagement within the beveled recesses in their seats in the seal, and a frangible seal having a single orifice longitudinally thereof, into which said locking end extends upwardly, so as to enter the seal from beneath, substantially as and for the purpose set forth.

2. In a seal-lock, a U-shaped spring locking-pin, the double prong at the locking end of said pin, the beveled grasping barbed points on the ends of said prongs that fit in the beveled recesses in their seats in the seal, the said locking end extending upwardly to enter the seal from beneath, a thimble-shaped frangible seal in which the key operates, having an annular recess at the bottom of said seal, and the anti-picker collar around the stem of the pin fitting in said recess, substantially as and for the purpose set forth.

3. In a seal-lock, a U-shaped spring locking-pin having a bifurcated operative end extending upwardly to enter the seal from beneath, barbed points on said bifurcated end, the inverted frangible seal provided with a key-hole running longitudinally with said seal, and locking-chamber, into which said key-hole enters, and the annular beveled shoulder within said seal, into which the barbed points of the locking-pin spring and effect a lock, and the wire 17, that passes through the perforations in the key and fastens around the staple 5, substantially as and for the purposes set forth.

409,035. REFRIGERATOR. ROBERT B. GRAF, Baltimore, Md., assignor, by mesne assignments to the National Refrigerating Company, same place. Filed Feb. 18, 1889. Serial No. 300,263. (No model.)

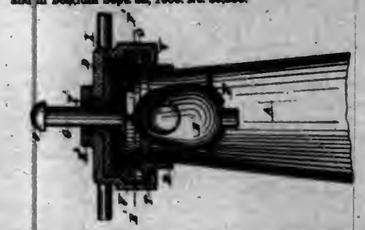
Claim.—The combination, in a refrigerator, of the cooling-chamber proper, a substantially cylindrical chamber communicating therewith and provided with double walls and a front opening, and the curved doors sliding in said walls, as described, so as to close either the front opening or the communication between the chambers, substantially as set forth.



409,036. HEATING-STOVE. LEWIS W. HAGEY, St. Louis, Mo. Filed Mar. 5, 1888. Serial No. 266,152. (No model.)

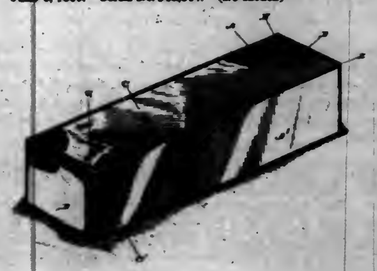
Claim.—1. In a heating-stove, the horizontal cylindric damper that projects in front of the stove near the bottom thereof, the outer cylinder having rotary movement around the inner one, and both cylinders being provided with U-shaped openings that are adjustable to regulate the draft, the outer casing, and lining to the stove that supports the damper, substantially as and for the purpose set forth.

2. The combination of the stove-body 1, lining 5, and projecting horizontal damper located near the bottom of the stove, consisting of the inner cylinder 9, formed with inner peripheral flange 9 secured to the lining, the U-shaped opening, and cap 10, having outer peripheral flange 11 and outer rotating cylinder 12, fitting around the inner cylinder, and formed with flanged handle 13 and U-shaped opening, substantially as described and shown.



409,037. CHEMICAL FIRE-EXTINGUISHER. JAMES HASLAM, Bury Road, Tonge, near Bolton, County of Lancaster, England. Filed May 15, 1889. Serial No. 310,863. (No model.) Patented in England Dec. 20, 1887, No. 17,467; in France Sept. 21, 1888, No. 196,120, and in Belgium Sept. 22, 1888, No. 83,263.

Claim.—1. In a chemical fire-extinguisher, the combination, with an alkali-vessel containing an acid-bottle in its upper portion, of a cover having a central orifice and a cavity in its under side, an elastic ring secured in said cavity, a tube extending through the orifice in the cover and resting on the elastic ring, and a spindle extending through the tube and through the ring and carrying a disk below the latter, substantially as described.



2. A chemical fire-extinguisher consisting of an alkali-vessel containing an acid-bottle, a nozzle arranged on the vessel and having a lateral projection, a cover hinged to the nozzle and having a central orifice and a cavity in its under side, an elastic ring arranged in said cavity, a ferrule arranged in the central orifice of the cover, a tube extending through the ferrule, a spindle passing through the tube and ring and having a disk below the latter, and a handle pivoted on the ferrule and having a lip to engage the projection on the nozzle, substantially as described.

409,038. CHEMICAL FIRE-EXTINGUISHING APPARATUS. JAMES HASLAM, Bury Road, Tonge, near Bolton, County of Lancaster, England. Filed May 15, 1889. Serial No. 310,864. (No model.) Patented in England Dec. 20, 1887, No. 17,467; in France Sept. 21, 1888, No. 196,120, and in Belgium Sept. 22, 1888, No. 83,263.

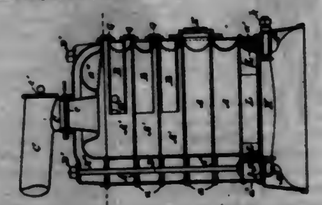
Claim.—A chemical fire-extinguisher consisting of an alkali-vessel containing an acid-bottle and having a nozzle at its top provided with lateral ribs, a swiveled cover having a central orifice and provided with ribs to engage the ribs on the nozzle, a metallic ring having a cavity, and a tubular stem rising through the orifice in the cover, a joint-ring arranged in said cavity and resting on the nozzle, and a spindle extending through the tubular stem and the joint-ring and having a disk below the latter, substantially as described.

409,039. MAILING-BOX. EDWIN B. HILLMAN, Peoria, Ill. Filed June 6, 1889. Serial No. 313,207. (No model.)

Claim.—1. The box composed of two approximately equal flat strips, the first bent into U shape and the second bent into the plane of the edges of the first, substantially as and for the purpose set forth.

2. The box composed of the transversely-grooved and marginally-rabbeted part A B A', bent into U shape, and the similarly-grooved part C D C', bent into like form and having its edges resting in the rabbet in the first part, substantially as set forth.

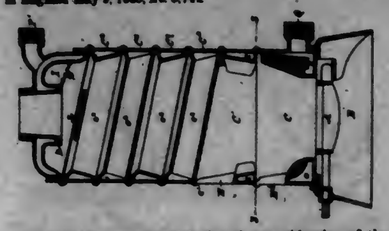
409,040. COTTON-HARVESTER. ALEXANDER E. HUGHES, Washington, D. C., assignor, by direct and mesne assignments, to the Hughes Cotton Harvester Company of Baltimore City. Filed May 25, 1888. Serial No. 275,064. (No model.)



Claim.—1. In a cotton-harvester, the combination of rotating disks arranged side by side, converging toward the rear and provided with picking-fingers arranged obliquely to the face of said disks, the upwardly-deflecting board forward of said disks, and a reticulated receiver for receiving the cotton, as specified.

2. The combination, in a cotton-harvester, of rotative disks mounted on substantially transverse axes, said disks converging toward the rear of the machine and having picker-fingers arranged obliquely to the face thereof, means for rotating the disks, a lint-receiver, and a blast-fan blowing across the disks into the receiver, as specified.

3. The combination, in a cotton-harvester, of two opposing rotating disks converging toward the rear of the machine, braced gatherers projecting forward therefrom, an upwardly-directed deflecting-board leading from the disks, and a fan for blowing the cotton off the disks over the board, as specified.

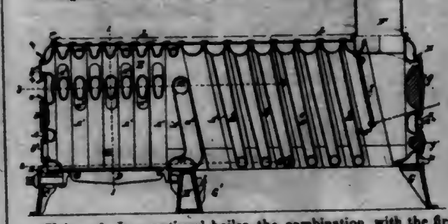


4. The combination, in a cotton-harvester, of two opposing rotating disks converging toward the rear of the machine, gatherers projecting forward therefrom, a reticulated cotton-receiver, a deflecting-board leading from the disks and projecting into said receiver, and a blast-fan blowing the cotton from the disks into the receiver, substantially as described.

409,041. SECTIONAL WATER-BOILER. JAMES KEITH, London, England. Filed Dec. 13, 1888. Serial No. 293,522. (No model.) Patented in England July 3, 1879, No. 2,709.

Claim.—In a sectional boiler, the combination of the superposed sections, the cross-connecting tubes B, and the cross-tubes B', connecting the tubes B, substantially as and for the purposes set forth.

409,042. SECTIONAL WATER-BOILER. JAMES KEITH, London, England. Filed Dec. 13, 1888. Serial No. 293,523. (No model.) Patented in England May 9, 1885, No. 5,744.



Claim.—1. In a sectional boiler, the combination of the lower section C, having a fire-brick lining and a surrounding water-jacket, the superposed section C', having inclined upper edges, and a number of superposed sections C^3, having inclined upper and lower edges, mounted on the section C', and all of said sections having communicating openings, substantially as set forth.

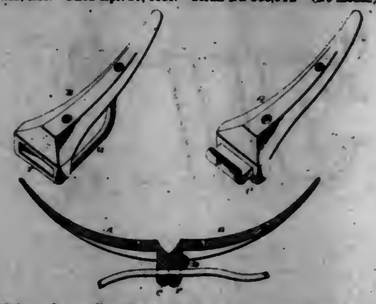
2. In a sectional boiler, the combination, with the fire-chamber, of the superposed section C', having a water-space and inclined upper edges, the superposed sections C^3, having vertical outer sides and inclined upper and lower edges mounted upon the section C', and having communication therewith and with each other, and inclined tubes c^4, extending across each of said sections C^3, substantially as and for the purposes set forth.

3. In a sectional boiler, the combination, with the fire-box, of the superposed section C', having the water-jacket c and inclined upper flanged edges, the superposed section C^3, having inclined upper and lower edges and the upper edges having flanges to receive the section immediately above, inclined tubes c^4, extending across the sections C^3, and a dome having inclined lower edges surmounting said sections C^3, and all of said sections and dome having communicating openings, substantially as and for the purposes set forth.

409,043. SECTIONAL WATER-BOILER. JAMES KEITH, London, England. Filed Dec. 13, 1888. Serial No. 293,524. (No model.) Patented in England Feb. 26, 1887, No. 3,013.

Claim.—1. In a sectional boiler, the combination, with the fire box, of the bridge-wall section A^4, having the upper and lower cross-tubes a^2 a^3, respectively, and said tubes being connected together by a series of inclined tubes a^4, substantially as set forth.

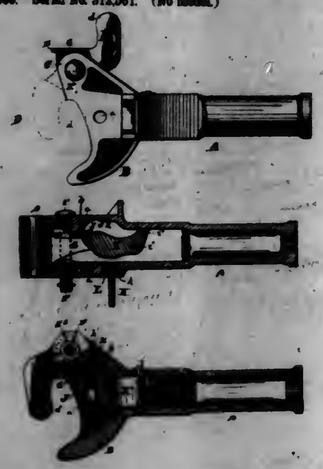
2. In a sectional boiler, the combination, with the fire-box, of a number of water-sections A^3, arranged on edge in a horizontal series and communicating with each other, and the tapering tubes a^5, connecting the upper and lower sides of each section together, substantially as set forth.



3. In a sectional boiler, the combination, with the fire-box, of a number of water-sections A^3, arranged on edge in a horizontal series and communicating with each other, and the hollow base G, serving as a support for said sections and as a soot and dust collector, substantially as set forth.

4. In a sectional boiler, the combination, with the fire-box, of a number of water-sections A^3, communicating with each other and arranged diagonally in a horizontal series, and the downwardly-tapering inclined tubes a^5, connecting the sides of each section together, substantially as set forth.

5. In a sectional boiler, the combination, with the fire-box, of a series of water-sections A^3, each having an upper horizontal tube and a lower horizontal tube of smaller diameter than said upper tube, and a number of downwardly-tapering cross-tubes connecting said upper and lower tubes together, substantially as set forth.



6. In a sectional boiler, the combination, with the sections A', forming the fire-box, of the tubes a^3, extending across said sections and inclined alternately in opposite directions, the bridge-wall section, and the water-sections A^3, arranged beyond said bridge-wall and having communication with each other and with said other sections, substantially as set forth.

409,044. HORSE-COLLAR FASTENER. JOSEPH H. KELLERMAN, Blair, Neb. Filed Apr. 29, 1889. Serial No. 308,944. (No model.)

Claim.—In a collar-fastener, the part A, provided with the hook D upon its inner end, and loop C, located below the hook, with the part B, provided with the loop F, and a shoulder upon the outer side of the loop, and a strap which is passed through the two loops C F, so as to keep the hook in contact with the shoulder, substantially as shown.

409,045. CAR-COUPLING. ISAAC KLINE, Louisville, Ky. Filed May 29, 1889. Serial No. 312,561. (No model.)

Claim.—1. In a car-coupling, the combination of the swinging hook formed with a shank upon which is a tooth, substantially as described, with a tumbler pivoted in the throat of the draw-bar and having a finger adapted to engage said tooth and lock the hook, substantially as described.

2. The combination of the draw-bar having a pair of ears at one side and a shoulder or recess in its side wall in rear of said ears with a swinging hook hinged between said ears and having a tooth on its shank adapted to enter said recess when the hook is closed, and a pivoted locking-tumbler engaging said tooth, all substantially as and for the purpose specified.

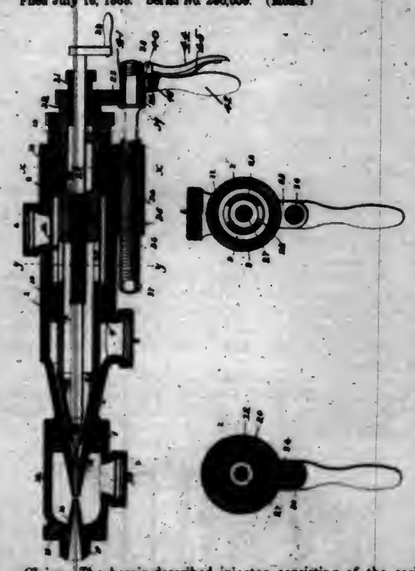
3. The combination of the draw-bar and the swinging hook hinged thereto and having a tooth on its shank adapted to enter the throat of the draw-bar when the hook is closed with a locking-tumbler pivoted in the throat of the draw-bar and having a forwardly-projecting finger adapted to engage said tooth, and the key for lifting said tumbler passing through the bottom of the draw-bar, substantially as and for the purpose specified.

4. The combination of the draw-bar having a pair of ears at one side, the lower one of which is notched on its upper face and the upper one annularly recessed, with a swinging hook having a shank hinged between said ears, said shank having a depending stud *d* adapted to engage the notches in the lower ear, and a beveled lug *e* on its lower edge, and an annular collar on its upper end engaging the recess in the upper ear, and an offset G, all substantially as described.

5. The combination, with the draw-bar having a channeled and notched opening in its floor, substantially as described, and a tumbler pivoted in the throat of the draw-bar above said opening, of a key playing through said opening to lift the tumbler, and having side flanges engaging the notches of the opening, all substantially as described.

6. The combination of the draw-bar and swinging hook hinged thereto, substantially as described, with the locking-tumbler for said hook pivoted in the throat of the draw-bar and having its rear end upturned, so that it will strike the roof of the draw-bar and prevent the front end of the tumbler resting on the floor thereof, substantially as specified.

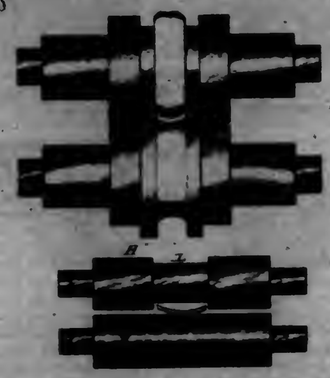
7. The combination of the draw-bar having side ears and the swinging hook having a shank hinged between said ears by a headed pin with a bolt playing in an opening in the upper ear beside the pin and confined between the head of the pin and shank, substantially as and for the purpose specified.



8. The combination of the draw-bar, the swinging hook, and the locking-tumbler in said draw-bar with the vertically-movable key playing through the floor of the draw-bar and engaging the bottom of said tumbler, the arm engaging said key and mounted on a hinged rod below the draw-bar, and the shaft and link connections for operating said arm to lift the key, substantially as described.

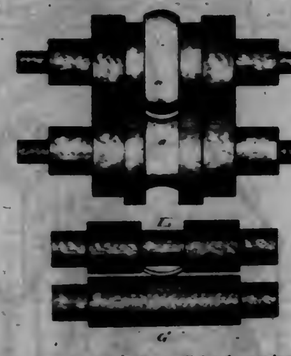
9. The combination of the uncoupling or releasing key and its operating arm and rod below the draw-bar with the horizontal shaft mounted on the front of the car, the handles thereon, and the devices, substantially as described, for sustaining these handles, when properly adjusted, to keep the locking devices released, all substantially as set forth.

10. The combination of the draw-bar and the swinging hook hinged thereto and having a tooth on its shank adapted to enter the throat of the draw-bar when the hook is closed with a locking-tumbler pivoted in the throat of the draw-bar and having a forwardly-projecting finger adapted to engage said tooth when the hook is closed, and also to engage a shoulder on the roof of the draw-bar to transfer strain to the latter, and the devices for operating said tumbler, all substantially as specified.



11. The combination of the draw-bar, the swinging hook hinged thereto, having an incline *e*, and an offset G, provided with a tooth H, with the locking-tumbler pivoted in the throat of the draw-bar having a forwardly-inclined stud J, an upturned end *i*, and the key for lifting said tumbler, and the operating devices for said key, all constructed and arranged as and for the purpose described.

409,046. INJECTOR. LARS G. LARSE, Cannon River Falls, Minn. Filed July 16, 1888. Serial No. 280,059. (Model.)



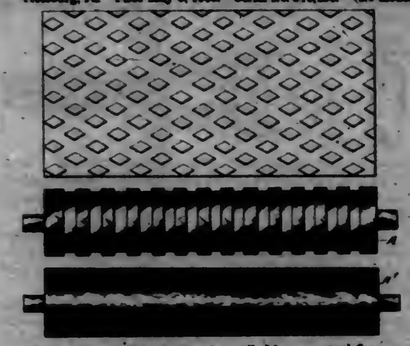
Claim.—The herein-described injector, consisting of the casing having inlet and outlet depending rib and threaded end, the extension connected to said threaded end carrying a conical nozzle and having an escape-opening, the tube provided with openings arranged in the casing and having a depending arm at one end, the stem in the tube, the stem passing through the rib and arm of the casing and tube, the handle connected to said stem, and the pawl and ratchet, said parts being arranged and adapted to serve substantially as and for the purpose described.

409,047. METHOD OF MAKING STRAP OR HOOP IRON. DAVID LARKIN, Pittsburg, Pa., assignor to himself, John B. Larkin, and Frank D. Larkin, same place. Filed Jan. 18, 1889. Serial No. 296,743. (No model.)

Claim.—In the manufacture of hoop, band, or strap metal by reduction through successive rolls, the method of rendering the stock self-sustaining and facilitating its delivery from one set of rolls to another, which consists in laterally bending, dishing, carving, or corrugating the blank during its reduction and finally flattening the same, substantially as described.

409,048. ROLLING-MILL FOR HOOP OR STRAP IRON. DAVID LARKIN, Pittsburg, Pa., assignor to himself, John B. Larkin, and Frank D. Larkin, same place. Filed Apr. 5, 1889. Serial No. 306,122. (No model.)

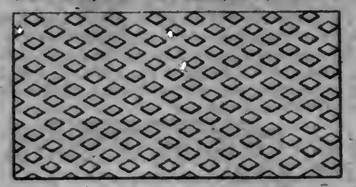
Claim.—1. A continuous rolling-mill for the production of hoop or strap metal, comprising several sets of reducing-rolls, of which two or more sets have their rolls respectively grooved and flanged, the grooves and flanges of one set being more abrupt than those of the preceding set and forming a pass of less depth, substantially as described.



2. A continuous rolling-mill for the production of hoop or strap metal, comprising a set of rolls intermediate in the train of which set one roll is dished or grooved and the other flanged, whereby a concaving, corrugating, or deflecting pass is formed for the purpose of dishing, corrugating, or laterally deflecting the metal in its course, substantially as described.

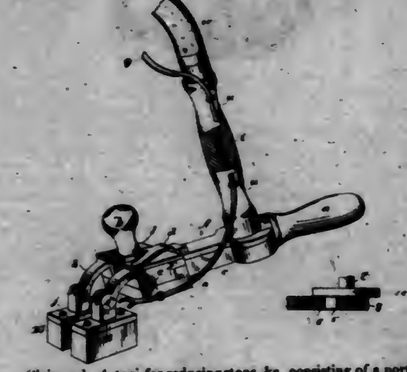
3. In a continuous rolling-mill for the production of hoop or strap metal, the combination, with one or more sets of rolls intermediate in the train, of which one roll is grooved or dished and the other correspondingly flanged, of a set of plain finishing-rolls terminating the train, substantially as described.

4. In a continuous rolling-mill for the production of hoop or strap metal, comprising one or more sets of laterally-deflecting, dishing, or corrugating rolls and a set of plain finishing-rolls, a set of fin-reducing rolls located in advance of the finishing-rolls and comprising a plain roll G and a slightly-grooved roll H, the groove L being of rectangular form, substantially as described.



5. In a continuous rolling-mill for the production of hoop or strap metal, the combination, with a train in which one or more sets have dished or corrugated deflecting-passes, of the grooved tables or guides H I, &c., located between the respective sets of rolls, substantially as described.

409,049. METHOD OF ROLLING METAL. WILLIAM J. LEWIS, Pittsburg, Pa. Filed May 9, 1889. Serial No. 310,126. (No model.)

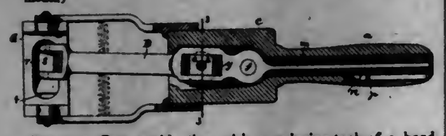


Claim.—The method of forming rolled iron or steel floor or stair plates having their tread-surfaces grooved or reticulated, which consists in subjecting the plate to two or more passes at different angles to each other between grooving or channeling rolls.

409,050. ROLLED METAL PLATE. WILLIAM J. LEWIS, Pittsburg, Pa. Filed June 17, 1889. Serial No. 314,542. (No model.)

Claim.—As a new article of manufacture, a rolled wrought-iron or steel plate having one of its surfaces plain and the other surface formed with intersecting rolled grooves or channels, substantially as described.

409,051. IMPLEMENT FOR REDUCING STONE, &c. JAMES W. MALOY, Marietta, Ga. Filed Dec. 24, 1887. Serial No. 258,904. (No model.)



Claim.—1. A tool for reducing stone, &c., consisting of a portable or hand frame supporting two carriages arranged in line, tools connected to said carriages, an operating-spindle, and a connection between the spindle and carriages, substantially as and for the purpose described.

2. The combination, with the portable or hand frame, of a rotatable spindle carried thereby, two carriages arranged in line with each other and movably supported at one end of the frame, tools connected to the carriages, and a reciprocating plate connecting the spindle and both carriages, substantially as and for the purpose set forth.

3. The combination, with the frame, driving-spindle, and laterally-movable tool-carriages arranged in line, of a longitudinally-reciprocating plate connected at one end to the spindle by an eccentric and at the other end to the carriages by legs and diagonal slots, substantially as and for the purpose described.

409,052. IMPLEMENT FOR REDUCING STONE, &c. JAMES W. MALOY, Marietta, Ga. Filed Dec. 24, 1887. Serial No. 258,905. (No model.)

Claim.—1. The combination, with a reducing-tool, of a hand-frame, a pivoted lever carried by said frame, and an operating-spindle also supported by the frame, substantially as and for the purpose described.

2. The combination, with a reducing-tool, of a lever connected therewith, a frame supporting said lever, an operating-spindle, and a spring connected with the lever to restore it normally to a mid-position, substantially as described.

3. The combination of the tool, lever, operating-spindle, a flexible shaft connected with said spindle, and a frame supporting the spindle, lever, and tool and provided with handles, substantially as described.

4. The combination of the frame having a hinged cross-piece, a lever and operating-spindle, a carriage supported by said cross-piece and pivoted to the lever, and a tool connected to said carriage, substantially as described.

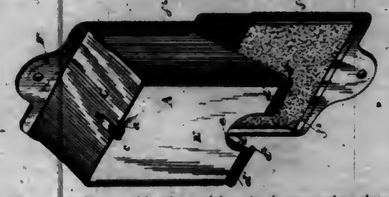
5. The combination of the frame, spindle, lever, tool, and spring-blade *m*, extending to the rear from said lever and tending to maintain it in a mid-position, substantially as described.

6. The combination, with the frame and lever having a blade *m*, of a longitudinally-adjustable bearing *n*, substantially as described.

7. The combination of the frame, spindle, flexible shaft, lever, swinging cross-piece G of the frame, and carriage F, sliding longitudinally on said cross-piece and connected by a universal joint with the lever, substantially as described.

409,053. GRASS-CATCHING ATTACHMENT FOR LAWN-MOWERS. GRANT C. MILLER, Mount Vernon, Iowa. Filed Nov. 3, 1888. Serial No. 289,895. (No model.)

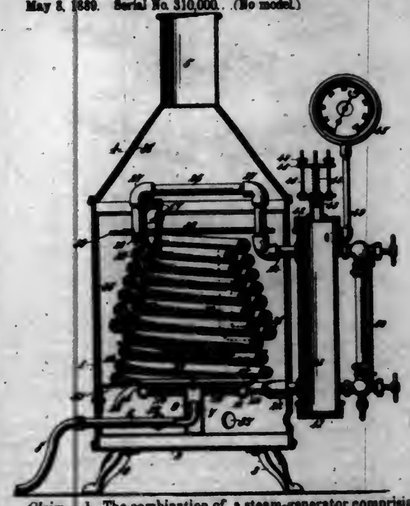
Claim.—The combination, with the tongue 12 and deflector C of a lawn-mower, which deflector is provided with the hooks 15, to rest on the axle of the mower, and the strap 16, to connect it with the tongue, of the staple 11, secured to the tongue, the box B, the upwardly-extending curved arms 1, provided with concentric slots 2, resting against the sides of the box and rigidly secured at their lower ends to the mower-frame, the bolts 5, attached to the sides of the box B, and their nuts 6, the shoulder 7, secured to the rear end of the floor of the box, the arm or rod 8, having its lower end bent and engaged in an opening in said shoulder and provided with a longitudinal inclosed recess extending from its upper end, the bent rod 9, passing through the staple 11, and the set-screw 10, to bind the two rods together at the proper points, substantially as specified.



409,054. VEHICLE-HUB. LUDVIG M. MILLER, Whitewater, Wis. Filed Apr. 30, 1888. Serial No. 272,381. (No model.)

Claim.—1. The combination, in a sectional hub, of the central longitudinal sleeve provided with the double series of screw-threads, and having a longitudinal channel *c*, the sections B C, having internal projections to engage said channel, and provided with the alternately-arranged projections to form alternate spoke-sockets, and outer clamping-nuts, substantially as set forth.

2. The combination, in a sectional hub, of the central longitudinal sleeve screw-threaded and provided with a longitudinal channel, two spoke-sections having internal projections to engage said channel and having alternating projections to form alternate spoke-sockets, and reamed on their outer faces, and clamping-nuts provided with portions corresponding with said reamed parts, substantially as set forth.



409,055. MATCH-SAFE. WICKLIFF B. MITCHELL, Owensburg, Ind. Filed Jan. 30, 1889. Serial No. 298,095. (No model.)

Claim.—1. The combination, with a back-supporting plate provided with a slitted upper portion having intermediate bulged portions, and also provided with forwardly-extending guides or flanges, of the match safe or box consisting of the front, rear, and side pieces, inclined bottom piece, and inclined hinged top or cover, the front piece thereof being provided with a circular opening upon its lower end and the bottom piece being slotted longitudinally, forming flexible strips or springs, substantially as set forth.

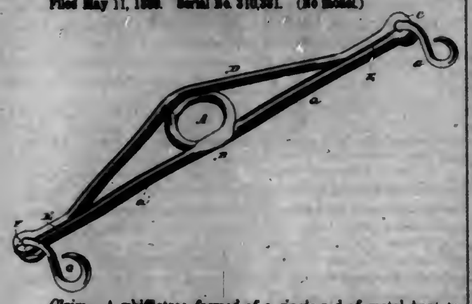
2. A match-safe provided with an inclined longitudinally-slotted bottom piece, terminating in flexible strips, said strips extending out beyond the front piece of the safe and bent downward at this point, said front piece being provided with an opening or aperture, substantially as set forth.

409,056. WATER COIL BOILER. EVERETT D. MOORE, Baltimore, Md., assignor of one-half to Rufus W. Applegarth, same place. Filed May 3, 1889. Serial No. 310,000. (No model.)

Claim.—1. The combination of a steam-generator comprising an outer shell having air-inlets near the bottom, a gas-burner located in the lower part of said shell, a steam-generating coil supported above the burner, a steam-superheating coil surrounding the steam-generating coil, a drum or expansion-chamber located outside the generator-shell and communicating with the generating and superheating coils, a valved pipe for conveying water into the steam-generating coil, and a valved pipe leading from the superheating-coil, substantially as described.

2. The combination of a steam-generator comprising generating and superheating coils inclosed by a shell, a drum or expansion-chamber located outside the generator-shell in communication with said coils and provided with water and steam gages, a pipe for supplying the steam-generating coil with water, a pipe for conducting steam and water from the superheating-coil through a hose to the pipe or pipes to be cleaned, and valves for controlling the inlet and outlet pipes of the generator, substantially as described.

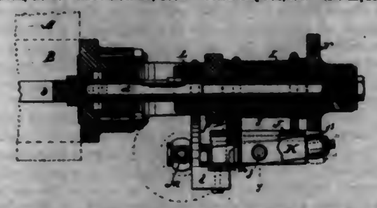
3. The combination of a steam-generator comprising an outer shell having air-inlets and a chimney, a gas-burner located in the lower part of the generator-shell, a steam-generating coil located above the gas-burner, a steam-superheating coil surrounding the steam-generating coil, a deflector-plate located above the burner in the lower part of the space inclosed by the steam-generating coil, a baffle-plate located above said deflector, a heat-retaining plate located above the superheating and generating coils, and an asbestus lining for the generator-shell, substantially as described.



4. The combination of a steam-generator having steam generating and superheating coils, baffle-plates for retaining the heat in contact with said coils, a drum or expansion-chamber communicating with the generating and superheating coils, a valved pipe for delivering a regulated supply of water to the generating-coil, and pipes for conducting steam and water from the coils to the pipe or pipes to be cleaned, substantially as described.

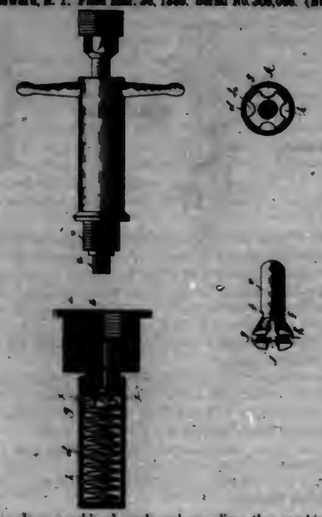
5. The combination, with a steam-generating coil 14, having inlet-pipe 16, provided with valve 18, of the by-pass tube 52, provided with valve 53, substantially as described.

6. The combination of a heater, a pipe-coil located above the heater, a valved pipe leading into one end of the pipe-coil and having a valved by-pass also leading into said coil, and a flexible tube communicating with the coil and adapted to be connected to the pipe or pipes to be cleaned, substantially as described.



7. The combination of a water-heating and steam-generating coil having a valved inlet provided with a valved by-pass, flexible tubing for delivering water to the said coil, and flexible tubing for conveying steam and water from the coil to the pipe to be cleaned, substantially as described.

409,057. WHIFFLETREE. ISAAC T. MCINTYRE, Carrollton, Miss. Filed May 11, 1889. Serial No. 310,281. (No model.)



Claim.—A whiffletree formed of a single rod of metal bent to form the front side *a* and the rear bowed portion D, the said portion *a* being bent at its center to form the rearward-extending looped brace A, the lapped portions B of which are flattened and welded together and in line with the front side of the whiffletree, and the ends of the portion D being welded to the rear sides of the ends of the front side *a*, eyes C F being formed at the ends of the whiffletree, and the center of the bowed portion D being welded to the rear side of the looped brace A, whereby a truss is formed on the rear side of the whiffletree and integral therewith, substantially as described.

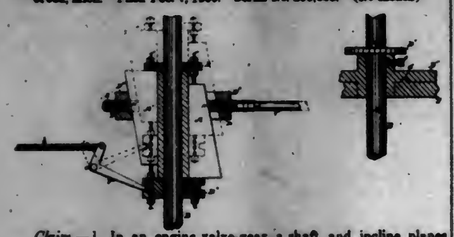
409,058. VALVE-GEAR FOR ENGINES. JOHN MCLAREN, New York, N. Y. Filed Feb. 28, 1889. Serial No. 301,808. (No model.)

Claim.—The combination, with the valve *b* and its stem *d*, mounted in a suitable bearing, of the sleeve I, loosely mounted on the bearing and carrying the valve-tripping tappet K, which is pivoted intermediate its ends, a spring *j*" for normally holding the tappet in its active position, means, substantially as described, for oscillating the sleeve, the hub L, fixed on the valve-stem and having the projecting arm *l*, against which one end of the tappet engages, the cam N, loosely mounted on the valve-stem bearing for acting on the opposite end of the tappet, the governor O, and connections between said governor and the cam for rotating the latter when the speed of the governor increases beyond a certain limit.

409,059. AUTOMATIC ALE TAP AND FAUCET. H. DAVIS NORTHUP, Fort Edward, N. Y. Filed Mar. 26, 1889. Serial No. 304,994. (No model.)

Claim.—In a combined cock and coupling, the combination of the plug having a bore, a cylindrical chamber on the inner end of the plug having induction-openings, a valve consisting of the tapered valve proper in said chamber, adapted to close the outer end of said bore and provided with the hollow stem extending into the bore and provided with inlet-apertures, and a coiled spring in said chamber and bearing against the end of said valve, said end face of the tapered valve having one or more deep transverse channels, forming lateral passages from the space within the spring, and longitudinal passages to said inlet-openings of the valve-stem, substantially as described.

409,060. POOL-TABLE. ROBERT A. PAINE, Richmond, Va. Filed Apr. 20, 1889. Serial No. 308,048. (No model.)



Claim.—1. In a pool-table, the combination, with a series of pipes or tubes leading from the several pockets to the center of the table, of a second series of pipes or tubes leading from the center to a series of receptacles, with an elbow-joint adapted to be rotated, whereby the first series of pipes or tubes is put into connection with each one of the second series of pipes or tubes successively, and means for operating said elbow-joint, substantially in the manner and for the purpose set forth.

2. In a pool-table, the combination, with a series of pipes or tubes leading from the several pockets on an incline to a common opening at the center, of a second series of pipes or tubes leading from the center on an incline to a series of receptacles on the outside edge of the table, with an elbow-joint having its upper arm constantly in connection with the central opening and its lower arm successively in connection with each of the pipes or tubes of the second series, and cogs on said elbow-joint adapted to be engaged by a suitable worm on a rod operated by a milled wheel, substantially in the manner and for the purpose set forth.

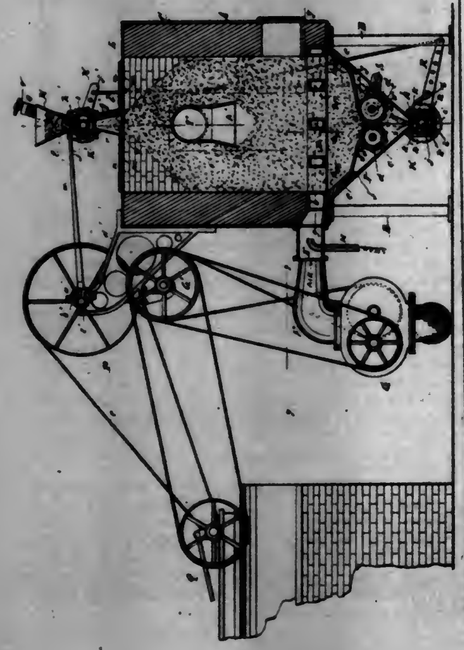
3. In a pool-table, the combination, with two series of pipes leading from the pockets to the center and from the center to a series of receptacles, respectively, of an elbow-joint connecting the two series of pipes, having cogs around its vertical arm adapted to be engaged by worms on suitable shafts, and a gear-wheel on each of said shafts adapted to engage by friction with a milled wheel having graduations on its milled surface, substantially in the manner and for the purpose set forth.

409,061. VALVE-GEAR FOR ENGINES. ROBERT H. PEASE, Battle Creek, Mich. Filed Feb. 7, 1889. Serial No. 299,068. (No model.)

Claim.—1. In an engine valve-gear, a shaft, and incline planes placed above and below said shaftt, in combination with a vertically-shifting eccentric formed with a slot adapted to receive said incline planes, and a shoe having its bearing on the top of said incline planes.

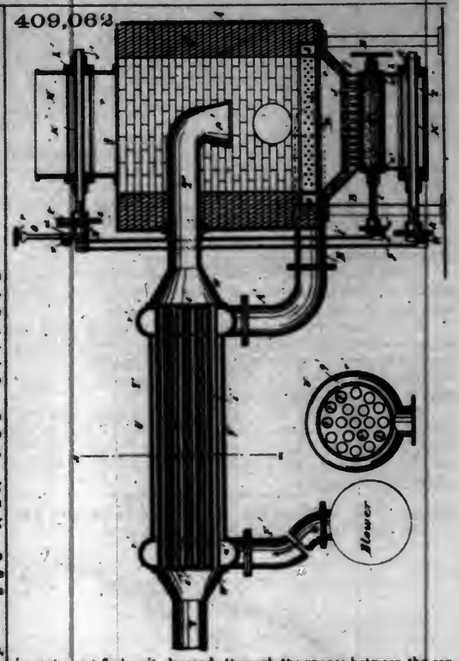
2. In an engine valve-gear, a shaft and incline planes placed centrally above and below said shaft, in combination with a vertically-shifting eccentric provided with a shoe having its bearing on the top of the said incline planes.

3. In an engine valve-gear, a shaft, incline planes placed above and below said shaft, and a shoe having its bearing on said incline planes, in combination with a shifting eccentric pivoted to said shoe, substantially as shown, and for the purpose set forth.



4. In an engine valve-gear, the shaft provided with a revolving frame, which frame consists of sliding sleeves and incline planes, in combination with a shifting eccentric and a shoe having its bearing on said incline planes.

5. In an engine valve-gear, a shaft, incline planes placed above and below said shaft, and a slotted embracing-disk for said incline planes, in combination with a shifting eccentric and a shoe having its bearing on said incline planes.



409,062. FUEL-GAS GENERATOR. JOHN R. PETERS, Georgetown, Pa. Filed Dec. 20, 1887. Serial No. 258,436. (No model.)

Claim.—1. The combination, with the gas-generator, of perforated air-supply pipes extending transversely into and across the fuel-space above the bed or grate, substantially as set forth.

2. The combination, with the fuel-receptacle, of a hollow air-supplying frame fitting therein across the fuel-space above the bed or grate and perforated on its inner sides, and the spaced perforated pipes within said frame and communicating with the interior thereof, whereby air may be delivered through and around the entire mass of

409,062

incandescent fuel as it descends through the spaces between the several pipes, substantially as set forth.

3. The combination, with the gas-tight generator having a central gas-discharging outlet-pipe, a hollow perforated frame having spaced perforated pipes within and crossing the fuel-space in said generator, and a pressure-blower for forcing air through the perforations in said frame into all parts of the descending fuel, of a grate below the said frame and within the lower end of the gas-tight generator and a gas-tight discharge-valve at the bottom of the generator below the grate, substantially as set forth.

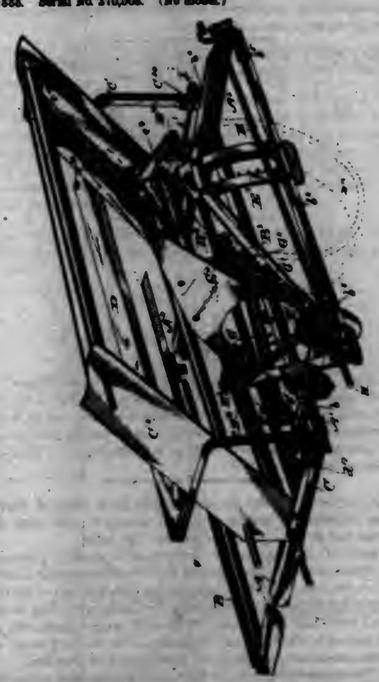
4. The combination, with the generator having a gas-tight receptacle provided with a V-shaped lower end, of parallel crushing-rollers journaled longitudinally in said lower end, space being left between the outer sides of rollers and inclined bottom for the passage of ashes, and grates extending to the upper sides of said rollers from the inclined bottom across the said ash-passages to direct the clinkers downward between the adjacent crushing-faces of the said rollers, substantially as set forth.

5. The combination, with the inclined or V-shaped bottom having a rotary gas-tight chambered discharge-valve at its vertex, of the crushing-rollers above the valve and the grates above and at opposite sides of the rollers, substantially as set forth.

6. The combination, with the parallel rotary crushing-rollers having tappets, of two grates fulcrumed at their outer ends above and parallel with the rollers, the inner or free ends of the grates extending over the rolls in the paths of their tappets, whereby the grates will be vibrated vertically to discharge the ashes and conduct the clinkers to the space between the rolls, substantially as set forth.

7. The combination, with the gas-tight generator, of a cylindrical casing at the upper end thereof, a similar casing in the bottom under the grate, said casings having vertically-aligned longitudinally-extending inlet and outlet slots or openings, and a rotary cylindrical valve closely fitting each of said cylinders to prevent the escape of gas and having a series of chambers extending in the direction of their length and registering with the upper and lower slots or openings in said casings, substantially as set forth.

8. In a gas-generator, the combination, with a feeder comprising the hopper, a tubular casing at the discharge end thereof, a rotary chambered valve fitting said casing to form a gas-tight joint, and a ratchet secured to the axis of the valve outside of the casing, of a rocking lever provided with a pivoted pawl engaging the ratchet, a block adjustable longitudinally on the lever, and a reciprocating rod connected to said block for operating the lever, whereby the throw of the lever and speed of the valve may be regulated by moving the said block, substantially as set forth.



9. In a gas-generator, the combination, with a feeder comprising the hopper, a tubular casing at the bottom thereof, a rotary chambered valve fitting said casing to form a gas-tight joint, and a ratchet secured to the axis of the valve outside of the casing, of the longitudinally-slotted rocking lever having a pawl engaging said ratchet, a block sliding in said slot, an adjusting-screw extending through the outer end of the lever into the slot and engaging the block, and a reciprocating lever connected to said block, substantially as set forth.

10. The combination, with the gas-tight fuel-receptacle having a V-shaped bottom, a horizontal hollow apertured grid-like frame extending through the fuel-space above the bottom, adapted to connect with a pressure-blower, a gas-tight chambered discharge-valve at its vertex, and the crushing-rolls and grates vibrated thereby between said valve and frame, of the central flaring outlet above said hollow frame, a feed-hopper on top of the receptacle, a cylindrical casing having a gas-tight connection therewith and with the interior of the receptacle, a rotary valve therein having a series of chambers and closely fitting in the casing, and mechanism connecting said two valves for continuous and simultaneous operation.

11. The combination, with the gas-tight fuel-receptacle having V-shaped bottom, a horizontal valve-casing communicating with the receptacle along the vertex of its bottom and having a discharge-opening in its lower side, and the feed-hopper having a similar horizontal feed casing leading into the top of the receptacle, of rotary valves closely fitting in said casings to prevent the escape of gas, and each having longitudinally-extending ribs forming receptacles, levers for operating said valves, and a rod connecting said levers, substantially as set forth.

12. In a fuel-gas generator, the combination, with the gas-tight fuel-receptacle and its feed and discharge valves, of the hollow perforated grid-like frame extending horizontally across and through the receptacle above its grate or bed, the central outlet-pipe having a jacketed regenerator, a pipe leading from the space within the jacket to the said perforated frame, and a blower leading into the opposite end of the jacketed space and forcing the air therethrough into the hollow frame, substantially as set forth.

409,063. SUPPORTING-FRAME FOR SELF-BINDING HARVESTERS. JULIAN H. PITKIN, Lake View, and JOHN F. STEWARD, Chicago, Ill.; said Pitkin assignor to William Deering, Chicago, Ill. Filed Apr. 12, 1888. Serial No. 270,503. (No model.)

Claim.—1. The harvester main-wheel frame having the axle-guiding plate E^3, provided with the top arm E^{13}, and the standard E, erected on the rear stubble corner and provided with a box or bearing at the top in line with arm E^{13}, and forming the inner bearing of the binder, whereby the frame is adapted to sustain a rocking or folding binder.

2. In a harvester and binder, the main-wheel frame having the axle-guiding plate E^3, with the top arm E^{13}, the standard E, erected on the rear stubble corner and provided with a top box or bearing E^9 for the packer-shaft, in line with arm E^{13} and forming the inner bearing of the binder, and the rigid arm G, projecting stubbleward beyond the remainder of the frame in position to sustain the outer side of the binder.

3. In a harvester main-wheel frame, the lower truss member b^2 and the standard E, secured to its rear end, in combination with the upper truss member B^2, having its rear end bent upward and secured to the standard, substantially as shown.

4. A harvester main-wheel frame having thereon on the stubble side a rigid arm E^{12} and a standard E, with a box or bearing E^9 at its top, in combination with a grain-binding machine having the long tubular base-arm suited to turn and slide in the arm E^{12} and the packer-shaft mounted in said base-arm and extended beyond the same to slide through bearing E^9, whereby the binder is permitted to rock inward and outward on the harvester, and also permitted to slide fore and aft thereon.

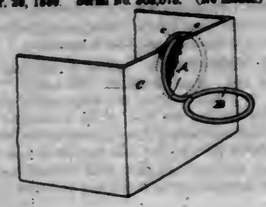
5. The binder-frame having the tubular base-arms E^4 and G^4 to sustain the packer-shaft and needle-shaft, respectively, in combination with the harvester main-wheel frame having the binder-frame mounted thereon to turn about the axis of the packer-shaft as a center, said main-wheel frame provided with the rigid outreaching arm G, adapted to rest beneath the arm G^4, whereby the binder is given direct support at its outer side when in operative position.

6. In combination with the binder-frame having the long horizontal base-arm E^4 inclosing the packer-shaft, the harvester main-wheel frame provided with a rigid arm or standard wherein the arm E^4 is mounted to turn and to slide endwise.

7. The binder-frame provided with the rigid tubular horizontal base-arm E^4, encircling the packer-shaft, whereby said arm is adapted to sustain the packer-shaft and also to serve as a partial support for a sliding and turning binder.

8. In a grain-elevating harvester, a main frame to carry the main wheel and platform, provided with fore-and-aft bars B' and b, extended to overhang at the front and rear, in combination with the angular bars or frames C C', mounted on the overhanging ends of the bars B' and b, and the elevator side boards or frames C^2 and C^3, secured to the bars C C', substantially as described and shown.

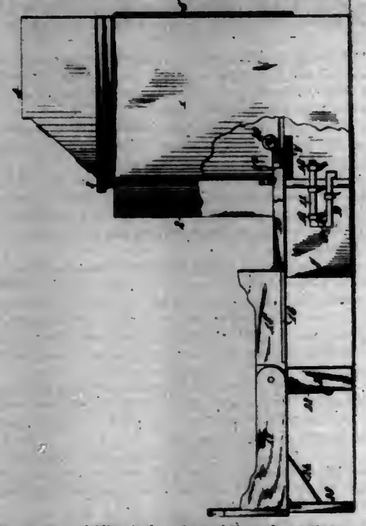
9. In a main-wheel frame for a harvester and binder, the combination of its rear sill A', the bar b^2, located at the stubble side, attached to the sill, and extended rearward beyond the same, and a binder-supporting standard E, rigidly attached to the rear end of said bar b^2, whereby the binder is given support in rear of the sill.



10. The truss for a harvester main-wheel frame, consisting of a lower bar or member b^2 and an upper member b^3, connected at its ends thereto, the upper member being arranged at one end directly over the lower member, but deflected at the opposite end to one side of the lower member.

11. In a harvester main-wheel frame provided with the front support b^7 for one end of the tongue-pivot, the truss at the grain side of the main wheel, extended at the front to sustain the support b^7 of the tongue-pivot, said truss deflected stubbleward as it approaches the front of the frame, whereby the supports for the tongue-pivot are widely separated without impairing the strength of the frame or interfering with the wheel.

12. In a harvester-frame, the forwardly-extending bar b and the transverse sill or finger-bar A^3, in combination with the metal strap b^8, secured to the under side of the bar and bent, as shown, to form a support for the tongue-pivot, and passed beneath the sill, substantially as described and shown, and secured at its rear end to the bar b, whereby it is caused to act as a truss to hold the pivot in position.



13. In combination with the bar B' and the sill or finger-bar A^3 thereunder, the strap b^7 to the upper face of the bar B', bent around the tongue-pivot and thence rearward on the under side to the lower edge of the sill and secured in place, substantially as shown.

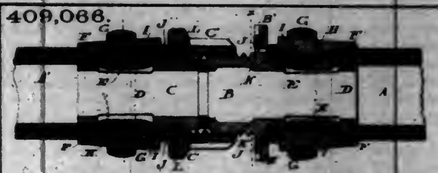
409,064. BOX-PULL. MORTIMER G. FOSTER, New Britain, Conn. Filed Apr. 20, 1889. Serial No. 308,073. (No model.)

Claim.—A box-pull constructed of a single wire having at one end a spiral clasp and at the opposite end a ring at right angles to the plane of the clasp, substantially as specified.

409,065. CABINET FOLDING BEDSTEAD. MARTIN RAUH, New York, N. Y. Filed May 9, 1888. Serial No. 310,153. (No model.)

Claim.—1. A folding bedstead consisting of a stationary casing having rear rails or trackways and side guideways, the horizontally-sliding central section engaging the guideways, the head-section hinged to the inner end of the central section and raised and lowered on the rails or trackways by the sliding movement of such central section, the foot-section hinged to the outer end of the sliding section and adapted to swing to a vertical position when the latter is moved into the casing, and hinged swinging doors on the casing to support either the central section or the head-section when the bedstead is opened, substantially as described.

2. A folding bedstead consisting of a casing having a bottom wall, opening and closing doors both above and below such wall, rear rails or trackways, and side guideways, the horizontally-sliding section engaging the guideways and supported by the lower doors when drawn outward, the head-section hinged to the inner end of such central section and raised and lowered thereby on the rear rails or trackways, and the foot-section hinged to the outer end of the central section and adapted to swing to a vertical position within the casing, substantially as described.



3. A folding bedstead consisting of a casing having side guideways, a skeleton back, and rear rails or trackways provided with curved lower ends, and triple sections hinged at their adjacent ends, the middle section sliding horizontally in the side guideways and by its sliding movement raising and lowering the head-section on the rails or trackways, and the foot-section having hinged side legs and a hinged leg-frame at its outer end and adapted to swing to a vertical position within the casing, substantially as described.

4. A folding bedstead consisting of a stationary casing having a bottom wall, rear rails or trackways, hinged doors and horizontal side guideways above the said wall, and a pair of hinged doors below the wall provided with locking-slides to lock them open parallel to the sides of the casing, the horizontally-sliding central section engaging the guideways, the head-section hinged to the inner end of the central section and raised and lowered by the sliding movement thereof, and the foot-section hinged to the outer end of the central section and provided with a hinged leg-frame at its outer end and adapted to swing to a vertical position within the casing, substantially as described.

409,066. HOSE-COUPLING. SAMUEL W. RAVENEL, Bonneville, Mo. Filed Oct. 26, 1888. Serial No. 289,226. (No model.)

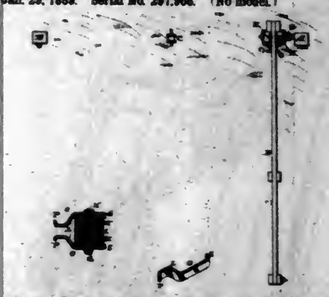
Claim.—1. In a hose-coupling, the combination, with a tube D, adapted to be inserted into the hose, of the removable independent plates F, having external bearing-faces inclined upward from each end toward the center of the coupling and adapted to bear throughout their length upon the hose, and plain rings G encircling the inclined bearing-faces, all substantially as shown and described.

409,066.

2. In a hose-coupling, the combination, with tube D, having openings E in its walls and adapted to be inserted into the hose, of plates F, provided on their inner faces with lugs H, directly over the openings E, and with inclined ribs on their outer faces, and rings G encircling the plates and adapted to force the hose into the openings, as and for the purpose set forth.

3. In combination with tube D, provided with openings E, hose A, plates F, provided with lugs H over the openings E, and with similar lugs to one side of the openings, inclined bearing-faces on the outer face of the plates, and rings G encircling the plates, all substantially as shown.

4. In combination with the couplings B C, having tubes D, hose-sections A A', separate independent plates F, secured to the couplings B C, and provided with external inclined bearing-faces, and rings G encircling the plates.



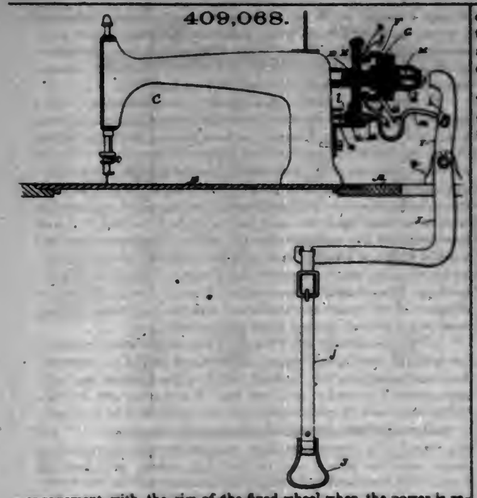
5. In combination with the male coupling B, having a tube D, plates F, each provided with a hook J, to engage the coupling, and a ring G encircling the plates.

6. In combination with coupling C, having a loose collar, and a tube D, plates F, engaging with the loose collar, and a ring G encircling the plates.

7. In combination with coupling C, having tube D and a loose collar, a groove in said collar, plates F, provided with a hook J, to engage the groove, and a ring G encircling the plates.

8. The hose-coupling herein described, comprising the following elements, to wit: a male coupling B, provided with a tube D, to be inserted into the interior of the hose and provided with openings E, female coupling C, provided with tube D, having openings E, and also provided with a loose collar or nut to engage the male coupling, plates F, secured to the couplings B C, and provided on their inner and outer faces, respectively, with lugs H and ribs I, and rings G encircling the plates, all substantially as shown.

409,067. GATE. WILLIAM H. REED, Council Grove, Kans. Filed Jan. 29, 1889. Serial No. 297,966. (No model.)



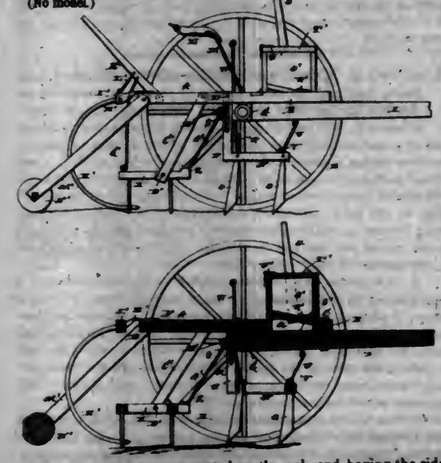
Claim.—The combination, with the gate, the hinged support, and the post upon which the gate is hung, of the guides which are secured to the outer sides of the support at their rear ends, and have their forwardly-extending ends bent inward so as to bear against the sides of the gate and their points beveled or turned outward, as shown, for the purpose set forth.

409,068. DRIVING OR STOP MECHANISM. OSCAR W. SCHMIDT, San Francisco, Cal., assignor of one-half to Israel S. Cohen, same place. Filed Feb. 23, 1889. Serial No. 300,924. (No model.)

Claim.—1. The combination, with the drive-shaft of a machine, of the friction-wheel E, fast upon the drive-shaft and having a socket in its hub, the adjacent clutch-pulley sliding upon the hub of the fixed wheel and having a socket in its hub, the spring within the hubs of the fixed wheel and clutch-pulley, the pivoted lever engaging the pulley for forcing it into frictional engagement with the fixed wheel, and a treadle-connection with the lever, substantially as described.

2. The combination, with the drive-shaft of a machine, of the fixed and sliding wheels and the lever for forcing them into engagement with each other, the sliding brake-shoe fitted to move in a bracket secured to the machine and having an arm connected with the main lever, and a spring in the bracket for projecting the brake-shoe into

409,068.

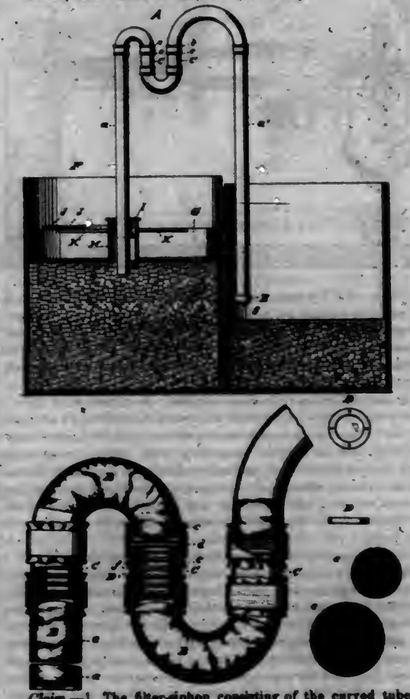


engagement with the rim of the fixed wheel when the power is removed from the treadle, substantially as described.

409,069. CARRIAGE-CURTAIN FASTENING. SAMUEL P. SCOTT, Hillsborough, Ohio, assignor to the Star Manufacturing Company, same place. Filed Apr. 4, 1889. Serial No. 305,918. (No model.)

Claim.—In a carriage-curtain fastening, the combination of the stationary base A, the hollow head B, having a central bore and a rounded end flattened at the outer extremity of said bore and provided with diametrically-opposite pairs of notches D and E, and the spring F, with the stationary pin G, passing through both base and head and having a pair of diametrically-opposite ribs *g g* at its outer end, and an enlarged rounded head H, projecting beyond said ribs and fitting closely on the flattened end of the head and adapted to cover the notches therein and strengthen the ribs, all substantially as and for the purpose specified.

409,070. COMBINED SEED-SOWER AND CLOD-CRUSHER. JOHN W. SELF, Bowling Green, Ky. Filed Mar. 30, 1889. Serial No. 305,367. (No model.)



Claim.—1. The frame mounted on the axle and having the side bars B and the parallel cross-bars C E, and the tongue with its rear end under the centers of said cross-bars, in combination with a detachable hopper rectangular in form and adapted to be placed on the rear end of the tongue and arranged between the bars B and the cross-bars C E, substantially as described.

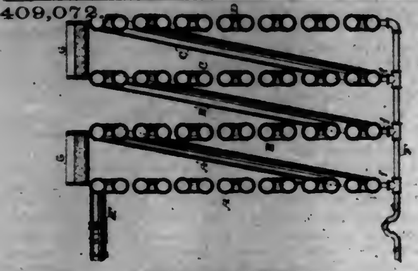
2. The combination, with the frame A, having the pins or studs T, of the clod-cutter, the hook-link connecting the front end thereof to the frame, the vertical arms R, having the vertical slots S, engaging the pins or studs T, and the lever or rod to raise and lower the rear end of the said frame, substantially as described.

3. The combination, with the frame A, having the keeper B', of the harrow-frame having the bail at its front end provided with the hook-arm to engage said keeper, the link-arm C', pivotally connected to and depending from the frame A, and having their lower end pivotally connected to the sides of the harrow-frame near the front side of the latter, the hand-lever pivoted on the frame, and the rod connecting the same to the rear side of the harrow-frame, substantially as described.

409,071. SIPHON-FILTER. THOMAS SLEVIN, St. Louis, Mo. Filed Dec. 21, 1888. Serial No. 294,201. (No model.)

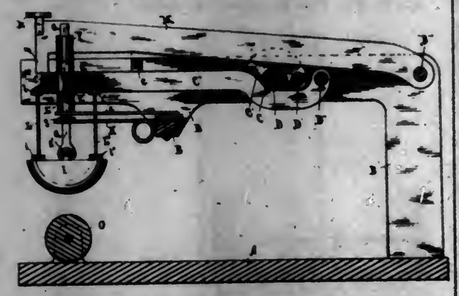
Claim.—1. The filter-siphon consisting of the curved tube, the cloth rolls packed therein, and the cap provided with the outlet-opening, substantially as specified.

2. The combination, with the siphon-tube, of the cloth rolls packed therein, the tube-sections adapted to fit thereon, the strainers, and the interspaces between said strainers, substantially as specified.



3. The combination, with the siphon-tube, of the filtering material therein, the tube-sections C, the rings D, and the cloth disks forming the interspaces *f*, substantially as specified.

4. The combination, with the vessel F and the siphon provided with filtering material, of the float having the central tube-opening, the counter-weights, and the removable flanged ring, substantially as specified.



409,072. AMMONIA-CONDENSER FOR ICE-MACHINES. PAUL STRIK, Oakland, assignor to Parke & Lacy, San Francisco, Cal. Filed Oct. 24, 1888. Serial No. 288,083. (No model.)

Claim.—In an ice-machine, the ammonia-condenser consisting of separate sections or coils of pipes, a pipe-connection between the lowermost pipe of each section or coil and the uppermost pipe of the succeeding section or coil, an inlet-pipe for the ammonia-gas communicating with the uppermost pipe of the first section or coil, and an outlet-pipe communicating with the bottom pipe of each section or coil, substantially as herein described.

409,072.

409,073. TYPE-WRITING MACHINE. DANIEL C. STOVER, Freeport, Ill. Filed May 23, 1888. Serial No. 274,784. (No model.)

Claim.—1. In a machine of the class described, the combination, with a suitably-suspended type-block free to oscillate about its center of suspension and having a convex type-bearing surface, of a series of independent keys and mechanism whereby each key in its descent imparts swinging and then bodily rectilineal motion to said block, substantially as set forth.

2. In a machine of the class described, the combination, with a suitable support and a type-block connected therewith by a universal joint and having a convex type-bearing surface, of three independently-oscillating bars connected, respectively, with three corresponding points upon said type-block, preferably equidistant from said universal joint, and means, substantially as shown and described, for operating said bars, whereby said type-block may be oscillated about said universal joint and any type upon said convex surface be brought into a given position with reference thereto.

3. In a machine of the class described, the combination, with a yielding support and a type-block connected therewith by a universal joint and having a convex type-bearing surface, of three independently-oscillating bars connected, respectively, with three corresponding points upon said type-block, preferably equidistant from said universal joint, and means, substantially as shown and described, for operating said bars, whereby said type-block may be first oscillated about said universal joint and any type upon said convex surface be brought into a given position with reference thereto and may then be moved bodily in a predetermined direction, substantially as and for the purpose set forth.

4. In a machine of the class described, the combination, with a yielding support, a spring adapted to press said support upward, and a type-block suspended below said support by a universal joint and having a convex lower face provided with raised type, of three independent vertically-oscillating bars connected, respectively, with three points upon said type-block by means permitting the free oscillation thereof, and type-actuating levers extending across said bars and having upon their lower edges wards of different arrangement upon the different levers, whereby a given downward movement of the various levers produces correspondingly different relative movements of said oscillating bars and brings the various type upon the convex surface of the type-block successively into a position directly below said universal joint.

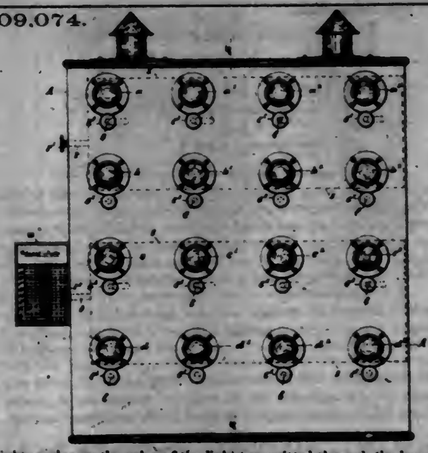
5. The combination, with the vertically-reciprocating support G, the spring H, adapted to press said support upward, and the type-block I, suspended from said support by a universal joint and having an approximately-spherical lower face provided with raised type, of the vertically-oscillating bars C C' C'', connected, respectively, with three points upon the upper surface of the type-block by rods L L' L'', stops *e* limiting the upward motion of the bars C C' C'', and type-actuating levers M, extending across said bars and provided with variously-arranged wards on their lower edges, whereby downward pressure upon the different levers produces different downward movements of the bars C C' C'' and brings different type upon the convex surface of the type-block into a position directly below said universal joint, substantially as and for the purpose set forth.

6. In a machine of the class described, the combination, with a suitable support and a type-block suspended therefrom by a universal joint, of a type-bearing spherical segment forming the lower portion of the type-block and susceptible of limited rotation about a vertical axis with reference to the body thereof, means, substantially as shown and described, for imparting such limited rotation to said segment, three independent vertically-oscillating bars connected, respectively, with three points upon the upper surface of the type-block by means permitting the free oscillation thereof about said universal joint, and a series of levers crossing said bars and provided with differently-arranged wards, whereby downward movement of the different levers produces different relative movements of said bars and different oscillations of the type-block and brings different type upon said segment into a position directly below said universal joint.

7. The combination, with the vertically-reciprocating support G, the spring H, pressing said support upward, and the plate I', suspended from said support by the universal joint K, of the spherical type-bearing segment I, pivoted to the lower face of said plate and having a limited rotation with reference thereto, the oscillating lever Q, adapted to impart such limited rotation to the segment, the bars C C' C'', and the rods L L' L'', connecting them respectively with corresponding points upon the plate I', and the levers M, crossing said bars and formed with wards, whereby downward movement of the levers actuates the bars C C' C'' and produces varying oscillations of the segment, bringing different type upon its surface into a position directly below the universal joint K, substantially as and for the purpose set forth.

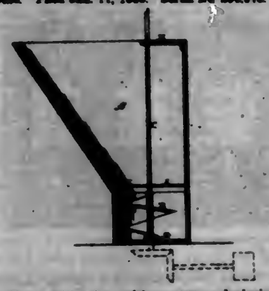
8. The combination, with a suitable support G, a plate I', suspended therefrom by a universal joint, and a spherical segment I, pivoted to the lower face of said plate and susceptible of reciprocal rotation within a limited angle with relation thereto, of two type mounted upon the surface of said segment at points equidistant from the center of rotation thereof and separated by an angular space equal to the angle of rotation of the segment with reference to the plate I', whereby, when said segment is at one limit of its rotation, a given oscillation of the type-block brings one of said type into a position directly below said universal joint, and when the segment is at its opposite limit of rotation the same oscillation of the type-block brings the other of said type into said position.

9. The combination, with the support G and the plate I', connected therewith by a universal joint, of the spherical segment I, pivoted to the lower face of the plate and susceptible of limited rotation about a vertical axis with reference thereto, the vertically-oscillating bars C C' C'', connected with corresponding points upon the plate I' by rods L L' L'', a lever M, crossing said bars and adapted by its downward movement to depress said bars in a given order and to bring a given point upon said segment into a position directly below said universal joint, and two type mounted upon said segment, one at said given point and the other at a second point equidistant therewith from the center of rotation of the segment and separated from said given point by an angular space equal to the limit of rotation of the segment with reference to the plate I', substantially as and for the purpose set forth.



409,074. MARINE SIGNALING APPARATUS. ANDREW TAYLOR, Bootle, County of Lancaster, assignor of one-half to George Beynon, Kirkdale, England. Filed Apr. 2, 1889. Serial No. 305,701. (No model.)

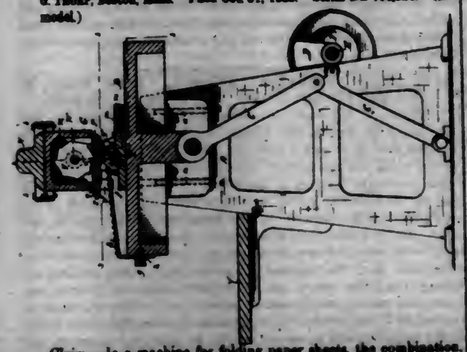
Claim.—1. In a marine night signaling apparatus, the combination of a case adapted to be illuminated, having a series of lenses, a series of frames *f*, adapted to be rotated and having a shield, a red-glazed pane, a green-glazed pane, and a white-glazed pane, said shield and glazed panes being arranged to shield the light or change the color of the light transmitted through the lenses, and said frames being carried on shafts *e*, the frames *k* on the shafts, the windows *i* in the rear of the case, and the shutters *s* in front of the said frames *f*, substantially as and for the purposes set forth.



2. In a marine night signaling apparatus, the combination of a case adapted to be illuminated, having a series of lenses, a series of frames *f*, adapted to be rotated with relation to said lenses and having a shield, a red-glazed pane, a green-glazed pane, and a white-glazed pane, said shield and glazed panes being arranged to shield the light or change the color of the light transmitted through the lenses, and said frames being carried on shafts *e*, windows *i*, and frames *k*, substantially as and for the purposes set forth.

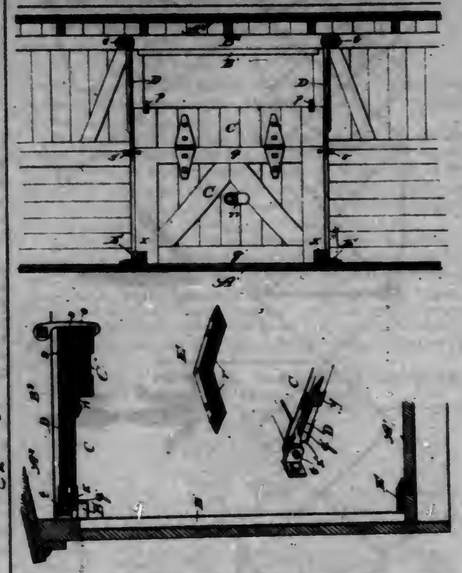
3. In a marine night signaling apparatus, the combination of a case adapted to be illuminated, having a series of lenses, a series of frames *f*, adapted to be rotated with relation to said lenses and having a shield, a red-glazed pane, a green-glazed pane, and a white-glazed pane, said shield and glazed panes being arranged to shield the light or change the color of the light transmitted through the lenses, substantially as and for the purpose set forth.

409,074.



409,075. POTTERY-DIPPING TUB. CARROLL C. THOMPSON, East Liverpool, Ohio. Filed Jan. 17, 1889. Serial No. 296,673. (No model.)

Claim.—1. The combination, with a pottery-glazier's dipping-tub, and an agitator placed in the bottom thereof and causing an upward current of the material placed in the tub, of a screen which covers the entire surface above the agitator, for the purpose of modifying the upward current, substantially as shown and described.



2. The combination, with a pottery-glazier's dipping-tub having its lower end reduced in size, and a screen which covers the top of the reduced portion, of an agitator placed within the reduced portion beneath the screen, which causes an upward current of the material, and which is modified by the screen, substantially as set forth.

409,076. MACHINE FOR FOLDING LEAVES FOR BOOKS. ELLIOTT G. THORP, Boston, Mass. Filed Oct. 31, 1888. Serial No. 110,690. (No model.)

Claim.—In a machine for folding paper sheets, the combination, with the plate L, provided with projections M N, having notches or slots *m*, of a plate P, having depressions Q R to engage with said projections, slots *n*, and cutters or saws V, substantially as and for the purpose specified.

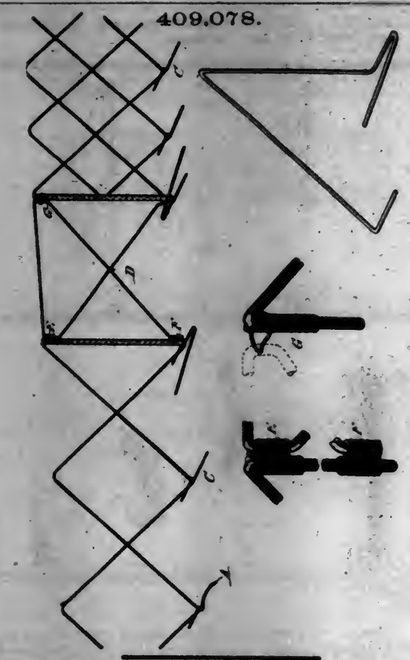
409,077. CAR-DOOR. CONRAD THIEM, Chicago, Ill. Filed Apr. 4, 1888. Serial No. 269,986. (No model.)

Claim.—1. In a freight-car, the combination, with the grain-door C, of hangers D, pivotally secured toward opposite ends, respectively, to the inside of the car near the top and at opposite sides of the door-opening and to opposite lateral edges of the door C, toward the upper end of the latter, a support for the end *q'* of the door, and a support for the end *q* of the door suspended from the ceiling of the car, substantially as described.

2. In a freight-car, the combination, with the grain-door C, of hangers D, pivotally secured toward opposite ends, respectively, to the inside of the car near the top and at opposite sides of the door-opening, and to the opposite sides of the door C, toward the upper end of the latter, angular keepers E, secured to the floor of the car at opposite sides of the door-opening, and each provided with two beveled faces *r r*, a support for the end *q'* of the door, and a support for the end *q* of the door suspended from the ceiling of the car, substantially as described.

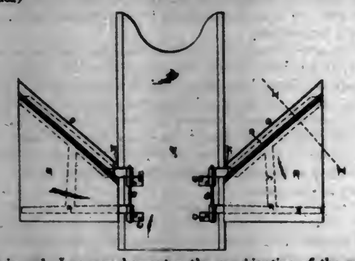
3. In a freight-car, the combination, with the grain-door C, of rods D, pivotally secured toward one end inside the car, near the top and at opposite sides of the door-opening, and provided toward their opposite ends with eyes *s* to receive pins *s'*, which project from the lateral edges of the door toward the top thereof, a support for the end *q'* of the door, and a support for the end *q* of the door suspended from the ceiling of the car, substantially as described.

409,078. FENCE. EDWARD TRENLOW, Summit, N. J. Filed Oct 20, 1887. Serial No. 252,942. (No model.)



Claim.—1. The herein-described improved fence, consisting of interlocked rods or bars having laterally-projecting feet resting upon or embedded in the ground, whereby the fence is sustained in position, substantially as described.

2. The combination, with the interlocked rods or bars comprising the fence, of the vertical stanchions for the gate, the upper gate-hinge E, consisting of hollow metal cylinders having inclined upper edges, the lower gate-hinge F, consisting of hollow metal cylinders, and the gate-frame D, consisting of a bent rod or bar, arranged substantially as described.



3. The combination, with the two vertical stanchions, the gate located between them and consisting of the bent rod or bar D, and the hinges on one of the stanchions for said gate, said hinges consisting of metal cylinders constructed and joined together substantially in the manner and for the purpose described.

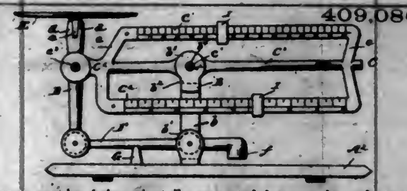
4. The combination, with the interlocked rods or bars having projecting feet resting upon or embedded in the ground, the vertical stanchions for the gate, the upper gate-hinge E, consisting of hollow metal cylinders, the lower gate-hinge F, the gate-frame D, consisting of a bent rod or bar, and a clasp for fastening the gate in a closed position, all the parts being arranged substantially in the manner described.

409,078.

409,079. CORN-HARVESTER. SAXTON C. VAN BUREN and SAXTON C. SHOUP, Carey, Ohio. Filed Oct. 8, 1888. Serial No. 287,508. (No model.)

Claim.—1. In a corn-harvester, the combination of the vehicle, the metallic frames hinged to opposite sides thereof and consisting of the prongs H I, and connecting-strip J with the knives O and the wings B, the front edges of the prongs I being made to project beyond the front edges of the wings B and turned upward at a suitable angle to receive the knives O, substantially as shown.

2. In a corn-harvester, the combination of the vehicle, the wings B, and the metallic frames hinged to opposite sides of the vehicle and forming supports for the wings, and the knives O, the front edges of the metallic frames being made to project beyond the front edge of the wings B and adapted to have the knives O secured thereto, substantially as described.

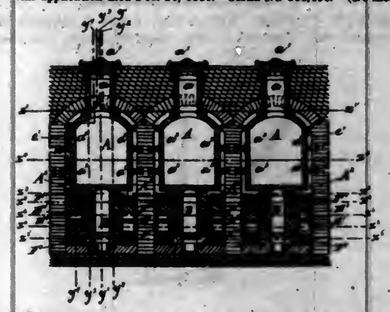


3. In a corn-harvester, the combination of the vehicle, the wings hinged to its sides, and the knives at the forward edges of the wings, there being spaces or openings left between the inner ends of the knives and the outer edges of the vehicle, substantially as set forth.

409,080. MEDICINE OR POSTAL SCALES. WILLIAM R. WATT, Somerville, Tenn. Filed Oct. 4, 1888. Serial No. 287,176. (No model.)

Claim.—1. A pocket-scale comprising a casing formed of a back or bottom strip, and two sides hinged at their inner edges thereto, and a scale having its standard secured to the inner side of said back or bottom strip, whereby when the two sides are swung outward in opposite directions the scale will be exposed and in position for use, substantially as set forth.

2. The combination, with the standard, of the scale-beam formed of three horizontal vertically-aligned members connected at their ends, the upper and lower members being graduated and the middle



409,080.

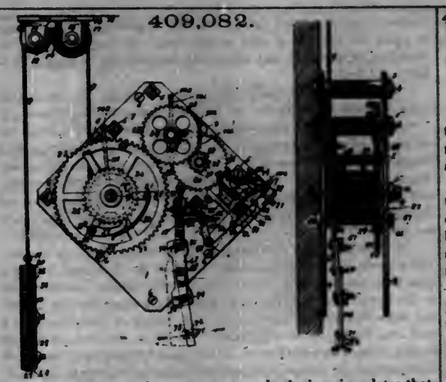
bar or member being pivotally connected between its ends to said standard, a vertical scale-pan supporting-arm pivotally connected between its ends to one end of said scale-beam, and a horizontal balance-arm pivoted between its ends to the standard, pivotally connected at one end to the lower end of said scale-pan supporting-arm, and provided at its opposite end with a weight, substantially as set forth.

3. The combination, with the scale-standard B, formed with a recess *b*, forming the enlarged lower and upper ends *b'* *b²*, of the scale-beam C, comprising three parallel members C' C² C³, the members C' C² being graduated, member C³ lying in the recess *b'* of standard B, and the member C² being pivoted to the upper enlarged end *b²* of said standard, the arm D, pivoted to the scale-beam and acting as a support for the scale-pan, and the weighted balance-arm F, pivoted to arm D and to lower end *b'* of standard B, substantially as described.

409,081. COKE-FURNACE. ADAM WEBER, New York, N. Y. Original application filed Sept. 25, 1888, Serial No. 286,332. Divided and this application filed Feb. 26, 1889. Serial No. 301,196. (No model.)

Claim.—1. The combination of a coking-chamber formed of blocks or tiles, a mantel surrounding said coking-chamber and forming a mantel-flue around the same, dovetailed lateral braces connecting the side walls of the coking-chamber and mantel, and a combustion-chamber below the coking-chamber, substantially as set forth.

2. The combination of a coking-chamber formed of blocks or tiles, a mantel surrounding said coking-chamber, angle-blocks supporting the bottom of the chamber, and dovetailed brace-blocks connecting the side walls of the coking-chamber and mantel, and a combustion-chamber below the coking-chamber, substantially as set forth.



3. The combination of a coking-chamber formed of blocks or tiles, a mantel surrounding the coking-chamber, lateral brace-blocks connecting the side walls of the coking-chamber and mantel, and lateral plates connecting the upper corners of the coking-chamber and mantel, said plates being provided with front and rear openings, and sliding dampers for regulating the size of said openings, substantially as set forth.

409,082. MECHANICAL MOVEMENT. ROBERT WHEELS, St. Louis, Mo. Filed Sept. 28, 1888. Serial No. 286,631. (No model.)

Claim.—1. In a mechanical movement for rock-fans, &c., the combination of the geared drive-wheels, the escapement-wheel, the shafts or axles that carry said wheels, the incasing-plates that inclose the power-works and that provide bearings for the said axles, the ratchet-wheel with tight bearings on the main drive-wheel shaft, the pawl 27 and its re-enforcing spring 30, which pawl dogs the teeth of the ratchet-wheel, the key-seat on said wheel-shaft, the drum on said shaft, the operating-cord that is wound on said drum, the twin pulleys over which said cord runs, the weight-carrier rod 20, that is suspended from said cord, the sectional actuating-weight whose sections are seated on said carrier-rod, the said weight constructed of slotted sections that provide the means to increase or diminish the weight to accord with the power it is required to exercise, the lower section being provided with a recessed boxing, in which the screw-nut rests that is seated on the bottom of the carrier-rod, substantially as and for the purpose set forth.

2. In a mechanical movement for rock-fans, &c., the combination of the geared drive-wheels, the escapement-wheel, the shafts or axles

409,082.

that carry said drive and escapement wheels, the incasing-plates that inclose said wheels and in which said axles have bearings, the pulsating or pendulum bar 43, the cross-head that surmounts said bar, the angle-arms of said cross-head, the shaft or axle 57, that carries said cross-head and its pendent pulsating bar, the tubular journal-box 62, that is screw-seated in the outer incasing-plate and provides a peripheral front bearing for the shaft or axle 57, the detent 42, its re-enforcing spring 47, and anti-rattler cushion 48, all three secured in the intervening space between the vertical angle-arms 44 of said cross-head, the coupling-yoke 68, provided with curved slots 74, the counterpoise-bar 70, the pivot-bolt 69, that connects the pulsating bar, the counterpoise-bar 70, and the coupling-yoke, the adjustable weight and set-screw secured to the counterpoise-bar, and the thumb set-screws 75, that adjust the relative positions of said bars and yokes to influence the action of the detent in its pulsations with the teeth of the escapement-wheel, substantially as and for the purpose set forth.

3. In a mechanical movement for rock-fans, &c., the combination of the geared drive-wheels, the escapement-wheel, the detent, the cross-head, the pulsating bar, the yoke, the counterpoise-bar, the compound lever 76, the conjutary dog-pawl said lever actuates, the anti-rattler cushion attached to said dog-pawl, the sliding bed-plate that carries said dog and by the influence of the lever enforces the periodic engagement of the dog with the teeth of the escapement-wheel in unison with the action of the detent, the flanged plates 82, that guide the sliding dog-plate 87, the toggle-link 53, that pivotally connects the compound lever to the angle-arms of the cross-head and enforces the unison of their pulsations, the adjustable buffer-bar 52, and the spur-lug 56 on the toggle-link, that together limit and adjust the movement of the compound lever and pulsating bar, substantially as and for the purpose set forth.

4. In a mechanical movement for rock-fans, &c., the combination of the drive-gear and escapement-wheels, the shafts or axles that carry said wheels, the rear and front incasing-plates that inclose said wheels and in which are provided bearings for the journals of said shafts or axles, the tubes or pipes that carry lubricant to said bearings, the pulsating bar 43, the cross-head that surmounts said bar, the angle-arms of said cross-head, and the detent 42, anti-rattler cushion, and enforcing-spring that are secured between the angle-arms of said cross-head, substantially as and for the purpose set forth.

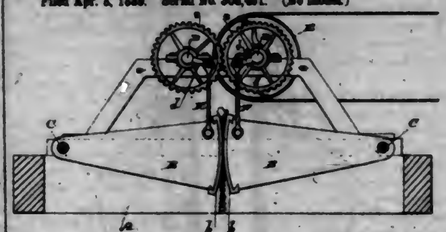
5. In a mechanical movement for rock-fans, &c., the escapement-wheel, the detent, the cross-head that carries the detent, the adjustable pulsating bar that carries the cross-head 45, the toggle-link 53, the compound lever 76, that is connected to the pulsating cross-head, the pivot-pin 77, on which said lever works, the spring seated in said pivot-pin that aids the reactionary movement of the lever, the adjustable bed-plate 78, that carries said pivot-pin, the set-screw that secures it, and the set-screw 81, that holds against the back of said bed-plate, substantially as and for the purpose set forth.

409,083. DUMPING-WAGON. WILLIAM E. WELSH, Bushton, Ill. Filed May 9, 1889. Serial No. 310,181. (No model.)

Claim.—1. The combination, with the running-gear of a wagon, constructed substantially as shown and provided with longitudinal beams A, having guide-rods E, and roller C, of a body having parallel beams F, the catch N, and a roller *i*, with projecting ends which pass beneath the guide-rods E, the under side of the beams F having hooks which engage with the roller C, substantially as shown, and for the purpose set forth.

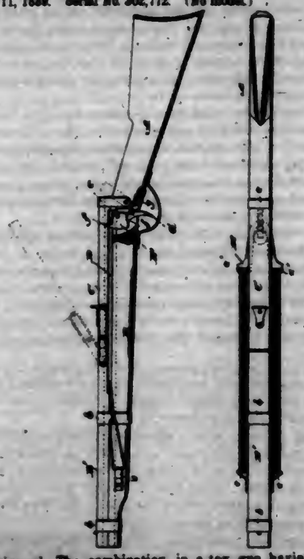
2. The combination, in a dumping-wagon having a body adapted to slide upon the running-gear and tilt thereon, of the pivoted levers H, carried by the body and adapted to be thrown to a vertical posi-

409,083.



tion at each side of said body to hold it stationary relative to the movement of the truck or "running-gear," substantially as shown, and for the purpose set forth.

3. The combination, with the running-gear of a vehicle, of longitudinal beams A, above which are mounted guide-rods E, the rear ends of which are bent outwardly and secured to the sides of the beams to permit the ends of the roller *i* to pass beneath the guide-rods and abut against the forward ends thereof to limit the forward movement of the body on the running-gear, substantially as shown.

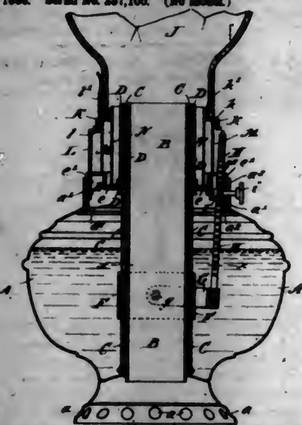


4. The combination, in a dumping-wagon, of the running-gear provided above the longitudinal beams thereof with guide-rods E, a roller C, journaled at the rear ends of the running-gear, a pivoted lever H, secured to the front bolster, a body having longitudinal beams F F, to which are secured cross-pieces *f*, *f'*, and *f²*, a roller *i*, the ends of which project and roll upon the beams A, a hook *k*, the catch N, and pivoted levers H, the parts being organized substantially as shown.

409,084. ORE-CRUSHER. SILAS W. WELLER, Baker City, Oreg. Filed Apr. 5, 1889. Serial No. 306,461. (No model.)

Claim.—An improved ore-crusher consisting of the combination of the frame A, having the upper portion *a*, the horizontal shafts C at each end of the frame, the opposing jaws B B, pivoted at their rear ends on the horizontal shafts and having oppositely-curved working-faces *b*, between which the ore is received and crushed, the shafts D D above, the gears connecting the shafts, the cranks of the shafts, and the links connecting the cranks with the jaws, whereby they are vibrated simultaneously through arcs in a vertical plane, substantially as described.

409,085. TOY GUN. GEORGE H. WARREN, St. Louis, Mont. Filed Mar. 11, 1889. Serial No. 302,772. (No model.)



Claim.—1. The combination, in a toy gun having the spring

actuated follower, dog, and trigger, of a stop and barrel extending therefrom, a breech-block C, mounted upon a horizontal pivot and grooved on its under side to form a part of the barrel-recess, and a bail or loop c, pivoted to the stock to clamp said breech-block, substantially as and for the purpose set forth.

2. The combination, in a toy gun, of a stock and barrel extending therefrom, a spring-actuated follower, a dog having an upwardly-projecting portion *f* to engage said follower, a spring-pressed trigger to engage said dog, a breech-block mounted upon a horizontal pivot and grooved on its under side to form a part of the barrel-recess, and a bail or loop pivoted to the stock to clamp said block, substantially as set forth.

3. The combination, in a toy gun, of a stock and barrel extending therefrom, a yoke-shaped follower of spring metal and elastic bands for actuating the same, engaging-dog and spring-trigger, a breech-block mounted upon a horizontal pivot and grooved on its under side to form part of the barrel-recess, and a bail or loop pivoted to the stock to clamp said breech, substantially as set forth.

409,086. LAMP. WILLIAM H. WILDER, Gardner, Mass. Filed Oct. 3, 1888. Serial No. 287,100. (No model.)

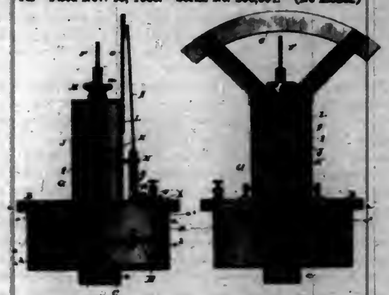
Claim.—1. In combination with a lamp-fount having an interior air-tube and wick, an adjusting ring or clamp for the wick, a yoke pivoted at its end to opposite parts of the wick-ring, and an operating-rod passing through the burner or lamp-body, substantially as described.

2. The combination, with the lamp-fount having an interior air-tube and wick and an adjusting ring or clamp device for the wick, of a burner fitted to the fount and having a guide for the wick, a yoke pivoted at its ends to opposite parts of the wick-ring, and a rod connected to the yoke and passed upward through the base-plate of the burner, substantially as herein set forth.

3. The combination, with the lamp-fount having a burner and an interior air-tube and wick and an adjusting ring or clamp device for the wick, of a yoke pivoted at its ends to opposite parts of the wick-ring, a rod connected to the yoke and provided with a rack and passed upward through the lamp-burner, and a pinion journaled to the burner and engaging the rod-rack when the burner is adjusted to the fount, substantially as herein set forth.

4. The combination, with the lamp-fount having an interior air-tube and wick and an adjusting ring or clamp device for the wick, of a yoke pivoted at its ends to opposite parts of the wick-ring and a rod connected to the yoke and normally leaning outward and passed through a guide-hole in the burner, substantially as described, whereby as the wick-ring is raised evenly by the yoke and rod the rod will be thrown outward at the top to clear the lamp burner or chimney, as set forth.

5. A lamp provided with a separable chimney-supporting ring and a perforated air-supply and wind-guard ring made separate from the chimney-ring and placed loosely between it and the burner, substantially as described, for the purposes set forth.



6. A lamp provided with a separable chimney-supporting ring sustained by and above the burner, a separable perforated outer air-supply and wind-guard ring M, placed between the chimney-supporting ring and the burner, and an auxiliary smaller inner air-supply and wind-guard ring N, located between the ring M and the wick-tube of the burner, substantially as herein set forth.

7. In a lamp, the combination, with its burner and shouldered posts or plates held thereto and forming clamps for the chimney, of a separable chimney-supporting ring having holes through which the chimney-supporting posts pass and an inner upwardly-projecting flange to which the chimney is held by the posts, said ring resting on the shoulders of the posts and above the burner-body, substantially as herein set forth.

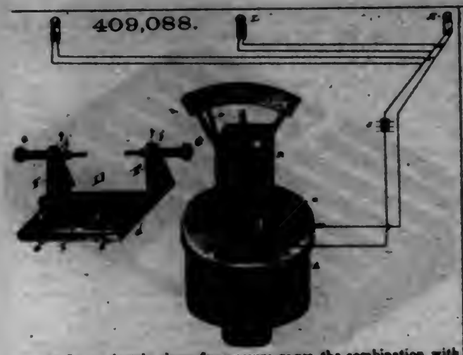
8. In a lamp, the combination, with its burner and shouldered posts or plates held thereto and forming clamps for the chimney, of a separable chimney-supporting ring having holes through which the chimney-posts or clamp-plates pass and an inner upwardly-projecting flange to which the chimney is held by the clamp-plates, said ring resting on the shoulders of the clamp-plates and above the burner-body, and a perforated air-supply and wind-guard ring placed between the chimney-supporting ring and the burner-body, substantially as herein set forth.

9. In a lamp, the combination of the fount A, having an interior air-tube B, a separable burner fitted to the fount and having a base-plate provided with a wick ring or tube, posts or plates L, held to the burner and provided with shoulders *l*, a separable ring K, having holes L^2, receiving the plates L and resting on their shoulders *l*, said ring having an interior flange *k'*, to which the chimney is held by the plates L, and perforated air-supply and wind-guard rings M N, fitted around the burner wick-tube and between the burner and chimney-supporting ring K, substantially as herein set forth.

409,087. PRESSURE-GAGE. GWILYM M. WILLIAMS, Wilkes-Barre, Pa. Filed Nov. 15, 1888. Serial No. 290,891. (No model.)

Claim.—1. The combination, with a drum and a casing mounted thereon, of a diaphragm disposed in the former, a shaft journaled in the latter, and mechanism connecting the diaphragm and shaft, consisting of a rod projecting upwardly from said diaphragm, a longitudinally-slotted bar projecting from said rod, and a lever rigidly secured to said shaft and provided at its free end with a pin playing in the slotted bar, said connecting mechanism being adapted to impart a partial rotary motion to the shaft during the movement of the diaphragm, substantially as set forth.

2. The combination, with a drum and a casing mounted thereon, of a diaphragm disposed in the former, a shaft journaled in the latter and carrying an indicator or recorder, connection between the diaphragm and shaft, whereby motion of said diaphragm is imparted to the shaft, and adjusting mechanism connected with the shaft and adapted for the adjustment of the indicator or recorder, substantially as and for the purpose set forth.



3. The combination, with a drum provided with an inlet-opening at one end and air-perforations near the other end, and a casing mounted thereon, of a diaphragm disposed in said drum between the inlet-opening and air-perforations, a shaft journaled in said casing and carrying an indicator or recorder, connection between the diaphragm and shaft, whereby motion of said diaphragm is imparted to the shaft, and adjusting mechanism connected with the shaft and adapted for the adjustment of the indicator or recorder, substantially as and for the purpose set forth.

4. The combination, with a drum and a casing mounted thereon, of a diaphragm disposed within the former, a shaft journaled within the latter, and connection between the diaphragm and shaft, whereby said shaft is adapted to be rotated by the action of the diaphragm, a graduated arc mounted upon the casing, an indicator secured to the outer end of the shaft and adapted to travel over said arc, and an adjustable spring-connection between the diaphragm and casing, substantially as and for the purpose set forth.

409,088. ALARM. GWILYM M. WILLIAMS, Wilkes-Barre, Pa. Filed Feb. 4, 1889. Serial No. 298,634. (No model.)

Claim.—1. In an electric alarm for pressure-gages, the combination, with a rigid plate, of a plate hinged thereto, provided with upwardly-projecting corresponding lugs disposed at each end thereof, and having opposing contact-points, substantially as and for the purpose set forth.

409,088.

2. In an electric alarm for pressure-gages, the combination, with a rigid plate, of two corresponding lugs pivotally connected therewith and provided with opposing adjustable screws forming contact-points, substantially as and for the purpose set forth.

3. The combination, with a pressure-gage provided with an oscillating indicator-shaft and a plate projecting downwardly from the latter, of an insulated circuit-closer comprising a rigid plate, lugs pivotally connected therewith, projecting at each side the downwardly-projecting plate and provided with contact-points for engagement by the latter, said circuit-closer being adapted to be thrown in or out of operation, and battery and alarm mechanism connected by wires with the shaft and circuit-closer, substantially as set forth.

4. The combination, with a pressure-gage provided with an oscillating indicator-shaft and a plate projecting downwardly from the latter, of an insulated circuit-closer comprising a rigid plate and a plate hinged thereto provided with two corresponding lugs projecting at each side the downwardly-projecting plate, opposing adjustable screws provided through the lugs, and battery and alarm mechanism connected by wires with the shaft and circuit-closer, substantially as set forth.

409,089. SHOE ATTACHMENT FOR THRASHING-MACHINES. LOREN M. WILSON, Venice Centre, N. Y. Filed May 9, 1888. Serial No. 310,177. (No model.)

Claim.—1. The combination, with a thrashing-machine having a concave, of an attachment comprising an extended frame located external to the thrashing-machine and having an endless carrier arranged therein, a trough projecting laterally from said frame and extending into the machine adjacent to the discharge of the concave and provided with an endless conveyer, and a discharge-trough located laterally on the other end of the frame and extending externally to communicate with a winnower or fan, and an endless conveyer located in said discharge-trough, substantially as set forth.

2. The combination, with a thrashing-machine having a feed-hopper and a concave, of an attachment comprising an extended frame located external to the thrashing-machine and having an endless carrier arranged therein, a trough projecting laterally from said frame and extending into the machine adjacent to the discharge of the concave and provided with an endless conveyer, and a discharge-trough located laterally on the other end of the frame and extending externally beneath the feed-hopper to communicate with a winnower or fan, and an endless conveyer located in said discharge-trough, substantially as set forth.

409,090. GAS-FURNACE. JOHN SELLWOOD, Chicago, Ill. Filed Dec. 19, 1887. Serial No. 258,242. (No model.)

Claim.—1. In a gas-furnace, the combination, with the furnace-chamber having ports for the inlet of gas and air and outlet of the products of combustion, all communicating therewith from the same side thereof, of a recuperator having unobstructed vertical air-flues extending from a level above the hearth downward, terminating and communicating with the atmosphere at a level below said hearth, and the fire-flues communicating with the ports for the outlet of the products of combustion and extending downward therefrom in proximity to the air-flues, substantially as set forth.

2. In a gas-furnace, the combination, with the furnace-chamber having ports for the inlet of gas and air and outlet of the products of combustion, all communicating therewith from the same side thereof above the level of the hearth, the inlet above the outlet, of a recuperator having an unobstructed vertical air-flue communicating at its upper end with the air-inlet port and extending from the level of said port downward, terminating and communicating with the atmosphere at a level below said hearth, and a fire-flue communicating at its upper end with the port for the outlet of the products of combustion and extending from the level of said port downward in proximity to the air-flue to a level far below the hearth, substantially as set forth.

3. In a gas-furnace, the combination, with the furnace-chamber having ports for the inlet of gas and air and a plurality of ports for the outlet of the products of combustion, all communicating therewith from the same side thereof, of a recuperator having unobstructed vertical air and fire flues located in proximity to each other and extending from a level above the hearth downward to a level far below it, said flues communicating at their upper ends with the ports for the inlet of air and outlet of products of combustion, respectively, said outlet for the products of combustion being horizontal, substantially as set forth.

4. In a gas-furnace, the combination of the furnace-chamber having a horizontal inlet for the gas, a vertical inlet for the air, situated beneath and in proximity to the gas-inlet, an outlet for the products of combustion, and a recuperator communicating with the external atmosphere directly and with said air-inlet for supplying the latter with heated air free from gas, substantially as set forth.

5. In a gas-furnace, the combination, with the furnace-chamber having a horizontal port for the inlet of gas and a horizontal port for the escape of the products of combustion communicating therewith from the same side thereof, of a recuperator having vertical air-flues terminating at their upper ends beneath and in proximity to the said gas-inlet, and fire-flues separated from said air-flues only by thin partitions and communicating at their upper ends with the horizontal outlet-port, said air and fire flues extending from the levels of the ports with which they respectively communicate downward, terminating at a level far below the hearth, communicating at their lower ends with the atmosphere and smoke-flue, respectively, substantially as set forth.

6. The combination, with the furnace-chamber having a port for the inlet of gas and a port for the outlet of the products of combustion, of the air-flues K, communicating at top with said chamber, the flue N, communicating with said air-flue at bottom, the fire-flues H, also communicating at top with said chamber, and the flues J, communicating with said fire-flues at bottom, the flues J being situated beneath the flues N and separated therefrom only by thin partitions, substantially as set forth.

7. In a gas-furnace, the combination, with the combustion-chamber, of an air-chamber, a recuperator having a plurality of air-flues all communicating with said air-chamber, a port opening into one side of said chamber for the admission of gas, and a port directly opposite said gas-inlet, forming communication between said air and combustion chambers, and through which the gas from the gas-inlet port passes directly into the combustion-chamber without striking against the walls of the air-chamber, as set forth.

8. In a gas-furnace, the combination, with the combustion-chamber, of an air-chamber, a port forming communication between said chambers, a recuperator having vertical air-flues communicating with said air-chamber through openings in the floor thereof and extending downward therefrom to a level far below the hearth, fire-flues located in proximity to said air-flues, and horizontal ports situated beneath the floor of the air-chamber and forming communication between said fire-flues and the combustion-chamber, substantially as set forth.

9. In a gas-furnace, the combination, with the furnace-chamber, of the partition L″, separating it into combustion-chamber F and air-chamber L, the port L‴, formed through said partition and connecting chambers F and L, the port D, opening into the chamber L directly opposite the port L‴, and a recuperator communicating with the chamber L, substantially as set forth.

10. In a gas-furnace, the combination, with the furnace-chamber having ports for the inlet of gas and outlet of the products of combustion communicating therewith from the same side thereof, the outlet below the inlet, of a recuperator having vertical air-flues communicating at top directly with one of said chambers and extending

downward therefrom to a level far below the hearth, where they communicate with the atmosphere, and the fire-flues separated from said air-flues only by thin partitions, said fire-flues communicating at top directly with each of the outlet ports and at bottom communicating with the smoke-flue, as set forth.

11. In a gas-furnace, the combination, with the furnace-chamber having ports for the inlet of gas and outlet of the products of combustion communicating therewith from the same side thereof, of a recuperator having a series of vertical air-flues arranged beneath and extending downward from the floor of said chamber communicating with said chamber through ports formed through the floor thereof, and the fire-flues separated from said air-flues only by thin partitions, substantially as set forth.

12. In a gas-furnace, the combination, with the furnace-chamber having its floor formed at different elevations (F' and L') and ports for the inlet of gas and outlet of the products of combustion communicating therewith, of a recuperator having a series of vertical air and fire flues arranged beneath the floor of said chamber and extending downward therefrom, said air-flues communicating at their upper ends with said chamber through ports formed through the higher portion L' of its floor and said fire-flues communicating with the ports for the outlet of the products of combustion, all of said ports being situated on the same side of the combustion-chamber, substantially as set forth.

13. In a gas-furnace, the combination, with the furnace-chamber having its floor formed at different elevations, (F' and L',) ports for the inlet of gas and outlet of products of combustion communicating therewith from the same side thereof, said inlet being situated above the higher portion L' of said floor and said outlet extending horizontally beneath said higher portion, of a recuperator having vertical air-flues situated beneath and extending from the portion L' of said floor downward to a level far below the outlet and communicating at top with said chamber through ports formed through the floor L' thereof, and the fire-flues communicating at top with the ports for the outlet of the products of combustion and extending downward therefrom in proximity to the air-flues, substantially as set forth.

14. In a gas-furnace, the combination, with the furnace-chamber having its floors formed at different elevations, (F' and L',) the gas-port D, communicating therewith above the higher portion L' of said floor, a plurality of ports for the outlet of the products of combustion situated beneath the portion L' of the said floor, a series of vertical air-flues K, situated beneath the portion L' of said floor and extending downward therefrom, of the ports K', formed through said floor and through which flues K communicate with the furnace-chamber, a plurality of vertical fire-flues H, also situated beneath the portion L' of said floor, extending downward in proximity to the air-flues K and communicating at top with the ports for the outlet of the products of combustion, and the partition L'', extending across the furnace-chamber and having port L''', substantially as and for the purpose set forth.

15. In a gas-furnace, the combination of a combustion-chamber, a single port for the inlet of gas and air, and a plurality of ports for the outlet of the products of combustion situated at a lower level than the inlet-port but on the same side of the combustion-chamber, said outlet being distributed in a horizontal direction over a much wider area than that occupied by the inlet, substantially as set forth.

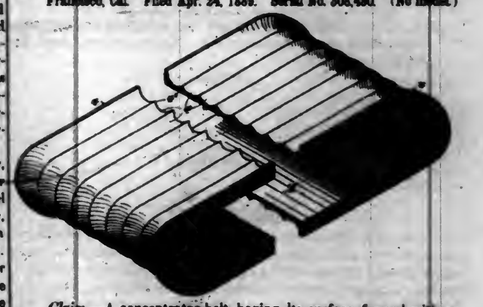
16. In a gas-furnace, the combination of a combustion-chamber having a gas and air inlet and plurality of ports for the outlet of the products of combustion, said inlet and outlet being upon the same side of the combustion-chamber, a recuperator having air-flues communicating with the inlet and having a plurality of fire-flues, one communicating at top directly with each of the outlet-ports, said air-flues and fire-flues being separated only by thin partitions and extending from a level above the hearth to a level far below it, substantially as set forth.

17. The combination, with the combustion-chamber having an inlet for gas and air and an outlet for the products of combustion, said inlet and outlet being situated on the same side of the combustion-chamber, of a vertically-elongated distributer situated opposite the inlet for distributing the flame horizontally, substantially as set forth.

18. In a gas-furnace, the combination, with the combustion-chamber having inlet for gas and air and outlet for products of combustion, all situated on the same side thereof, the outlet being distributed in a horizontal direction over a much wider area than said inlet, of a vertically-elongated distributor placed opposite the inlet for distributing the flame in a horizontal direction over the entire width of the combustion-chamber, substantially as set forth.

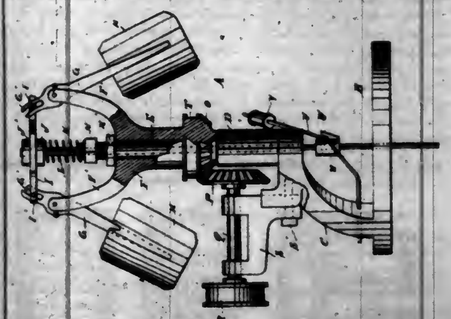
19. A gas-furnace having a combustion-chamber, an inlet for gas and air, and a plurality of ports opening directly from said chamber for the outlet of the products of combustion, said outlet being situated on the same side of the combustion-chamber as the inlet but distributed in a horizontal direction over a wider area, the sizes of said outlet-ports increasing in proportion to their distance from the inlet, substantially as and for the purpose set forth.

409,091. ORE-CONCENTRATOR BELT. JOHN M. ADAMS, San Francisco, Cal. Filed Apr. 24, 1889. Serial No. 308,479. (No model.)



Claim.—1. In a belt for an ore-concentrator, the combination therewith of continuous overflow channels or passages formed on or with said belt and having continuous bottoms, whereby the overflow is carried down to the end of the belt and discharged, substantially as described.

2. In an ore-concentrator belt, the combination, with the belt, of raised flanges formed with or secured to the surface of the belt and separated to form continuous intervening channels or passages having continuous bottoms, whereby the overflow is carried to the lower end of the belt and discharged, substantially as described.

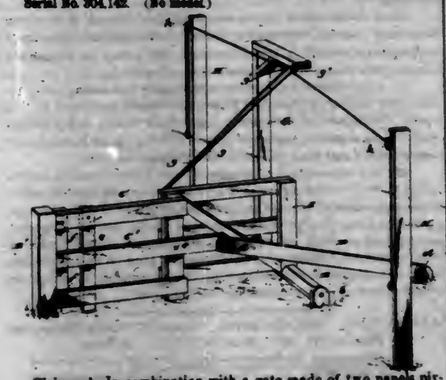


3. In an ore-concentrator belt, a series of narrow parallel belts having side flanges, said belts being separated to form continuous channels or passages between adjacent flanges and an underlying continuous surface lying directly under and against said belts to form continuous bottoms for said channels or passages, whereby the overflow is carried to the lower end of the belt and discharged, substantially as described.

409,092. ORE-CONCENTRATOR BELT. JOHN M. ADAMS, San Francisco, Cal. Filed Apr. 24, 1889. Serial No. 308,480. (No model.)

Claim.—A concentrator-belt having its surface formed with or divided into continuous parallel concave runs or ways extending throughout the belt in the direction of the flow of material on said belt, substantially as described.

409,098. GOVERNOR. GEORGE S. AGEE, Burnham, Me. Filed June 27, 1888. Renewed July 17, 1889. Serial No. 317,732. (No model.)



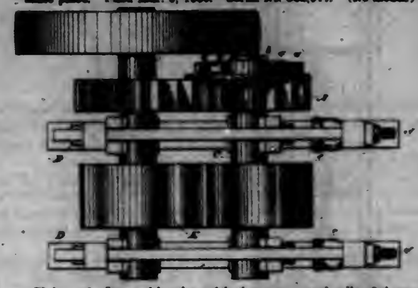
Claim.—1. The herein-described governor, comprising the base E, provided with a vertical bearing D, terminating in a reduced upper portion E, the governor-frame F, journaled on said reduced portion and having a gear on its lower end and forked arms F' on its upper end, the levers G, pivoted in said forked ends, slotted at their upper ends, as at G', and provided with inclined fans H at their lower ends, the governor-rod K, extending down through the bearing D E and having a cross-arm I at its upper end, provided with pins I', entering the slots G', and the spring L, between the under side of arm I and a collar or nut on the part E, and pressing the arm I and governor-rod upward, substantially as set forth.

2. The combination, with the base having a bracket C, provided with a vertical bearing D, the governor-frame F, mounted on said bearing and having the governor-arms at its upper end and a pulley T and gear O at its lower end, of the detachable bracket S, secured to the said bracket C and having a horizontal shaft Q, provided with a gear P at its inner end meshing with gear O, and a pulley R at its opposite end, substantially as set forth.

3. In a governor, the combination, with the governor-frame, its arms, and the vertical governor-rod K, having a lug W' below the governor-frame, of a lever pivoted at its inner end, extending across said lug and having a pulley V at its outer end, substantially as set forth.

4. The combination, with the base B, having a bracket C on its upper side provided with a vertical bearing D, the governor-frame on said bearing, and the governor-rod K, extending down through the bearing D, upper end of the bracket, and the base, of the collar W, having a lug W' and mounted on the governor-rod between the base and the bracket, and the lever U, pivoted to the bracket C, extending across the lug W' and having a pulley on its outer end, substantially as set forth.

409,094. GATE. ANDREW ALLEN, Pana, Ill. Filed Mar. 21, 1889. Serial No. 304,142. (No model.)



Claim.—1. In combination with a gate made of two panels pivoted to each other and swinging vertically on their pivots, one of said panels being journaled to fixed supports and said journaled or pivoted panel carrying a panel the rear end of which is pivoted thereto, a bar D, pivoted to a fixed support and to the outer panel of the gate, substantially as shown, and for the purpose set forth.

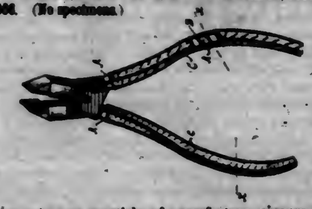
2. The combination, in a gate made up of two gate-sections, one of said sections being pivoted to fixed supports and the other section being provided with an extended rail, of a pivot for connecting the sections to each other, and a bar pivoted to the end of the extended rail and to a fixed support, whereby the gate-sections, when placed across the gateway, will be placed in a horizontal position, and when the gateway is open will assume a vertical parallel position, substantially as shown, and for the purpose set forth.

3. The combination, in a tilting gate, of the sections A C, the former being pivoted at one lower corner to a fixed support and the latter being pivoted to the former to fold vertically parallel therewith when said section A is raised to a vertical position, and a bar *e*, pivoted at the upper end to the top rail of the section C, to drop to a vertical position when the said section is lowered, substantially as set forth.

4. The combination, in a tilting gate, of the sections A and C, pivoted to each other at their adjacent portions to fold parallel with each other when the section A is raised to a vertical position, the section A being suitably journaled to fixed supports, the section C having an extended rail C', to which one end of a bar D is pivoted, the opposite end of said bar being pivoted to a fixed support beyond the supports for the gate A, and cords *g g*, which pass through guides, the ends of said cords being attached to the gate-section A, substantially as shown, and for the purpose set forth.

409,095. ADJUSTABLE GEAR FOR CRUSHING-ROLLS. HANS C. BEHR, San Francisco, Cal., assignor of one-half to Benjamin T. Lacy, same place. Filed Mar. 9, 1888. Serial No. 302,677. (No model.)

Claim.—1. In combination with the corrugated rolls of the crushing-mill, a gear on the roll shaft adjustable rotatively on said shaft, substantially as described.



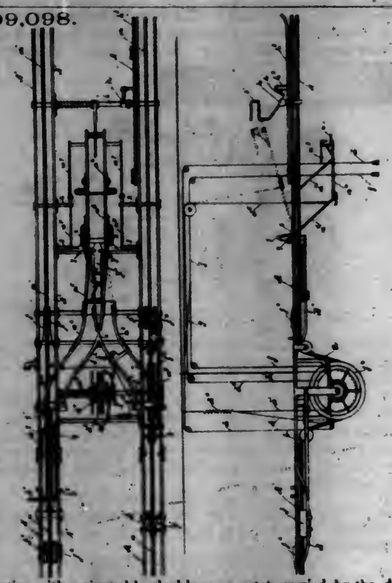
2. In combination with the corrugated rolls of the crushing-mill and their shafts, intermeshing gears mounted upon said shafts and the means for adjusting one of said gears rotatively upon the shaft, consisting of the set-screws mounted on the gear, and fixed projections carried by the shaft, against both sides of which the set-screws bear, substantially as described.

409,096. WATER-PROOF AND FIRE-PROOF MATERIAL FOR ROOFING. ALOIS BLANK, St. Louis, Mo. Filed Jan. 23, 1889. Serial No. 297,261. (Specimens.)

Claim.—The metallized asbestos material composed of a body 1 of asbestos having its interstices supplied with carbonaceous material, a coat 3 of copper adhering to the carbonaceous material and entering the interstices of the asbestos, and an outer sheet or layer 4 of metal overlying the copper 3, substantially as set forth.

409,097. INSULATED NIPPERS AND CUTTING-INSTRUMENT. PERRIN M. CASEY, Mount Vernon, N. Y. Filed Jan. 27, 1887. Serial No. 225,666. (No specimens.)

Claim.—As a new article of manufacture, nippers having handles covered with a vitreous insulating material, substantially as described.



409,098. STORE-SERVICE APPARATUS. GILBERT B. ELLIOTT, Boston, Mass. Filed Oct. 10, 1888. Serial No. 287,737. (No model.)

Claim.—1. In a store-service apparatus, the combination of the conveying-cable, a pulley and shaft revolved by the same, and a carrier-receiving drop-section connected with and adapted to be raised by said shaft, substantially as described.

2. In a store-service apparatus, the combination of a shaft driven by the conveying-cable, a drum loosely mounted on the shaft, a carrier-receiving drop-section, an elevator-cord connecting said section and drum, and means whereby the drum can be thrown in or out of gear with the shaft to raise the drop-section or allow the same to be lowered, substantially as described.

3. In a store-service apparatus, a receiving drop-section, in com-

409,098.

bination with a pivoted hooked lever or catch carried by the drop-section to hold a carrier on the same, a rock-shaft having an arm, and a spring to actuate the same in one direction, said arm adapted to be thrown back by the upward movement of the drop-section and then released to spring forward and detach the catch from the car, substantially as described.

4. In a store-service apparatus, the carrier-receiving drop-section provided with a catch to hold a carrier thereon and an arm to release the catch, in combination with a main track provided with a rod linked thereto and connected with said releasing-arm and adapted to be lifted by an engaging projection on a passing carrier, and thereby prevent said arm from releasing the carrier from said receiving-section, substantially as described.

5. The combination, with the carrier-receiving drop-track and a carrier-holding latch, of a latch-lifting arm, a rock-shaft, a locking-pawl to engage the rock-shaft, and a main track provided with a rod linked thereto, the linked rod adapted to be lifted by the engaging projection of a passing carrier, and thereby raise the pawl and lock the latch-lifting arm and prevent the release of a carrier on the receiving-section while another carrier is passing on the main track, substantially as described.

6. In a store-service apparatus, the combination of a track, a switch, a forked tumbler pivotally connected with the switch to throw the same, an armed lever pivoted on the track with one of its arms loosely located between the arms of the tumbler to swing the tumbler and lock the same, and a pivoted lever or arm connected with said armed lever and adapted to be operated by a passing car to throw the switch, substantially as described.

7. In a store-service apparatus, the combination of a two-rail main track, a two-rail side track, a pivoted two-rail section of the main track at the junction of main and side tracks movable to place the side and main tracks in continuity or insure continuity of main track, a horizontally-swinging lever between the rails of the track and connected with and adapted to swing said section, and a pair of levers connected with said horizontal lever to swing the same in opposite directions, and having extending arms to be engaged by passing carriers to throw said section in one direction or the other, substantially as described.

8. A store-service apparatus comprising a car provided with cable-grips, a conveying-cable, a main track above the cable, a side track, the main track being depressed below the cable near the junction of main and side tracks, for the purpose set forth, projections on the track on one side of said depression for opening the grip-jaws, and jaws or guides in the depression for closing the grip-jaws, substantially as described.

9. In a store-service apparatus, the combination of receiving drop-section a^4, tilting section a^5, and parallel links a^7, substantially as described.

10. In a store-service apparatus, the combination of receiving drop-section a^4, tilting section a^5, parallel links a^7, and supplemental links a^8, substantially as and for the purpose specified.

11. In a store-service apparatus, the combination, with the cable, of pulley f^4, shaft f^5, friction-clutch f^7 d^3, and drum d^2 and drop-section cord d^3, substantially as described.

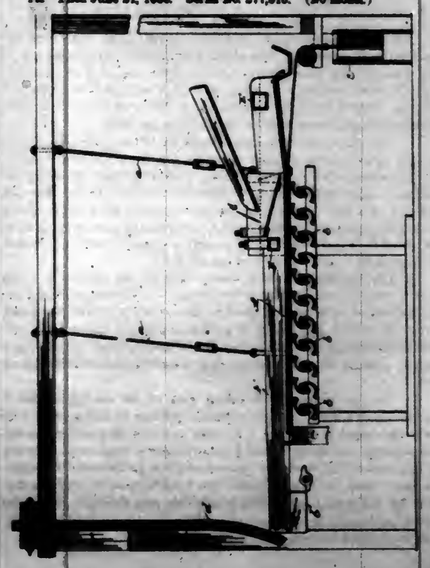
12. In combination with a car for store-service apparatus, the grip consisting of the holding-jaws k k' and the latch k^2, arranged and operating substantially as described.

13. In a store-service apparatus, the combination, with the conveying-cable and a shaft rotated by the same, of the carrier-elevator, a drum adapted to be rotated by said shaft, and elevator-cords connecting the shaft and drum, substantially as and for the purpose specified.

14. A store-service apparatus comprising a forwarding cable railway, a return cable railway, a station-track connected with the forwarding and return tracks and adapted to be placed in continuity with either of said tracks, and a receiving drop-track section, substantially as described.

15. A store-service apparatus comprising a forwarding-track, a return-track, a forwarding side track, a switch to throw the forwarding main and side tracks into continuity a return side track, a switch to throw the return main and side tracks into continuity, a receiving drop-track section, and another switch to throw said drop-track into continuity with either of said side tracks, substantially as described.

16. A store-service apparatus comprising the forwarding and return cable railways, a receiving drop-track, side tracks extending inwardly from the forwarding and return tracks to and connected with the receiving-track, and means whereby the receiving-track can be dropped from or raised to the plane of said side tracks, substantially as described.

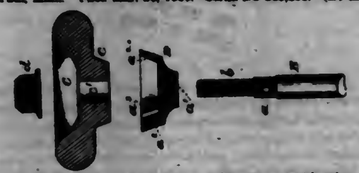


17. A store-service apparatus comprising a track, a receiving drop-track section, and a tilting-track section pivoted at one end to said track and at the other end to said drop-section, substantially as described.

18. A store-service apparatus comprising a track, a receiving drop-track section connected with said track, parallel pivoted supporting-links pivoted to said drop-track, and means for raising and lowering the drop-section, substantially as described.

19. A store-service apparatus comprising a forwarding and a return cable railway, a receiving drop-track section connected by side tracks with both the forwarding and return tracks, and a switch whereby the receiving-section is capable of being placed in continuity with either of said main tracks, substantially as described.

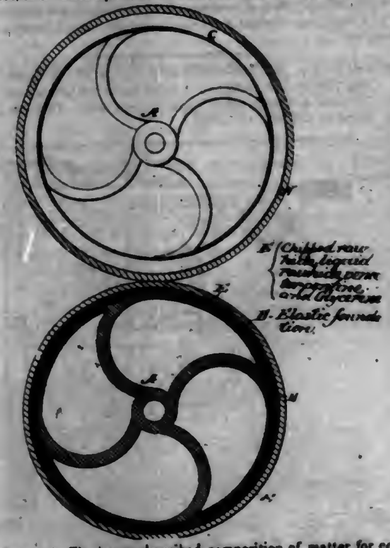
20. In a store-service apparatus, a track and a switch, in combination with a tumbler swinging in a vertical plane and located below, connected with and adapted to throw the switch, a three-armed lever pivoted to swing in a horizontal plane and having one arm engaging and adapted to swing the tumbler, and a pair of pivoted levers or arms connected, respectively, with opposite arms of said horizontal lever and adapted to be operated by passing carriers to throw the switch closed or open, substantially as described.



409,099. ORE-SEPARATOR. SAMUEL E. GRESSON, Philadelphia, Pa. Filed June 21, 1888. Serial No. 277,813. (No model.)

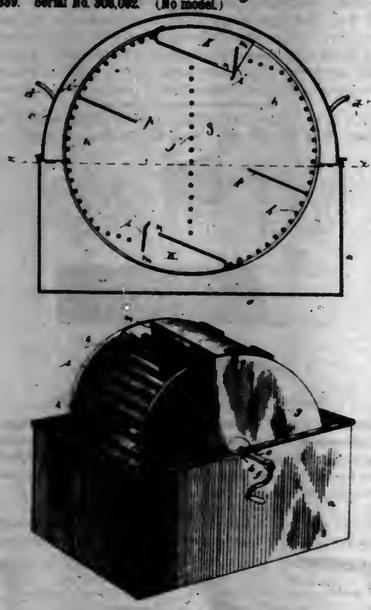
Claim.—1. An ore-concentrator comprising a bumping beam or beams, a table supported thereby, with a tailings-delivery at one end and an ore-delivery at the other, and means for imparting movement to said table, combined with a series of hammers or knockers arranged beneath the table, with means for imparting movement thereto to vibrate the said table and thereby assist in the separation, substantially as described.

2. An ore-concentrator comprising a suitable table, with an ore-delivery at one end and a tailings-delivery at the other, means for bumping said table to cause the ore to travel to the delivery end, and a series of hammers or knockers arranged beneath the table, with means for imparting movement thereto to vibrate said table and agitate the mass upon its surface, substantially as described.



409,100. VALVE FOR STEAM OR WATER. STEPHEN T. HALL, St. Paul, Minn. Filed Mar. 20, 1889. Serial No. 304,208. (No model.)

Claim.—1. In a steam or water valve, the combination of a threaded stem, a socket having an outwardly-flaring ferrule portion, a wooden handle provided with a central or hub part adapted to enter the ferrule, and a nut screwing upon the threaded portion of the stem to clamp the handle within the socket, substantially as described.



2. In a steam or water valve, the combination of a threaded stem, a socket having an outwardly-flaring ferrule portion provided with one or more internal ribs, a wooden handle having a central or hub portion adapted to enter the ferrule and with slits to fit the ribs thereof, and a nut screwing upon the threaded portion of the stem to clamp the handle within the socket, substantially as described.

409,101. COVERING FOR ROLLERS. CHARLES HALSTEAD, Providence, R. I. Filed Apr. 4, 1888. Serial No. 269,571. (No model.)

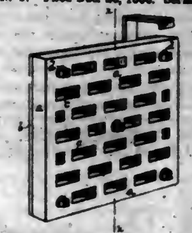
A
A
A

4. The electrical railway-conduit having the angle-iron frames H upon each side, the frames J, by which the surface-rails are supported, and the braces I, extending therefrom and passing between the angle-iron frames H, in combination with the brackets whereby the electrical conducting-rails are supported, and the bolts G, passing through said brackets and through the slot or space between the frames H, whereby a vertical adjustment of the brackets and rails may be had, substantially as herein described.

409,105. **WASHING-MACHINE.** BRAINARD KINGSLEY, Danville, Ill., assignor of one-half to John H. Swisher, same place. Filed Apr. 22, 1889. Serial No. 308,092. (No model.)

Claim.—1. In a washing-machine, the combination, with a boiler, of a cylindrical drum to rotate therein, comprising heads to which the supporting-gudgeons are secured, a series of rods secured to and extending between the heads and forming the periphery of the drum, a transverse partition dividing the drum into two compartments, buckets secured to the periphery of the drum and at opposite ends of said partition, and wings extending from head to head and projecting inwardly from the periphery toward the axis of the drum, substantially as described.

2. A washing-machine drum having a transverse partition dividing the drum into two compartments and water lifting and discharging buckets at opposite ends of the partition, one of said buckets being hinged to allow access to said compartments, substantially as described.



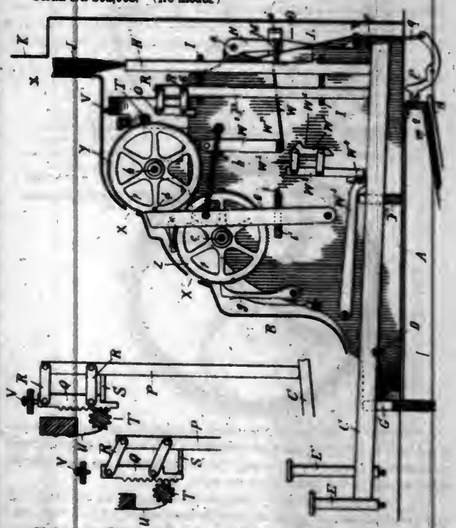
3. In a washing-machine, the combination, with a suds-box or boiler, of a cylindrical rotary clothes-drum therein, a central transverse partition in the drum dividing the same into two compartments, and buckets carried by the drum at opposite ends of the partition to pour and dash water upon the clothes on the partition as the drum revolves, substantially as described.

4. In a washing-machine, the combination of a rotary clothes-drum composed of heads and a periphery formed of longitudinal rods secured to the heads, a bucket secured to said periphery having a deflecting-plate at its open end forming an inlet and discharge opening, the rods forming the periphery of the drum at the inlet-opening to said bucket being located nearer the axis of the drum to allow free flow of the water into said bucket, substantially as described.

5. The combination, in a rotary clothes-drum, of the heads of the drum and a water lifting and discharging bucket consisting of an outer side secured to said heads, a corresponding inner side of less width than the outer side, and an inclined deflecting-plate extending across the open end of the bucket, and having its inner edge curved inwardly, and forming an induction-opening in the outer upper end of the bucket and a discharge-opening in the bottom thereof, substantially as described.

6. The combination, in a rotary clothes-drum, of the periphery of the drum, a central transverse partition dividing the drum into two compartments, said periphery having an opening at one end of the partition into both compartments, and a hinged water lifting and discharging bucket normally closing said opening and provided with a spring-catch to normally hold it closed, substantially as described.

409,106. **ELECTRODE FOR SECONDARY BATTERIES.** WILLIAM P. KOOKOGEY, Brooklyn, assignor to the Kookogey Electric Company, New York, N. Y. Filed Dec. 26, 1888. Serial No. 294,663. (No model.)



Claim.—1. In a secondary electric cell, as one of the elements or electrodes thereof, the combination of active material, a supporting-plate therefor having perforations to contain and support the active material, which supporting-plate consists of a substance not injuriously acted upon by the liquid, and has a low difference of potential with lead, and a conductor leading to the terminal of the cell and held in contact with the active material, substantially as and for the purpose described.

2. A plate for a storage-battery, consisting of the combination of a supporting-plate having perforations in which the active material is contained and supported, such plate being of a material which is not injuriously acted upon by the liquid and has a low difference of potential with lead, and a thin plate of lead fastened to the supporting-plate, substantially as and for the purpose described.

3. A plate for a storage-battery, consisting of a supporting-plate of wood, having perforations in which the active material is contained and supported, and a conducting-plate of lead fastened to such supporting-plate, substantially as and for the purpose described.

4. A plate for a storage-battery, consisting of a wooden plate *a*, having perforations *c* to contain and support the active material, and a thin lead plate *b* bolted thereto, substantially as and for the purpose described.

409,107. **CASH REGISTER AND INDICATOR.** WILLIAM G. LAFFER, Detroit, Mich., assignor, by direct and mesne assignments, to the Universal Automatic Cashier Company, same place. Filed Dec. 3, 1888. Serial No. 292,963. (No model.)

Claim.—1. The combination, with a series of levers, of a series of indicating supporting-rods, one upon each lever and carrying a series of indicating-tablets arranged in three groups, a series of registering supporting-rods, one for each lever, parallel with the indicating supporting-rods and resting upon the levers, and a series of registering-wheels actuated by those registering supporting-rods and divided into three groups, one pair in each group, substantially as described.

2. The combination, with the actuating-levers, of a series of indicating supporting-rods, each provided with a rearwardly-projecting stud or offset, a horizontal swinging cross-bar, upon which said studs are adapted to engage, the swinging knocker actuating such swinging cross-bar, the vertically-reciprocating striker actuating said knocker, and a rising and falling cross-bar supported on top of the levers to which said striker is secured.

3. The combination of a series of levers provided with a series of keys in two banks, representing three like groups and distinguished into three like groups of nine keys each, substantially as described, the series of supporting-rods, one for each lever, and vertically supported upon the extremity of the levers, a series of indicating-tablets secured to the upper ends of the supporting-rods and arranged in three groups corresponding to the groups of levers, with the tablets of each group in front of each other, and of three stationary zero-tablets correspondingly grouped above the indicating-tablets of the supporting-rods, substantially as described.

4. The combination, with a series of levers, of three groups of serrated registering-wheels, each containing one pair of wheels, of three serrated rollers journaled in axial line with each other, one for each pair of registering-wheels, and of a series of supporting-rods divided into three groups, one group for each roller, and of rack-pawls pivotally secured to the supporting-rods and adapted to operate the rollers by the actuation of the levers, substantially as described.

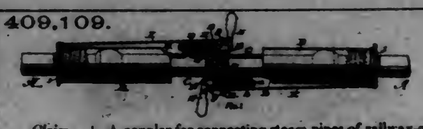
5. The combination, with a series of levers, of a series of indicating supporting-rods supported near the extremities of each levers and provided upon their upper ends with hinged rack-pawls, a series of three transverse serrated rollers adapted to be operated by those rack-pawls, three groups of serrated registering-wheels in pairs, one pair of each group engaging with one of the serrated rollers, respectively, and the other one of each group being provided with an oscillating feed-pawl operated by a stud on its actuating registering-wheel, substantially as described.

6. The combination, with a series of levers, of two series of supporting-rods supported in vertical guides upon the extremities of those levers, one series of rods being provided with indicating-tablets and the other series of rods carrying rack-pawls to actuate the registering device, substantially as described.

7. As an improvement in actuating devices in cash registers and indicators, the combination, with the levers and supporting-rods carrying the indicating-tablets, of the swinging cross-bar M, the lugs L on the supporting-bars adapted to engage thereon, the cross-bar W^7 of the swinging knocker, the striker W', having an inclined head, and the shoulder W^6, the supporting-rods W^5, to which the strike is hinged, the cross-bar W^4, carrying the supporting-rod W^3 and being vertically-movably supported on top of the levers by the arms W^2, substantially as described.

8. As an improvement in actuating devices in cash registers and indicators, the combination of the levers and registering-wheels, the registering-rods P, the rack-pawls Q, hinged thereto in parallel relation by the links R, and the support S, substantially as described.

9. As an improvement in actuating devices in cash registers and indicators, in combination with the levers and registering-wheels, the registering supporting-rods P, the rack-pawls Q, pivotally hinged thereto in parallel relation by the links R, the support S, and the set-screws V, substantially as described.



409,108. **NIPPLE-HOLDING CHUCK.** THOMAS R. LEMERTON, Erie, Pa., assignor to the Jarecki Manufacturing Company, (Limited,) same place. Filed May 31, 1889. Serial No. 312,673. (No model.)

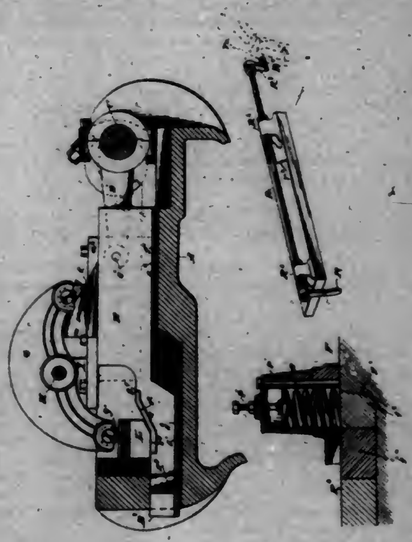
Claim.—In a nipple-holding chuck, the combination, with the body A, having a longitudinal chamber A' therein, of pivoted nipper-levers B B, arranged within said chamber and having their ends protruding therefrom at both ends, and a sliding sleeve D, which embraces said body A and acts upon the said protruding ends of the nipper-levers as it is moved one way or the other and thereby opens or closes the said nippers.

409,109. **DETACHABLE COUPLER FOR CONNECTING SUPPLY-PIPES OF STEAM-HEATING APPARATUS FOR RAILWAY-CARS.** JOHN LOFTUS, Albany, N. Y., assignor of one-half to Ezra W. Smith, same place. Filed Feb. 15, 1889. Serial No. 299,906. (No model.)

409,109.

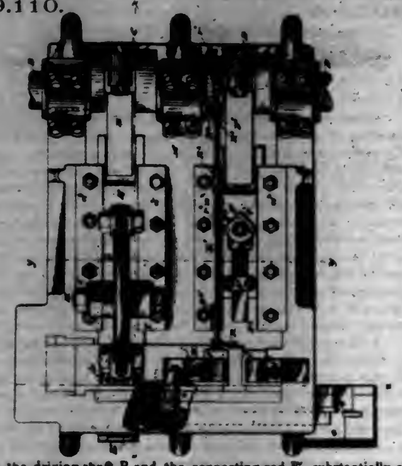
Claim.—1. A coupler for connecting steam-pipes of railway-cars, consisting of an open-ended cylinder that is connected to said steam-pipe and contains a sliding joint provided with a spherical enlargement fitted to slide in the bore of said cylinder, a sleeve, provided with a cup-shaped flange, which fits upon the convex surface of said spherical enlargement, a packing contained in the annular space formed by said sleeve and the bore of said cylinder, a packing-gland fitted to slide freely in said cylinder and to bear upon said packing, a spring bearing upon said gland for the purpose of compressing said packing and to force said sliding joint outwardly in said cylinder, a packing-seat secured to the outer end of said sliding joint and provided with a locking device, whereby a pair of said couplers can be mutually secured together, as and for the purpose herein specified.

2. In a detachable coupler for connecting the steam-heating pipes of railway-cars, the combination of an open-ended stationary cylinder that is connected to the steam-supply pipe and has a notch formed in the side of its open end, a sliding joint provided with a spherical enlargement which is fitted to slide in said cylinder and has at its outer end a lever-locking device which is connected by check-chain to a stationary part of the pipes or car, a sleeve provided with a cup-shaped seat, which is fitted to receive the spherical enlargement of the sliding joint, a packing-gland fitted to compress the packing in the annular space between said sleeve and the bore of the stationary cylinder, and a spring which bears upon said gland to force the sliding joint outwardly, said check-chain being arranged to produce a disengagement of said locking device and to deflect said sliding joint laterally into the notch of the stationary cylinder, as and for the purpose herein specified.



409,110. **BOLT HEADING AND FORGING MACHINE.** MICHEL D. LOMBIS and DANIEL S. COE, Cleveland, Ohio, assignors to the Acme Machinery Company, same place. Filed Mar. 15, 1889. Serial No. 303,476. (No model.)

Claim.—1. The combination, in a bolt heading and forging machine, of the toggle-block L and toggles M and M' with the incline e^2 and the plane surfaces e^1 and e^3 on the sliding bar E, substantially as and for the purpose set forth.



2. The combination, in a bolt heading and forging machine, of the toggle-block L and toggles M and M', and the rock-arm G, with the sliding bar E, having inclines e and e^2 and the plane surfaces e^1 and e^3, substantially as set forth.

3. The combination, in a bolt heading and forging machine, of the sliding bar E, having the incline e^2 and plane surfaces e^1 and e^3, with the toggle-block L and toggles M and M', and movable die-block K, substantially as set forth.

4. The combination, in a bolt heading and forging machine, of the sliding bar E, having the incline e^2 and plane surfaces e^1 and e^3.

409,110.

with the driving-shaft B and the connecting-rod E, substantially as shown.

5. The combination, in a bolt heading and forging machine, of the toggle-block L and toggles M and M', loose block N, and movable die-block K with the sliding bar E, provided with the incline e^4 and plane surfaces e^5 and e^6, substantially as set forth.

6. The combination of the sliding bar E, provided with the inclines e and e^3 and the plane surfaces e^5 and e^6, with the toggle-block L and toggles M and M', substantially as shown.

7. The combination of the sliding bar E, provided with the inclines e and e^3 and the plane surfaces e^5 and e^6, with the toggle-block and toggles, and movable die-block K, substantially as shown.

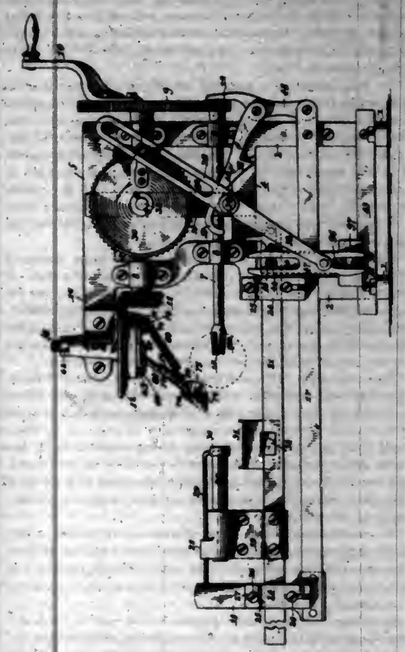
8. The combination of the heading-bar F with the wedge f^2, interposed between said bar and the incline f^3, the incline f^4, the spring P, and means for supporting the spring, substantially as shown.

9. The combination of the wedge f^2, the incline f^3, the spring P, and the heading-bar F with the sliding bar E, having inclines and plane surfaces upon its upper side, substantially as shown.

10. The stock-gage mechanism consisting of the arm R, the rod R', the arm R^2, the disk r', having on its face the cam r, and the spring r^2, substantially as set forth.

11. The side cutting device consisting of the cutting-bar O, the incline e^2 on the sliding bar E, and means for returning said cutting-bar, substantially as shown.

12. The combination, in a bolt heading and forging machine, of the side cutting device consisting of the cutting-bar O, and the incline e^2 on the sliding bar E, with said sliding bar, the movable die-block K, and the toggle-block L and toggles M and M', substantially as shown.



13. The combination, in a bolt heading and forging machine, of the stock-gage mechanism, consisting of the arm R, the rod R', the arm R^2, the disk r', provided with the cam r, and the spring r^2, with the side cutting device consisting of the cutting-bar O, the incline e^2 on the sliding bar E, and means for returning said cutting-bar, substantially as shown.

14. The combination, in a heading and forging machine, substantially as shown, of the following parts: the sliding bar E, provided with inclines and plane surfaces on its upper face, the toggle-block L and toggles M and M', the loose block N, the movable block K, the heading-bar, the wedge f^2, interposed between the said heading-bar and the incline f^3, the spring P, and the rocking arm G, substantially as shown.

15. The combination, substantially as shown, of the following parts: the sliding bar E, provided with inclines and plane surfaces on its upper face, the toggle-block L and toggles M and M', the loose block N, the movable block K, the heading-bar, the wedge f^2, interposed between said heading-bar and the incline f^3, the spring P, the rocking arm G, and the stock-gage, consisting of the arm R, the rod R', the arm R^2, the disk r', with cam r on its face, and the spring r^2.

16. The combination, substantially as shown, of the sliding bar E, provided with inclines and plane surfaces on its upper face and the incline e^2 on its side, the toggle-block L and toggles M and M', the loose block N, the heading-bar F, the wedge f^2, interposed between said heading-bar and the incline f^3, the rocking arm G, the stock-gage arm R, the rod R', the arm R^2, the disk r', with cam r on its face, the spring r^2, the cutting-bar O, attached to the front bed-plate and operated by means of the incline e^2 on the sliding bar E, and means for returning said cutting-bar.

409,111. PARING AND CORING MACHINE. SAMUEL LYON, Pattonsville, N. Y. Filed Jan. 21, 1889. Serial No. 297,021. (No model.)

Claim.—1. In a paring and coring machine, the combination, with the main frame, the turn-table carrying the paring-knife, the fork-shaft, gearing for connecting the turn-table and fork-shaft, and a wheel gearing with the fork-shaft and provided with a projection, of the slide carrying the coring-tube, and a lever connected thereto pivoted on the frame and provided with a slot in which the projection on the gear operates to reciprocate said slide in opposite directions alternately, substantially as described.

2. The combination, with the slide, of the rotating gear having the wrist-pin, the pivoted lever having the slot in which the pin operates, and the cross-head mounted on the lever and connected to the slide by the slot-and-pin connection, substantially as described.

3. The combination, with the slide having the two pins thereon, of the rotating gear having the wrist-pin, the pivoted lever having the slot in which the pin operates, and the cross-head mounted on the lever and having the slots with which the pins on the slide co-operate, substantially as described.

4. The combination, with main frame, the slide-bar having the arm 96, and the guideway for the end of the latter, of the rotating gear having the pin, and the pivoted lever having the slot in which the pin operates connected to the slide, substantially as described.

5. The combination, with the main frame having the way 43, on which the slide operates, the bar secured to the frame, and the casting at the outer end of the latter having a projection thereon, of the slide and the adjustable plates 24, co-operating with the way on the main frame, and the projection on the casting forming guides for the slide, substantially as described.

6. The combination, with the main frame, the bar 17, connected thereto, and the casting at the end of the bar, having the projection, of the slide and the plate 24, secured to the casting, one portion co-operating with the projection on the casting to form a bearing for the slide and another clamping the bar 17 and casting together, substantially as described.

7. The combination, with the main frame, the bar 17, connected thereto, and the casting at the end of the bar having the projection, of the slide and the slotted plate 24, and screws for securing it to the casting, one portion co-operating with the projection on the casting to form a bearing for the slide and another projecting over and clamping the bar 17 and casting together, substantially as described.

8. The combination, with the slide, the bracket on the slide having the two lugs thereon, and the coring-tube attached to the bracket, of the fruit-doffer consisting of a rod and a sleeve encircling the tube, the doffer-rod resting between the lugs on the bracket, a projection which the doffer-rod strikes to operate it, and the fruit-fork, substantially as described.

9. The combination, with the fruit-fork, the slide located below the fork, and a coring-tube located thereon, of the fruit-chute mounted on said slide, substantially as described.

10. The combination, with the fruit-fork, the slide, and a coring-tube located thereon, of the fruit chute or incline having the depending arms adapted to embrace the said slide, substantially as described.

11. The combination, with the fruit-fork, the slide, and a coring device thereon, of the fruit-chute having the arms adapted to removably engage the slide and hold the chute thereon in position to receive the fruit from the fork, substantially as described.

12. The combination, with the main frame, the fruit-fork, and core-doffer rod operating between the tines of the fork, the pivoted lever operating the doffer, and the latch connected to the lever and having a projection thereon, of the reciprocating slide having a projection for co-operating with the one on the latch, substantially as described.

13. The combination, with the main frame, the fruit-fork, and core-doffer operating between the tines of the fork, the pivoted lever operating the doffer, and the latch connected thereto having a projection, of the reciprocating slide having a projection for co-operating with the one on the latch, and a projection on the main frame operating to lift the latch out of engagement with the slide, substantially as described.

14. The combination, with the turn-table, the pivoted knife-arm, and the knife-head loosely mounted thereon, of a spring connected to the knife-head, and a series of points on the turn-table, to any of which the other end of the spring may be connected to vary the angle of the knife relative to the arm, substantially as described.

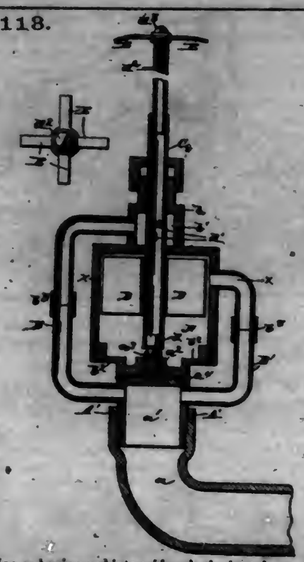
15. The combination, with the main frame, the overhanging portion formed with the portion of the cam thereon, the co-operating casting forming the other part of the cam, the bolt between said parts, and the turn-table mounted on the bolt, of the knife-arm pivoted on the turn-table and engaging the cam, and the fork-shaft, substantially as described.

16. The combination, with the fruit-fork, the turn-table, and the knife-arm pivoted thereon, of the wedge secured upon the inner side of the arm and adapted to engage the turn-table and limit the inward movement of the knife-arm.

409,112. GLASS OR PORCELAIN LINED METAL T-PIECE OR ELBOW FOR PIPES. ROBERT MORAFF, London, England, assignor, by direct and mesne assignments, to James Kemp Welch, same place. Filed Feb. 6, 1889. Serial No. 298,822. (No model.) Patented in England Mar. 15, 1887, No. 3,907.

Claim.—1. A lined T-piece consisting of a glass part A, pieces of tube C D E placed on glass and fitting together and permanently secured by molten metal G, cast round, and cement I, substantially as described.

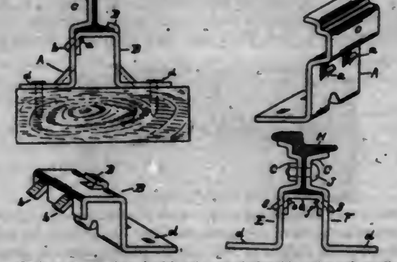
2. A lined elbow-piece consisting of an inside glass part, pieces of tube placed on the glass having one end arranged to fit close together and permanently secured by molten metal G, cast round, and cement I, substantially as described.



409,113. BOTTLE-WASHER. PETER F. MCCARTY and ROBERT SEYFER, Corning, N. Y.; said Seyfer assignor to said McCarty. Filed Aug. 24, 1888. Serial No. 283,675. (No model.)

Claim.—1. As an improvement in bottle-washers, the housing or boxing having an upper water-supply chamber, the water-pipes opening, respectively, into said chamber and said housing or boxing, the jet-tube having an upper apertured end provided with rubber arms, and a series of apertures in said chamber, and a wheel secured on said tube within said housing or chamber, substantially as set forth.

2. The herein-described improved bottle-washer, comprising the housing or boxing having the upper and lower necks, the water-supply pipes connected to said lower neck, and opening, respectively, into



409,118.

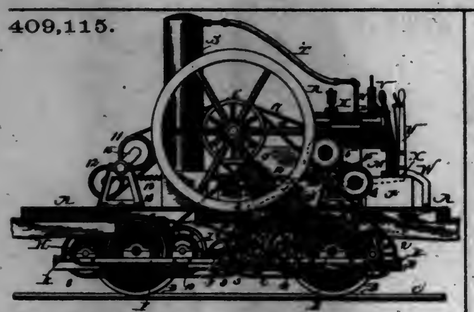
said housing or boxing and into said neck, the jet-tube passing through and extending above said chamber and provided with apertures d^3 d^3, the wheel secured to said tube, and the rubber arms attached to the upper end of said jet-tube, substantially as shown and described.

409,114. INTERLOCKING BRACE-CHAIR FOR RAILROAD-RAILS. PATRICK O'CONNELL, Johnstown, Pa., assignor to the Johnson Company, same place. Filed Apr. 22, 1889. Serial No. 308,196. (No model.)

Claim.—1. An interlocking brace-chair of box form for railroad-rails, having a rail-seat provided with lugs to interlock the parts of the chair and clamp the rail to the chair, substantially as set forth.

2. A two-part chair of box form for railroad-rails, provided with a rail-seat secured to the two parts or sides of the chair by interlocking lugs, substantially as set forth.

3. A two-part brace-chair of box form for railroad-rails, provided with a rail-seat secured to the two parts or sides of the chair by interlocking lugs and by bolts to the rails of the track, substantially as set forth.



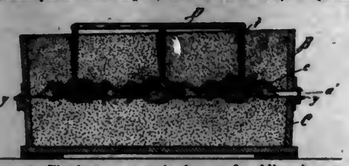
409,115. MOTOR FOR STREET-CARS. WILLIAM H. PATTON, Englewood, Ill., assignor to the Patton Motor Company, Preble, Colo. Filed Feb. 26, 1889. Serial No. 301,008. (No model.)

Claim.—1. In a street-car motor constructed substantially as described, the combination of two systems of driving-gear connected with separate axles or trucks adapted to propel the motor-car at different rates of speed and in either direction from either axle by a single engine, substantially as specified.

2. The sub-frame D, in combination with the sliding frames E and F, each carrying separate driving-pulleys of a different size, substantially as described.

3. The combination of the rope or belt 17, wheels 1, 2, 3, and 4, and sliding frame E with the crank-shaft Q, rope or belt 18, and wheels 7, 8, 9, and 10, and sliding frame F, whereby the motive power may be operated continuously in one direction and the car moved in either direction with varying rates of speed, substantially as specified.

409,115.

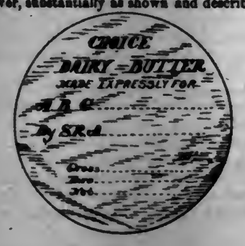


4. The rock-shaft *e*, having the arms *d f*, one or more link-rods *g*, and sliding frame F, with the link-rod X and hand-lever U, substantially as specified.

409,116. MOTOR FOR STREET-CARS. WILLIAM H. PATTON, Englewood, Ill., assignor to the Patton Motor Company, Pueblo, Colo. Filed Feb. 25, 1889. Serial No. 301,004. (No model.)

Claim.—The combination, with the engine or motive power of a motor-car for street-cars, of a dynamo E, a storage-battery F, an electric motor G, conductors *e*, *f*, *g*, and *h*, and a gearing, substantially as set forth, for driving the wheels of a car from the electric motor, substantially as and for the purpose set forth.

409,117. PROCESS OF MOLDING SHEAVES. EDWARD RILEY, Milwaukee, Wis., assignor of one-half to the Milwaukee Harvester Company, same place. Filed May 11, 1888. Serial No. 310,671. (No model.)



Claim.—1. The improvement in the art of molding sheaves which consists in making a forced supplemental parting after the mold has been set up for the purpose of removing the patterns from the mold.

2. The improvement in the art of molding a gate of split sheave-patterns which consists in detaining the removable part of the patterns after the mold has been set up, while the cope and drag are separated sufficiently to cause the mold to part around the patterns, the external concavity of the sheaves retaining part of the mold, thus forming a forced supplemental parting for the purpose of removing the patterns.

409,118. CRATE. SHERMAN G. SEAMAN, Clinton, Iowa. Filed Apr. 19, 1889. Serial No. 307,747. (No model.)

Claim.—1. A box having corner-pieces extending less than its entire depth, a platform adapted to rest upon the corner-pieces and having cross-pieces on the upper and lower surfaces of the platform, and similar cross-pieces on the bottom of the box and on the inner surface of its cover, substantially as shown and described.

409,118.

2. In combination with a box having corner-pieces extending less than the entire depth and cross-pieces arranged at right angles on the inner surface of its cover and of its bottom, a platform having similar cross-pieces secured to both of its surfaces and adapted to fit within the box and to be supported by said corner-pieces, and packing-cases adapted to rest above and below the platform and be supported by the same and the bottom of the box within the angles of the cross-bars, substantially as specified.

409,119. LOCK. CARL J. A. STORERS, Rockaway, N. J. Filed May 29, 1888. Serial No. 275,449. (Model.)

Claim.—1. In a lock, the combination of a key-plate provided with a bolt, a body-plate for attachment of the lock, and a flat spring back plate having a projection adapted to press upon the key-plate and snap upon either edge of it to hold it in its extreme positions.

2. The combination of a body-plate, a flat key-plate having two curved bolts pointing in opposite directions, and a flat spring back plate adapted to press upon said key-plate and hold it in position to the body-plate, and provided with a projection adapted to press against said key-plate and retain it in position when the bolts are shot.

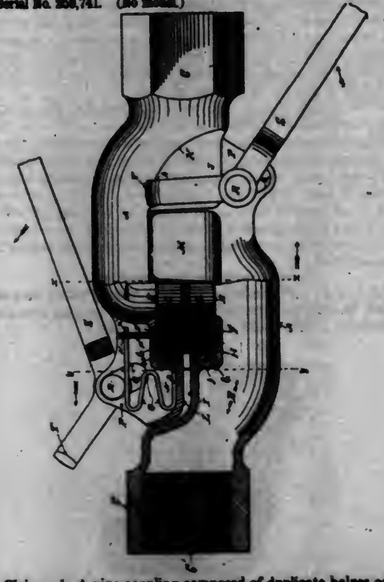
3. In a lock, the combination of a body and a back plate, a flat key-plate guided by said main and back plate, provided with recesses or edges, a bolt operated directly by said key-plate, and means, substantially as described, to lock said key-plate and hold the bolt in its shot or unshot positions, consisting of projections upon said back plate adapted to engage in the recesses or over the edges of said key-plate.

4. In a lock, the combination of a key-plate provided with a bolt, a body-plate for attachment of the lock, a flat spring back plate, and a projection upon one of said parts adapted to press upon the adjacent part and hold the key-plate in its extreme positions.

409,120. PIPE-CONNECTION FOR CARS. RICHARD H. SOULE, Pittsburg, Pa., assignor to the Standard Car Heating and Ventilating Company, same place. Filed Apr. 15, 1889. Serial No. 307,340. (No model.)

Claim.—1. The combination of a section of hose or flexible tubing having suitable abutments or shoulders and a spring under compression interposed between said abutments, substantially as set forth.

2. The combination of a section of flexible tubing having suitable abutments or shoulders and a spring under compression interposed between said abutments and surrounding the tubing, substantially as set forth.



3. The combination, in a pipe-connection, of an expansible joint,

409,120.

a section of flexible tubing provided with abutments or shoulders, and a spring under compression interposed between said abutments, substantially as set forth.

409,121. PIPE-COUPLING. JOHN C. STUNKARD, Erie, Pa., assignor of one-fourth to Samuel A. Davenport, same place. Filed Jan. 3, 1889. Serial No. 295,741. (No model.)

Claim.—1. A pipe-coupling composed of duplicate halves or sections, each half consisting of a shell adapted to be secured to a pipe or hose and having a longitudinal coupling-face and a lateral passage opening therein, annular packing around said opening, and flanges projecting laterally from the periphery of the outer end or half of the coupling-face adapted to engage with flanges or lugs on a duplicate half or section of the coupling, and lever and cam mechanism for securing the halves or sections of the coupling together, substantially as and for the purpose set forth.

2. A pipe-coupling composed of duplicate halves or sections, each half consisting of a shell adapted to be secured to a pipe or hose, a longitudinal-coupling-face having a lateral opening therein and annular packing around said opening, a pocket or slot at one side of the coupling-face, and a projection at the opposite side thereof, adapted to enter a pocket or slot in a duplicate half or section of the coupling, and lever mechanism on each half or section adapted to engage with cam-surfaces on duplicate halves or sections for securing the coupling together, substantially as and for the purpose set forth.

3. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections having a passage opening laterally through a longitudinal coupling-face on one side of the half or section and annular packing in said face around said opening, of a pocket or slot having cam-faces on the outer sides thereof at one side of the coupling-face, and a projection at the opposite side of said coupling-face, adapted to enter a pocket or slot in a duplicate half or section of the coupling, with a locking-lever having hooks thereon adapted to engage with the cam-surfaces on a duplicate half of the coupling, and a spring under the axis of said locking-lever, substantially as and for the purpose set forth.

4. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections having a passage opening laterally through a longitudinal coupling-face, of a projection at one side of said opening, with a locking-lever mounted in slotted ears at the sides of said projection and adapted to engage with cam-surfaces on a duplicate half or section of the coupling, and a spring secured to the back of said projection under the axis of said locking-lever, substantially as and for the purpose set forth.

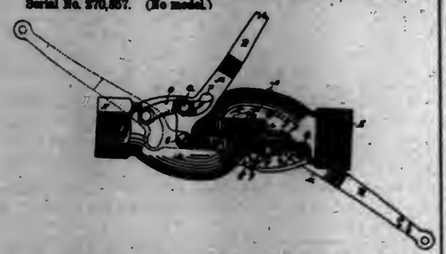
5. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of a shell having a passage opening laterally through a longitudinal coupling-face and annular packing around said opening, with laterally-projecting flanges or lugs adapted to engage with the periphery of the coupling-face on a duplicate half or section of the coupling, so as to prevent the halves of the coupling from being drawn apart longitudinally, substantially as and for the purpose set forth.

6. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of a shell having longitudinal coupling-faces, a passage opening laterally through said coupling-face, and annular packing in said coupling-face, around said opening, with flanges forming a slot or pocket at one side of the coupling-face and a projection at its opposite side adapted to enter a like pocket or slot in a duplicate half or section of the coupling, and flanges or lugs extending laterally from the sides of the coupling-face, substantially as and for the purpose set forth.

7. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, each having a passage adapted at one end to be secured to a pipe and at the other opening laterally through a longitudinal coupling-face, of cam-surfaces at one side of said coupling-face, with a locking-lever at the opposite side of the coupling-face adapted to engage with the cam-surfaces on a duplicate half or section of the coupling for securing the two halves of the coupling together, substantially as and for the purpose set forth.

8. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of a longitudinal coupling-face D, a passage B, having a lateral opening E in said coupling-face, and annular packing H in the coupling-face around the opening E, with laterally-projecting flanges or lugs M on the periphery of the outer end or half of the coupling-face D, adapted to engage with flanges or lugs on a duplicate half or section of the coupling, substantially as and for the purpose set forth.

9. The combination, in each half or section of a pipe-coupling consisting of duplicate halves or sections having longitudinal coupling-faces adapted to be placed together and separated on a line at right angles to the coupling-faces thereof, of a shell A, having a longitudinal coupling-face D, a passage B, a lateral opening E through said coupling-face, and annular packing H in the coupling-face around the opening E, with a slot or pocket I at one side of the coupling-face D and a projection L at its opposite side, and flanges M M, projecting laterally from the periphery of the outer end or half of the coupling-face D, substantially as and for the purpose set forth.



10. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of a shell A, having a collar C at one end thereof, and a passage B, having a lateral opening E through the coupling-face D, and an annular packing-shell G, containing packing H, surrounding the opening E, with the pocket or slot I, having cam-surfaces K *k* thereon at one side of the coupling-face, and the projection L, having the locking-lever S T mounted thereon at the opposite side of the coupling-face, substantially as and for the purpose set forth.

11. The combination, in a half or section of a pipe-coupling composed of duplicate halves or sections, of the longitudinal coupling-face D and the lateral passage-opening E therein, the pocket or slot I, the projecting end L, and the laterally-projecting flanges or lugs M, with the locking-lever S and spring O, for securing duplicate halves or sections together, substantially as and for the purpose set forth.

12. The combination, in a half or section of a pipe-coupling composed of duplicate halves or sections, of the longitudinal coupling-face D, having the lateral passage-opening E and the annular packing H therein, the pocket or slot I, having the cam-surfaces K thereon, the projection L, adapted to enter the pocket or slot I in a duplicate half or section of a coupling, and the lateral flanges or lugs M, with the locking-lever S, mounted in the slots Q and adapted to engage with the cams K, and a spring O under the axis of said locking-lever, substantially as and for the purpose set forth.

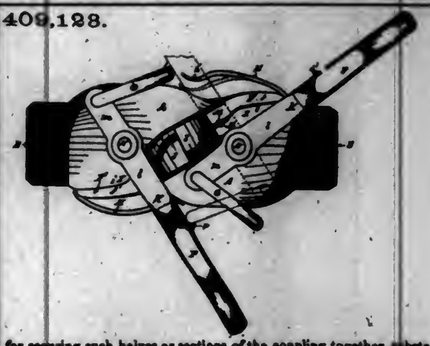
13. The combination, in a half or section of a pipe-coupling composed of duplicate halves or sections, of a longitudinal coupling-face having cam-surfaces K at one side thereof, with a spring O and locking-lever S on the opposite side resting upon said spring, and adapted to engage with like cam-surfaces K on a duplicate half or section for securing the sections of the coupling together, substantially as and for the purpose set forth.

409,122. PIPE-COUPLING. JOHN C. STURGEON, Erie, Pa., assignor of one-fourth to Samuel A. Davenport, same place. Filed Apr. 16, 1888. Serial No. 270,857. (No model.)

Claim.—1. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of a lever pivoted to each half or section at one side of the coupling-face, with a spring secured to such half or section at the opposite side of the coupling-face, so that when the two halves or sections of the coupling are brought together the lever on each half or section may be moved around to engage with the spring on the duplicate half or section, so as to secure the sections of the coupling together, substantially as and for the purpose set forth.

2. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections adapted to be coupled together, of a sliding bolt operating sidewise in cam-shaped slots and a slotted lever actuating said sliding bolt in said slots, with spring mechanism on another part of such half or section, whereby the sliding-bolt mechanism of each half engages with the spring mechanism of the corresponding half of the coupling for securing the halves of the coupling together, substantially as and for the purpose set forth.

3. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections adapted to be coupled together, of a locking-lever having cam-shaped slots therein, with a sliding bolt operating in the slots in said lever, substantially as and for the purpose set forth.



4. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of ears N N, having slots O therein, with the forked lever R, having the slots D therein, and the sliding bolt Q, substantially as and for the purpose set forth.

5. The combination, in each half or section of a pipe-coupling composed of duplicate halves or sections, of the pocket or slot L and the sides N N thereof, having slots O therein, the slotted lever R, and sliding bolt Q, with the projection K and spring mechanism F thereon, substantially as and for the purpose set forth.

409,123. PIPE OR HOSE COUPLING. JOHN C. STURGEON, Erie, Pa., assignor of one-fourth to Samuel A. Davenport, same place. Filed Aug. 4, 1888. Serial No. 282,004. (No model.)

Claim.—1. The combination, in each half or section of a pipe or hose coupling composed of duplicate halves or sections, of a shell having a diagonal coupling-face and laterally-projecting flanges on the periphery of the outer end or portion of said coupling-face adapted to engage with like flanges on a duplicate half or section of the coupling and prevent them from being drawn apart longitudinally, with lever mechanism on each half adapted to be moved around so as to engage with a projection on a duplicate half or section of the coupling

409,128.

for securing such halves or sections of the coupling together, substantially as and for the purpose set forth.

2. The combination, in each half or section of a pipe or hose coupling composed of duplicate halves or sections, of a lever pivoted to such half or section at one side of the coupling-face, with a curved leaf-spring secured to a projection of such half or section at the opposite side of the coupling-face within the path of the lever pivoted to a duplicate half or section when the two halves or sections of the coupling are brought together, so that the lever on each half or section may be moved around so as to engage with the spring on the duplicate half or section of the coupling, substantially as and for the purpose set forth.

3. The combination, in each half or section of a pipe or hose coupling composed of duplicate halves or sections, of a shell having diagonal coupling-face and a projection at one side of the coupling-face and a spring mounted therein, with a pocket at the opposite side of the coupling-face adapted to receive the projection on a duplicate half or section of the coupling, and a lever pivoted to such half or section adapted to be moved around so as to engage with the spring on a duplicate half or section of the coupling when two such halves or sections of the coupling are placed together, substantially as and for the purpose set forth.

4. The combination, in a pipe-coupling composed of duplicate halves or sections, of a locking-lever on each half or section adapted to be moved around so as to engage with a duplicate half or section when two halves or sections are coupled together, with a link pivoted to the locking-lever on each half or section and adapted to be moved around into contact with the locking-lever of a duplicate half or section when the two halves or sections of a coupling are locked together, substantially as and for the purpose set forth.

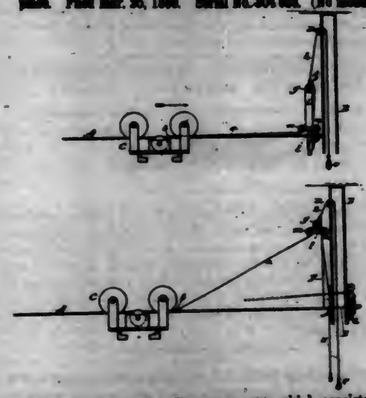
5. The combination, in each half or section of a pipe or hose coupling composed of duplicate halves or sections, of a hollow shell A, having a diagonal coupling-face E and laterally-projecting flanges J thereon and a longitudinal projection F at one side of the coupling-face E and a pocket I at the other, with a spring H, mounted in said projection F, and a forked lever K, mounted in the shell A below the pocket I and adapted to be moved around so as to engage with a spring H on a duplicate half or section of the coupling when two sections of the coupling are placed together, substantially as and for the purpose set forth.

409,124. BALL-AND-SOCKET PIPE-JOINT. JOHN C. STURGEON, Erie, Pa., assignor of one-fourth to Samuel A. Davenport, same place. Filed Oct. 1, 1888. Serial No. 286,897. (No model.)

Claim.—1. The combination, in a flexible ball-and-socket pipe-joint, of a socket a portion of which has parallel hemispherical outer and inner surfaces, and a hollow semi-spherical ball seated and operating on the inner hemispherical surface of said socket, and having a hollow stem projecting out through an opening in the central portion of said hemispherical socket, with a semi-spherical cap having an

opening therein fitting loosely over the said stem and operating on the outer hemispherical surface of said socket, and a spring on said stem operating between a collar thereon and the outer end of said socket, adapted to automatically retain the semi-spherical ball on the inner end of the stem in close contact with the inner surface of the socket and the semi-spherical cap in like close contact with the outer surface of the socket, whereby a tight, dust-proof, flexible ball-and-socket joint not affected by the expansion and contraction of the parts thereof is secured, substantially as and for the purpose set forth.

2. The combination, in a ball-and-socket pipe-joint, of a socket a portion of which is hemispherical, a hollow semi-spherical ball having a hollow stem thereon and operating in the hemispherical portion of said socket, and an inlet-pipe projecting down into the chamber in said semi-spherical ball, with a loose socket operating over the stem of said ball and adapted to partially embrace the outer surface of the hemispherical portion of the socket in which said ball operates, and a spiral spring operating between a collar on said socket and a collar on the stem of the ball, substantially as and for the purpose set forth.



3. The combination, in a ball-and-socket pipe-joint, of a hemispherical socket portion B and a hollow semi-spherical ball F, having a hollow stem G thereon and operating in said socket-section B, with a loose sleeve K, covering the hollow ball-stem G outside of the socket B, and having a socket L thereon partially embracing and operating against the outside of the socket B, and a spiral spring M, operating between a collar on said sleeve-socket and a collar on the outer end of the stem G, substantially as and for the purpose set forth.

4. The combination, in a ball-and-socket pipe-joint, of the right-angled inlet-pipe E, having an extension *b* reaching down into the hollow ball F, and the socket-section B, with the half-ball F operating in said socket, the loose sleeve-socket K, operating on the ball-sleeve G and against the outside of the socket-section B, the elbow H, and the spring operating between the shoulder K on said socket-sleeve and the shoulder A on said elbow H, substantially as and for the purpose set forth.

409,125. CASH-CARRIER. MORRIS C. SUMNEY, New Haven, Conn., assignor to the Acme Cash Railway Corporation, same place. Filed Oct. 15, 1888. Serial No. 288,094. (No model.)

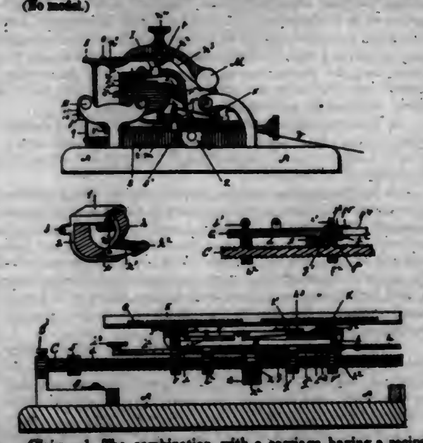
Claim.—In cash-carrier apparatus, the combination of a wire track having a gradually-increasing transverse area as it approaches its termination, with a car having wheels above the track, a wheel below the track, and bearings for the axle of the latter wheel, provided with longitudinal slots, all substantially as described.

409,126. STORE-SERVICE APPARATUS. MORRIS C. SUMNEY, New Haven, Conn., assignor to the Acme Cash Railway Corporation, same place. Filed Mar. 26, 1888. Serial No. 304,093. (No model.)

Claim.—1. In a cash-railway apparatus which consists of a track composed of a wire, with a car suspended from wheels upon the track, the combination therewith of a cord *a*, attached by one end to the track at a point distant from the station and upon which the wheels of the car may run as it approaches the station, the other end of the said cord attached at the station, the said cord being of greater length than the distance between its two points of attachment, a suspended pulley *g*, over which the said cord *a* runs between its two points of attachment, a cord *h*, running from said suspended pulley over a pulley above and thence down to convenient reach for the hand, and a weight applied to the cord *a* between the said pulley *g* and the points where the cord *a* is attached, said weight adapted to embrace the two runs of the cord *a* below the said pulley *g*, substantially as and for the purpose described.

2. In a cash-railway apparatus, the combination of the wire track A, the upright B, from which the track extends, a carriage D, arranged to run vertically on said upright, that end of the track being secured to said carriage, a cord *a*, attached by one end to the track at the upright and by the other end at a point *b* distant from said upright, a cord *h*, running over a pulley above, one end extending downward and carrying a pulley over which the said cord *a* passes, the other end of the cord extending down and provided with convenient means for pulling upon said cord, the said cord *h* having an extension F in connection with said track at the upright, substantially as and for the purpose described.

409,127. PIPE-COUPLING. WILLIAM T. TAGGART, Pittsburg, Pa., assignor to the Standard Car Heating and Ventilating Company, same place. Filed Jan. 10, 1888. Serial No. 260,926. (No model.)



Claim.—1. In a pair of couplings having lateral openings, the combination of engaging-hooks formed on each member, one of the hooks on each member being rigid and the other hook constructed to have a spring or yielding engagement with the rigid hook of the other member, the resilience of the spring being at right angles to the faces of the couplings, substantially as set forth.

2. In a pair of couplings having lateral openings, the combination of engaging-hooks formed on each member, one of the hooks on each member being formed of spring-leaf and re-enforcing springs, substantially as set forth.

3. In a pair of couplings having lateral openings, said openings being surrounded by an unyielding packing, the combination of engaging-hooks formed on each member, one of said hooks being constructed to exert a yielding pressure, substantially as set forth.

409,128. TYPE-WRITING MACHINE. CHARLES R. THURBER, Worcester, Mass., assignor, by mesne assignments, to the Thurber Manufacturing Company, Portland, Me. Filed Dec. 19, 1884. Serial No. 150,777. (No model.)

Claim.—1. The combination, with a carriage having a reciprocating motion in a right line and elastic type-bars attached to said carriage, of a carriage capable of an intermittent motion, a hammer *p'*, notched bar I, pivoted on the carriage, having an intermittent motion, key M, attached to said type-bar carriage, and arm *p*, attached to said key, substantially as described.

2. The combination, with the stationary rod D and type-bar car-

riage having a reciprocating motion on said rod, of elastic type-bars N', types *m*, attached to said elastic bars, key M, pivoted pointer *n'*, arm *p*, hammer *p'*, notched bar I, and index-plate E, having spurs *o*, substantially as described.

3. The combination, with the type-bar carriage carrying elastic type-bars N' and key M, of a hammer-carriage having an intermittent motion, hammer *p'*, notched bar I, provided with arms I' I², pivoted on the hammer-carriage, projection *b*, lever J, and spring *c*, and an escapement mechanism, substantially as described, and operated by the lever J, substantially as described.

4. The combination, with a carriage having a rocking motion about a horizontal axis and having a series of type-bars attached thereto, of a key M, hammer *p'*, notched bar I, arm *p*, attached to the key M, blade *s* on hammer *p'*, curved swinging plate *r*, spring r^3, pivoted arms *r'*, ink-roll r^4, and inking-plate *t*, substantially as described.

5. The combination, with a type-bar carriage having a rocking motion about a horizontal axis, of elastic type-bars N', types *m* on the under side of the free ends of said bars, key M, arm *p*, hammer-carriage carrying a hammer *p'* and a notched bar I, blade *s* on said hammer, swinging plate *r*, arms *r'*, carrying roll r^2, and spring r^3, by which the roll r^2 is carried beneath the type-bars, said blade *s*, swinging plate *r*, roll r^2, and types *m* being all relatively so arranged that the rocking motion of the type-bar carriage carries the types *m* into the path of the roll r^2 prior to the rearward motion of said roll over the types *m* as actuated by the blade *s* upon said swinging plate *r*, whereby the tension of the elastic type-bars is caused to press the types upon the roll *r*, substantially as described.

6. The combination, with a type-bar carriage having a horizontal reciprocating motion and a hammer-carriage having an intermittent reciprocating motion, of key M, carried by the type-bar carriage, arm *p*, and pivoted pointer *n'*, index-plate E, and notched bar I, carried by the hammer-carriage and having notches corresponding with the characters upon said index-plate, substantially as described.

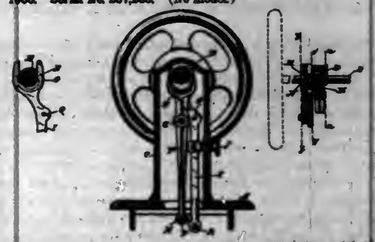
7. The combination, with an index-plate E, having V-shaped teeth, and an arm or key M, having its end *n* resting against the under side of the index-plate, of a finger or pointer pivoted to said arm or key and having the end of its longer arm *n'* resting on the upper side of the index-plate, and a spring attached to the arm or key and pressing against the shorter arm of the pivoted finger, substantially as described.

8. The combination, with the hammer-carriage carrying a hammer *p'* and notched bar I, having arms I' I², of the projection *b*, lever J, spring *c*, plunger *b'*, ring f^3, plunger *f'*, spring *g*, and notched rod C, said rod being capable of being reversed or turned in its bearings, and having notches on opposite sides, of varying spaces, substantially as described.

9. In a type-writing machine, the combination, with a carriage carrying a hammer pivoted thereto and adapted to press the type upon the platen, and a notched bar or rod, and mechanism, substantially as described, by which said carriage is moved along the notched bar or rod, of an "escapement" consisting of a lever pivoted on said carriage, plungers connected to the ends of the lever and sliding in ways, so as to be alternately connected with and disconnected from the notched bar or rod by the action of the lever, one of said plungers being carried in a sliding block actuated by a spring, whereby it is carried along the notched bar or rod independently of the carriage, together with mechanism for actuating the lever as each letter is printed, substantially as described.

10. The combination, with the carriage of a type-writing machine having motive power connected therewith, of the pivoted lever J, spring *c*, plungers *b'* and *f'*, sliding ring f^3, spring *g'*, and notched bar C, substantially as described.

11. In a type-writing machine, the combination, with a hammer-lever carriage, of an escapement consisting of a lever having plungers connected with its ends and engaging a rack bar or rod, one of said plungers having a sliding motion along the rack bar or rod independently of the other, said plunger being slotted at its connection with the lever, substantially as described, and a lever K, adapted to lift said slotted plunger independently of the action of the lever, whereby both plungers may be disengaged from the rack-bar, substantially as described.



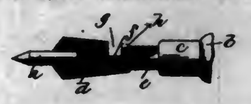
12. In a type-writing machine, the combination, with a hammer-lever carriage having a ring f^3, sliding in a slot f^4 of lever J, and carrying a plunger *f'* and screw g^3, of a spacing-lever i^3, pivoted by the arms *i* and *i'*, and having a spur i^4 and a spring *j*, whose tension is applied to raise the lever i^3, substantially as described.

13. In a type-writing machine, the combination, with a platen to receive the impression of the type, of a feed-roll and a plate with its surface tangential to the surface of said feed-roll and also parallel with said platen, and a spring whose tension is applied to said plate to press it against said feed-roll, substantially as described.

14. In a type-writing machine, the combination, with a platen to receive the impression of the type and a feeding-roll at the side of and parallel with said platen, of a plate held by the frame of the machine upon the side of the feeding-roll opposite said platen, the under surface of said plate presenting a plane surface in tangential contact with the feeding-roll and substantially parallel with said platen and exerting a yielding pressure upon said roll, whereby the paper is held from curling or rolling as it passes beneath said plate, substantially as described.

15. In a type-writing machine, the combination, with a hammer-lever carriage having an intermittent or stepping motion, of a blade 11, placed obliquely to the line of motion of said carriage, a bell-hammer supported upon a spring 9 and provided with an oblique blade 10, and a bell attached to the frame-work of the machine, substantially as described.

409,129. FEED-OPERATING MECHANISM FOR SEWING-MACHINES. JAMES TRIPP, New York, N. Y., assignor to CHARLES S. Scofield and FRANK M. Scofield, both of Greenwich, Conn. Filed Oct. 5, 1883. Serial No. 257,283. (No model.)



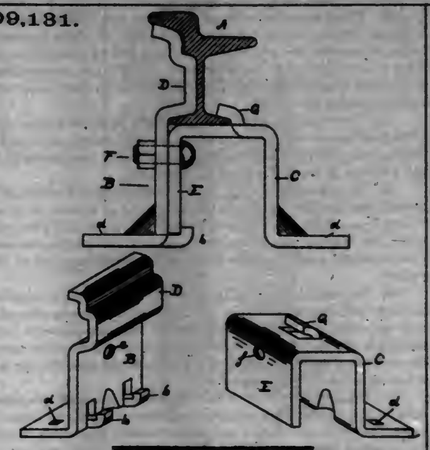
Claim.—1. In a sewing-machine, the combination, with the main shaft, the feed-bar, the horizontal feed-bar lever mounted on a universal joint, and the vertical feed-bar lever, with the fulcrum through which it reciprocates, of two cams upon the main shaft, one engaging a fork on the vertical feed-bar lever and one engaging a yoke pivotally attached to said lever, substantially as and for the purpose set forth.

2. In a sewing-machine, the combination, with the main shaft, the feed-bar, the horizontal feed-bar lever mounted on a universal joint, and the vertical feed-bar lever supported upon and reciprocating through a vertically-adjustable fulcrum, of two cams upon the main shaft, a fork upon the vertical feed-lever engaging one of said cams and a yoke engaging the other of said cams and pivoted to said lever, substantially as and for the purpose set forth.

3. In a sewing-machine, the combination, with the main shaft, of two cams thereon operating the fork of a vertical feed-lever and a link pivotally attached to said lever, and a fulcrum through which the lever reciprocates, with a feed-bar and a horizontal feed-bar lever K, supported in a fork T, having a pivotal stem S, substantially as and for the purpose set forth.

4. In combination, the feed-bar L and the feed-lever K and its pivotally-supporting fork S T, the vertical feed-lever having a vertically-adjustable fulcrum through which it reciprocates, and the main shaft having two cams thereon, one engaged by a fork on the vertical feed-lever and the other inclosed by a link pivotally attached to said lever, substantially as and for the purpose set forth.

409,130. CENTERING-AWL. LAWRENCE VAN ALSTYNE, Sharon, Conn. Filed Mar. 28, 1889. Serial No. 305,142. (No model.)



Claim.—The described tool, consisting of a handle, a pointed shank embedded therein, said shank having a portion of its periphery cut away or flattened to form a shoulder, a covering-cap on the outer end of said shank, and a spring interposed between the face of said cap and the handle of the tool, said cap having a slot cut through its periphery to form a bridge-piece A, which acts in connection with the shoulder on the shank to limit the outward movement of the cap, substantially as described.

409,131. BRACE-CHAIR FOR RAILROAD-RAILS. JOHN R. WHITTEREEN, Johnstown, Pa., assignor to the Johnson Company, same place. Filed Apr. 22, 1889. Serial No. 308,094. (No model.)

Claim.—1. A two-part brace-chair of box form for railroad-rails, provided with lugs, as G *b*.

2. A two-part brace-chair of box form for railroad-rails, provided with lugs, as G *b*, the two parts secured together by a bolt, substantially as set forth.

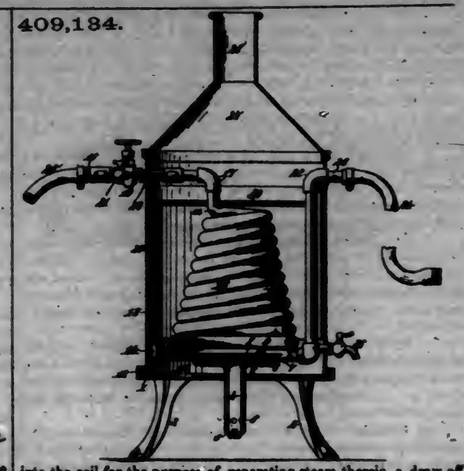
409,131.

409,132. BUTTON OR BADGE. STEPHEN C. WILCOX, Dubuque, Iowa, assignor of one-half to Abram V. Richards. Filed Aug. 18, 1887. Renewed July 9, 1889. Serial No. 316,994. (No model.)

Claim.—The combination of the cap A, formed with the opening A' and provided with the rim A", having inwardly-bent lips *a*, the base-plate C, formed with notches adapted to pass over said lips and having its margin gradually increased in thickness from said notches in one direction, and a layer of colored material B lying between the base-plate and the inner face of the cap, substantially as and for the purpose set forth.

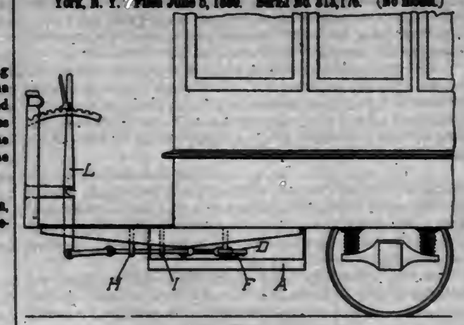
409,133. PLANT-PROTECTOR. CORA M. YARBROUGH, Durham, N. C., assignor to James H. Lyons, same place. Filed Feb. 26, 1889. Serial No. 301,109. (No model.)

Claim.—1. In a plant-protector, the combination, with a two-sided metallic spring-frame provided on its opposite sides or arms with inwardly-facing holding-jaws, of a segmental shield having its opposite edges secured between the holding-jaws, substantially as described.

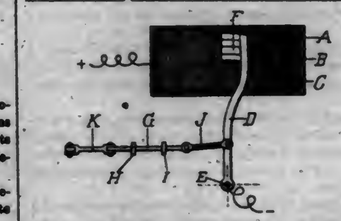


2. The combination, in a plant-protector, of the two-sided metallic spring-frame, the inwardly-facing jaws secured to the opposite side of the frame, and the pliable or elastic shield secured between the jaws within the frame, substantially as and for the purpose described.

409,134. WATER COIL BOILER. RUFUS W. APPLEGARTH and EVERETT D. MOORE, Baltimore, Md. Filed May 11, 1886. Serial No. 310,208. (No model.)



Claim.—1. The combination of a shell or casing having air-inlets near the bottom, a water-heating and steam-generating coil supported in said casing, and a valved inlet-pipe communicating with the upper end of said coil and adapted to admit thereto either a large or small stream of water, the lower leg of said coil being extended upward within the casing and adapted at its upper end for attachment of a flexible hose, substantially as described.



2. The combination of a shell or casing having air-inlets near the bottom, a Bunsen burner located in the lower part of said shell, a water-heating and steam-generating coil supported in the shell or casing with its lower portion in position to be acted on by the diverging flame-jets of the Bunsen burner, a valved inlet-pipe communicating with the upper end of the coil for the purpose of introducing water to flood the same, said inlet-pipe provided with a by-pass having a petty valve to control the introduction of a small stream of water into the coil for the purpose of generating steam therein, a draw-off cock located in the lower part of the coil, and an outlet-pipe extending from the lower end of the coil, substantially as described.

409,134.

409,135. ELECTRICAL RESISTANCE. EDWARD M. BENTLEY, New York, N. Y. Filed June 5, 1889. Serial No. 313,176. (No model.)

Claim.—1. The combination, with an electrically-propelled vehicle, of a controlling-resistance therefor carried upon the vehicle, consisting of a series of plates connected to one another, the containing box or holder for the plates being set horizontally, and a pivoted contact-arm moving in a horizontal plane and passing over the plates to bring more or less of them into circuit.

2. The combination, with an electrically-propelled vehicle and a resistance-box composed of a series of plates in contact with one another, of a pivoted arm adapted to pass over the plates and bring more or less of them into circuit, and an actuating device for the said contact-arm moving in a straight line and operated from an accessible part of the vehicle.

3. The combination, with an electrically-propelled vehicle, and a resistance-box thereon placed horizontally and composed of a number of iron or steel plates in connection with one another, of a contact-arm movable in a horizontal plane, and a direct-moving actuating device connected with the said arm.

4. The combination, with an electrically-propelled vehicle, and a resistance-box thereon placed horizontally and composed of a number of iron or steel plates in connection with one another, of a contact-arm movable in a horizontal plane, and a direct-moving actuating device connected with the said arm.

5. The combination, with an electrically-propelled vehicle, of a regulating-resistance therefor, consisting of a series of plates in contact with one another and placed horizontally with a pivoted contact-arm, and an actuating device for the said arm movable in a direct line.

6. The combination, with an electrically-propelled vehicle, of a horizontal resistance-box controlling the same, a pivoted contact-arm for said box, and connections therefrom leading to the platform of the vehicle and movable in a straight line.

7. The combination, with an electrically-propelled vehicle, of a horizontal resistance-box controlling the same, a pivoted contact-arm therefor, and a longitudinally-moving contact device connected to the said contact-arm and extending to an accessible point of the vehicle, with a lever or similar operating device therefor.

8. In an electrical resistance, the combination, with an electrically-propelled vehicle and a series of plates in connection with one another, of a contact-arm adapted to pass over the said plates, and an actuating device for the said contact-arm extending to an accessible part of the vehicle and attached to the contact-arm, but insulated therefrom.

9. The combination, in an electrical resistance, of a series of plates in connection with one another, a pivoted contact-arm adapted to bring more or less of the plates into circuit, and a longitudinally-moving device for actuating the said contact-arm, connected therewith and insulated therefrom.

10. The combination, with an electrically-propelled vehicle, of a controlling-resistance therefor, consisting of a series of plates connected to one another, a pivoted contact-arm therefor, and an actuating device for the said arm, connected therewith, but insulated therefrom and extending to the platform or a similar accessible part of the vehicle.

11. The combination, with an electrically-propelled vehicle, of a controlling-resistance therefor, composed of a series of plates, a pivoted contact-arm therefor moving in a horizontal plane, and a longitudinal actuating device for the said arm, insulated therefrom and leading to the platform or other accessible part of the vehicle.

12. The combination, with an electrically-propelled vehicle, of a resistance therefor consisting of a series of plates suspended beneath the body of the vehicle, a pivoted contact-arm, a longitudinal actuating device attached to the said arm, and a handle for operating the same extending vertically to an accessible part of the body of the vehicle.

13. The combination, with an electrically-propelled vehicle, of a resistance composed of a series of plates placed horizontally beneath the body of the vehicle, a longitudinally-moving rod or similar actuating device for the resistance, said an upright handle or similar actuating device extending above the floor of the vehicle for operating the resistance.

14. The combination, in an electrically-propelled vehicle, of a plate-resistance therefor beneath the body of the vehicle, a pivoted contact-arm therefor, an upright handle on the platform of the vehicle, and a jointed or flexible connection between the said handle and contact-arm.

15. The combination, in an electrically-propelled vehicle, of a plate-resistance therefor beneath the body of the vehicle, a horizontal actuating device therefor, and an upright handle connected therewith for moving the same.

16. The combination, in an electrically-propelled vehicle, of a resistance therefor consisting of a series of plates beneath the body of the vehicle, a contact device therefor, an actuating-handle on the platform of the vehicle, and an intermediate connection insulated from the said contact device.

17. The combination, in an electrically-propelled vehicle, of a plate-resistance therefor, a contact-arm for the said resistance, the said arm forming a movable electric connection for bringing more or less of the plates into circuit, an actuating device on the platform or other accessible part of the vehicle, and an intermediate insulated connection, whereby the said actuating device forms no part of the electric circuit.

18. The combination, with an electrically-propelled vehicle, of a resistance consisting of a horizontal series of upright plates beneath the vehicle, an operating device therefor consisting of a contact-arm or traveler between the plates and the floor of the vehicle movable over the series of plates, and a manual connection extending therefrom to the platform or operating point of the vehicle.

19. The combination, with an electrical resistance composed of a series of metallic plates in contact with one another, of an arm or traveler movable along the series of plates and provided with an offsetting sliding spring contact-piece bearing on the edges of the plates, an electrically-propelled vehicle, and an actuating device for the contact-arm extending to an accessible part of the vehicle.

20. The combination, with an electrically-propelled vehicle and a controlling plate-resistance therefor, of a contact piece passing over the edges of the plates, and an operating-lever therefor on the platform or controlling-point of the vehicle.

21. The combination, with an electrically-propelled vehicle, of a resistance for the motor, consisting of a series of plates in contact with one another, the said resistance being located beneath the vehicle at an intermediate point between its ends, and a controlling-connection therefor extending longitudinally to the platform or controlling-point of the vehicle.

22. The combination, with an electrically-propelled vehicle, of a plate-resistance for the motor, having a movable contact-piece, and a mechanical connection from said piece extending longitudinally to the platform or controlling-point of the vehicle.

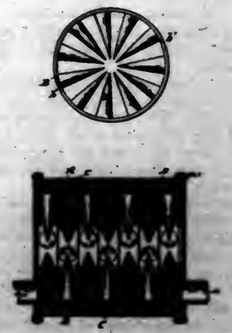
23. The combination, with an electrically-propelled vehicle, of a controlling-resistance for the motor, consisting of a series of plates having exposed edges and located beneath the vehicle, and a contact-piece, also beneath the vehicle, provided with an operating-connection extending upward to the platform or controlling-point of the vehicle.

24. The combination, with a series of resistance-plates beneath an electrically-propelled vehicle, of a centered contact-arm sweeping over the edges of the plates, a longitudinal operating-connection extending to the platform or controlling-point of the vehicle, and means for converting the longitudinal movement of said connection into the rotary movement of the contact-arm.

25. The combination, with the motor of an electrically-propelled vehicle, of a controlling resistance consisting of a series of plates in connection with one another and placed beneath the vehicle, a centered contact-piece movable over the edges of the plates, and an operating-connection for said contact-piece, extending up to the platform or controlling-point of the vehicle.

26. The combination, with an electrically-propelled vehicle and a controlling-resistance therefor, of a contact-piece moving over the contact-surface of the resistance, and a metallic operating device extending to the platform or controlling-point of the vehicle, but insulated from the said contact-piece.

27. The combination of an electrically-propelled vehicle and a controlling-resistance therefor, consisting of a series of resistance-plates with a sliding spring contact-piece so arranged as to trail over the said plates when resistance is being cut into circuit, whereby danger of losing control of the car by the catching of the contacts is avoided.

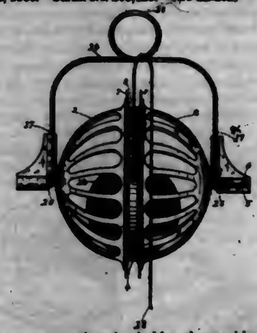


28. The combination of an electrically-propelled vehicle and a controlling-resistance beneath the car, consisting of a series of plates with a contact-arm and a sliding spring contact-piece offset from said arm toward the terminal of the resistance, and an actuating device for said arm extending to the platform or accessible part of the car, whereby the said contact-piece trails over the edges of the plates when resistance is being cut into the motor-circuit to stop the car, as described.

29. The combination, with an electrically-propelled vehicle, of a controlling-resistance at an intermediate point between the ends of the vehicle, a horizontal pivoted contact-arm, and a laterally-movable operating-connection attached to said contact-arm at a point to one side of its pivot and extending to the end of the vehicle.

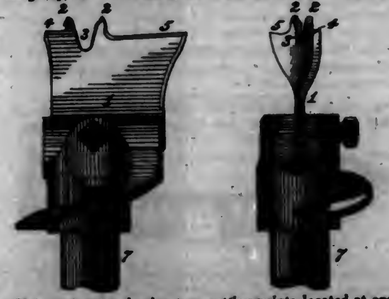
409,186. MEANS FOR PREVENTING INCRUSTATION IN STEAM-BOILERS. SAMUEL G. CAMELL, Washington, D. C. Filed June 20, 1888. Serial No. 315,567. (No model.)

Claim.—1. The combination of a hollow vessel or conduit made up of a plurality of sections having interposed non-magnetic rings and a plurality of magnetic points or projections extending into and across the space within the walls of said vessel, substantially as described.



2. The combination of a hollow vessel and a plurality of rings, each carrying a plurality of magnetic points extending into and across the space within the rings, substantially as described.

409,186.



409,187. AUTOMATIC TWINE-HOLDER. WILLIAM H. CARSON, Buffalo, N. Y., assignor to himself and George S. Thorne, same place. Filed Jan. 2, 1889. Serial No. 295,125. (No model.)

Claim.—In an automatic twine-holder, the combination of a holding-case formed in two halves adapted to fit together and leave a groove surrounding them to receive the surplus twine, two steep-pitched screw-bearings rigidly secured to each half of the case, a spring-ball having a screw on each lower end of the ball-arms adapted to receive the screw-bearings, so they can turn therein and move the ends of the ball-arms to or from the case, and perforations through the bottom of the surrounding groove, through which the twine is passed, substantially as described.

409,188. CUTTER FOR MINING-MACHINES. EDWIN E. CARTER, Allegheny, Pa. Filed June 6, 1889. Serial No. 313,151. (No model.)

Claim.—A cutter having two cutting-points located at opposite sides of a central recess, a preliminary lateral cutting-lip located in a plane below one of said cutting-points, and a supplemental lateral cutting-lip located on the opposite side of the axis of the cutter, with its outer end in a plane below that of the preliminary cutting-lip and at a greater distance from the axis than the outer end of said preliminary lip, and extending to the base of the adjacent cutting-point wholly below the plane of its outer end, substantially as set forth.

409,189. FABRIC-TURFING IMPLEMENT. MARTIN L. CORBETT, Bellefontaine, Ohio, assignor, by mesne assignments, to Matthew F. Cornett and John Hale Hicks, both of Kansas City, Mo. Filed Aug. 16, 1888. Serial No. 282,843. (No model.)

Claim.—1. In a fabric-turfing implement in which a needle-bar is operated to reciprocate a threaded needle through a fabric, the combination, with the needle-bar, of a clamp for the thread between the thread-supply and the eye of the needle, connected with and movable with the needle-bar, and operating by the reciprocation thereof alternately to lock and unlock the thread in the progress of the latter to the eye of the needle, substantially as described.

2. In a fabric-turfing implement in which a needle-bar is operated to reciprocate a threaded needle through a fabric, a clamp for the thread upon and movable with the needle-bar, and a handle upon the needle-bar connected with the clamp and having limited play independent of the needle-bar to open and close the clamp, whereby movement of the handle to advance the needle-bar first opens the clamp and unlocks the thread, and movement of the handle to withdraw the needle-bar first closes the clamp and locks the thread, substantially as described.

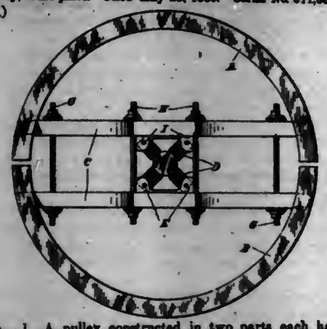
3. In a fabric-turfing implement, the combination, with the holder, of a reciprocating needle-bar carrying toward one end a block G, provided with a needle-socket *g*, a slot *p*, and an eye *e*, and a stirrup K, movable in the slot *p* and connected with a handle A, substantially as described.

4. In a fabric-turfing implement, the combination, with the holder, of a reciprocating needle-bar carrying toward one end a pivotal block G, provided with a needle-socket *g*, a slot *p*, and an eye *e*, and a spring-stirrup K, movable in the slot *p* and bearing against the pivotal block G, substantially as described.

5. In a fabric-turfing implement, the combination, with the holder C and presser-foot E, of a reciprocating needle-bar within the holder carrying toward one end a pivotal block G, provided with a needle-socket *g*, a slot *p*, and an eye *e*, and a spring-stirrup K within the holder, having a handle at one end and bearing toward its opposite end against the pivotal block G, with its extremity in the slot *p*, in which it has limited play to clamp and release alternately a thread in the eye *e*, substantially as described.

6. In a fabric-turfing implement, the combination, with the holder C and presser-foot E, of a channeled reciprocating needle-bar B within the holder, carrying toward one end a pivotal block G, provided with a needle-socket *g*, a slot *p*, and an eye *e*, and a spring-stirrup K within the channel of the needle-bar and provided at one end with a handle A, and extending at the other end into the slot *p* and bearing against the block G, and of such length as to have limited play within the slot, whereby it clamps the thread when the needle is withdrawn and releases it as the needle is advanced, substantially as described.

7. In a fabric-turfing implement, the combination, with the holder C, reciprocating needle-bar B, provided toward its upper extremity with notches *t* and carrying at its opposite end a needle, and locking mechanism to clamp the thread when the needle is withdrawn, and release it when the needle is advanced, of a friction-spring D, interposed between the holder and needle-bar and provided with a head affording a stop D′ and catch *f* to enter the notches *t*, substantially as described.



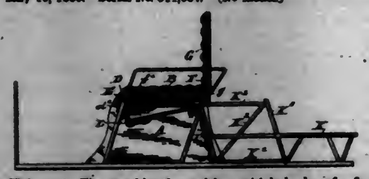
8. In a fabric-turfing implement, the combination, with the holder C and presser-foot E, of a channeled reciprocating needle-bar B within the holder, provided with a recess at one end and a stop I adjacent to the recess, a block G, pivoted to the needle-bar, provided with a needle-socket *g*, a slot *p*, and an eye *e*, and a spring-stirrup K within the channel of the needle-bar and provided at one end with a handle A, and extending at the other end into the slot *p* and bearing against the block G, and of such length as to have limited play within the slot, whereby it clamps the thread when the needle is withdrawn and releases it as the needle is advanced, substantially as described.

9. In a fabric-turfing implement, the combination, with the holder C, presser-foot E, and channeled reciprocating needle-bar B, carrying toward one end a pivotal block G, provided with a needle-socket *g*, a slot *p*, and an eye *e*, of a curved spring-stirrup K, extending through the channel of a needle-bar and bearing against opposite

sides of its casing to provide a spring toward one end which bears against the block G, and extending at its extremity into the slot *p*, and provided at its opposite end with a handle A, the stirrup being of such length as to have limited play within the slot, whereby it clamps the thread when the needle is withdrawn and releases it as the needle is advanced, substantially as described.

10. A fabric-tarring implement comprising, in combination, a holder C, carrying a presser-foot E, a channeled reciprocating needle-bar B within the holder, having a stop I toward one end and notches *f* toward its opposite end, and carrying a pivotal block G, provided with a needle-socket *q*, a slot *p*, and an eye *o*, a spring-stirrup K within the channel of the needle-bar and bearing against opposite sides of its casing, provided at one end with a handle A, and extending at the other end into the slot *p* and bearing against the block G, the stirrup being of such length as to have limited play within the slot, whereby it clamps the thread when the needle is withdrawn and releases it as the needle is advanced, substantially as described.

409,140. SPLIT PULLEY. JOHN R. CORNWALL and HERMAN A. BARNARD, Moline, Ill., assignors to the Barnard & Leas Manufacturing Company, same place. Filed May 23, 1889. Serial No. 311,631. (No model.)



Claim.—1. A pulley constructed in two parts, each having a main cross-arm, intermediate clamping-blocks, and bolts whereby the parts of the pulley are held together and the blocks caused to clamp against the shaft, substantially as specified.

2. The combination, in a split pulley, of the main cross-arms extending from side to side of each part, the bolts for clamping the arms together, the clamping-blocks located between the said arms and the clamping-bolts, whereby the clamping-blocks may be caused to clamp the shaft, substantially as specified.

3. The combination, in a split pulley having its parts held together by bolts passing through the cross-arms thereof, of the clamp-blocks secured to said arms, the said blocks being made of sufficient length to admit of shortening to fit shafts of varying diameters, substantially as and for the purpose specified.

4. The combination, in a split pulley, of the halves thereof, having cross-arms securely fastened therein, clamp-boxes secured to said arms, clamp-blocks having bearings in said arms, and bolts passing through the cross-bars, whereby the parts of the pulley are held together and firmly clamped to the shaft, substantially as specified.

409,141. JUMP-SEAT VEHICLE. FRANCIS G. DAVIS, Watertown, N. Y., assignor to the H. H. Babcock Buggy Company, same place. Filed May 16, 1889. Serial No. 311,037. (No model.)

Claim.—1. The combination, with a vehicle-body, of a front seat hinged to the front of said body and a rear seat and back also independently hinged to the front of said body, whereby said front and rear seat may be independently raised to a vertical or nearly vertical position, substantially as described.

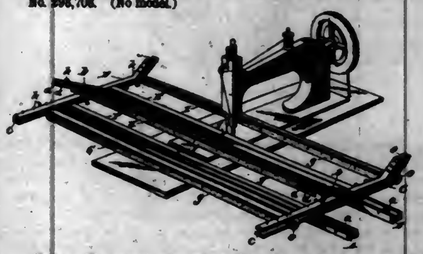
2. In combination with a vehicle-body, the hinge D, composed of the straps *b' d'* and the arm E, the hinge F connected to said arm, the front seats connected to the straps *b'*, the straps *d'* bolted to the body, and the rear seat and back G, secured to the hinges F, substantially as and for the purpose described.

3. The combination, with the vehicle-body, of the front and rear seat and back G, hinged independently to the front of the body, the hinge F, to which said seat G is also hinged, and the rear seat I, hinged to the vehicle at the rear of the body, whereby when the front seat and seat G are raised and turned up the said rear seat I may be turned under the front seat, substantially as described.

4. The rear seat I, in combination with a supporting-frame composed of front uprights K', rear uprights K^2, and bottom pieces K^3, and the railing K, to which the uprights K' are hinged, while the rear uprights rest on the bottom of the vehicle, and the lazy-back L, rigidly secured to the seat I, substantially as described.

5. In combination with the body, the rear seat and back G, hinged to the front of the body, and the rear seat I, provided with the frame-work K' K^2 K^3, whereby when the said seat G is lowered to a horizontal position and the rear seat L is folded within the body the seat G will be supported on said frame-work, substantially as described.

6. In combination with the vehicle-body, the front seat hinged to the front of said body, the rear seat and back G, also hinged to the front of the said body, and the lazy-back secured to the front end of said rear seat and back G, substantially as described.



409,142. CLAMP-FILE. ALEXANDER DOE, Mount Healthy, Ohio. Filed June 17, 1889. Serial No. 314,615. (No model.)

Claim.—1. In combination with the clamp-board and clamp, the latter having the side lugs and central rearward projection integral therewith, the spring-support connected to said clamp-board and so bent as to form a base-support and journal-bearings for the clamp-shaft, the latter passing through the coiled portions of said spring, the ends of said spring bearing against the under face of the extension of the clamp, substantially as set forth.

2. A file consisting of a clamp-board E, clamp A, the latter having the side lugs *a a*, and rearward projection *a'*, having the grooves a^2 a^3 therein, in combination with the spring-support consisting of a base D, coiled bearings *d d*, and projections *d' d'*, the clamp-shaft B passing through the coiled portions *d d*, the ends of said shaft being connected to the side lugs *a a* of the clamp, substantially as described.

409,143. QUILTING-FRAME FOR SEWING-MACHINES. JAMES R. GIBBS, Jonesborough, assignor of two-thirds to Elliot C. Kirkpatrick and Thomas R. Chase, Johnson City, Tenn. Filed Feb. 5, 1889. Serial No. 298,708. (No model.)

Claim.—The combination of a quilting-frame, tracks or ways A B, supported by the table of a sewing-machine and provided with suitable friction-rollers, and swiveled staples for holding the frame in said guideways, and rollers G, H, and I for holding the material and completed article, each made in two sections, one of which carries a ratchet attachment on its outer end, and on its inner end is provided with a recess T, having one open side to receive the other section of the roller, which is detachably secured therein, whereby the rollers may be removed from the frame without removing the ratchet portion, substantially as described.

409,144. HORSE-COLLAR FASTENER. JOSEPH F. GLIDDEN, De Kalb, Ill. Filed May 23, 1889. Serial No. 311,949. (No model.)

Claim.—A harness-collar fastening consisting of the straight tubular sections A and B, the former provided with a wall *d*, and the latter with a closed end wall and adapted to pass within section A and be held by friction, substantially as specified.

409,145. BOX-NAILING MACHINE. LEWIS F. GRABNER, Allentown, Pa., assignor of one-half to C. J. P. Bittner, same place. Filed Dec. 17, 1887. Serial No. 258,202. (No model.)

Claim.—1. A picker attachment for box-nailing machines, comprising an inclined slotted table, duplicate picker-plates mounted at the end of said table and for relatively-opposite oscillation, and mechanism for oscillating the same, substantially as specified.

2. The combination, with a nailing-machine, of a picker attachment comprising an inclined table having a slot and duplicate picking-plates provided with picking-fingers and nail-passages and pivoted and arranged one upon the other at the end of said slot, and mechanism for oscillating said plates in relatively-opposite directions, substantially as specified.

3. The combination, in a nailing-machine, of a picker attachment comprising an inclined table having a slot, pivoted nail-picking plates mounted one upon the other at the end of said slot and provided with picking-fingers and nail-passages, and mechanism for oscillating said plates in contrary directions, substantially as specified.

4. In a box-nailing machine, the combination of a picker attachment, comprising a slotted inclined table having picker-plates provided with picking-fingers pivoted thereon, mechanism for operating the same in contrary directions, a gate, and gate-operating mechanism for presenting nails singly to said fingers, substantially as specified.

5. The combination, in a box-nailing machine, of an inclined table having a slot with pivoted picking-plates mounted one upon the other and provided with oppositely-arranged picking-fingers, and with a locking-bar connecting said plates and retaining the same in a locked or closed position, substantially as specified.

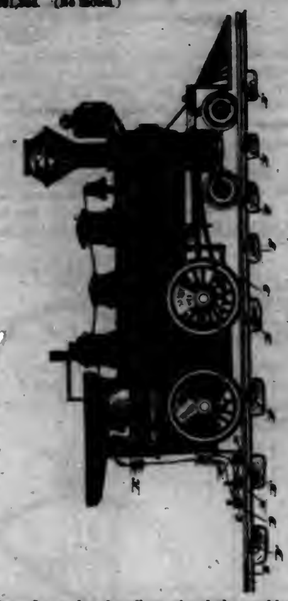
6. In a box-nailing machine, the combination of an inclined slotted table, picking-plates mounted at the end of said table, a pivoted gate mounted in rear of said plates, and mechanism, substantially as shown and described, for operating said pivoted gate in advance of the operation of said plates, substantially as specified.

7. The combination of a box-nailing machine, with a picking attachment comprising an inclined table, slotted and provided with nail-picking plates having studs projecting therefrom, and a bar pivoted to the table and slotted for the reception of the studs, whereby when one of said plates is oscillated in one direction its companion is oscillated in an opposite direction, substantially as specified.

8. In a picker attachment for box-nailing machines, the combination of a slotted inclined table, with pivoted picker-plates mounted one upon the other at the end of said slot and provided with oppositely-disposed long and short picking-fingers and with studs, and a plate-operating bar slotted to receive said studs, substantially as specified.

9. In a box-nailing machine, the combination of an inclined table having a slot and provided with pivoted operatively-connected picking-plates having picking-fingers, one of said plates having a slotted extension, with an adjustable bolt mounted in said slot, and oscillating bars mounted in brackets below the same and provided with lugs for coming in contact with and operating said bolt, substantially as specified.

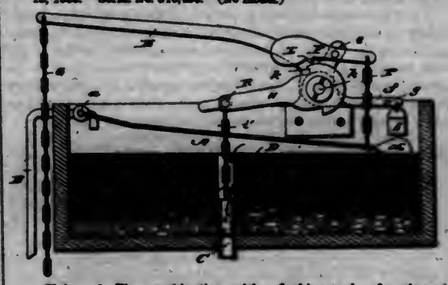
10. In a box-nailing machine, the combination of an inclined table having picking-plates pivoted at the end thereof, and having a gate pivoted in rear of said plates, with oscillating bars, one of which operates said plates and the other the gate, substantially as specified.



11. The combination of the inclined table B, having the slot B', with the plates C and D, pivoted, as at D^4, thereon and formed with the long and short fingers C^2 C^3 and D^2 D^3, and having the openings C' C^4 and D' D^4, substantially as specified.

12. The combination of the table B, having the slot D', and the plates C and D, pivoted thereon, with the bar E, slotted as at E' E^2 and mounted on said plate, and the spring F, substantially as specified.

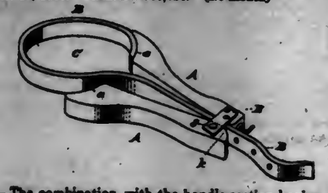
13. The combination of the inclined table B, slotted as at B', and the plates C and D, pivoted as at D^4 at the end of said slots, the bolt H, mounted in the plate C, and the bar G', having the lug G^2 and spring G^3, substantially as specified.



14. The combination of the inclined table B, slotted and provided with the pivoted plates C and D, the bar E, connecting the same with the gate I, pivoted as at I', slotted as at I^2, and the bars G and G', the latter having arm G^4 for operating said gate, substantially as specified.

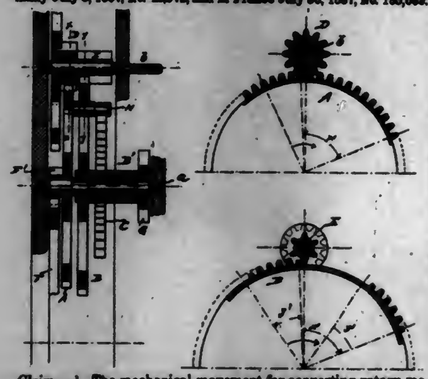
409,146. ELECTRIC RAILROAD-SIGNAL. WILLIAM F. GRABNER, Williamsport, Pa., assignor of three-fourths to C. G. Gibson, W. G. Elliot, and W. B. Updegraff, all of same place. Filed Nov. 20, 1888. Serial No. 291,393. (No model.)

Claim.—In an electric railway-signal, the combination of a series of locomotives each carrying an electric generator, alarm, and insulated contact-brushes, with an insulated continuous conductor in the path of the contact-brushes, such conductor being provided at regular intervals along its length with deflections, as and for the purpose set forth.



409,147. FLUSHING-TANK. JAMES GREENHALGH, Woonsocket, R. I., assignor of one-half to John F. Mulvey, same place. Filed May 13, 1889. Serial No. 310,499. (No model.)

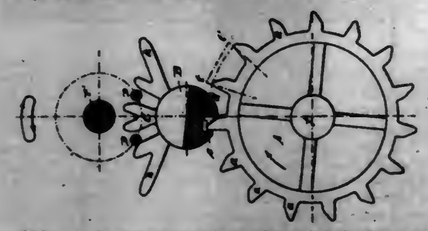
Claim.—1. The combination, with a flushing-tank, of a pivoted operating-lever having one end weighted, a preponderating lever carried by the operating-lever and provided with a shoulder, and a pivoted shouldered lever adapted to be engaged by the preponderating lever and connected with the outlet-valve, substantially as specified.



2. The combination, with a flushing-tank, of a pivoted lever weighted at one end, a pivoted lever connected with a discharge-valve, and a preponderating lever adapted to engage and be moved by the lever connected with the valve and having its lighter end connected with a float, the said preponderating lever being journaled on the operating-lever, substantially as specified.

409,148. DEVICE FOR HOLDING FRUIT-CANS. JOHN HALLER, Port Clinton, Ohio, assignor of one-half to William Bertsch, same place. Filed Mar. 12, 1889. Serial No. 303,726. (No model.)

Claim.—The combination, with the handle-section having a concave end and a clamp-strap fastened thereto, of a movable handle-section pivoted to its fellow at the inward end from the portions grasped by the hand, and having a stop to prevent it from opening out from said fellow too far for grasping with the fingers of the hand holding and operating the instrument, substantially as specified.



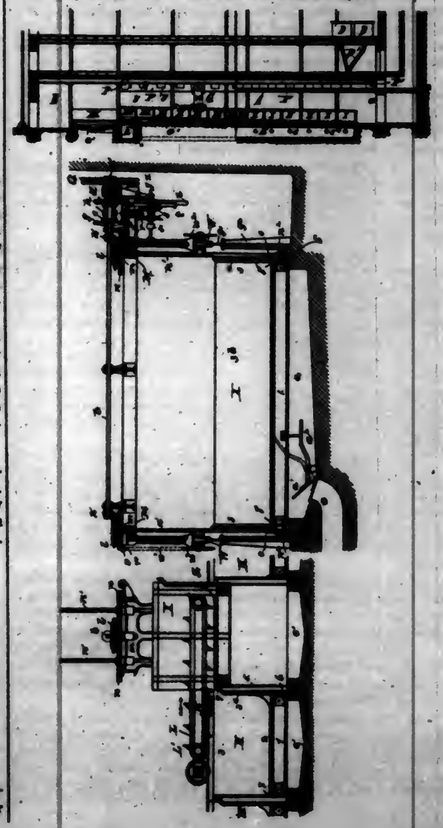
409,149. MECHANISM FOR CONVERTING MOTION. ALEXANDER KAISER, Berlin, Germany, assignor to Ludwig Marckwald, same place. Filed Mar. 7, 1888. Serial No. 266,623. (No model.) Patented in Germany July 8, 1887, No. 42,372, and in France July 30, 1887, No. 185,089.

Claim.—1. The mechanical movement for converting rotary motion into intermittent rotary motion, consisting of an arbor, two cog-wheels mounted on the same, one fixed and the other loose, a spring connecting the two cog-wheels, and two pinions fixed on an arbor and engaging, respectively, with the fixed and loose cog-wheel, the proportion of the teeth of the fixed wheel to its pinion and the relation of the teeth of the loose wheel to its pinion being such that the speed of rotation of the loose cog-wheel during the time the same is engaged with its pinion is different from the speed of the fixed cog-wheel, substantially as shown and described.

2. The combination, with an arbor *a*, of the cog-wheel A, mounted rigidly on the same, the cog-wheel B, mounted loosely on the arbor and having the hub B', the spring C, connected with the hub B' and with the wheel A, the cog-wheel G on the hub B', the pinion F on the arbor *a*, the pinion E, engaging with the cog-wheel B, and the pinion D, engaging with the cog-wheel A, some of the teeth of the cog-wheel B being broken out, substantially as shown and described.

409,150. TIME-PIECE ESCAPEMENT. ALEXANDER KAISER, Berlin, Germany, assignor to Ludwig Marckwald, same place. Filed Oct. 9, 1888. Serial No. 287,651. (No model.) Patented in Germany May 19, 1888, No. 46,989; in France Aug. 7, 1888, No. 188,294; in Belgium Sept. 12, 1888, No. 83,243, and in Switzerland Nov. 21, 1888, No. 175.

Claim.—1. In an escapement for watches and clocks, the combination, with an escapement-wheel, of a cylinder having a notch for receiving the teeth of the escapement-wheel, the double fork on the cylinder, a balance-wheel having one or more pins, and arms on said cylinder of such length that they can rest against the hub of the balance-wheel, substantially as set forth.



2. In an escapement for watches and clocks, the combination, with an escapement-wheel, of a cylinder having a notch for receiving the teeth of the escapement-wheel, a balance-wheel having one or more pins, projections on the cylinder, on which projections the pins on the balance-wheel can act, and projections on the cylinder, which projections can rest against the hub of the balance-wheel, substantially as set forth.

3. In an escapement for watches and clocks, the combination, with an escapement-wheel, of a cylinder formed of two concentric sections of different radii, each section having a notch, a balance-wheel, pins on said balance-wheel, and projections on the cylinder, on which projections the pins of the balance-wheel can act, substantially as set forth.

4. In an escapement for watches and clocks, the combination, with an escapement-wheel, of a cylinder composed of two concentric circular sections of different radii, each section having a notch, the notch of the larger section being larger than that of the smaller section, a balance-wheel having pins and projections on the cylinder, on which projections the said pins on the balance-wheel can act, substantially as set forth.

5. In an escapement for watches and clocks, the combination, with an escapement-wheel, of a cylinder having a notch for receiving the teeth of the escapement-wheel, a balance-wheel provided with a hub having parts cut away, pins on said balance-wheel, projections on the cylinder, on which projections the pins on the balance-wheel can act, and arms or projections on the cylinder, which arms or projections can come in contact with the hub of the balance-wheel, substantially as set forth.

409,151. PNEUMATIC MALTING APPARATUS. REICH KASTNER, Mannheim, Baden, Germany. Filed Sept. 13, 1888. Serial No. 285,673. (No model.) Patented in Germany June 22, 1886, No. 43,366, and in Austria-Hungary Nov. 20, 1888, No. 27,743 and No. 46,384.

Claim.—1. In a malt-house, a plurality of adjacent vertically-movable perforated malting-floors inclosed on three sides, and a stationary partition interposed between the floors and forming the inclosing-wall for the open side of such floors, in combination with an elevating mechanism arranged above said floors and adapted to be moved from one floor to another and connected therewith, substantially as and for the purposes specified.

2. In a malt-house, a plurality of adjacent vertically-movable perforated malting-floors inclosed on three sides, and a stationary partition interposed between the floors and forming the inclosing-wall for the open side of such floors, and in combination therewith a conveyer or scraper arranged above said floors and operating to transfer the malt from one floor to another, substantially as and for the purposes specified.

3. In a malt-house, a plurality of adjacent vertically-movable perforated malting-floors inclosed on three sides, and a stationary partition interposed between the floors and forming the inclosing-wall for the open side of such floors, in combination with an elevating mechanism adapted to be connected to said floors, and a conveyer or scraper, both mounted on the same support and adapted to be moved to and fro above the malting-floors, substantially as and for the purposes specified.

4. In a malt-house, a plurality of adjacent vertically-movable perforated malting-floors inclosed on three sides, and a stationary partition interposed between the floors and forming the inclosing-wall for the open side of such floors, and in combination therewith a conveyer or scraper, a wheeled carriage therefor, an elevated way for said carriage, and a driving mechanism for the conveyer mounted on said carriage, substantially as and for the purposes specified.

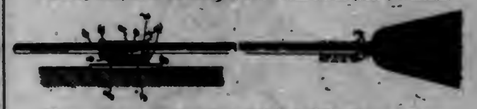
5. In a malt-house, a plurality of adjacent vertically-movable perforated malting-floors inclosed on three sides, and a stationary partition interposed between the floors and forming the inclosing-wall for the open side of such floors, and in combination therewith an elevated way, a wheeled carriage adapted to travel on said way, and an elevating mechanism mounted on said carriage for elevating the floors, substantially as and for the purposes specified.

6. In a malt-house, a plurality of adjacent and vertically-movable malting-floors comprising a rectangular frame, a perforated floor secured thereto, and vertical inclosing-walls arranged on one side and at opposite ends of said frame, in combination with a stationary partition arranged to close the fourth open side of the floor, substantially as and for the purposes specified.

7. In a malt-house, a plurality of adjacent and vertically-movable malting-floors comprising a rectangular frame, a perforated floor secured thereto, and vertical inclosing-walls arranged on one side and at opposite ends of said frame, in combination with a stationary inclosing-wall arranged to close the fourth open side of the floor, and a packing secured to the edge of said floor along the open side to form a tight joint with the stationary inclosing-wall, substantially as and for the purposes specified.

8. The combination, with a plurality of contiguous or adjacent vertically-movable perforated malting-floors provided with lugs or bearings S at opposite ends, of an elevated way, a carriage adapted to travel to and fro on said way, and a lifting mechanism comprising the screw-threaded hooked rods *x'*, the hooks of which are adapted to engage the lugs or bearings S of the floors, the bevel-wheels *n*, having interiorly-threaded hubs in which said rods work, and a driving-gear for driving said bevel-wheels, substantially as and for the purposes specified.

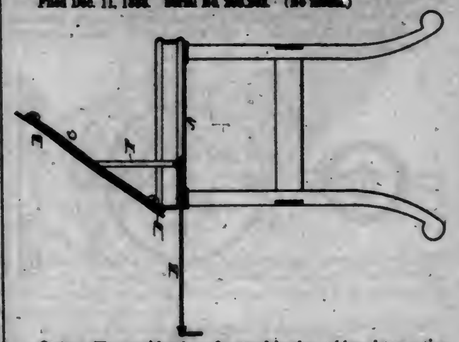
9. The combination, with a plurality of contiguous or adjacent vertically-movable perforated malting-floors, of an elevated way, a carriage adapted to travel to and fro on said way, a conveyer or scraper comprising an endless belt arranged to travel in a horizontal plane and provided with conveyer buckets or scrapers, mechanism for imparting motion to said belt, and an elevating mechanism for elevating the malting-floor to said conveyer mounted on said carriage, substantially as and for the purposes specified.



10. In a malt-house, a vertically-movable perforated malting-floor, a suction-chamber below said floor, an air-exhaust duct connected with said chamber, and a gravity-valve interposed in said connection, said valve having its stem in contact with the floor or a projection thereon when said floor is seated on the suction-chamber to hold the valve open, substantially as and for the purposes specified.

11. In a malt house, a plurality of contiguous or adjacent vertically-movable malting-floors, a suction-chamber below each floor, an air-exhaust duct connected with said chambers, a gravity-valve in said connections, said valves having their stems in contact with their respective malting-floors to hold the valve open when the floor is seated on the suction-chamber, an elevated way, a carriage adapted to travel to and fro on said way, and an elevating mechanism mounted on said carriage for elevating the floors, whereby, when a malting-floor is elevated, the valve will automatically close to cut off the communication between the suction-chamber and air-exhaust duct, substantially as and for the purposes specified.

12. In a malt-house, a malting-chamber, a series of contiguous or adjacent vertically-movable perforated malting-floors, and a stationary malting-floor at the end of the series, a withering-chamber adjacent to the malting-chamber, a perforated withering-floor in said chamber, and a suction-chamber arranged under each of said floors, and in combination therewith an air-duct in communication with the malting-chamber, a separate air-supply for the withering-chamber, and an air-exhaust duct common to all the suction-chambers of the floors, substantially as and for the purposes specified.



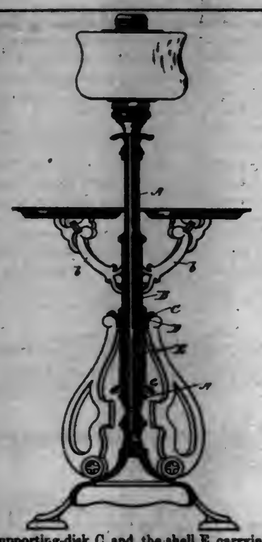
13. In a malt-house, a substantially air-tight malting-chamber, a plurality of contiguous or adjacent vertically-movable perforated malting-floors, and a suction-chamber under each of said floors, in combination with an air-distributing duct provided with separate outlet-ports for each malting-floor, means for combining moisture with the air admitted, an air-exhaust duct, a separate connection between the suction-chamber of each malting-floor and said air-exhaust duct and a valve in said connection, substantially as and for the purposes specified.

409,152. BROOM-SUPPORTER. ROBERT KIDNEY, Weatherly, Pa., assignor of one-half to George Marsh and Edward C. Hall, both of St. Anthony Park, Minn. Filed July 3, 1888. Serial No. 278,180. (No model.)

Claim.—A broom-supporter consisting of the sleeve having a hook and heel on the broom-handle by a rubber ring, and a bracket having a pocket, substantially as shown and described.

409,153. MIRROR-STAND. JOSEPH KIRK, Ballard Vale, Mass., assignor to himself and the Craighead & Kirk Company, same place. Filed Dec. 11, 1886. Serial No. 220,362. (No model.)

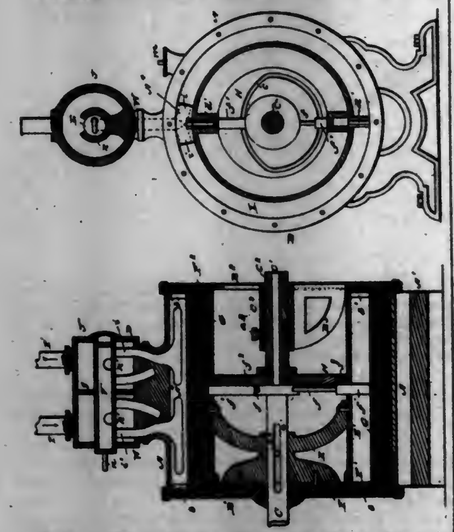
Claim.—The combination of a stand having a hinged top, a tray adapted to slide into and out of the stand below the top, and a pivoted link-connection between the tray and top, whereby the top will be raised and supported when the tray is pulled out and be lowered when the tray is pushed in, substantially as described.



409,154. REVOLVING-STAND LAMP. JOSEPH KIRK, Ballard Vale, Mass., assignor to himself and the Craighead & Kirk Company, same place. Filed Jan. 17, 1889. Serial No. 296,947. (No model.)

Claim.—1. The improved revolving-stand lamp herein described, consisting of a lamp provided with a suitable standard A, a sleeve B, carrying a stand and provided at its base with a series of holes, as described, and a spring-supported shell carrying a pin adapted to enter one of the holes to lock the sleeve against rotation, the said shell being adapted, by drawing it down against the pressure of the spring, to withdraw the pin and permit the revolution of the sleeve B around the standard when desired, all substantially as set forth.

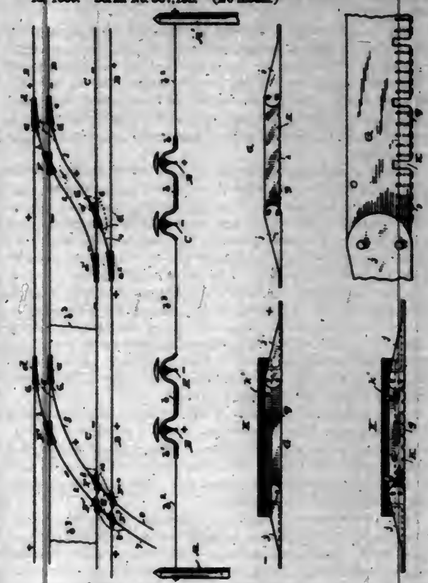
2. In combination, the standard A, the revolvable sleeve B, carrying the stand and provided at its base with the series of holes *b'*,



409,154.

the perforated supporting-disk C, and the shell E, carrying the pin D and provided with a finger-piece G, for depressing the shell, and the coiled spring F, for elevating it, all substantially as shown and described.

409,155. STEAM-ENGINE. CHARLES R. DELLENBAUGH, Pittsburg, Pa., assignor of three-fourths to William H. Hoover, Charles Hess, and J. W. King, all of same place. Filed Mar. 18, 1889. Serial No. 303,687 (No model.)



Claim.—1. The combination, with the main cylinder, of the inner cylinder bearing radially-reciprocating pistons, the grooved head and grooved ring at the ends of the inner cylinder adapted for guiding the pistons, the spider E, connected to the head F and inner cylinder and to the main shaft, the fixed cam-grooved disk H, and the sleeves secured to the pistons and guided by stems, all as specified.

2. In a rotary engine, the combination, with the main cylinder, of the internal cylinder having an open end and a closed end, the cylinder E, provided with radially-grooved flanges and the pistons working therein, the spider E, securing this cylinder to the main shaft, the sleeves f', secured to the said pistons and guided by rods f, the stationary cam-grooved disk H, for actuating the said sleeves and pistons, and the bracket secured to the open head of the casing or main cylinder and affording a journal for one end of the main shaft inside of the open-end cylinder E, all as specified

3. In a rotary engine, the combination of the external cylinder A, having one end open, the internal open-end cylinder E, rigidly secured to the outer cylinder, as specified, and provided with radially-grooved flanges having movable pistons, the stationary disk H, having a cam-groove in one face, the radially-movable sleeves secured to the said pistons, the guide-rods f, secured to a boss on the main shaft C, the spider E, securing the cylinder E to the head thereof and itself secured to the main shaft C, and the bracket B^2, affording a journal-box for a sleeve C^1, all as specified.

409,156. DOUBLE SUSPENDED CONDUCTOR SYSTEM FOR ELECTRIC RAILWAYS. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Apr. 13, 1889. Serial No. 307,132. (No model.)

Claim.—1. A double suspended conductor system for electric railways, comprising positive and negative conductors following the line of each track, the conductors of one polarity over each track being arranged upon the inner sides thereof and electrically connected at intervals, the remaining conductors being parallel therewith but nearer to the outer sides of said tracks.

2. A double suspended conductor system for electric railways, comprising positive and negative supply-conductors following the line of each track, a branch extending from said main conductors, comprising metallic frogs in electrical connection with said main conductors, branch conductors connected to but insulated from said frogs, and an upward-pressure contact device having a plurality of independent insulated contacts adapted to engage the said supply-conductors.

3. Switching devices for a double suspended conductor system comprising metallic frogs in contact with the main conductors, an insulated crossing for one of said conductors, a branch conductor extending from the frog of one of said conductors and engaging the crossing, but insulated therefrom, a continuation of the insulated branch conductor, and an electrical connection uniting the insulated extremities thereof, and a branch conductor extending from and in electrical connection with the frog of the other main conductor.

4. Switching devices for a double suspended conductor system, comprising metallic frogs connected to the main conductors, branch conductors connected to but insulated from said frogs, a crossing for one of said main conductors to which one branch is electrically connected, a continuation of said branch conductor and a frog upon the next adjacent main conductor to which the said continued branch is electrically connected, and a branch extending from the other main frog to but insulated from a crossing upon the next adjacent main conductor, a continuation of said second branch conductor and a frog upon the other main conductor to which said continuation is connected, and electrical connections between the insulated portions of the branch conductor.

5. A switch and crossing for a double system of duplex suspended conductors, comprising metallic frogs in electrical connection with one set of main conductors, a branch conductor extending from one frog to and insulated from a crossing attached to conductors of the opposite polarity and connected thence but insulated therefrom by a conductor secured to a crossing of similar polarity, and a branch conductor extending from the other frog to an insulated crossing, and thence by a continuation of the branch conductor to a crossing of like polarity, thence to a crossing of opposite polarity from which it is insulated, thence by a continuation of the branch conductor, and an electrical connection between the insulated terminals of the branch conductor.

6. In a system of double suspended conductors, a switch and crossing for a double duplex line comprising metallic frogs in contact with the main conductors of one line, an insulated crossing for one of said conductors, a branch conductor extending from the frog of one of said conductors and engaging the crossing and insulated therefrom, a continuation of the insulated branch conductor, and an electrical connection uniting the insulated extremities thereof, a branch conductor extending from and in electrical connection with the frog of the other main conductor, and two sets of crossings connected with the main conductors of the other main line to which the branch conductors from the first-mentioned main line are connected and from which they may be continued, substantially as described.

7. In a duplex suspended system of conductors, a metallic frog in electrical connection with one of said conductors, a branch conductor connected thereto, and an insulating-section between the frog and the branch conductor, substantially as described.

8. A crossing-plate having a flat metallic surface, a central downward projection for guiding a grooved contact-wheel, and lateral flanges to prevent lateral displacement of the contact device.

9. The combination, with a metallic crossing-plate, of a main conductor of one polarity connected thereto and ribs or pieces of insulating material also connected to said plate, and conductors of opposite polarity connected to the extremities of said insulating-ribs.

10. A crossing-plate for conductors of opposite polarity, comprising a metallic plate secured to and in electrical connection with the main conductor, insulating-sections secured at opposite ends of the plate, and conductors of opposite polarity secured to the extremities of said insulated sections, substantially as described.

11. A crossing-plate comprising a metallic surface to which the main conductor may be attached, insulating-sections extending from each end thereof and connected to terminals of conductors of opposite polarity, a crossing-plate comprising a metallic surface, a central downward projection for guiding a grooved contact-wheel thereacross, and terminals extending from each end for connection to their respective conductors, substantially as described.

12. The combination, with a crossing-plate, of a main conductor connected thereto for crossing at one direction, ribs composed in part of insulating material and connected to said crossing-plates for attachment to conductors of opposite polarity for a crossing of another direction, and protecting-roofs extending over the insulated portions of the said insulating-ribs, substantially as described.

13. In a system of suspended conductors, an insulating-section and conductors of opposite polarity connected to the extremities thereof, whereby the said section is adapted to convey the contact device between insulated and separated continuous conductors.

14. In a system of suspended conductors, an insulating-section for connecting conductors of opposite polarity, having high tensile strength and composed of a metallic body having an exterior insulating-surface.

15. In a system of suspended conductors, an insulating-section the lower or contact surface of which is discontinuous, substantially as described.

16. In a system of suspended conductors, an insulating-section uniting the extremities of conductors of opposite polarity and provided with a protecting roof or cover, substantially as described.

17. In a system of suspended conductors, an insulated section for uniting conductors of opposite polarity, having its lower edge made discontinuous by notches or serrations and provided with a discontinuous metallic wearing-surface between the serrations, substantially as described.

18. In a double suspended system of electric-railway conductors, a contact device comprising a pair of independent upwardly spring-pressed arms each provided with a contact device at its outer extremity, both said arms being free to swing about a vertical axis, separate insulated connections between the contact devices and a stationary support or base, and a slack and flexible portion between the fixed and movable parts of the said circuit-connections for permitting said arms to swing upon their vertical axis for reversing.

19. In a double suspended conductor system, the combination, with a suitable support mounted upon a car or other vehicle, of a pair of contact-carrying arms, vertical and transverse axes sustaining said arms in positions to swing freely about the vertical axis, tension-springs pressing said arms independently upward against suspended conductors, and separate flexible conductors extending between the contact devices carried by the arms and connected to fixed terminals of the motor-circuit.

20. In a double suspended conductor system the combination of a pair of arms, vertical and transverse axes for said arms, upon which they are mounted at their lower ends, tension-springs for imparting an upward tendency to said arms independently, and self-adjusting and locking connections between the inner ends of said springs and a support, whereby the tension of the springs may be adjusted by moving the arms away from their operative position.

21. In a double suspended conductor system, the combination of a block Q, mounted upon a vertical pivot, transverse arms, contact carrying-arms hinged thereupon, and tension-springs upon the arms, the outer ends of said springs engaging the contact-carrying arms and their inner ends being held by detent mechanism connected to said springs and engaging detents carried by the block Q, substantially as described.

409,157. HARMONIC TELEGRAPHY. FRANÇOIS VAN RYSSELBERGHE, Brussels, Belgium, assignor to the Phono-Multiplex Telegraph Company, Baltimore County, Md. Filed July 26, 1888. Serial No. 281,077. (No model.)

Claim.—1. In a tone or harmonic telegraph, a magnet controlled by main-line currents, and a series of sectors adjustable to vibrate at different rates arranged in proximity to and operated by said magnets, substantially as described.

2. In a tone or harmonic telegraph, a magnet controlled by main-line currents, a series of sectors adjustable to vibrate at different rates arranged in proximity to and operated by said magnet, contact devices carried by the sectors, and adjustable contact devices arranged to make contact with the first contact devices, substantially as described.

3. In a tone or harmonic telegraph, a magnet operated by main-line currents, a series of sectors adjustable to vibrate at different rates operated thereby carrying contact-pieces, and a series of levers carrying other contact-pieces arranged to co-operate therewith, substantially as described.

4. In a tone or harmonic telegraph, a magnet controlled by main-line currents and a series of vibrators operated thereby, the vibrators being provided with adjustable weights to regulate their rates of vibration, substantially as described.

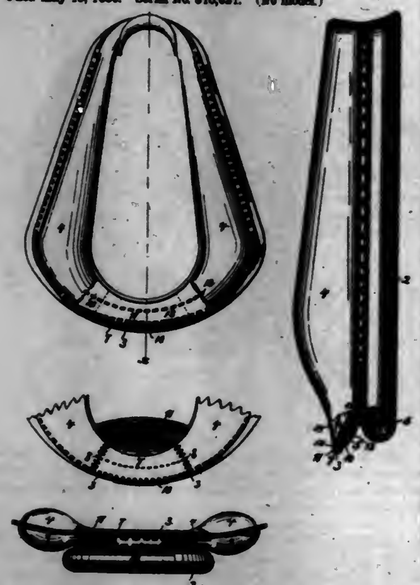
5. In a tone or harmonic telegraph, the combination, with a series of vibrators carrying contact-pieces, of a series of levers also carrying contact-pieces, a series of arms forming fulcra for said levers, and adjusting devices for regulating the contacts, substantially as described.

6. In a tone or harmonic telegraph, a magnet consisting of a central core surrounded by a main-line coil, and an exterior rim and a series of vibrators secured to said rim and extending in proximity to the core, substantially as described.

7. In a tone or harmonic telegraph, a magnet having a central core and an exterior rim, a series of vibrators carrying contact-pieces secured to the rim, arms also secured to the rim, and a series of levers supported upon said arms carrying contact-pieces, substantially as described.

8. In a tone or harmonic telegraph, the combination, with a series of vibrators carrying contact-pieces, of arms supported above the vi-

brators, levers carrying contact-pieces supported on said arms, and adjusting-slides secured to said arms, substantially as described.

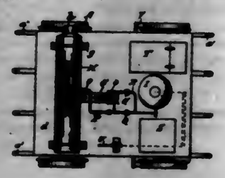


9. In a tone or harmonic telegraph, the combination, with the vibrators carrying contact-pieces, of the levers also carrying contact-pieces on their short arms and having adjusting devices operating upon their long arms, substantially as described.

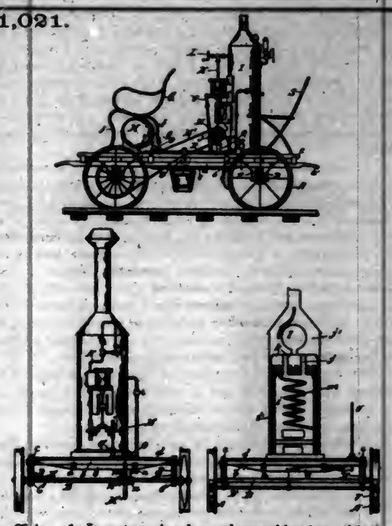
10. In a tone or harmonic telegraph, the combination, with a magnet operated by main-line currents, of a coil connected with the magnet operated by a local current creating a field of force, and a series of sectors arranged to be operated by said magnet, substantially as described.

11. In a tone or harmonic telegraph, a magnet having a differentially-wound main-line-circuit coil and a local coil, and a series of vibrating devices arranged to be operated by said magnet, substantially as described.

12. In a tone or harmonic telegraph, the combination, with a transmitter arranged to send a series of varying predetermined signals over the line, of a receiving-instrument or analyzer consisting of a magnet operated by the main-line currents, and a series of sectors operated by said magnet, substantially as described.



409,158. HORSE-COLLAR. JOHN B. CONNOLLY, Minneapolis, Minn. Filed May 13, 1889. Serial No. 310,621. (No model.)



Claim.—A horse-collar comprising the rim 2 and shoulder-pieces 3, the liners 4, and a throat portion having a filling of straw extending across through the throat portion from one liner to the other, the inside throat-piece 7 arranged between and whipped to the liners 4, the outside throat-piece extending across from one liner to the other and covering the joints of the inside throat-piece, the central piece 10, covering the ends of the pieces 3, and a series of quilting-stitches passing through said throat portion, all substantially as described.

REISSUES.

11,021. STEAM HAND CAR. TIMOTHY MORRISSEY and JOHN DOYLE, Ionia, Mich., assignors to the Ionia Steam Hand Car Company, same place. Filed June 27, 1889. Serial No. 315,819. Original No. 400,408, dated Mar. 26, 1889.

11,021.

Claim.—1. In a steam hand-car, the combination, with the platform F and running-gear of the car, of the boiler I, the engine and the crank-shaft J, secured upon the side thereof and above said platform, and gearing for transmitting motion from crank-shaft to said running-gear, substantially as described.

2. In a steam hand-car, the combination, with the platform F and running-gear of the car, of the boiler I, the engine secured upon the side thereof and provided with a crank-shaft J, having a sprocket-wheel M, the sprocket-wheel M^3, secured to the front axle of said running-gear, and the drive-chain M', substantially as described.

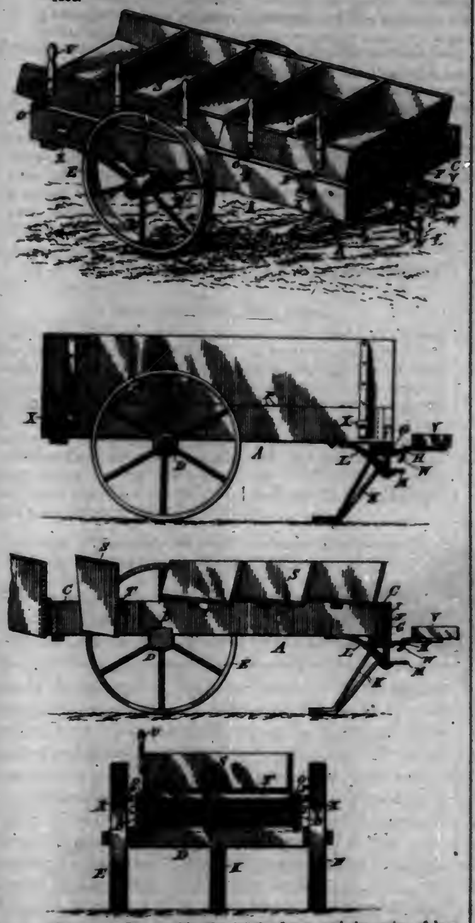
3. In a steam hand-car, the combination, with the platform F and the running-gear of the car, of the boiler I, the engine secured upon the side thereof and provided with a crank-shaft J, having a sprocket-wheel M, the sprocket-wheel M^3, secured to the front axle of said running-gear, the drive-chain M', and the idlers O and O', substantially as described.

4. In a steam hand-car, the combination, with the platform and car, of the generator I, supported on the rear end thereof, the engine mounted on the front side thereof and having its crank-shaft J in proximity to the platform, the sprocket-wheel M, mounted on said shaft, the sprocket-wheel M^3, mounted on the front axle of the car, the drive-chain M', and the idlers O and O', the latter having a yielding connection with the platform, substantially as described.

5. In a steam hand-car, the combination, with the platform F, the running-gear of the car, the boiler I, the engine, and the crank-shaft J, secured upon the front side thereof and above said platform, of chain-gearing for transmitting motion from said crank-shaft to said running-gear, substantially as described.

6. The combination, with a car provided with a platform F, constructed substantially as described and mounted on springs E, of the seat G, supported on the front end of said car, the water-tank H, secured under said seat, the boiler I, mounted on the rear end of the car, the engine mounted upon the front side of the boiler and with its crank-shaft in proximity to the platform of the car, the sprocket-wheel M, mounted on said shaft, the sprocket-wheel M^3, mounted on the front axle of the car, the drive-chain M', the fixed idler O, and the idler O', secured in sliding bearings and provided with the spring o, substantially as described.

7. In a steam hand-car, the combination, with the platform F, the running-gear of the car, the boiler I, the engine secured upon the front side thereof and provided with a crank-shaft J, and gearing for transmitting motion from said crank-shaft to said running-gear, of the springs E, for yieldingly supporting said platform, the water-tank H, the feed-pipe P, the hand-pump Q, the branch pipe R, and the steam-pump Q', substantially as described.



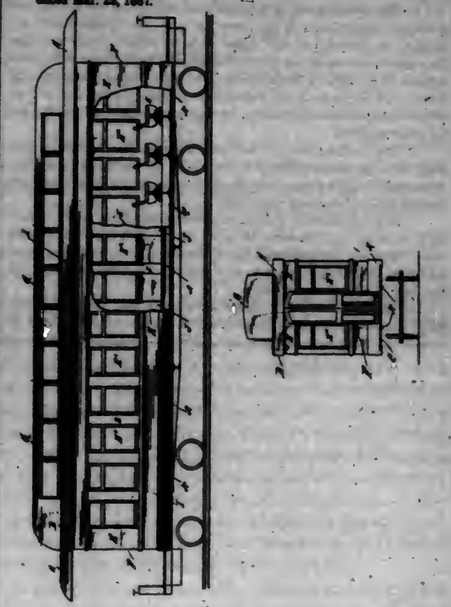
8. In a steam hand-car, the combination, with the platform F, the running-gear of the car, the boiler I, the engine and the crank-shaft J, secured upon the front side thereof and above said platform, and chain-gearing for transmitting motion from said crank-shaft to said running-gear, of the springs E, for yieldingly supporting said platform and the parts mounted thereon, substantially as described.

9. In a steam hand-car, the combination, with the platform F, the running-gear of the car, the boiler I, the engine secured upon the front side thereof and provided with a crank-shaft J, and gearing for transmitting motion from said crank-shaft to said running-gear, of the water-tank H, the hand-pump Q, the steam-pump Q', and the pipes connecting said tank and pumps, substantially as described.

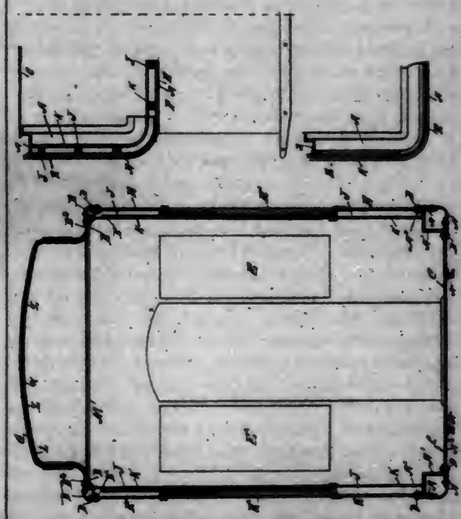
10. In a steam hand-car, the platform F, constructed of the longitudinal bed-timbers *a*, having the handles *a'*, the transverse timbers *b*, the longitudinal timbers *c*, the flooring *d*, the transverse truss-rods *e*, and the longitudinal truss-rods *e'*, all securely fastened together, whereby said platform is constructed of great strength combined with lightness, substantially as described.

11. The herein-described hand-car, comprising the following parts: the platform F, the running-gear of the car, the boiler I, water-tank H, feed-pipe P, hand-pump Q, branch pipe R, steam-pump Q', the engine secured to the front side of said boiler and provided with the crank-shaft J, gearing for transmitting motion from said crank-shaft to said running-gear, the brake mechanism U and V, the coal-bunker T, and the seats G and S, substantially as described.

11,022. TRUCK. EDWARD F. SCHOLDER, Fort Scott, Kans. Filed Feb. 6, 1889. Serial No. 298,936. Original No. 367,741, dated Aug. 14, 1888.



Claim.—1. The combination of the frame and the series of hoppers pivoted on the frame, the said hoppers having their front and rear sides inclined, the front side of one hopper resting against and closing the rear side of the next adjacent hopper, as set forth.



2. The truck having the supporting-wheels E mounted at a suitable distance in the rear of center thereof, and provided at its front end with a pivoted trailing support, substantially as described.

3. The combination, in a truck, of the frame having the supporting-wheels E and provided at its front end with the pivoted trailing support having the ear M, adapted to receive a whiffletree, and the tongue or shaft having the hook engaging the bracket or plate at the front end of the frame, substantially as described.

4. The combination, in a truck, of a frame having the bearings P in its sides and the hoppers having the trunnions engaging the said bearings, the said hoppers being provided with the standards U, substantially as described.

11,023. RAILWAY-CAR. CHESTER W. M. SMITH, San Francisco, Cal. Filed May 20, 1889. Serial No. 312,096. Original No. 360,040, dated Mar. 22, 1887.

Claim.—1. The combination, in a metallic railway-car, of tubular sills arranged one at each lower corner and a single-thickness metal flooring secured to said sills, substantially as and for the purposes specified.

2. The combination, in a metallic railway-car, of tubular sills arranged at the respective lower corners thereof and single-thickness side plates secured to the said sills, substantially as and for the purposes specified.

3. The combination, in a metallic railway-car, of tubular sills ar-

ranged at the respective lower corners, tubular beams arranged at the respective upper corners, and single-thickness side plates secured at the bottom to the said sills and at the top to the said beams, substantially as and for the purposes specified.

4. The combination, in a metallic railway-car, of tubular sills at the lower corners thereof and single-thickness floor-plates and side plates secured, respectively, to the said sills, substantially as and for the purposes specified.

5. The combination, in a metallic railway-car, of the tubular sills arranged, respectively, at the lower corners, the tubular beams arranged, respectively, at the upper corners thereof, single-thickness floor-plates secured to the respective sills, single-thickness side plates secured at the bottom to the tubular sills and at the top to the tubular beams, and single-thickness roof-plate bent into proper form and secured to the respective tubular beams, substantially as and for the purposes specified.

6. The combination, in a car constructed wholly of metal, or partially of metal and partially of wood, of the sills and beams or girders composed of angle-plates bent so as to form double horizontal and vertical lips or flanges, as described.

7. The combination, in a car constructed wholly of metal, or partially of metal and partially of wood, of the iron sheet or flooring bolted between the horizontal lips or flanges of the sills, the edges of said sheet or floor extending to or nearly to the outer plates of the sills, in the manner described.

8. The combination, in a car constructed wholly of metal, or partially of metal and partially of wood, of the side walls or sheets E, bolted or riveted between the lips or flanges of the sills and the lips or flanges of the beams or girders, in the manner set forth and specified.

9. The combination, in a car constructed wholly of metal, or partially of metal and partially of wood, of the metallic roof G, bolted or riveted between the lips or flanges of the inverted beams or girders B B', constructed and arranged substantially in the manner herein set forth and specified.

10. In a railway-car, the ends of the side sheets or walls bent around against the ends of the sills and beams or girders to form the corners and ends of the car, in the manner described, when continuous or extended sheets are employed, or the separate end sheets or plates bent so as to form the corners and front of the car-body and lapped and riveted to the said side sheets, as described.

11. The combination, in a car constructed wholly of metal, or partially of metal and partially of wood, of the upright or vertical posts resting upon and bolted to the sills and beams or girders, or with the lower ends of said posts mortised into the sills, as specified, for the purposes set forth.

12. The method herein described of forming sills, beams, or girders for railway cars and other structures where sheets of metal are to be vertically and horizontally united by bolts or rivets, consisting of two metal plates, one of which is bent at right angles and the other plate bent to a right angle, and the edge of each member bent to a right angle and placed parallel to the outer plate, whereby the two series of vertical and horizontal lips, laps, or flanges are formed for bolting or riveting vertical and horizontal connecting-sheets, as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Eastern District of Michigan.

THE CONSOLIDATED ROLLER MILL COMPANY *v.* COOMBS.

Decided July 22, 1889.

1. PRELIMINARY INJUNCTION—STAY OF.
It is well settled that while a patent may be adjudged valid and the defendant an infringer the award of a preliminary injunction is purely a matter of discretion, and courts are in the habit of withholding it upon such terms as to the giving of a bond and the like as may seem just and equitable, having regard to the comparative injury that will result to the parties by granting or withholding it.

2. INJUNCTION AFTER FINAL DECREE—SAME.
The power of the court to stay an injunction, even after final decree, not denied.

STATEMENT OF THE CASE.

Plaintiff obtained against the defendant the usual decree in patent cases for an injunction against further infringement and a reference to a master to compute damages. Defendant moved to stay the issuing of the injunction upon the ground that the plaintiff was not a manufacturer, but derived its profits from selling or licensing its machine, and that the damages to defendant by stopping his mill would be out of all proportion to the amount of plaintiff's license or to any damages that would be occasioned to it by defendant's continued use of machines.

Messrs. Parkinson & Parkinson for the plaintiff.
Mr. R. Mason for the defendant.

BROWN, *J.*:

We are asked by this motion to determine whether, after an adjudication adverse to the defendants upon the merits of a patent case, we ought to stay the issue of an injunction until final decree. So far as preliminary injunctions are concerned it is entirely well settled that while the patent may be adjudged valid and the defendant an infringer the award of an injunction is purely a matter of discretion, and courts are constantly in the habit of withholding it upon such terms as to the giving of a bond and the like as may seem just and equitable, having regard to the comparative injury that will result to the parties by granting or withholding it. (*Parker* v. *Sears*, 1 Fish., 94; *Howe* v. *Morton*, 1 Fish., 486; *Morris* v. *Lowell Manufacturing Co.*, 3 Fish., 67; *Tracey* v. *Torrey*, 2 Blatchf., 275; *Potter* v. *Whitney*, 1 Lowell, 87; *Hoe* v. *Boston Daily Advertiser Co.*, 14 Fed. Rep., 914; *Forbush* v. *Bradford*, 1 Fish., 317.)

After an adjudication upon the merits the case becomes somewhat complicated by the provisions of the Constitution and statutes which secure to the inventor "the exclusive right to his discovery." If this right be "exclusive," it is difficult to see how the court can limit or impair it by requiring the patentee to accept anything less than the complete monopoly which the law awards him. While he may not be a manufacturer himself, and may derive his sole profit from licensing others to use his device, still such licenses are entirely voluntary upon his part, are completely within his own control, and the courts have, strictly speaking, no power to demand of him that he shall license the defendants to use his machine, as they are enabled to do indirectly by refusing an injunction, upon requiring a bond to pay the amount of the license or such damages as he may have suffered by defendant's use of his machines. If this, then, were a final decree, we should have no hesitation in denying this motion to stay the injunction unless immediate notice were given of an appeal, when the provision of the ninety-third rule would attach, and the staying of an injunction would become a matter of discretion, to be determined by the facts of each particular case.

It has undoubtedly been the practice in a few of the circuits to stay an injunction in certain cases where an appeal is contemplated and defendant would be irreparably injured, and where public interests are involved and the people are likely to be injured by denying them the use of plaintiff's machine there can be no question as to the propriety of such action. (*Bliss* v. *City of Brooklyn*, 4 Fish., 597; *McElroy* v. *Kansas City*, 21 Fed. Rep., 257; *Ballard* v. *City of Pittsburg*, 12 Fed. Rep., 783.)

A reference to some of the leading cases will show under what circumstances it has been the practice of the courts in these districts to suspend an injunction after an adjudication upon the merits. In *Barnard* v. *Gibson* (7 How., 650) the Supreme Court indicated that the injunction ought to be suspended where defendant had invested many thousand dollars in machinery which by such procedure became useless and their right to run the machines would expire in the course of a few months. The Court remarked that unless the defendants were in doubtful circumstances and could not give bond to respond in damages should the right of the plaintiff be finally established they supposed the injunction would be suspended. In *Sanders* v. *Logan* (2 Fish., 167) Mr. Justice Grier held that neither an injunction nor an accounting was necessary or proper, because the only injury to the plaintiff's rights consisted, not in using his invention, but in failure to pay the price of the license. The learned judge uses strong language in this connection, and the opinion undoubtedly lends considerable support to the defendant's position in this case. In

Dorsey Harvester Rake Company v. *Marsh* (6 Fish., 387) Judge McKennon, of the third circuit, withheld an injunction upon filing a bond, upon the ground that the plaintiff, not being a manufacturer, would be adequately protected by the payment of a just compensation for the use of his invention, and the defendants had an extensive establishment and a large capital invested in it for the manufacture of machines, and seemed to have conducted their business under the impression that it was no invasion of the rights of others. "A sudden stoppage of it would be disastrous to them and would not benefit the plaintiff." In its facts the case is readily distinguishable from the one under consideration. In the same circuit, in *McCrary* v. *Penn. Canal Company*, (5 Fed. Rep., 367,) an injunction was denied without discussion, upon the ground that much greater injury to the respondent than benefit to the complainant would result from it. We think these three cases may be regarded as establishing a rule in the third circuit somewhat at variance with those existing in most of the others. In *Hoe* v. *Knapp* (27 Fed. Rep., 204) Judge Blodgett denied an injunction, after entering the interlocutory degree, upon the ground that the owner of a patent had not after a reasonable time put it into use, holding, as a matter of law, that a patentee is bound either to use the patent himself or allow others to use it on reasonable or equitable terms. I find myself unable to concur in this view. A man has a right to deal as he chooses with his own. I know of no reason why a patentee is bound to make use of his own invention or to license others to use them any more than the owner of a manufacturing establishment is bound to run it for the benefit of his neighbors or employés. As observed in the earlier portion of this opinion, the question of licensing another to use an invention is one which the patentee alone has the right to answer, and courts cannot lawfully compel him to make use of his invention or to permit others to use it against his will.

We will now proceed to examine the authorities in the other circuits. In *Howe* v. *Newton* (2 Fish., 531) Judge Lowell, of the first circuit, held that the fact that plaintiff granted licenses and that defendant was not a maker and vender, but only a user, was, independently of the fact that the maker had not been sued, a circumstance to be taken into account—

but it has not been considered sufficient reason in this circuit to refuse the writ, excepting in combination with other circumstance s either of doubt as to title or of hardship in the operation of the injunction.

The defendant was restrained from using one boottree. It is but just to say that it appeared that no special damage would result to defendant by enjoining the machine. The case is not unlike the one under consideration. In *Potter* v. *Mack* (3 Fish., 428) Mr. Justice Swayne observed that when a patentee obtains a decree settling the right to an injunction the practice in all the circuits, as he had understood, was to make the injunction a part of the decree.

That is a right of the party unquestionably, unless there be shown some special grounds of peculiar hardship to the defendant. * * * There may be circumstances which would render that action proper; but I should not be willing to establish such a rule as general. * * * Again, too, as within my knowledge, the practice in all the other courts is adverse from that now sought to be established, and I should be reluctant to strike out a new course.

The Court found no special hardship in the case and ordered an injunction. (See, also, *Whitney* v. *Mowry*, (3 Fish., 175.) In *The Rumford Chemical Works* v. *Hecker* (11 O. G., 330) Judge Nixon, of New Jersey, refused to assent to the proposition that it had become the established practice in his circuit to stay injunctions until the coming in of the master's report.

No special practice [says he] has ever prevailed in this circuit, although sporadic instances may be found where the court has very properly listened to and heeded such applications. On the other hand, the ordinary practice is for an injunction, as a matter of course to follow a decree in favor of the complainant on the merits, unless the defendant is able to show the court such facts and circumstances existing in the case as make it manifest that the equities between the parties demand the withholding of the injunction until after an accounting has been had.

In *Brown* v. *Deere* (6 Fed. Rep., 487) the question has been discussed at length by Judge Treat, and the motion to suspend the injunction was overruled, although before the hearing defendants had entered into a large number of contracts to furnish their machines to agriculturists in several states, and there was no adequate time for them to reconstruct them so as to avoid the infringement without disappointing their customers and fastening large damages upon themselves for non-fulfillment of their contracts. The opinion is a very valuable and instructive one, and the question appears to have been fully considered by the court. In *Munson* v. *The Mayor* (19 Fed. Rep., 313) Judge Wheeler held, on a motion to suspend an injunction during the pendency of an appeal from a final decree, that it should not be suspended unless some extraordinary cause were shown to exist outside the rights of the parties established by the decree. The defendant in this case was the City of New York, and the patented device was a register to preserve for safety and convenience of reference paid bonds and coupons. The learned judge held that the interests of the public were not such as required protection by staying the injunction.

There is no case in the Supreme Court which throws much light upon this question, although in *Birdsell* v. *Shaliol* (112 U. S., 485) it is held that an infringer does not, by paying damages for making and using a machine in infringement of a patent, acquire any right himself to the future use of the machine.

On the contrary, [says the Court,] he may, in addition to the payment of damages for past infringement, be restrained by injunction from further use, and when the whole machine is an infringement of the patent be ordered to deliver it up to be destroyed.

In *Penn* v. *Bibby* (L. R., 3 Eq., 308) the Vice-Chancellor observed:

The patent is a continuing patent, and I do not see why the article should not be followed in every man's hand until the infringement is got rid of. So long as the article is used there is continuing damages. * * * As to the royalties, I cannot compel the plaintiff to accept the same royalty from these defendants as he received from others. I cannot in the decree do less than give the plaintiff his full rights, and I cannot bargain for what he may choose or may not choose to do.

The circumstances relied upon in this case in support of the motion are: That the plaintiff is not a manufacturer of these machines itself, but derives its sole profit from licensing others to use them; that the defendant is not a manufacturer, but uses one of these machines in a series of roller-mills, and that the issuing of this injunction would involve the stoppage of the entire series and a large expense to him in purchasing a new mill, or in so reconstructing this one as to avoid the use of plaintiff's invention. The counter affidavits, however, satisfy me that his estimate of damages is greatly exaggerated, and that the change could be made with but little expense or inconvenience and without stopping his establishment. It is incredible that an accident, which is liable to occur at any time, should involve the disastrous consequences set forth in the defendant's affidavits. We are willing, however, that he should have 20 days to make the necessary changes. At the expiration of this time the usual injunction will issue, to stand until the final decree, after which, if an appeal be taken, the propriety of continuing the injunction under the ninety-third rule will be considered by the court.

We do not wish to be understood as denying the power of the court to stay an injunction, even after final decree, and if this writ involve the stoppage of a manufactory in the operation of which a large number of people were interested the question might be determined by different considerations.

The motion is denied.

U. S. Circuit Court—Northern District of New York.

CONSOLIDATED OIL WELL PACKER COMPANY *v.* GALEY.

Decided June 7, 1889.

1. CROSS—PACKING FOR OIL-WELLS.
The second claim of reissued Letters Patent No. 7,772, granted July 3, 1877, upon the application of John R. Cross, for an improvement in packing for oil-wells, obtained 12 years after the date of the original patent, is an undue expansion of the first claim of the original patent

2. ROBINSON AND STRONG—PACKING FOR DEEP WELLS.
Reissued Letters Patent No. 8,786, granted July 1, 1879, to John K. Robinson and D. A. Strong, for packing for deep wells, *Held* to be an unwarranted enlargement of the original patent. The thing which was the subject of the original patent and the thing which it is desired to bring within the terms of the reissue are entirely dissimilar.

3. MARTIN—DEEP-WELL PACKING.
The fourth claim of reissued Letters Patent No. 7,244, granted July 25, 1876, to Francis Martin, for deep-well packing, compared with the second claim of the original patent, and *Held* to be not an enlargement or expansion of the original claim, but a statement in more clear and precise language of what is contained in the modified language of the original claim. The question of patentable novelty not considered.

Mr. H. H. Doubleday and *Messrs. Frost & Coe* for the plaintiff.

Mr. James G. Boyce for the defendant.

SHIPMAN, *J.*:

This is a bill in equity to restrain the defendant from the alleged infringement of Reissued Letters Patent No. 7,772, dated July 3, 1877, to John R. Cross, assignor to H. H. Bliss; of Reissued Letters Patent No. 8,786, dated July 1, 1879, to John K. Robinson and David A. Strong, and of Reissued Letters Patent No. 7,244, dated July 25, 1876, to Francis Martin, assignor to Henry H. Doubleday, all being for improvements in packing for oil or deep wells. The original patents were issued as follows: the Cross patent upon February 7, 1865; the Robinson and Strong patent upon February 6, 1866, and the Martin patent upon September 12, 1865.

The Cross and Martin patents were before me in the case of the *Consolidated Well Packer Co.* v. *Eaton, Cole & Burnham Co.* in the District of Connecticut, and the alleged infringing device in this case is believed to be substantially the same which was the subject of that suit. The opinion in that case (12 Fed. Rep., 865) states the facts relating to the history of the art, the character of the improvements which were the subject of the Cross and Martin patents, the several claims which were said to be infringed, the claims of the original Cross patent, the reason why all the claims of the reissued Cross patent were deemed to be invalid unless limited to the scope of the original claims, in which case there was no infringement, and the fact that the validity of one claim only of the reissued Martin patent was in dispute. The discussion in the present case was confined, by agreement of the parties, to the consideration of the validity of the reissues, and all other questions which may arise were reserved for a future hearing.

It is earnestly contended by the plaintiff that the second claim of the reissued Cross patent was not an undue expansion of the first claim of the original patent. The question was succinctly stated and answered in the decision in the Connecticut case, and little is to be added to what was there said. The first claim of the original patent was carefully limited to a packer in which the rings which compress or relax the packing material are operated from the top of the well by screw-rods. The second claim of the reissue omits that limitation, and thus eleven years after the original patent was granted its scope was greatly enlarged. It is not important that other and different means by which the rings might be operated were stated in the original specification, because these means were not claimed, and the invention as patented was limited to the use of screw-rods and their equivalent and so remained for a long period.

The Robinson and Strong reissue, which was granted 13 years after the date of the original patent, is of the same expanded character. The packer which was described in the original patent was constructed as follows: A cone was placed upon the end of one of the sections of the tubing, which could be a part of the tube or could be attached thereto. A concave made of elastic material was attached to the upper tubing, which, when the upper tubing reached the cone, was by its aid pressed out against the sides of the well.

The claims were as follows:

1. The tubes B and E, forming a telescopic joint, in combination with the flexible packing G, substantially as described.
2. In combination with a telescopic joint, the conical enlargement A, slots F, and screws or pins D, substantially as described.
3. The cone A and flexible packing G, arranged and operating substantially as described, forming a packing both for the well and the tube.

The first claim, unless the tube B should be construed to mean the tube with the attached cone, was larger than the invention. The specification of the reissue was rewritten and expanded. The cone became an enlargement or unyielding band or ring and the concave became a ring or band of elastic material which, as the upper section moved downward, was compressed or expanded, and this, it was said, was only one form of the invention. The first three claims of the reissue are capable of including a large variety of devices.

The claims are as follows:

1. In combination with the eduction-tube of an oil or other deep well, an outer tubular connection attached to the tubing in such manner that the upper section can move vertically, and a rubber annulus supported against downward thrust by the outer tubular connection and pressed against the wall of the

well by the weight of the vertically-moving eduction-tube, substantially as set forth.

2. An eduction-tube of an oil or other deep well, made in two sections connected with each other by means of an outer tubular connection in such manner that the upper section can slide vertically, and the rubber annulus surrounding the tube supported against downward thrust by the lower tube-section and pressed against the wall of the well by the upper tube-section, substantially as set forth.

3. In combination with the eduction-tube of an oil or other deep well, which is composed of two sections, an elastic or flexible packing and a telescopic coupling which is provided with means, substantially as described, whereby, when the upper section is removed from the well, the lower section will be carried up with it.

4. An eduction-tube of an oil-well or other deep well, composed of two sections coupled together in such manner that the upper section can slide vertically relative to the lower section, in combination with a flexible ring or band supported upon one of the tube-sections, and an unyielding wedge-shaped enlargement which presses the packing against the wall of the well when the upper section of the tubing moves downward relative to the lower section, substantially as set forth.

For these claims the device which was clearly described in and was the only subject of the original specification is not described. The cone and the concave packing have both disappeared. In place of the cone the first claim has "an outer tubular connection attached to the tubing in such manner that the upper section can move vertically," and has in place of the concave packing "a rubber annulus supported against downward thrust by the outer tubular connection." Each of the other claims is a marked example of the same attempt to expand a narrow patent and a narrow invention so as to cover a broad territory. The thing which was the subject of the original patent and the thing which it is desired to bring within the terms of the reissue are entirely dissimilar.

The important part of the Martin invention was—

a series of flat springs arranged lengthwise in the form of a cylinder about a well-tube, the latter being divided or made in two sections within the points inclosed by the springs and their ends connected by a coupling in such a way as to make a sliding joint.

The springs were surrounded by a cylinder of gutta-percha or other elastic material. The upper end of the coupling-tube was enlarged on the inside so as to form an inner circumferential rim which slides along the outside of the upper section, but is prevented from coming off the same by a rim surrounding the lower end of said section, and then the lower end which contains the packing is removed from the well.

The fourth claim of the reissue is the only one which is said to have been infringed. It is admitted that the other claims are an improper enlargement of the original patent, unless they shall be limited to the same construction of springs or leaves, in which case there was no infringement. The point at issue is whether the fourth claim of the reissue and the second claim of the original patent describe the same invention. For the purpose of thoroughly comparing the respective claims, I quote the first and second claims of the original patent and the fourth claim of the reissue, which are as follows:

1. In packing the tubes of oil and other deep wells, connecting the ends of the packing device or apparatus to separate or disconnected sections of the well-tube, so as to inclose the joint within said packing device, substantially as above described.

2. Connecting such separate sections of the well-tube to each other by means of a coupling one end of which slides on one of the sections, substantially as described.

4. In combination with the eduction-tube of an Artesian well, an elastic or flexible packing, a rim or shoulder upon the eduction-tube, and a corresponding rim upon the packer-support, whereby, when the eduction-tube is removed from the well, the rim or shoulders shall engage with each other and withdraw the packer-support, substantially as set forth.

The second claim of the original is for that portion of a packing device for tubes of oil-wells which consists of separate sections of the well-tube connected together by means of the described coupling, and does not describe any particular kind of packing. The claim has for its elements an elastic packing, separate tube-sections, one being the upper tube and the other the packer-support, connected together by the described rims or coupling. The fourth claim of the reissue is not an enlargement or expansion of the second claim of the original, but states in more clear and precise language what is contained in the inartificial language of the original claim. The infringing device would have infringed the terms of that claim. It must be remembered that upon this hearing the validity of the reissues as compared with the original patents is solely in issue. The novelty or the patentability of the various devices or parts of devices are not now the subject of consideration.

The defendant insists that if the complainant is entitled to a decree upon this claim it must be upon condition of a disclaimer, so as to limit the patented invention to that which was contained in the original patent and without costs. It is not now necessary to consider the question of costs, because upon a hearing of the facts the court may be of opinion that the invention of the fourth claim has no patentable novelty and that the bill should be dismissed.

U. S. Circuit Court—Eastern District of Pennsylvania.

DOBSON *et al. v.* GRAHAM.

Decided June 25, 1889.

INFRINGEMENT CONDUCTED SECRETLY.

In a suit for an alleged infringement conducted secretly in a manufactory reliable evidence tending to show such infringement must be produced. The plaintiff cannot depend upon the chance of obtaining evidence to support the charge from the defendant and his workmen or from an inspection of his machinery.

Mr. Hector T. Fenton for the complainants.

Messrs. Strawbridge & Taylor for the defendant.

BUTLER, *J.*:

These motions must be dismissed, for the reasons stated in disposing of similar motions at an earlier period in the case. As then said, the plaintiff filed his bill charging infringement of his rights without having any positive knowledge upon the subject. He seems to have relied on the chance of obtaining evidence to support the charge from the defendant and his workmen. Such a case is not entitled to the special favor of a court of equity. The defendant's business is conducted in private, for the purpose of securing to himself (as he asserts) the use of his peculiar machinery and methods of manufacture. These secrets of his business, if they cover nothing unlawful, are his property and as well entitled to protection as the rights secured by the plaintiffs' patent. His workmen are bound by express contract not to divulge them. In the absence of such contract equity would imply an obligation of equal force. If it were shown that these secrets are used as a cloak to cover an invasion of the plaintiffs' rights, or if there was reliable evidence tending to show it, and justifying a belief that they are so used, the motions would be sustained. But there is no such evidence before us. It appears that the defendant employs certain workmen who were formerly employed by the plaintiff; that these workmen are familiar with the plaintiff's patented machinery, and that they aided in constructing the defendant's. This is substantially all. These workmen have been permitted to answer questions directed toward a comparison of the defendant's machinery with the plaintiff's, except where the answers would tend to describe wherein the former differs from the latter, and thus to describe the peculiarities of the defendant's machinery. The court cannot properly compel them to go further, nor, in this state of the facts, compel the defendant to submit his machinery to inspection.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—

DESIGNS.

19,269 and 19,270.—CLOCK-CASE.—*George Ward Bidwell*, New Haven, Conn. Applications filed May 10, 1889. Serial Nos. 310,347 and 310,348. Term of patents 7 years.

19,271.—BADGE.—*Joseph K. Davison*, Philadelphia, Pa. Application filed June 11, 1889. Serial No. 313,929. Term of patent 14 years.

19,272.—ORNAMENTATION OF HARDWARE.—*John E. Harbster*, Reading, Pa., assignor to *The Reading Hardware Company*, same place. Application filed July 3, 1889. Serial No. 316,444. Term of patent 7 years.

19,273 and 19,274.—DISH.—*Charles Ed. Haviland*, Limoges, France. Applications filed January 5, 1889. Serial Nos. 295,569 and 295,570. Term of patents 14 years.

19,275.—ELECTRIC-LIGHT SHADE.—*Andrew Howard*, Wilkinsburg, Pa. Application filed July 11, 1889. Serial No. 317,218. Term of patent 3½ years.

19,276.—HANDLE FOR TABLE-WARE.—*Robert Henry Klingel*, Bridgeport, Conn., assignor to *The Holmes & Edwards Silver Company*, same place. Application filed July 24, 1889. Serial No. 318,556. Term of patent 14 years.

19,277 and 19,278.—FOUNTAIN-PEN OR PENCIL HOLDER.—*Edward Todd, Jr.*, New York, N. Y., assignor to *Edward Todd & Co.*, same place. Applications filed July 10, 1889. Serial Nos. 317,053 and 317,054. Term of patents 7 years.

19,279.—ELECTRIC-LIGHT SHADE.—*Joseph Webb*, Beaver, Pa. Application filed July 11, 1889. Serial No. 317,219. Term of patent 3½ years.

19,280.—FLOWER-POT.—*John G. Whilldin*, Philadelphia, Pa. Application filed July 12, 1889. Serial No. 317,332. Term of patent 14 years.

19,281.—GAS-STOVE.—*Hiram G. Wilson*, Minneapolis, Minn., assignor to *John C. Higdon*, Washington, D. C. Application filed July 23, 1889. Serial No. 318,431. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,936.—BOOTS AND SHOES.—*American Shoe Company*, Lynn and Boston, Mass. Application filed July 19, 1889. Used since July 1, 1887.
"The word 'NATIONAL.'"

16,937.—HORSE-BLANKETS.—*Wm. Ayres & Sons*, Philadelphia, Pa. Application filed July 8, 1889. Used since June, 1887.
"The word 'ELECTRIC.'"

16,938.—HORSE-NETS.—*Wm. Ayres & Sons*, Philadelphia, Pa. Application filed July 8, 1889. Used since November, 1887.
"The word 'CLIPPER.'"

16,939.—BLEACHED COTTON SHEETINGS.—*Amos N. Beckwith*, Providence, R. I. Application filed July 9, 1889. Used since October 29, 1874.
"The words 'ROCKLAND MILLS WATER TWIST.'"

16,940.—CHEWING-TOBACCO.—*Bitting & Hay*, Winston, N. C. Application filed June 26, 1889. Used since April 9, 1889.
"The words 'HENRY GRADY.'"

16,941.—RUBBER BOOTS AND SHOES AND ALL KINDS OF RUBBER AND OIL CLOTHING, ALSO RUBBER HOSE AND TUBING.—*Day Rubber Company*, St. Louis, Mo. Application filed June 22, 1889. Used since January 1, 1889.
"The representation of a swan and the words 'SWAN BRAND.'"

16,942.—CHECK-ROW CORN-PLANTERS.—*The H. P. Deuscher Company*, Hamilton, Ohio. Application filed June 22, 1889. Used since February 1, 1885.
"The word 'UNIVERSAL.'"

16,943.—WRITING-PAPER AND ENVELOPES.—*George H. Dickson's Sons*, New York, N. Y. Application filed July 15, 1889. Used since July 1, 1889.
"The words 'ROYAL PLATE.'"

16,944.—WRITING-INK.—*Charles Patton Dimitry*, New Orleans, La. Application filed July 19, 1889. Used since April 15, 1889.
"The representation of a hand holding a pen."

16,945.—CORSETS.—*J. Richd. Freud*, New York, N. Y. Application filed July 6, 1889. Used since January 1, 1889.
"The letters 'R. F.'"

16,946.—VELVETS AND PLUSHES.—*Peltzer Gebrüder*, Crefeld, Prussia, Germany. Application filed July 6, 1889. Used since February 1, 1889.
"The word 'CONSTELLATION.'"

16,947.—FLOUR.—*The Estate of George V. Hecker*, New York, N. Y. Application filed June 25, 1889. Used since March 14, 1889.
"The letters 'BB' arranged within a circle of medals."

16,948.—JUTE PRODUCTS, SUCH AS TWINE, BAGGING, CARPETINGS, OIL-CLOTH, AND THE LIKE.—*Chelsea Jute Mills*, New York, N. Y. Application filed July 24, 1889. Used since July 1, 1886.
"The representation of an arrow with the letters 'C J M' thereon."

16,949.—POWDERED LYE.—*E. Myers & Co.*, St. Louis, Mo. Application filed July 6, 1889. Used since October 4, 1888.
"The words 'MERRY WAR.'"

16,950.—MILK FOOD FOR INFANTS AND INVALIDS.—*Reed & Carnrick*, New York, N. Y. Application filed July 11, 1889. Used since February 12, 1889.
"The word 'LACTO-PREPARATA.'"

16,951.—PLAYING-CARDS.—*Robinson & Brandoo*, New Orleans, La. Application filed July 19, 1889. Used since November, 1888.
"The monogram 'R AND B.'"

16,952.—TOBACCO-PIPES.—*Ruth Pipe Company*, St. Louis, Mo. Application filed July 16, 1889. Used since June 1, 1888.
"The word 'CHAMPION.'"

16,953.—CURED TOBACCO.—*William H. Snow*, High Point, N. C. Application filed May 3, 1889. Used since September 10, 1887.
"The words 'MODERN BARN.'"

16,954.—CORSETS.—*K. B. Sonnehill & Son*, Baltimore, Md. Application filed July 8, 1889. Used since April 1, 1889.
"The words 'LEGAL TENDER.'"

16,955.—PUZZLE.—*Maurice Warnier*, New York, N. Y. Application filed April 19, 1889. Used since April 13, 1889.
"The words 'THE OLD CONTINENTALS.'"

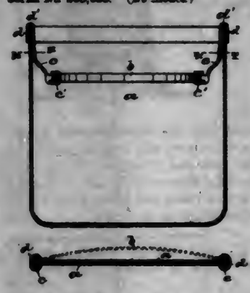
16,956.—METALLIC TUBES OF ALL DESCRIPTIONS.—*The Weldless Steel Tube Co.*, Birmingham, county of Warwick, England. Application filed July 25, 1888. Used since 1874.
"The word 'WELDLESS.'"

16,957.—BRUSSELS CARPETS.—*Matthew J. Whittall*, Worcester, Mass. Application filed July 8, 1889. Used since January 1, 1886.
"The words 'VICTORIA BRUSSELS.'"

16,958.—FACIAL SOAP.—*John H. Woodbury*, New York, N. Y. Application filed June 3, 1889. Used since January 1, 1889.
"The representation of a human head and face minus the bust and neck."

LABELS.

5,999.—Title: "OUR NATIVE HERBS." (For a medicine.)—*A. O. Bliss*, Richmond, Va. Application filed July 29, 1889.

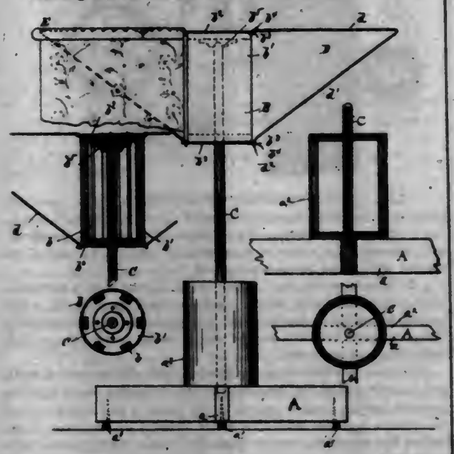


6,000.—Title: "MERCHANT'S ROOFING."—*Merchant & Co.*, Philadelphia, Pa. Application filed July 24, 1889.

6,001.—Title: "ONE (BAKER'S) DOZEN." (For safety-pins.)—*George Frost & Co.*, Boston, Mass. Application filed July 30, 1889.

PATENTS

GRANTED AUGUST 20, 1889.

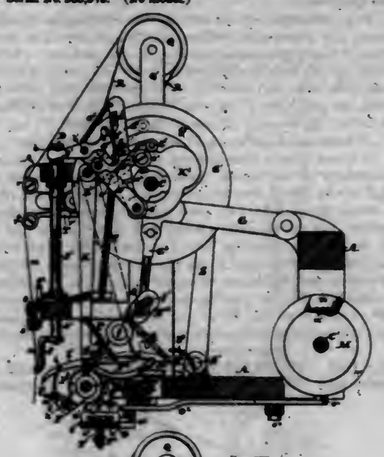


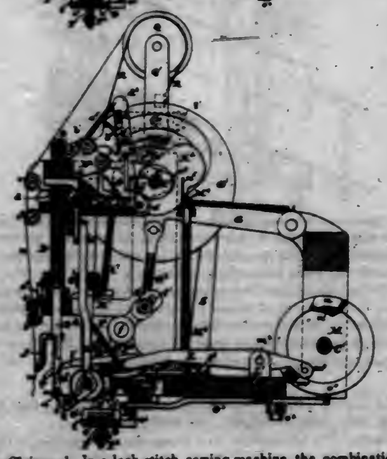
409,159. POUCH OR BAG. GEORGE R. ADAMS, Irvington, N. J. Filed Jan. 7, 1889. Serial No. 295,933. (No model.)

Claim.—1. A self-closing bag or pouch having a flexible mouth, having a spring arranged near said mouth and adapted to move in a horizontal plane when the ends of said mouth are pressed, said spring having arms at the ends thereof and extending up and engaging with the ends of the mouth of the bag to keep said mouth stretched longitudinally when in its normal position, for the purposes set forth.

2. A self-closing bag or pouch having a flexible mouth, having a spring arranged near said mouth adapted to move in a horizontal plane when the ends of said mouth are pressed, said spring having arms thereon and secured thereto by means of projections *c'*, said arms also being secured at the opposite ends thereof to the ends of the mouth of the bag by means of clamping-clips or metallic plates bent around the ends of the mouth of the bag and the arms on said spring, for the purposes set forth.

409,160. EXHIBITOR. CHARLES H. BACON, Danielsonville, Conn. Filed Aug. 27, 1888. Serial No. 283,949. (No model.)





Claim.—1. As an improvement in show stands or racks, the combination of the vertical shaft, the upper revolving cylinder secured thereon, and the series of suspending-racks having upper and lower bent ends removably secured to the upper and lower ends of said cylinder, substantially as set forth.

2. As an improvement in show stands and racks, the upper revolving cylinder having upper and lower head-plates provided with apertures around their edges, and the series of suspending-racks composed of a single bent rod having hooked ends secured in said apertures, substantially as set forth.

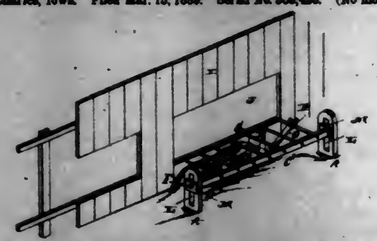
3. The combination, with the vertical shaft and the upper cylinder, of the series of racks secured to said cylinder, and having upper horizontal portions, and the shoulders or U-shaped bars secured on the said horizontal portions of the racks, substantially as set forth.

409,161. SOLE-SEWING MACHINE. JOSEPH E. BERTRAND, Boston, assignor of one-half to Mellen Bray, Newton, Mass. Filed Sept. 17, 1888. Serial No. 285,575. (No model.)

Claim.—1. In a lock-stitch sewing-machine, the combination of

the oscillating needle and awl-carrier F, provided with the groove *j* and shoulder *j'*, the needle *i*, fitted to said groove *j*, the awl *i'*, provided with a plate-like shank i^2, having a thickness equal to the aggregate thickness of the body of said awl and the distance required between said awl and needle and provided with the slot i^3, the threaded stud *k*, and the nut *k'*.

2. In a lock-stitch sewing-machine, the combination of a fixed work-support, a presser-foot, a spring for pressing said foot upon the work, an oscillating curved awl and a barbed needle arranged side by side and parallel with each other and to enter the work from the side opposite to said presser-foot, the lever D', connected at one end to the upper end of the presser-foot rod and provided at its other end with two sets of ratchet-teeth b^2 and b^3, with the shoulders of their teeth opposed to each other or facing in opposite directions, the lever E, pawl *c*, and cam c^2, for locking said presser-foot, and the lever d^2, arm d^3, pawl *d'*, and the cam c^4, for lifting said presser-foot above the work when the work is to be fed.



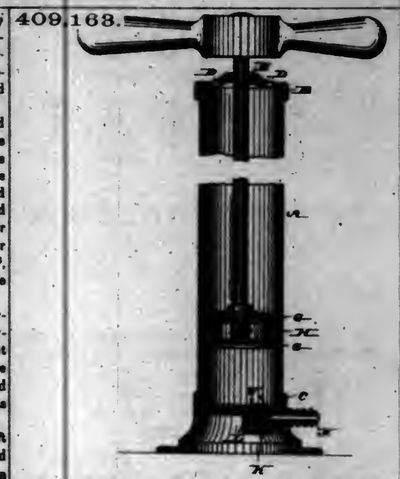
3. In a lock-stitch sewing-machine, the combination, with a circularly-curved barbed needle and a thread guide or carrier for carrying the thread into engagement with the barb of the needle after it has pierced the work, of the arm *l'*, provided with the hook l^2, the elbow-lever K, the revolving-cam K^2, the spring l^3, and the curved cam-plate l^4, all constructed, arranged, and operating substantially as and for the purposes described.

4. In a lock-stitch sewing-machine, the combination of the shaft F', the carrier-arm F, the curved needle *i* and awl *i'*, secured to said carrier side by side and arranged to be forced through the work from the same side, a pinion secured upon said shaft, a toothed segment engaging with said pinion and provided with a slotted arm, the link G^2, the lever G, truck f^3, and cam G', for oscillating said shaft and carrier, the levers H, H^2, and I, the rocker-shaft H^3, and cam I, for imparting to said shaft an intermittent reciprocatory motion, substantially as described.

5. In a lock-stitch sewing-machine, the combination of a shaft constructed and arranged to oscillate about its axis and to be moved endwise in its bearings, a carrier-arm secured upon said shaft, a barbed needle and an awl, both secured to said carrier-arm side by side, parallel with each other, and bent to a curve concentric with the axis of said shaft, the gear-wheel F^2, segment F^3, arm F^4, the lever G, the cam G', the rod G^2, the levers H, H^2, and I, the rocker-shaft H^3, and the cam I', all constructed and arranged substantially as described.

6. In a lock-stitch sewing-machine, the combination of an oscillating circularly-curved barbed needle and a circularly-curved awl arranged side by side in the same carrier-arm, parallel to each other, and to pierce the work from the same side, the loop-spreading finger *m*, mounted upon and revoluble with the hub of the needle and awl carrier, the lever L, provided with the loop-opening finger *m'* and pivoted in the swiveling stand L', the cams for imparting to said lever L both vertical and horizontal vibratory motions, the pivoted lever M', provided with the loop receiving and releasing finger n^2, the rocker-shaft M^2, the levers M^3 and M^4 n^3, and the cam c^3, all constructed, arranged, and operating substantially as and for the purposes described.

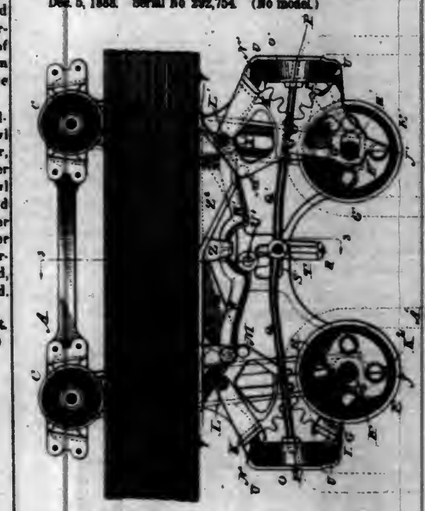
409,162. **DEVICE FOR FEEDING STOCK.** George Black, St. Charles, Iowa. Filed Mar. 15, 1889. Serial No. 303,426. (No model.)



Claim.—1. The combination, with the posts having vertical slots, of the blocks mounted to slide vertically in the said slots, the swinging frames mounted in the said blocks, and a fence or barrier erected in front of the posts, substantially as set forth.

2. The combination of the posts or uprights, the swinging frames suitably mounted in the same and provided with transverse cross-bars, the forked props or supports suitably attached to the free edges of the swinging frames, and the fence or barrier erected in front of the posts, substantially as and for the purpose herein set forth.

409,163. **PUMP.** William Bonsil, Philadelphia, Pa. Filed Sept. 13, 1888. Serial No. 285,297. (No model.)



Claim.—The combination, in a pump, of a chamber having inlet-openings at the top and a valveless piston therein, the piston-head

409,163.

having a flexible cup, the depending wall of which is free to yield inwardly, so as to be in contact with the walls of the chamber during the downstroke and free therefrom on the upstroke, and a second chamber below said first chamber and in communication therewith and provided with a rising and falling valve which controls said communication, substantially as described.

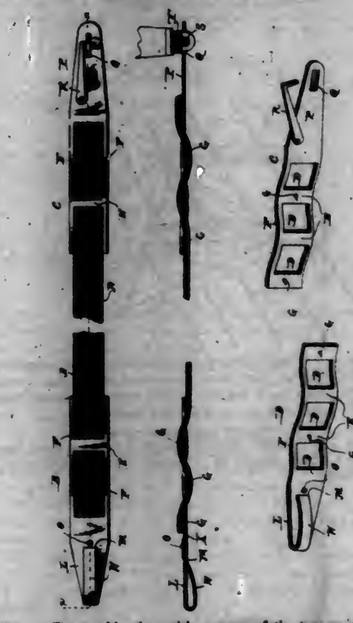
409,164. **HAY-CARRIER.** Allen P. Boyer, Sturgis, Mich. Filed Dec. 5, 1888. Serial No. 292,754. (No model.)

Claim.—1. In a hay-carrier, the combination, with a frame and lifting-sheaves carried thereon, of a set of clutch-gear for each sheave, and a lifting-rope passing over each sheave and through the clutch-gear, whereby the clutch is automatically operated to prevent the slipping of the rope, substantially as set forth

2. In a reversible hay-carrier, the combination of a suspended track, a frame movable thereon, latches secured to the track, a bolt against which the latches impinge, and mechanism for automatically lifting the latch and releasing the carrier by the act of lifting a load, substantially as set forth.

3. In a reversible hay-carrier provided with a lifting-rope, sheaves, and pendent pulley, the combination of a suspended track, a frame movable thereon, latches secured to the track, a bolt against which the latches impinge, and a latch-key adapted to lift either of the latches and release the carrier when the load is raised, substantially as set forth.

4. In a reversible hay-carrier provided with sheaves and pendent pulley, the combination of a suspended track, a frame movable thereon, latches secured to the track, a bolt against which the latches



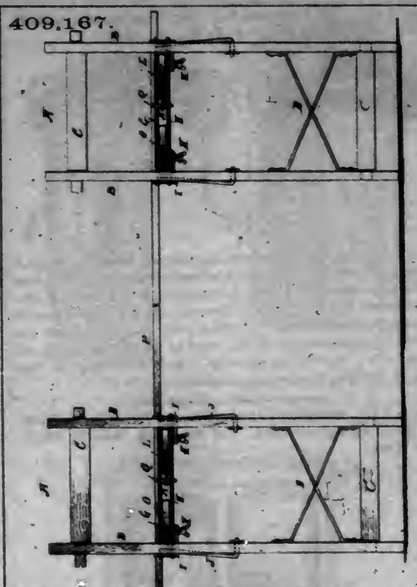
impinge, and a latch-key provided with guide-rods, guide-pieces for supporting the guide-rods, and the lifting-rope having obstructions, whereby the position of the latch-key is automatically shifted by the act of lifting the load, substantially as set forth.

5. In a reversible hay-carrier, the combination, with a suspended track, of a frame, lifting-rope, pulley, sheaves, cams G G' K K', each being provided with jaws, lugs upon said cams K K', and projections Z' Z^2, secured to the track, whereby the jaws of the said cams are held separated while the carrier is being operated to lift a load, substantially as set forth.

6. In a reversible hay-carrier, the combination, with a suspended track, of a frame, pulley, sheaves, cams G G' K K', each being provided with jaws, lugs upon said cams K K', projections Z' Z^2, and latches W W', secured to the track-bolt U', the latch-key R, having its bearings in the said frame, latch-key guide-rods Q Q', guide-pieces O O', provided with guide-holes P P', and the lifting-rope having obstructions, as and for the purpose set forth.

409,165. WITHDRAWN.

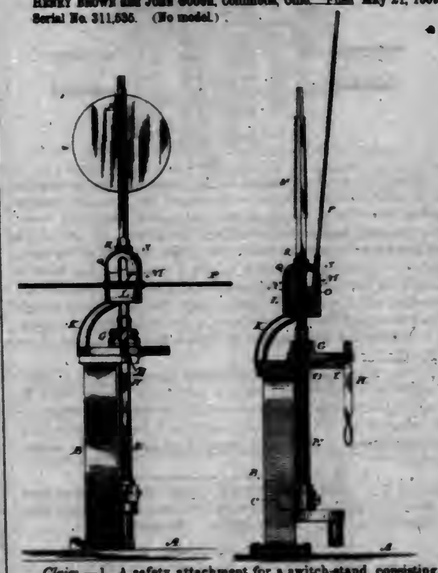
409,166. **TRACE.** Alexander W. Brigden, Mackville, Ky. Filed Mar. 26, 1889. Serial No. 304,798. (No model.)



Claim.—The combination, with a trace, of the transversely-slotted plates, through which the ends of said trace are threaded, one of said plates being provided with a projecting lip turned back through a transverse slot at the base of the shank of said lip and secured by means of a rivet, and the other plate being provided with a perforated extension having a pivoted hook, substantially as and for the purpose set forth.

409,167. **SCAFFOLD.** Edward Brockbank, Tremont, N. Y. Filed Mar. 6, 1889. Serial No. 302,063. (No model.)

Claim.—1. The combination of the frames A, containing the upright members B, provided with openings, as E F, the movable transverse bars G H, received in said openings, a stop Q, movable on said bars, and a swinging strut J, pivoted on the exterior of one of said members B, and having a clamp, such as K, upon its free end, substantially as described.



2. The combination of the frames A, each having two upright members, as B, and a fixed transverse member, as C, a series of diagonally-disposed openings, as E F, in each of said members B, movable transverse bars G H received in said openings and extending between the members B, a platform L, received between and supported upon the bars G H of the respective frames A, and swinging struts J, pivoted on the exterior of the respective members B and provided with clamps K at their free ends, the aforesaid elements operating and arranged so that when the platform is in place supported upon the bars

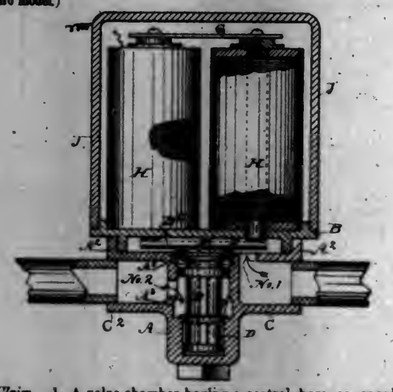
409,167.

G H the struts J may be swung upward and the clamps on the end thereof secured to the edges of said platform.

409,168. **SAFETY ATTACHMENT FOR RAILWAY-SWITCHES.** Henry Brown and John Gough, Columbus, Ohio. Filed May 21, 1889. Serial No. 311,635. (No model.)

Claim.—1. A safety attachment for a switch-stand, consisting of the combination, with the signal-shaft, of a pivoted arm secured to the shaft and carrying a hoop or cage at its free end, and an inclined cam-surface against which the arm bears when the switch is turned, substantially as set forth.

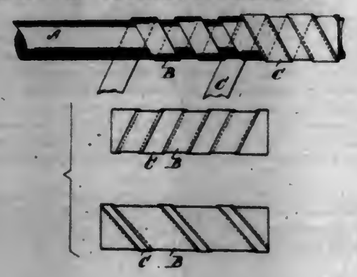
2. In a switch-stand, the combination of a bracket K, supporting a notched block or cylinder L, having cam-surfaces M, and an arm O, pivoted to the switch-shaft and carrying a cage P, substantially as set forth.



3. In a switch-stand, the combination of a bracket K, supporting a notched block or cylinder L, having cam-surfaces M, an arm O, pivoted to the switch-shaft and carrying a cage P, and a cap Q, slotted at S, substantially as set forth.

409,169. SELF-SEALING JAR. JOHN W. BULGER, East Liverpool, Ohio. Filed Oct. 3, 1888. Serial No. 287,100. (Model.)

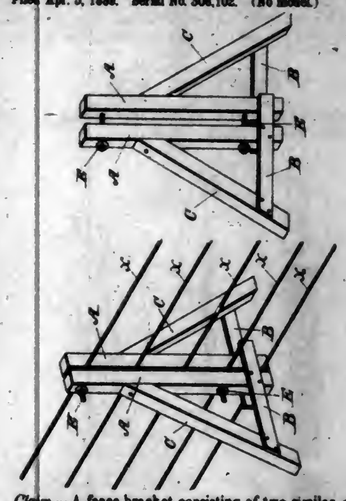
Claim.—The combination, with a jar having horizontal beads at its upper end arranged to provide intervening spaces for the insertion of bail-clamps and a lid or cover having a screw-threaded boss integral therewith, of a bail-clamp constructed with inwardly-projecting lips to engage the beads and provided with a screw-threaded nut substantially equal in length to the length of the boss on the lid and furnished with a series of female screw-threads that engage the male threads of the boss, substantially as set forth.



409,170. ELECTRIC VALVE. MILTON C. WHEELER and ALBERT M. CLARK, Marshalltown, Iowa. Filed Feb. 4, 1889. Serial No. 298,663. (No model.)

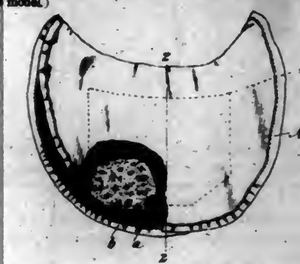
Claim.—1. A valve-chamber having a central bore, an angular groove and valve-seat in the lower portion of the bore and a corresponding valve-seat at the top of the bore, and a detachable cover, electro-magnets supported by the cover, a branch at one side of the valve and a port extending from its bore into the top of the valve-chamber, a corresponding branch having a port extending from its bore into the bore of the valve-chamber at a point between the two valve-seats, and a cylindrical tubular valve having annular flanges adapted to engage the two valve-seats in the bore of the valve-chamber, to be balanced and operated by electric force, in the manner set forth.

2. The valve-chamber A A^1, having an annular groove A^1, tubular extensions C and C^2, and ports 1 and 2, the tubular valve D, having annular flanges D', that are beveled on their under sides, the fixed armature D^2, and the electro-magnets F, arranged and combined substantially as shown and described, to operate in the manner set forth.



409,171. SINGLE-PLY SPIRAL TUBING. EDWARD K. COAS, Providence, R. I., assignor to the Detroit Spiral Tube Company, Detroit, Mich. Filed Jan. 14, 1889. Serial No. 296,340. (No model.)

Claim.—1. A metallic pipe formed by winding a ribbon of metal upon a mandrel, with a space between its successive convolutions, and a second strip wound over said space and lapping at both edges over the edges of the first strip and soldered thereto along the meeting faces, substantially as described.



2. A metallic pipe formed by winding a tinned strip of iron or steel upon a mandrel, with a wide space between its successive convolutions, then winding thereon through a solder-bath another tinned strip of iron or steel over said space and lapping onto the metal on both sides thereof, said two strips being thus soldered together along their meeting faces, substantially as described.

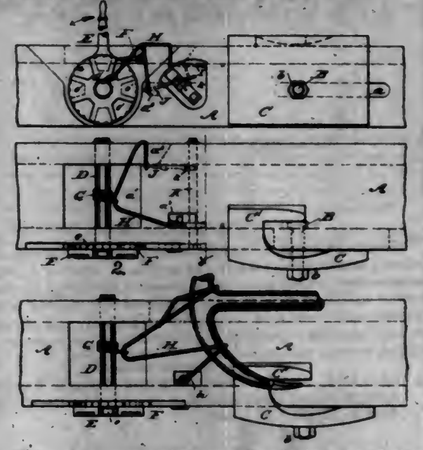
409,172. FENCE-BRACKET. ABRAM O. CORELL, Charlotte, Mich. Filed Apr. 5, 1888. Serial No. 306,102. (No model.)

Claim.—A fence-bracket consisting of two similar opposite sections bolted together, each section composed of a post, a brace, and a connecting base-board, the base of each extending beyond both upright posts, substantially as set forth and described.

409,173. DRESS-SHIELD. MARY E. CRANDAL, Hyde Park, and EFFIE B. REESE, Chicago, Ill. Filed Apr. 25, 1888. Serial No. 271,782. (No model.)

Claim.—As an improved article of manufacture, a dress-shield containing a volatilizable compound of sandal-wood, cascarilla, vetivert, benzoin, myrrh, tonqua, and essential oils to neutralize the odors of the perspiration and of the material of the shield, substantially as described.

409,174. WHIFFLETREE-HOOK. WILLIAM H. CUTSHAW and JACOB SUMMERS, Hollandsburg, Ind. Filed May 25, 1889. Serial No. 312,107. (No model.)



Claim.—A spring draft-hook for vehicles, having the square shank *b* and round nut B' on its threaded end, the straight barreled case A.

in which said shank and nut fit, and perforated end flanges *a a* in line with said barrel, whereby screw-caps at the ends are dispensed with, and the hook may be applied on the right or left on the inside of shafts, as described.

409,175. VERMIFUGE. WALLACE DAWSON, Montreal, Quebec, Canada. Filed May 13, 1889. Serial No. 310,635. (No specimens.)

Claim.—The herein-described worm remedy, consisting of a drop of chocolate cream having santonin and elaterium incorporated therein, substantially in the proportions specified.

409,176. ANCHOR-TRIPPER. CHARLES W. DYLOS, Wiscasset, Me., assignor to the American Ship Windlass Company, Providence, R. I. Filed Apr. 10, 1889. Serial No. 306,655. (No model.)

Claim.—1. An anchor-tripper consisting of a hook-shaped plate adapted to slide fore and aft along the rail and engage with a fluke of the anchor, substantially as described.

2. The combination, with the plate A, adapted to be fastened to the rail of a vessel, of the anchor-tripper C, having the L-shaped arm C', to engage with a fluke of the anchor and adapted to slide fore and aft along the plate A, substantially as described.

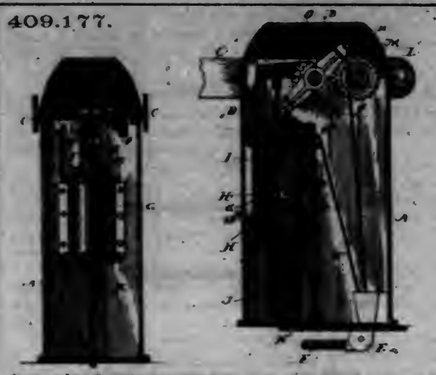
3. The combination, with the rail of a vessel, of the plate A, having a depending flange provided with a slot *a*, the tripper C, adapted to slide along the plate A, and the bolt B, passed through the slot *a* and serving to lock the tripper C, substantially as described.

4. The combination, with a sliding hook-shaped anchor-tripper adapted to engage with a fluke of the anchor, of a shank-painter, substantially as described.

5. The combination, with a sliding hook-shaped anchor-tripper adapted to engage with a fluke of the anchor, of a shank-painter and means for putting and retaining a tension on the painter, substantially as described.

6. A shank-painter for anchors, consisting of a rope, chain, or wire having an eye in each end, detachable fastenings for the eyes and means for heaving taut the bight of the rope, substantially as described.

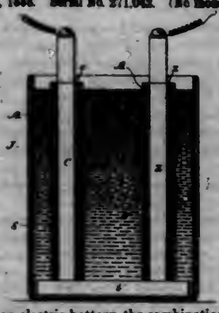
7. The combination, with the shaft D, of the rope G, wound thereon, the painter H, fastened to the rope G and having the eye *h* at each end, and the bolts I J, suitably supported on the rail of the vessel and adapted to engage with the eyes, substantially as described.



8. The combination, with the shaft D, of the wheel E, having ratchet-teeth and sockets, the pawl F, engaging with the ratchet-teeth, the rope G, wound on the shaft, the painter H, fastened to the rope G and provided with the eyes *h*, the bolts I J, and the shaft K, having the arms *k*, for actuating the bolts, substantially as described.

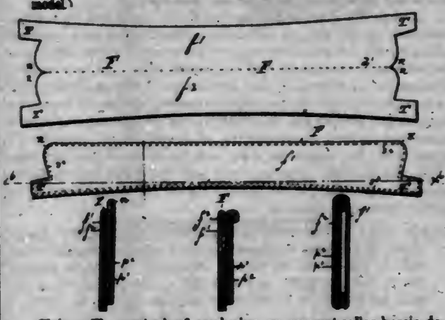
409,177. RAILWAY-GATE. ROBERT C. DOUGLAS, Chicago, Ill., assignor to the Pneumatic Power and Railroad Gate Company, same place. Filed Jan. 28, 1889. Serial No. 297,842. (No model.)

Claim.—1. In a railway-gate, the combination, with a gate-shaft, of a double-acting power-cylinder whose piston has a hollow system projected through the end of the cylinder and a connecting-rod pivoted to the piston and to a walking-beam or crank-arm connected to the gate-shaft and adapted to reciprocate within the hollow of said stem, substantially as described.



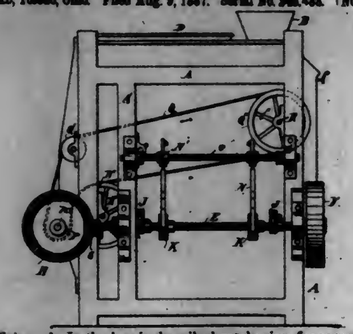
2. In a railway-gate, the combination, with the gate-shaft, of a power-cylinder whose piston has a hollow stem projected through the end wall of the cylinder, a connecting-arm pivoted at one end to the

409,177.



piston and at the other to a walking-beam or crank on the gate-shaft, and a gate-arm rigidly secured to said shaft, whereby the reciprocation of the piston causes the lowering or raising of the arm, substantially as described.

409,178. SECONDARY BATTERY. CAMILLE A. FAURE, New York, N. Y., assignor to the Electrical Accumulator Company, of New York. Filed Apr. 16, 1888. Serial No. 271,042. (No model.)



Claim.—In an electric battery, the combination of a negative element, a positive element, and a diaphragm or septum composed of asbestos, a soluble salt, and a silicate, combined together substantially as described.

409,179. METHOD OF MAKING APPAREL-COLLARS. JAMES F. FELLOWS, Troy, N. Y. Filed Mar. 16, 1889. Serial No. 303,509. (No model.)

Claim.—The method of producing an apparel-collar herein described, and consisting in cutting the facing-blank in one piece of double width, and folding it longitudinally and centrally to produce the facings, substantially as described, cutting the ply-blank in one piece of double width and folding it longitudinally and centrally to produce two thicknesses of the ply, substantially as described, laying the folded ply-blank upon the folded facing-blank, so as to subtend the latter at the top edge of the collar, turning down the subtending top edge of the ply, sewing the ends of the blanks as thus laid, turning the parts through the open side so as to bring the facing-folds at the outside, then turning in the bottom edges and border-stitching the parts, as herein set forth.

409,180. DEVICE FOR SEPARATING WEEVIL AND WEEVIL-DUST FROM GRAIN. THOMAS R. FERGUSON and ADONIJH H. BLANCHARD, Toledo, Ohio. Filed Aug. 9, 1887. Serial No. 246,488. (No model.)

Claim.—1. In the herein-described mechanism for operating two independently-reciprocating shoes, the combination, with a horizontal driving-shaft carrying a pulley at one end, of the angularly-arranged eccentrics secured to the shaft, a rock-shaft in parallel relation with the driving-shaft, bell-crank levers secured thereto, pitmen connecting two of the eccentrics, and bell-crank levers, and the link-arms and pitman connecting the shoes and operating mechanism, substantially as shown and described.

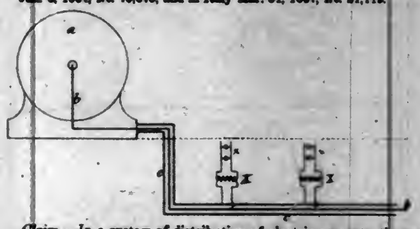
2. In a machine for separating weevil and weevil-dust from grain, the combination, with an inclined shoe provided with a screen and carrying an endless scraper-belt beneath the screen, of a horizontal power-shaft having eccentrics arranged thereon, a horizontal rock-shaft located above the power-shaft and carrying bell-crank levers, pitmen connecting the eccentrics and bell-crank levers, link-arms connecting the shoe and said levers, gear-wheels G, arranged upon one end of the power-shaft adapted to mesh with a second gear H, the pulleys P and Q', mounted as described, and the belt for operating them, all arranged and adapted to operate substantially as shown and described.

3. The herein-described mechanism for supporting and operating two independently-reciprocating shoes and the endless scraper-belts carried within them, consisting of the horizontal power-shaft having a pulley at one end and a gear-wheel at the other, two pairs of angularly-arranged eccentrics secured to the shaft, a horizontal rock-shaft located above the power-shaft and having bell-crank levers secured thereon, pitmen N, connecting one pair of eccentrics with the bell-crank levers, link-arms N", connected to the crank-levers, the pitmen J', connected to the second pair of eccentrics, a gear-wheel mounted upon a transverse shaft H' and meshing with the gear upon the power-shaft, the pulleys P, Q', and R", mounted, respectively, upon the shaft H', R, and R"', the belt Q, and the idler Q', all arranged and adapted to operate substantially as shown and described.

4. A machine for separating weevil and weevil-dust from grain, consisting of the pair of oppositely-inclined chutes, each provided with a screen, and the endless scraper-belts mounted within said chutes, the horizontal power-shaft with its beveled pinion and its eccentrics arranged in two differential pairs, the horizontal rock-shaft having the pair of bell-crank levers, the pitmen connecting one pair of eccentrics to the lower scraper and the other pair of eccentrics to end of the levers, and the links connecting the other ends of said levers to the upper chute, the transverse shaft, with its beveled wheel and belt-pulley, and the belt extending from said belt-pulley to belt-wheels upon the upper shafts of the belts in the two chutes, substantially as and for the purpose specified.

409,181. CONDUCTOR FOR CONVEYING ELECTRICITY. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Sept. 24, 1888. Serial No. 286,306. (No model.) Patented in England Dec. 11, 1885, No. 15,351; in France Dec. 9, 1886, No. 180,176; in Belgium Jan. 8, 1887, No. 75,875, and in Italy Jan 19, 1887, No. 21,119.

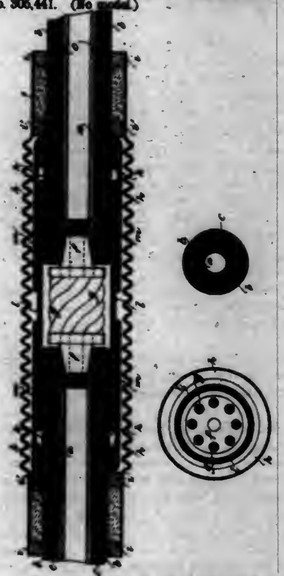
Claim.—1. The combination of two concentric conductors consisting of the interior metallic tube *a*, the exterior solid metallic tube *b*, and insulating material filling the space between them.



2. The combination of two concentric conductors consisting, respectively, of the interior metal tube *a* and the exterior solid metal tube *b* and the intervening solid insulating material *c*, consisting of paper saturated with paraffine.

3. An electric cable or conductor composed of an uninsulated exterior solid metallic tube *b*, an interior metallic tube *a*, and insulating material filling the space between them.

4. The joint consisting of two pairs of concentric conductors *a* and *b*, the metallic cone between the ends of the interior conductors *a*, and the socket-piece coupling the outer tubes or conductors *b*.



5. The joint consisting of two pairs of concentric conductors *a* and *b*, the metallic cone *d* between the inner conductors, and the socket-piece *e*, soldered to the outer tubes or conductors *b*.

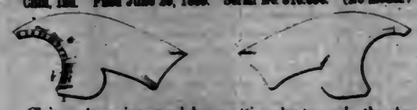
409,182. DISTRIBUTION OF ELECTRICAL ENERGY. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Feb. 16, 1889. Serial No. 300,456. (No model.) Patented in England Dec. 11, 1885, No. 15,351; in France Dec. 9, 1886, No. 180,176; in Belgium Jan. 8, 1887, No. 75,875, and in Italy Mar. 31, 1887, No. 21,119.

Claim.—In a system of distribution of electric currents, the combination, substantially as and for the purpose set forth, of an alternating-current dynamo generating high-tension alternating currents, leads or main distributing-conductors connected with the poles of the dynamo, one or both of said conductors being tubular, said conductors being arranged in proximity, and translating devices connected in multiple between said conductors.

409,183. JOINT FOR ELECTRIC MAINS. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Mar. 30, 1889. Serial No. 305,441. (No model.)

Claim.—1. The combination of the inner conductors *a*, coupled by cones or plugs *f*, and flexible conducting-strands *g*, the outer concentric conductors *b*, coupled by an extensible tube A, and the insulating-screens *k l m*, interposed between the extensible tube and the cones *f* and strands *g*.

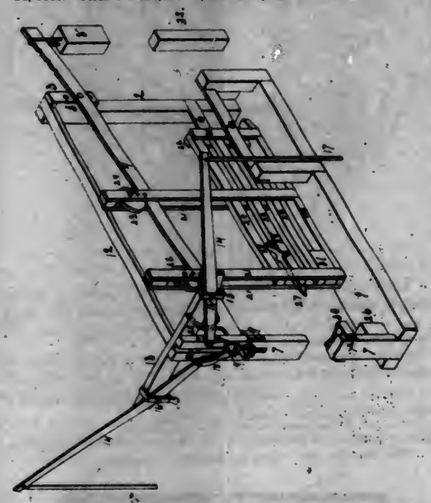
2. The combination, with two electric conductors end to end and connected by a flexible connection, as *g*, of the surrounding telescoping insulators.



3. The combination, with two electric conductors connected end to end, of the surrounding telescoping insulators and the corrugated metal tube surrounding the insulators, substantially as set forth.

4. A flexible or expansion joint for electric conductors formed of a metal tube corrugated transversely and secured at one end to the end of one length of conductor and at the other end to the next length.

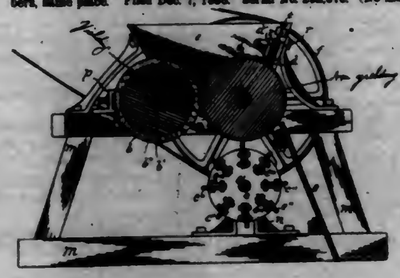
5. A joint connecting the end of two lengths of an electrical conductor composed of two rings *i i'*, surrounding each length near its end at a distance apart from one another, a metallic tube, as A, surrounding the rings on both lengths, and fusible metal filling the spaces on each length between the two rings and between the conductor and metallic tube.



6. The combination of two rigid interior tubular conductors or rods, flexible copper strands connecting them end to end, other tubular conductors surrounding the interior conductors, and insulating material separating the interior conductors and their coupling-connection from the exterior conductors.

409,184. CHART FOR DRAFTING GARMENTS. HENRY P. FISH, Galt, Ind. Filed June 20, 1889. Serial No. 314,696. (No model.)

Claim.—As an improved drum-cutting chart or rule, the chart or rule herein described, provided with a curved front-neck measure *a*, a curved back-neck measure *b*, forming a continuation of the curve of the part *a*, and marks indicating the starting-points upon opposite sides of said rule or chart, substantially as shown and described.



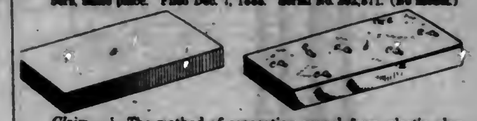
409,185. GATE. MARK W. FOSTER, Pontoosuc, Ill. Filed Mar. 26, 1889. Serial No. 305,133. (No model.)

Claim.—1. The combination of the pivoted trackway having a hook on its upper face and provided with a counterbalancing-weight, a gate supported on said trackway and engaging the hook when closed, pivoted operating-handles, and links connecting the handles with the trackway, substantially as set forth.

2. The combination of a pivoted trackway having a semicircular hook on its upper face and a gate supported on said trackway and engaging the semicircular hook when closed, substantially as set forth.

409,186. MACHINE FOR SEPARATING GRAVEL FROM CLAY. SAMUEL FRIEND, Decatur, Ill., assignor of one-half to William B. Chambers, same place. Filed Dec. 7, 1888. Serial No. 292,870. (No model.)

Claim.—1. A machine for separating gravel from clay, comprising a non-yielding roll, a yielding roll opposed to the non-yielding roll, beaters in proximity to the non-yielding roll, and a scraper adapted to the non-yielding roll, as set forth.

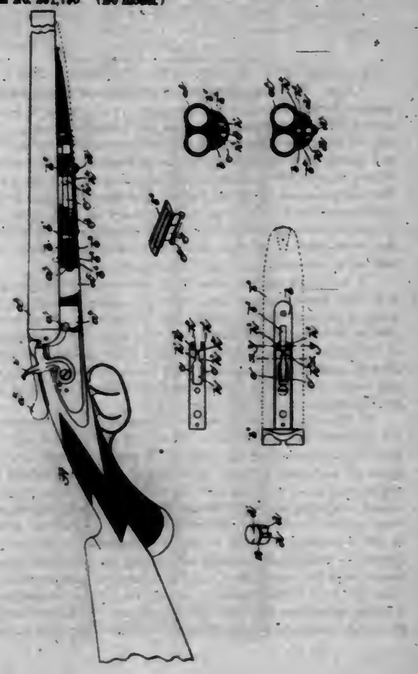


2. A machine for separating gravel from clay, comprising a non-yielding roll grooved parallelly around its circumference, a yielding roll opposed to the non-yielding roll, beaters in proximity to the non-yielding roll, and a scraper for the non-yielding roll having teeth adapted to the grooves, as set forth.

3. A machine for separating gravel from clay, comprising a non-yielding roll grooved parallelly around its circumference, a roll opposed to the non-yielding roll mounted in yielding bearings and having a yielding external surface, beaters in proximity to the non-yielding roll, and a scraper for the non-yielding roll having teeth adapted to the grooves, as set forth.

4. A machine for separating gravel from clay, comprising rolls *a* and *b*, the one non-yielding, the other yielding, hopper *c* above the rolls, beaters *c'* under roll *a*, and scraper *d* presented to roll *a*, substantially as set forth.

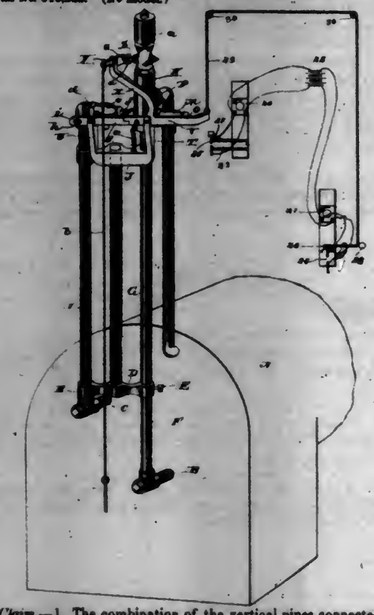
5. A machine for separating gravel from clay, comprising shaft *a'*, carrying roll *a*, drive-wheel *f*, gear-wheel *g*, and sprocket-wheel *k*, shaft *b'*, carrying roll *b* and gear-wheel *l*, the latter meshing with wheel *g*, shaft *c'*, carrying beaters *c'* and sprocket-wheel *k*, chain *l*, connecting sprocket-wheel *k* with sprocket-wheel *k*, hopper *c* above the rolls, and scraper *d* in contact with roll *a*, as set forth.



409,187. METHOD OF SEPARATING GRAVEL FROM CLAY. SAMUEL FRIEND, Decatur, Ill., assignor of one-half to William B. Chambers, same place. Filed Dec. 7, 1888. Serial No. 292,871. (No model.)

Claim.—1. The method of separating gravel from plastic clay, which consists in pressing the clay into a sheet thinner than the gravel, and then removing the projecting gravel from the sheet of clay, as set forth.

2. The method of separating gravel from plastic clay, which consists in pressing the clay with a yielding presser into a sheet thinner than the gravel, and then removing the projecting gravel from the sheet of clay, as set forth.



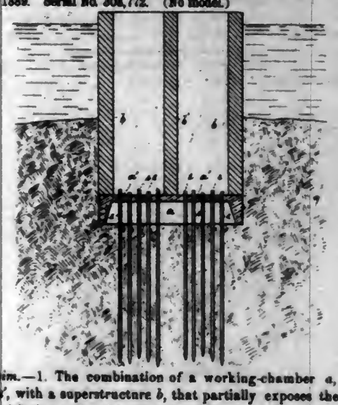
409,188. MEANS FOR ATTACHING FORE-END STOCKS TO GUN-BARRELS. JAMES E. GAGE, Concord, N. H. Filed Nov. 24, 1888. Serial No. 291,790. (No model.)

Claim.—1. In a breech-loading gun comprising a barrel and a stock, the combination, with a shoe b^4, secured to the barrel, of a sliding hand-piece provided with a locking device consisting of spring-arms permanently attached to the hand-piece to engage the said shoe and secure the hand-piece to the barrel, and a releasing device, substantially as described, to operate upon the spring-arms and disengage them from the said shoe, substantially as and for the purpose specified.

2. In a breech-loading gun comprising a barrel and a stock, the combination, with a shoe b^4, of a hand-piece provided with a locking device consisting of spring-arms to engage the said shoe and lock the hand-piece to the barrel, and a releasing device consisting of the thumb-piece d', provided with the beveled arms d, to engage the spring-arms, substantially as and for the purpose specified.

409,189. HIGH AND LOW WATER ALARM FOR STEAM-BOILERS. ADAM W. GILFILLAN, Mendocino, Cal. Filed May 10, 1889. Serial No. 310,222. (No model.)

Claim.—1. The combination of the vertical pipes connected, respectively, with the water and steam spaces of a boiler, a bracket attached securely to one of said pipes and having a sleeve for the passage of the other pipe, an arm extending upwardly from said bracket and having at its upper end a horizontal bracket provided with guide-sleeves for said pipes and upwardly-extending arms, levers pivoted to the said arms and connected loosely with the said pipes, an arm extending upwardly from one of said levers and carrying a disk adapted to bear against and operate the plug of a spring-valve connected with the steam-space of a boiler, and a steam-whistle connected with the said valve, substantially as and for the purpose set forth.

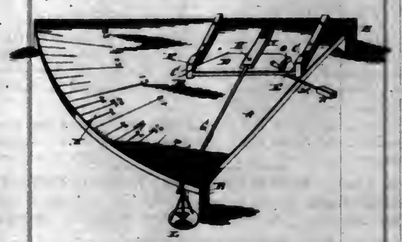


2. In a high and low water alarm for steam-boilers, the combination, with the expansion and contraction pipes connected, respectively, to the low and high water lines of the boiler, of the levers pivoted to stationary supports and connected loosely with the upper ends of said pipes, a steam-whistle arranged to be actuated by means of an arm extending from one of said levers, and cams at the ends of said levers adapted to operate the escape-valves at the upper ends of the said pipes, substantially as set forth.

3. The combination of the vertical expansion-pipe connected with the low-water line of a boiler, a T-coupling at the upper end of said pipe, the horizontal branch of which is connected with the steam-space of the boiler, and the upper end of which is provided with a steam-whistle and a spring-valve for admitting steam to the latter, a branch extending laterally from said T-coupling and having an escape-valve provided with a laterally-extending plug, a partition arranged in the T-coupling between its laterally-extending branches, a lever pivoted to a stationary support and having its inner end connected loosely with the inner end of the expansion-pipe and provided at its outer end with a cam adapted to engage the plug of the escape-valve, a spring connecting the inner end of the lever with its stationary support, and an arm extending upwardly from the lever and carrying a disk adapted to engage the valve-plug of the steam-whistle, substantially as and for the purpose set forth.

4. The combination of the lever having one end connected loosely with an expansion-pipe, the lower end of which is connected with the low-water line of the boiler, a steam-whistle having a spring-valve connected with the steam-space of the boiler, an arm extending upwardly from the said lever, a lever mounted pivotally at the upper end of said arm, a screw-threaded rod mounted adjustably in one end of said lever, and a concave disk at the inner end of said screw-threaded rod adapted to engage the valve-plug of the steam-whistle, substantially as and for the purpose set forth.

5. The combination of the expansion-pipe connected with the low-water line of a boiler, a steam-whistle connected with the steam-space of the boiler, a lever pivoted to a stationary support and carrying a disk adapted to engage the valve-plug of the steam-whistle, said lever having one end connected loosely with the upper end of the expansion-pipe, a contraction-pipe connected to the high-water line of the boiler, and a lever pivoted to a stationary support and having one end connected loosely with the upper end of said contraction-pipe, the other end of said lever being extended under and adapted to bear against the adjacent end of the signal-operating lever, substantially as and for the purpose herein set forth.

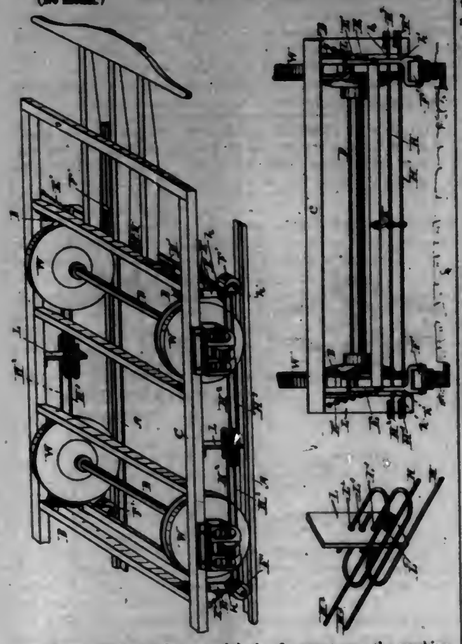


409,190. CAISSON. FRANZ GERSH, New York, N. Y. Filed Apr. 27, 1889. Serial No. 308,772. (No model.)

Claim.—1. The combination of a working-chamber a, having ceiling a', with a superstructure b, that partially exposes the ceiling a', and with the perforations d made within the ceiling for the reception of piles, substantially as specified.

2. The combination of working-chamber a, having ceiling a', with the stone wall b built upon the ceiling a' to inclose a chamber, and with the man-holes c and the pile-holes d made through ceiling a' within the chamber, substantially as specified.

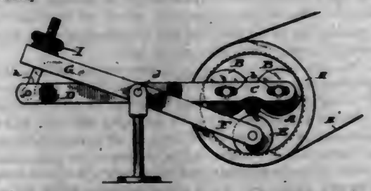
409,191. WEIGHING-SCALES. ROBERT E. GLOVER, Granger, Mo. Filed Mar. 19, 1889. Serial No. 303,833. (No model.)



Claim.—1. The combination, in the scales having the pivoted fulcrum-plate, of the scale-arm G, pivoted thereon at a distance beyond the pivotal axis of the fulcrum-plate, the shorter end of the said arm having a counterbalancing-weight and the longer end thereof being adapted to support the scale-pan, substantially as described.

2. The table or base having the graduated scale K, the fulcrum-plate pivoted in bearings on said table or base, and the scale-arm pivoted to the fulcrum-plate at a point beyond the pivotal axis of the latter, the shorter end of said arm having a counterbalancing-weight and the longer end thereof being adapted to support the scale-pan, all in combination, substantially as described.

3. In scales, the combination, with the pivoted fulcrum-plate, of the scale-arm pivoted thereon at a point beyond the pivotal axis of the fulcrum-plate, said scale-arm having the counterbalancing-weight, for the purpose set forth, and the adjusting-arm M, pivoted to the fulcrum-plate and having the weight N, substantially as described.

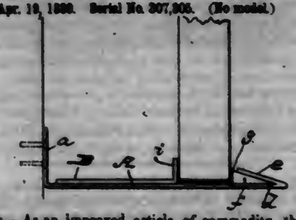


409,192. SAFETY-GUARD FOR STREET-CARS. MAXWELL J. GOODWIN, Somerville, Mass. Filed June 14, 1889. Serial No. 314,290. (No model.)

Claim.—1. In a safety-guard device for street-cars, the combination of the flexible guard-rods and swinging bars E E, adapted to suspend the said guard-rods and provided with trolley-rollers F F, with the pendent bracket L, substantially as and for the purpose set forth.

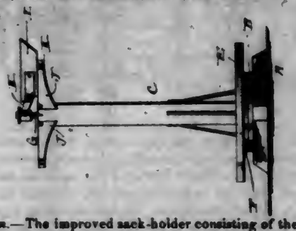
2. In a safety-guard device for street-cars, the combination of the guard-rods having return-bends at their ends and adapted to slide freely in the pendent brackets L L, with the pendent brackets L L, substantially as and for the purpose set forth.

409,193. MECHANICAL MOVEMENT. WILLIAM W. GRIGGS, Haverford College, Pa. Filed Dec. 10, 1887. Serial No. 257,513. (No model.)



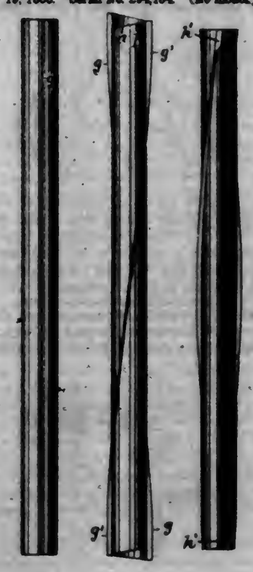
Claim.—1. In the described device, a main driving-shaft, wheels B B in engagement therewith, adjustably mounted in suitable bearings, a wheel, as E, also engaging the shaft, but from a direction opposing the wheels B B, a floating rim encircling said wheels, said wheels E being mounted in a movable frame, a suitable screw device acting upon the said frame for forcing upward the wheel E, whereby the wheels B B are spread to increase the friction against the floating rim, substantially as described.

2. In the described device, a main driving-shaft, wheels B B in engagement therewith, adjustably mounted in suitable bearings, a wheel, as E, mounted in the end of a pivoted lever, also engaging the shaft, but from a direction opposing the wheels B B, a floating rim encircling said wheels, and a suitable screw and nut acting on the said lever for giving the wheel E a vertical movement, whereby the wheels B B are spread to increase the friction against the floating rim, substantially as described.



3. In the described device, a main driving-shaft, wheels B B in engagement therewith, having their axes movable in suitable bearings upon a frame, a wheel E, supported on a suitable frame, said wheel engaging the main shaft, but from a direction opposing the wheels B B, and a floating rim encircling said wheels, the frame supporting the wheel E being pivoted to the frame supporting the wheels B B, and connected therewith by a suitable nut and screw at one end, whereby upon the adjustment of said nut the wheels B B may be spread, substantially as described.

409,194. DOOR-CHECK. LEWIS W. HARDY, Yellow Springs, Ohio. Filed Apr. 19, 1889. Serial No. 307,905. (No model.)



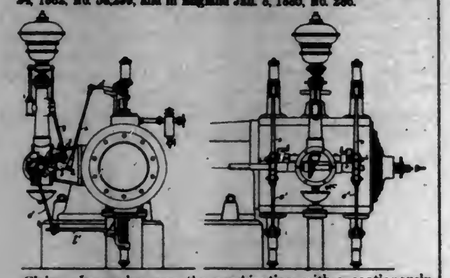
Claim.—As an improved article of commodity, the within-described combined door stop and holder, comprising the following elements: a spring-plate b, having a rectangular portion a on one end, an acute angular portion on the opposite end, a rubber block confined in the acute angular portion and protruding backward beyond the edge of the bent lip of said angular portion, whereby a door is prevented from injury when in contact with the holder, and an independent stop-plate B, having a stop-lip i, as shown and described.

409,195. SACK-HOLDER. JOHN B. HARMAN, Gilboa, Ohio. Filed Mar. 30, 1889. Serial No. 305,260. (No model.)

Claim.—The improved sack-holder consisting of the base, the rotary standard mounted thereon, the radial arms at the upper end of the standard having hooks on their sides, the horizontally-swinging bracket H, mounted on the standard above said radial arms, and the hopper secured to and carried by said bracket, as set forth.

409,196. SHEET-METAL PIPE. CHARLES L. HART, Brooklyn, N. Y. Filed Dec. 19, 1888. Serial No. 294,134. (No model.)

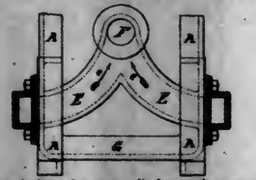
Claim.—1. As a new article of manufacture, a sheet-metal pipe formed in two or more longitudinal sections and having twisted seams at the joints of the sections, substantially as herein set forth.



2. As a new article of manufacture, sheet-metal pipes in uniform lengths formed in two or more longitudinal sections and having twisted seams at the joints of the sections, substantially as herein set forth.

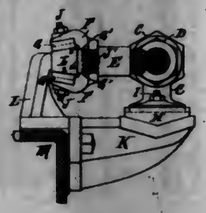
3. As a new article of manufacture, a sheet-metal pipe formed in two or more longitudinal sections and having twisted standing seams at the joints of the sections, substantially as herein set forth.

4. As a new article of manufacture, a sheet-metal pipe formed in two or more longitudinal sections and having twisted standing seams at the joints of the sections, with the projection of the seam removed at the ends of the pipe and the ends longitudinally flared and tapered to join the same in series, substantially as herein set forth.



5. As a new article of manufacture, a sheet-metal pipe formed in two or more longitudinal sections united by longitudinal standing seams and having the sections and seams twisted and held in a twisted condition by the locking of the seams, as and for the purpose set forth.

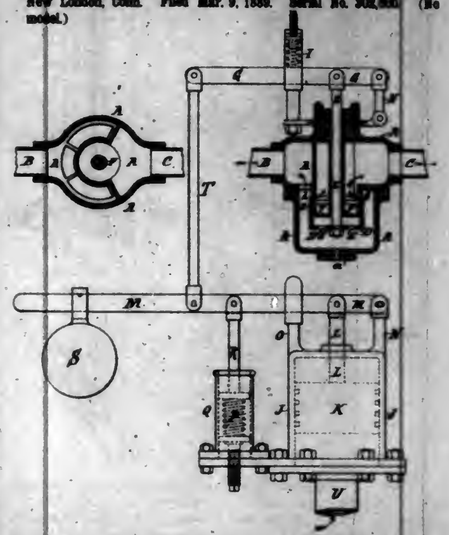
409,197. **VALVE-GEAR.** CARL HARTUNG, Magdeburg, Germany. Filed Mar. 14, 1888. Serial No. 306,253. (No model.) Patented in Germany Dec. 22, 1880, No. 15,806, and Oct. 7, 1884, No. 31,367; in Austria-Hungary Mar. 18, 1883, No. 3,736 and No. 9,811; in Belgium June 24, 1882, No. 58,290, and in England Jan. 3, 1885, No. 206.



Claim.—In a valve-gear, the combination, with a continuously-revoluble eccentric, of an eccentric-rod, a pivoted reversing-disk provided with a guide-slot, a block sliding in the said slot and operatively connected with the said eccentric-rod and with the engine valve or valves, a second pivoted disk, also provided with a guide-slot, a block sliding in the said slot and pivotally supporting the said eccentric-rod, a rod pivotally coupling the two said disks, and lever mechanism operatively connecting the sliding block of the said second disk with the steam-valve, substantially as and for the purpose set forth.

409,198. **BED-PLATE FOR STEAM-ENGINES.** MICHAEL HARTUNG, Brooklyn, N. Y., assignor to Thomas W. Williams and Charles A. Williams, New London, Conn. Filed Mar. 9, 1889. Serial No. 302,598. (No model.)

Claim.—In a bed-plate for two-cylinder engines, a pair of passages leading from the cylinder-bolting faces of said bed-plate in a direction curved from said faces and uniting to form one central nozzle, in combination with a cross-rib of said bed-plate constructed and formed independent of and free from the temperature effects of said passages, as and for the purposes set forth.



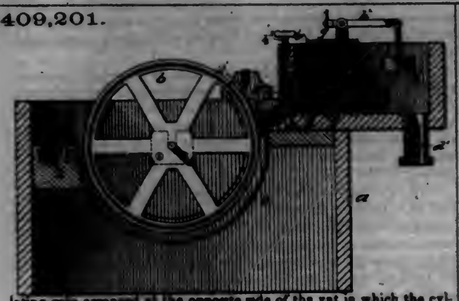
409,199. **PISTON-ROD GUIDE.** MICHAEL HARTUNG, Brooklyn, N. Y., assignor to Thomas W. Williams and Charles A. Williams, New London, Conn. Filed Mar. 9, 1889. Serial No. 302,599. (No model.)

Claim.—1. A guide for rods having a reciprocating motion, consisting, essentially, of a connected jaw F, said jaw being provided with adjusting-screws J and J' and contained adjustable brasses or wearing parts G and G', the said outer brasses G forming an acute angle with the said inner bras G', in combination with a slide L, upon which said brasses move, substantially as set forth.

2. In combination with a rod having a reciprocating motion, connecting-pin E and attached jaw F, said jaw F being provided with the outer wearing-brasses G and the inner wearing-bras G', and the said outer brasses G being set at an angle acute to said inner bras G', each of said brasses being provided with adjusting-screws J and J' and operating upon a slide L, substantially as set forth.

409,200. **PRESSURE-REGULATOR.** MICHAEL HASTINGS, Brooklyn, N. Y., assignor to Thomas W. Williams and Charles A. Williams, New London, Conn. Filed Mar. 9, 1889. Serial No. 302,600. (No model.)

Claim.—1. The combination of a valve-chamber located within the line of steam-pipe supplying an air-compressor or pump-cylinder with steam, a perforated annular valve and valve-stem moving within said valve-chamber, a special circular valve-guide operating within said perforated annular valve, a lever for operating said perforated valve and its stem, an air-pressure cylinder and inclosed piston and rod located within the line of air-pipe communicating with the compressed-air receiver or tank, a weighted lever operated by said piston and rod, and a communicating rod attached at one end to the lever operating the steam-valve and its stem and at the other end to the lever operated by said piston and rod of said air-pressure cylinder, substantially as and for the purposes set forth.



2. The combination of a valve-chamber having an annular valve and operating-stem of the character herein shown and described located within the line of steam-pipe supplying an air-compressor or pump cylinder with steam, a lever for operating said valve and stem, a resistance-spring acting upon said lever, an air-pressure cylinder and inclosed piston and rod located within the line of air-pipe communicating with the compressed-air receiver or tank, a weighted lever operated by said piston and rod, a spring-regulator acting upon said lever, and a communicating rod attached at one end to the lever operating the steam-valve and stem and at the other end to the lever operated by said piston and rod of said air-pressure cylinder, substantially as shown and described.

409,201. **PAPER-MAKING MACHINE.** JONATHAN HAYES, South Windham, Conn. Filed Mar. 12, 1887. Serial No. 230,578. (No model.)

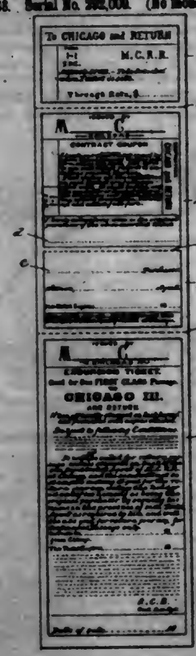
Claim.—1. In a paper-making machine, the combination of the paper-mold, the reservoir adapted to receive and hold a quantity of stuff, the outlet consisting of a spout that projects from the reservoir and terminates near the wire of the paper-mold, the blanket that defines the line of application of the pulp, and the mixer located in the reservoir, all substantially as described.

2. In a paper-making machine, the combination of the vat in which the cylinder is located, the paper-mold, the reservoir adapted to receive and hold a certain quantity of stuff and having an outlet controlled by a gate located at the spout, the said gate and the regulating-gate arranged at the opposite side of the vat in which the cylinder turns, all substantially as described.

409,201.

3. In a paper-making machine, the reservoir for holding the stuff with crosswise perforated partitions, and the mixer having arms extending between the partitions, all substantially as described.

4. In combination with the cylinder, the reservoir, the mixer arranged therein, the sliding gate, the spout having the gages that determine the width of its outlet, and the regulating-gate, and the blanket that rests against the receiving side of the cylinder near the outlet of the spout from the reservoir, all substantially as described.

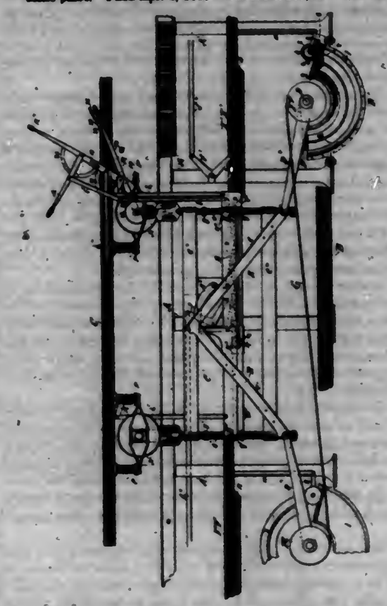


409,202. **PLOW.** JOHN S. HAWLEY, Hamden, N. Y. Filed Dec. 12, 1888. Serial No. 293,402. (No model.)

Claim.—1. The combination, in a reversible side-hill plow, of the reversible plate *c*, having a shank *d*, resting in bearings *e*, and having an arm *f*, spring *g*, and connecting-rod *h*, all substantially as shown and described, and for the purposes specified.

2. The combination, with a mold-board, of the reversible plate *c*, provided with a shank which extends under the mold-board and rests in bearings carried by the mold-board, substantially as and for the purposes described.

409,203. **RAILROAD-TICKET.** LOUIS D. HEUMER, Chicago, Ill. Filed Nov. 27, 1888. Serial No. 292,009. (No model.)



Claim.—A railroad-ticket provided with the destination-agent's identifying-section B, separable from the ticket, whereby such agent only is furnished with the signature of the original purchaser, for the purpose of identification, substantially as and for the purpose described.

409,204. **NUT-LOCK.** CHARLES R. JENKINS, Janesville, Wis. Filed July 19, 1888. Serial No. 280,406. (No model.)

Claim.—A nut-lock consisting of a screw-threaded bolt, a nut having a bore through its sides practically perpendicular to the axis of the bolt, and a hardened steel pin, of slightly greater diameter than the diameter of the lateral bore, driven into said bore until its point penetrates the bolt and left with its head protruding beyond the nut.

409,205. **PNEUMATIC RAILWAY.** WHITCOMB L. JUDSON, Minneapolis, Minn., assignor to the Judson Pneumatic Railway Company, same place. Filed Apr. 2, 1888. Serial No. 269,825. (No model.)

Claim.—1. The combination, with a movable car, of a series of cam-levers along the line of travel, a cam on the car with which said levers engage in succession, and one or more motors for actuating said levers, substantially as described.

2. The combination with a movable car, of a series of vibratory levers arranged along the line of travel adapted to successively engage a part of said car and one or more motors for actuating said levers, substantially as described.

3. The combination, with a movable car, of a cam-track connected with the car, a series of cam-levers along the line of travel adapted in their normal position of rest to engage with said cam-track in the movement of the car, and one or more motors for actuating said levers, substantially as described.

4. The combination, with a movable car, of a cam on the car, a series of levers along the line of travel, the relative lengths and positions of the cam and cam-levers being such that one lever will engage the cam before the preceding lever has left it, and one or more motors for actuating said levers, substantially as described.

5. The combination, with a movable car, of a cam-track connected thereto, a series of cam-shafts along the line of the car's travel, a corresponding series of cam-levers connected with said shafts, adapted to traverse said cam-track in succession and propel the car, and one or more motors for driving said shafts, substantially as described.

6. The combination, with a movable car, of a A-shaped cam-track connected thereto, a series of cam-shafts along the line of the

car's travel, a corresponding series of cam-levers connected with said shafts, adapted to traverse said cam-track in succession and propel the car, and one or more motors for driving said shafts, substantially as described.

7. The combination, with a movable car, of a cam-track connected thereto, a series of cam-shafts along the line of the car's travel, a corresponding series of cam-levers connected with said shafts, adapted to traverse said cam-track and propel the car, and a corresponding series of stationary motors for driving said shafts, substantially as described.

8. The combination, with a movable car, of a A-shaped cam-track connected thereto, a series of cam-shafts along the line of the car's travel, a corresponding series of cam-levers connected with said shafts, adapted to traverse said cam-track in succession and propel the car, and a corresponding series of stationary motors for driving said cam-shafts, substantially as described.

9. The combination, with a movable car, of a cam-track connected thereto, a curved cylinder adapted to receive an expansible motive force, a piston movable lengthwise of said cylinder, a cam-lever pivoted to a fixed support adapted to traverse said cam-track and propel the car, and a connection from said piston to said cam-lever, substantially as described.

10. The combination, with a movable car, of a cam-track connected thereto, a curved cylinder adapted to receive an expansible motive force, a piston movable longitudinally of said cylinder, a rock-shaft, a connection from said piston to said shaft, and a cam-lever on said shaft adapted to traverse said cam-track and propel the car, substantially as described.

11. The combination, with a movable car, of a A-shaped cam-track connected thereto, a curved cylinder approximately a half-circle in length adapted to receive an expansible motive force, a piston movable longitudinally of said cylinder, provided with a rigid stem of equal length of a like curvature to the cylinder passing out through one end of the same and traversing the supplementary arc of the cylinder-circle, a rock-shaft arranged at right angles to the plane of the piston's movement, a crank-arm on said shaft having its outer end rigidly attached to the outer end of said piston-stem, and a cam-lever on said shaft having a cam-head adapted to traverse the said cam-track and propel the car, substantially as described.

12. In a railway system, the combination, with a movable car, of a cam-track connected thereto, a rock-shaft arranged crosswise of the car's path, a cam-lever having at one end bifurcated arms embracing said shaft at right angles to its axis and pivotally secured thereto and at the other a cam-head adapted to traverse said track, and a motor for driving said shaft, substantially as described, for the better traversing of curves.

13. The combination, with two or more independent vibratory levers, of two or more independent motors adapted each to move its respective lever through a half-revolution in a constant direction and a flexible connection coupling together said levers having sufficient slack to allow a single throw of one lever before becoming taut, substantially as described, whereby the motor in use is made to restore the idle lever and the movable part of the idle motor to their normal positions.

14. The combination, with a series of vibratory levers, of a corresponding series of stationary motors adapted to move said levers in succession in a constant direction and couplings connecting all of said levers in pairs with allowance for the throw of one of the pair of levers before the coupling comes into use, substantially as described, whereby the working-lever of the pair restores the idle lever to its normal position.

15. The combination, with a movable car having a cam-track connected thereto, of a series of rock-shafts mounted in fixed supports at definite intervals along the line of the car's travel, a corresponding series of cam-levers connected with said shafts, adapted to traverse said cam-track in succession in a constant direction for propelling the car, and a connection coupling together said shafts in pairs with allowance for the throw of one shaft before coming into use, substantially as and for the purpose set forth.

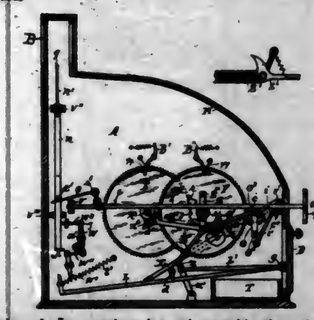
16. The combination, with two or more independent rock-shafts, of a corresponding series of independent motors adapted each to move its respective rock-shaft through a half-revolution, sheaves on said shafts, and a flexible connection coupling together the sheaves of adjacent shafts having sufficient slack to allow only a single throw of the rock-shaft before becoming taut, substantially as described, whereby the working-motor is made to restore the rock-shaft last used to its normal position.

17. The combination, with a series of two or more independent rock-shafts having crank-arms, of a corresponding series of curved cylinders having pistons movable lengthwise of the cylinder and piston-stems attached to said crank-arms and movable through supplementary arcs of the cylinder-circles, sheaves on said rock-shafts, and flexible connections coupling together said sheaves, each having sufficient slack to allow only a single forward throw of the shaft, substantially as described, whereby the piston under pressure restores the piston and rock-shaft last used to their normal positions, substantially as described.

18. The combination, with a movable car, of a series of stationary pressure-motors acting on the car in succession to propel the same, valves for controlling the supply to said motors, levers for operating said valves, and connections from said levers to the car for operating the valves with an automatically-variable cut-off, substantially as described, whereby the air may be used expansively for a greater or less part of the stroke.

19. The combination, with a movable car having a dependent portion, of a series of stationary pressure-motors acting on the car in succession, valves on said motors for controlling the supply of motive force to the same, vertically-movable horizontal valve-rails corresponding in number to the said motors and supported one above every motor, each rail having bearing-surfaces on its under side in two different horizontal planes for cutting off at part stroke connections from said valve-rails to said valves, and a projection on the dependent portion of said car adapted to engage with said valve-rail, substantially as described.

20. The combination, with a movable car having a dependent portion, of a series of stationary pressure-motors acting on said car in succession, valves on said motors for controlling the supply of motive force to the same, vertically-movable horizontal valve-rails supported one above each of said motors, each rail having bearing-surfaces on its under side on two different horizontal planes, connections from said rails to said valves, a vertically-adjustable bar on the dependent portion of said car, a pair of lateral projections on said bar, one of which is fixed and the other adjustable horizontally to and from the same, and an operating-connection from said adjustable projection to within reach of the car-operator, substantially as described.



21. The combination, with a movable car, of a slotted power-conduit, swiveled bars extending from different parts of the car to the interior of the conduit, and braces connecting said bars, substantially as described.

22. The combination, with a movable car, of laterally movable head-blocks attached to the front and rear truck-frames, dependent bars swiveled in said head-blocks, and braces connecting said bars, substantially as described.

23. The combination, with a movable car, of a slotted power-conduit, laterally-movable head-blocks on the car, swiveled bars extending from said blocks through the slot into the interior of the conduit, and braces connecting said bars, substantially as described.

24. The combination, with a movable car, of a slotted power-conduit, laterally-movable head-blocks attached to the front and rear of the car, swiveled bars extending from said head-blocks through the slot into the interior of the conduit, braces connecting the parts of said bars within the conduit, a cam-track mounted on said braces, a series of pivoted levers within the conduit along the line of travel adapted to successively engage with said cam-track, and one or more motors for driving said levers, substantially as described.

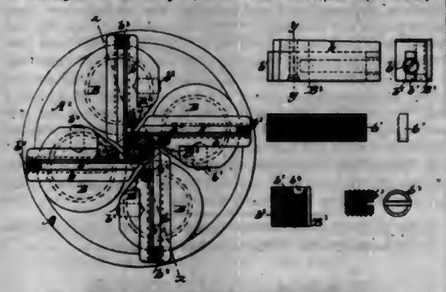
409,206. CASH INDICATOR AND REGISTER. CLARENCE H. KAMLER, Wilmington, Ill. Filed Aug. 27, 1888. Serial No. 283,849. (No model.)

Claim.—1. In a cash-register, the combination of the series of numbered key-slides having a graduated series of rests *r*, the series of tablet-rods having numbered tablets to correspond with the numbers of the key-slides, the dial-wheels E and F, having numbered peripheral notches, the oscillating frame S, having the cross-bar S'', and the mechanism described for rotating said dials, substantially as and for the purpose set forth.

2. In the cash-register shown and described, the combination of the dials E and F, having numbered peripheral notches, the oscillating frame S, the dial E being arranged to be rotated by dial F one notch to each revolution of dial F, a series of numbered key-slides for rotating said dials, and having rests or stops *r* for controlling the rotation of said dials, so as to cause them to rotate the sufficient number of notches to register the aggregate of the denominational numbers of the key-slides, and the mechanism, substantially as shown, for connecting said slides and dials, substantially as and for the purpose set forth.

3. In the cash-register shown and described, in combination with the dials E and F, having numbered peripheral notches, the door D, and the mechanism for connecting said dials and door, substantially as specified, whereby the dials are rotated when said door is closed, the number of notches corresponding with the number of the key slide or slides by which said door was opened, substantially as and for the purpose set forth.

409,207. ELECTRICAL INDICATOR. EDWARD R. KNOWLES, Brooklyn, N. Y. Filed Feb. 14, 1888. Serial No. 263,843. (No model.)



Claim.—1. In an electrical indicator, a coil or helix through which the main current passes, having marked upon its supporting-spool or upon a plate rigidly attached thereto a scale, the said coil and its spool being adjustably mounted upon a support or base, all in combination with an index or pointer whose movements are controlled by the magnetism induced by the helix, the said pointer being hung and normally balanced upon a shaft.

2. In an electrical indicator, a balanced shaft carrying an index or pointer, a magnet exerting its influence to rotate said shaft, a scale rigidly attached to the frame of said magnet, the magnet being rotably adjustable to bring any desired point on the scale into coincidence with the index or pointer.

3. The combination, with the magnet-coil, having attached thereto a scale, of the adjustable clips *b*, for the purpose described.

409,208. SCREW-CUTTING HEAD. ABRAHAM R. LANDIS, Waynesborough, Pa. Filed May 14, 1889. Serial No. 310,692. (No model.)

Claim.—1. In a screw-cutting head, the combination of a series of rotatable studs, a block secured in the head of each stud, a cutter adjustably secured in said block, a nut in engagement with the series of studs, and a screw-threaded sleeve in engagement with the center of said nut, substantially as described.

2. In a screw-cutting head, the combination of a series of rotatable studs, a block secured in the head of each stud, a cutter adjustably secured in said block, and a nut in engagement with a series of studs, substantially as described.

3. In a screw-cutting head, the combination of a longitudinally-slotted block and cutter therein, the slot in said block being screw-tapped, with a screw b^3 in said screw-tapped slot, substantially as and for the purpose described.

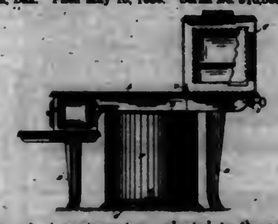
4. In a screw-cutting head, the combination of a longitudinally-slotted block and cutter therein, the slot in said block being screw-tapped for the reception of screw, with a screw b^3 and a screw b^4, inserted in said block alongside of the cutter, substantially as and for the purpose described.

5. In a screw-cutting head, the combination of a rotatable stud, a longitudinally-slotted block secured in the head of said stud, a cutter within the slot of said block, and a short screw b^3, inserted in the slot of the block in the rear of the cutter, the groove in said block being screw-tapped for its reception, substantially as described.

6. In a screw-cutting head, the combination of a rotatable stud, a longitudinally-slotted block secured in the head of said stud, a cutter within the slot of said block, a screw b^3, inserted in said block alongside of the cutter, and a screw b^4, inserted in the screw-tapped slot of the block, substantially as and for the purpose described.

7. In a screw-cutting head, the combination of a rotatable stud, a longitudinally-slotted block in the head of said stud and having a shoulder B^3 on one side and screw b^3 also in one side, a cutter within the slot of said block, a screw b^4, inserted in said block alongside of the cutter, and a screw b^3, inserted in the screw-tapped slot of the block, substantially as and for the purpose described.

8. In a screw-cutting head, the combination of a series of rotatable spirally-grooved studs, carrying cutters adjustably secured therein, and a nut in engagement with a series of studs and carrying a rack attached thereto and engaging with a pinion attached to the circular graduated dial on the periphery of the head, substantially as and for the purpose described.



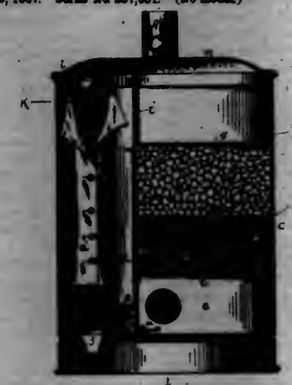
9. In a screw-cutting head, the combination of a series of rotatable spirally-grooved studs carrying cutters adjustably secured therein, a nut in engagement with the series of studs, a screw-threaded sleeve in engagement with the center of said nut, a bevel-tooth wheel upon one end of said sleeve, and a bevel-pinion f^4, meshing therewith and having a spindle extending to the periphery of the head, substantially as and for the purpose described.

10. In a screw-cutting head, the combination of a series of rotatable spirally-grooved studs carrying cutters adjustably secured therein, a nut in engagement with the series of studs, a screw-threaded sleeve in engagement with the center of said nut and having a groove cut in its periphery, a collar C in engagement with said groove, and a ring E, mounted upon said collar and capable of lateral movement, substantially as and for the purpose described.

11. In a screw-cutting head, the combination of a series of rotatable spirally-grooved studs carrying cutters adjustably secured therein, a nut in engagement with the series of studs, a screw-threaded sleeve in engagement with the center of said nut and having a groove cut in its periphery, a collar C in engagement with said groove, and a ring E, mounted upon said collar and capable of lateral movement and provided with a beveled surface d^4, with the radial locking-blocks *d*, having inclines d^5, substantially as and for the purpose described.

12. In a screw-cutting head, the combination of a longitudinally-slotted block having the bottom thereof tapering in thickness, a cutter secured within said block with its cutting end projecting beyond the end of the block, and said cutting end ground to form with the axis of the cutting-head an angle, as with line b^2, substantially as and for the purpose described.

409,209. STRAW-BURNING COOK-STOVE. GODFRED LAURS, Huron, Dak. Filed May 13, 1889. Serial No. 310,568. (No model.)

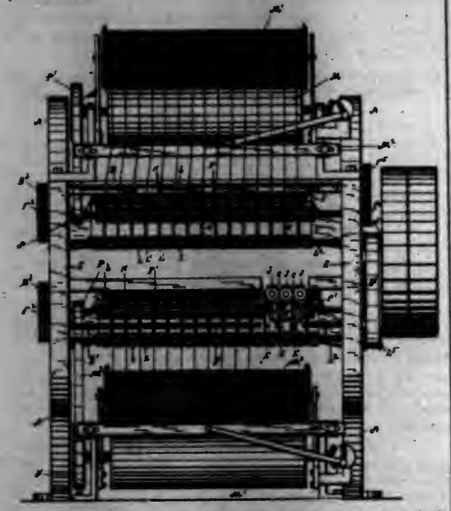


Claim.—1. A cooking-stove adapted to the use of straw, hay, wood, and coal as fuel, comprising an elevated shallow stove-body having a wood and coal fire-pot in its front and an opening in its under plate in the rear of the fire-pot, and a removable straw-burning magazine having an opening in its top adapted to register with said opening in the under plate of the stove-body, substantially as described.

2. A cooking-stove comprising a shallow stove-body having a wood and coal fire-pot in its front and an opening in its under plate in the rear of the fire-pot, suitable supports therefor so applied as to leave a clear space under the body of the stove in the rear of the fire-pot, and a removable straw-burning magazine having an opening in its top adapted to register with said opening in the under plate of the stove-body, substantially as described.

3. A cooking-stove comprising the stove-body A, with fire-pot A' and hearth A'', the supporting-legs B B', the partition *a*, the opening *a''*, the damper D, the oven C, and the removable fuel-magazine F, having an opening in its top adapted to register with the opening *a''*, substantially as described.

409,210. FILTER. PATRICK LAUGHLIN, Mount Sterling, Ky. Filed May 9, 1887. Serial No. 237,651. (No model.)



Claim.—1. The combination, in a filter-case C, of the receiving-chamber B at the bottom of said case, the partition *d*, the strainer *e* above the chamber B, and the filter-bed resting on said strainer, the screen *i*, and the clear-water chamber, with the removable tubular strainer K over the outlet *j*, as set forth.

2. The combination, in a filter-case C, of a partition *d*, a receiving-chamber B, and filter-bed on one side of said partition and a clear-water chamber on the other side, and the gate N and plug *m*, whereby silt may be washed from chamber B and discharged through gate N.

3. The combination, in a filter-case C, of the partition *d*, on one side whereof is the receiving-chamber B and the filter-bed, and the clear-water chamber on the other side, and the filtering leak-plug *l*, whereby the water in chamber B and in the filter-bed may be permitted to pass into the clear-water chamber and be saved.

4. The combination, in a filter-case C, of a partition *d*, having the receiving-chamber and filter-bed on one side and the clear-water chamber on the other side, an outlet *j*, and a removable tubular strainer K, with a removable cloth cover, as set forth, whereby the final strainer may be removed and cleansed at any time.

409,211. CONDENSING MECHANISM FOR CARDING-ENGINES. GEORGE LATHE, Worcester, Mass. Filed June 15, 1886. Serial No. 205,286. (No model.)

Claim.—1. The combination, with doffing mechanism by which several slivers or independent strands of roping are delivered in a common horizontal plane, of short belts arranged in a vertical plane, a belt being placed between each pair of contiguous strands of roping and each belt being driven through connected operating mechanism, substantially as described, and tightening devices applied to each of said belts, substantially as described, by which the pressure upon each of the strands of roping is varied, substantially as described.

2. The combination, with doffing mechanism by which slivers or independent strands of roping are delivered, of a roll over which said slivers pass, a weighted roll resting upon said slivers, a series of short independently-moving belts placed at right angles to said slivers as they are delivered from said rolls, and a series of pulleys arranged in pairs for supporting said belts, with the opposing surfaces of each pair of belts in contact with the slivers which pass between the belts and connected operating mechanism, substantially as described.

3. The combination, with the doffing mechanism by which slivers or independent strands of roping are delivered, of the roll F, weighted roll G, the roll F', and weighted roll H, a series of short independently-moving belts placed between the rolls F and F' and at right angles to the slivers as they pass from the rolls F G to the rolls F' H, and a series of pulleys arranged in pairs for supporting said belts, with the oppositely-moving surfaces of each pair of belts in contact with said slivers, and connected actuating mechanism by which said belts are operated, substantially as described.

4. The combination, with the doffing mechanism by which slivers or independent strands of roping are delivered, of the rolls F and F', of different circumferential speed, weighted rolls G and H, by which the slivers are held upon the rolls F and F', a series of short independently-moving belts placed between the rolls F F' and at right angles with the slivers as they pass from roll F to roll F', a series of pulleys arranged in pairs for supporting the belts with their oppositely-moving surfaces in contact with the slivers, and connected actuating mechanism by which said belts are operated, substantially as described.

5. In the condenser of a carding-engine, the combination, with a doffing-cylinder, of a series of flanged pulleys arranged in pairs and carrying belts placed at an angle with the slivers from the doffing-cylinder, a series of bevel gear-wheels attached to one of the flanged pulleys in each pair of pulleys, and a series of actuating bevel-gears engaging the bevel-gears attached to said pulleys, as described.

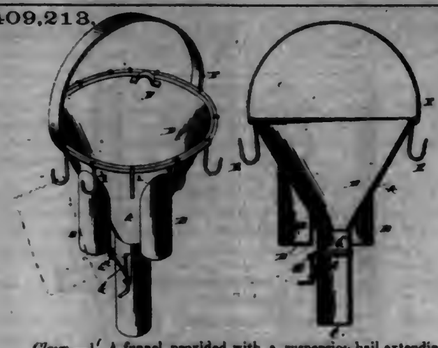
6. In the condenser of a carding-engine, the transverse slotted plate I, and a series of flanged pulleys held by said plate and carrying continuously-moving belts in contact with the sliver, and connected actuating mechanism by which said belts are operated, all combined as described.

7. The combination, with doffing mechanism by which slivers or independent strands of roping are delivered, of the rolls F and F', weighted rolls G and H, a series of short belts placed between the rolls F and F' at right angles to the axes of said rolls and also at right angles with said slivers, connected operating mechanism by which said belts are driven, and tightening devices by which said belts are independently tightened and the pressure varied upon each individual strand or sliver, substantially as described.

8. The combination of the transverse plate I, a series of pulleys supported upon said plate and carrying short independently-moving belts driven by connected mechanism, substantially as described, and placed at right angles to the slivers, which pass between them, levers pivoted upon said plate, and a friction-roll carried upon the free end of said levers and bearing upon the slack and inner side of said belts, whereby they are pressed against the slivers, substantially as described.

9. The combination, with doffing mechanism by which a series of slivers or independent strands of roping are delivered, of the rolls F and F', weighted rolls G and H, belts K, placed between said rolls and at right angles with their axes and also at right angles with said strands or slivers, said belts being driven through connected mechanism, substantially as described, and the bars *g g'*, by which the slivers, as they are delivered from the rolls F and H, are deflected to the winding mechanism, substantially as described.

409,212. ANIMAL-TRAP. LYSANDER H. LOOMIS, Wauwatosa, Wis. Filed Apr. 20, 1889. Serial No. 307,955. (No model.)



Claim.—1. The combination, with a case A, having an aperture R in its cover and a portion of the cover about a part of the aperture removable, of a trap having jaws H H, spring I, trigger-plate L, and latch M, the trap being located within the case in such manner that the trigger-plate L is directly below and at a short distance from the aperture R, substantially as described.

2. The combination, with a case A, having an aperture R in its cover, of a spring-trap having jaws H H and two prongs F F projecting inwardly from each of the jaws, substantially as described.

409,213. PAPER-BAG AND TWINE HOLDER. CHARLES A. LOWRY, Knoxville, Tenn. Filed Apr. 13, 1889. Serial No. 307,098. (No model.)

409,213.

Claim.—1. A funnel provided with a suspension-bail extending transversely across the mouth thereof and provided with a series of paper bag-receiving hooks, substantially as specified.

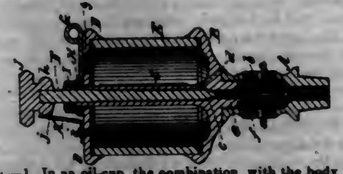
2. An outer funnel, and twine-holder opening into the same and depending therefrom, in combination with an inner funnel fitting in said outer funnel, substantially as described.

3. An outer funnel, twine-holders opening into the same and having perforations, and an outlet-cylinder at the mouth of said funnel, in combination with an inner funnel fitting into said outer funnel, substantially as described.

4. An outer funnel having hooks attached to its rim, and twine-holders opening into said funnel and depending therefrom, in combination with an inner funnel fitting into said outer funnel, substantially as described.

5. A funnel provided with a suspension-bail and with a cord-receiving pocket projecting from one side thereof, substantially as specified.

6. The combination, with an outer funnel having a series of depending cord-receiving pockets, the upper ends of which are open and flush with the funnel, of an inner funnel mounted in the outer funnel and closing said openings, substantially as specified.



7. An outer funnel having hooks attached to its rim, twine-holders opening into said funnel and provided with perforations, and an outlet-cylinder at the mouth of said funnel, in combination with an inner funnel fitting into said outer funnel, a wire spring attached to said outlet-cylinder, a handle projecting through the sides of said cylinder, and a valve fixed to said wire, substantially as described.

409,214. STANDARD FOR LAMPS. OSCAR LUSTER, Brooklyn, N. Y. Filed Nov. 1, 1888. Serial No. 289,764. (No model.)

Claim.—An adjustable standard consisting of an upright stationary tube, a movable tube telescoping into the stationary tube, a soft-metal tube supported in the stationary tube, and an expanding mechanism attached to the telescoping tube and longitudinally adjustable in the soft-metal tube and constructed to produce indentures in the soft-metal tube to hold it in its adjusted position.

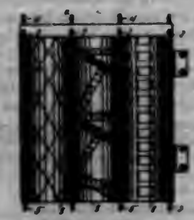
409,215. OIL-CUP. EDMUND LUNKENHEIMER, Cincinnati, Ohio, assignor to the Lunkenheimer Brass Manufacturing Company, same place. Filed May 20, 1889. Serial No. 311,377. (No model.)

Claim.—1. In an oil-cup, the combination, with the body of the cup and its rotating adjustable valve-stem provided with a collar having a flattened side, of the top cap of the cup made revolubie and having secured thereto a spring bearing against said collar on the stem, substantially as and for the purpose described.

2. In an oil-cup, the combination, with the body of the cup having a revoluble cap D, to which is secured an upwardly-extending flat spring K, of the hollow stem C and rotating valve-stem F, provided with a collar A, having a flattened side *j*, with which said spring K constantly engages under tension, substantially as and for the purpose described.

409,216. FLEXIBLE PIPE-JOINT. DANIEL W. MASON, New York, N. Y. Filed Apr. 4, 1887. Serial No. 233,582. (No model.)

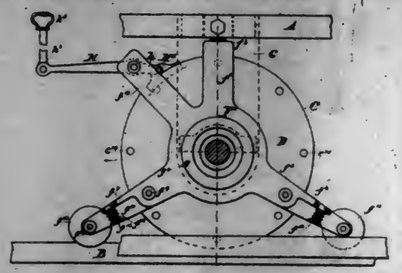
Claim.—In combination with a number of lengths of rigid pipe, a joint composed of a body part *c*, forming a quarter-turn, with its bearing-face having an annular projection *c'*, the body part *d*, with an annular socket *d'* in its bearing-face, and the supplemental ducts *i*, leading from the annular chamber into the steamway, the bolt *e*, rigidly secured within one part and extending through the opposite wall of the other part and forming the central pivot of the joint, a screw-cap A, and the ring-packing *g* and *g'*, all substantially as described.



409,217. SAFETY-VALVE ATTACHMENT FOR GAGE-COCKS. FRANK MEARS, Cleveland, Ohio. Filed June 27, 1888. Serial No. 315,771. (No model.)

Claim.—1. In a valve of the character described, the chambered body E, having necks *c* and *c²* and a partition having valve-seat *c³*, the valve-stem F, having valve *f* and screw-threaded portion *f²* playing in neck *c²* and cap G, and having its inner end pointed and playing in lug *b⁴* of plug B, the handle H, and nozzle I, all constructed, combined, and operating substantially as described.

2. In combination, the hollow plug B, having nipple *b³* and valve-seat *b²*, the bail C, secured onto nipple *b³*, the valve D, having pointed stem *d* and playing in the bail C, and lug *b⁴* in plug B, the chambered body E, secured in plug B by neck *c* and having partition provided with valve-seat *c³*, and nozzle I, the valve-stem F, having valve *f*, and screw-thread *f²* playing in neck *c²* and cap G, and in lug *b⁴* of plug B, and having handle H, all constructed and arranged to operate substantially as and for the purpose specified.



409,218. EXHIBITOR FOR WALL-PAPER OR OTHER GOODS. HERMAN MICHAELS, Denver, Colo. Filed Mar. 23, 1889. Serial No. 304,523. (No model.)

Claim.—1. A merchandise-exhibitor consisting of a base, curved or oval panels thereon, and goods-holders pivoted at one end to the base and snapping or springing over the edge thereof at the other end, substantially as set forth.

2. A merchandise-exhibitor consisting of a base, and a frame thereon for holding the goods thereto, having vertical wires pivoted at one end in the base and having snap ends for springing over the edge thereof at the other end, substantially as set forth.

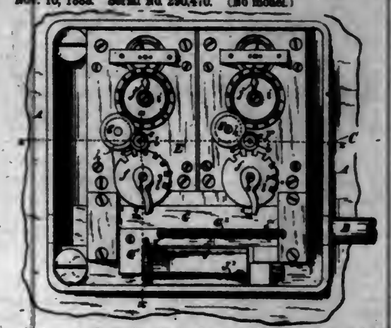
409,219. CAR-WHEEL. WAITHAN M. MORGAN, Kansas City, Mo. Filed Sept. 7, 1888. Serial No. 284,309. (No model.)

Claim.—1. In a car-wheel having an axle and laterally-vibrating radial disks on said axle, the combination of laterally-extended supporting-cylinders on opposite sides of said disks in the line of the axis of said wheel, and suitably-connected circular disks loosely mounted in the line of their axis on said cylinders, having radial arms, substantially as and for the purpose described.

2. In a car-wheel having an axle and laterally-vibrating radial disks on said axle, the combination of laterally-extended supporting-cylinders on opposite sides of said disks in the line of the axis of said wheel, and suitably-connected circular disks loosely mounted in the line of their axis on said cylinder, having radial arms extending in the line of the tread of said wheel and provided with adjustable guide-rollers, for the purpose described.

3. The combination, with a car-wheel having an axle and suitable axle-bearings and with the opposite radial sides of said wheel, of laterally-extended flanged supporting-cylinders in the line of the axis of said wheel, and around said axle circular disks loosely mounted in the line of their axis on said cylinder and provided with radial arms extending downwardly in the line of the tread of said car-wheel and provided with laterally-adjustable guide-rollers, for the purpose described.

4. The combination, in a car-wheel having an axle, of laterally-vibrating radial disks on said axle, laterally-extended supporting-cylinders on opposite sides of said disks in the line of the axis of said wheel, and around said axle circular disks loosely mounted in the line of their axis on said cylinders and provided with radial arms extending downwardly in the line of the tread of said car-wheel and provided with laterally-adjustable guide-rollers, for the purpose described.



5. The combination, with a car-wheel having an axle and suitable axle-bearings and with the opposite radial sides of said wheel, of laterally-extended flanged supporting-cylinders in the line of the axis of said wheel, and around said axle circular disks loosely mounted in the line of their axis on said cylinders and provided with radial arms and extensions of said arms pivoted thereto, and having an intermediate spring-bearing for said radial arms thereon, and laterally-adjustable guide-rollers on the said extension of said arms extending downwardly to and in the line of the tread of said car-wheel, for the purpose described.

6. In the herein-described wheel, the combination, with the opposite radial disks of said wheel, of laterally-extended flanged supporting-cylinders in the line of the axis of said wheel, and around said axle circular disks loosely mounted in the line of their axis on said cylinders and provided with radial arms, an extension of said arms pivoted thereto and having an intermediate spring-bearing for said radial arms thereon, and laterally-adjustable guide-rollers on the said extensions of said arms extending downwardly to and in the line of the tread of said car-wheel, for the purpose described.

7. The combination, in a car-wheel having an axle and laterally-vibrating radial disks on said axle, of laterally-extended supporting-cylinders on opposite sides of said disks in the line of the axis of said wheel, and suitably-connected circular disks loosely mounted in the line of their axis on said cylinders, having radial rollers carrying arms extending in the line of the tread of said wheel, and anti-friction devices in the side of the disks of said wheel in rotary contact with said radial arms, for the purpose described.

8. The combination, in a car-wheel consisting of radial disks having concavé depressions extending through the sides of said disks and a ring forming the tread of said wheel between said disks, having transverse slots opposite said concave depressions, of anti-friction rollers in said transverse slots and globular rollers in said concave depressions in frictional contact, for the purpose described.

409,220. TIME-LOCK. LYMAN F. MUNGER, Rochester, N. Y. Filed Nov. 10, 1883. Serial No. 290,470. (No model.)

Claim.—1. In a time-lock, the combination, with the bolt and controlling devices therefor, of two time-movements mounted in separate frames independently of the bolt-controlling devices, interchangeable, and each arranged to operate independently the bolt-controlling devices at the same time and in the same manner even when they are interchanged, as set forth.

2. In a time-lock, the combination, with the bolt and controlling devices therefor embodying a portion adapted to be moved in one direction to cause the unlocking, of two interchangeable time-movements independent of the bolt-controlling devices and each other, arranged to operate said bolt-controlling devices in the same manner, substantially as described.

3. In a time-lock, the combination, with the bolt and controlling devices therefor embodying a portion adapted to be moved in one direction to cause the unlocking, of two interchangeable time-movements independent of the bolt-controlling devices and each other, arranged to positively operate the bolt-controlling devices in the same manner, substantially as described.

4. In a time lock, the combination, with a bolt and controlling devices therefor, of a clock-movement, stop-works therefor geared to the winding-arbor and adapted to operate directly upon the bolt-controlling mechanism, and an indicator also geared to the winding-arbor, substantially as described.

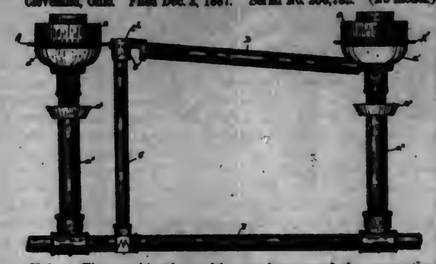
5. The combination, with the lock or dogging bolt, the movable catch or slide for holding the same in locked position, the latch and spring connecting it to the bolt, said latch being arranged next the slide in the direction in which the latter moves to effect the locking, of a tongue-piece or projection connected to the safe-bolt, arranged to strike the dogging-bolt when the latter is in one position and to engage said bolt and prevent its movement by the latch-spring when in another, substantially as described.

6. The combination, with the lock or dogging bolt, the movable catch or slide for holding the same in locked position, the spring for operating it, the latch and a spring connecting it to the bolt, said latch being arranged next the catch in the direction in which it moves to effect the locking, of a tongue-piece or projection connected to the safe-bolt, arranged to strike the dogging-bolt when the latter is in one position and to engage the latch-spring when in another, and a clock-movement arranged to operate the catch against the tension of its spring, substantially as described.

7. The combination, with the pivoted lock or dogging bolt, the pivoted latch for the same having a spring for moving it and a projection co-operating with the bolt to move in one direction, a spring connecting the bolt and latch for holding them together, of a catch or slide and a spring for moving it in a direction to engage first the latch and then the bolt, and a clock-movement arranged to operate the catch against the tension of its spring, substantially as described.

8. The combination, with the lock or dogging bolt, the catch or slide for locking the same, of the clock-movement, the wheel geared thereto carrying a pin or projection, and the loosely-pivoted arm normally out of engagement with the catch adapted, when moved by the projection on the wheel, to engage with and operate the catch releasing the dogging-bolt, substantially as described.

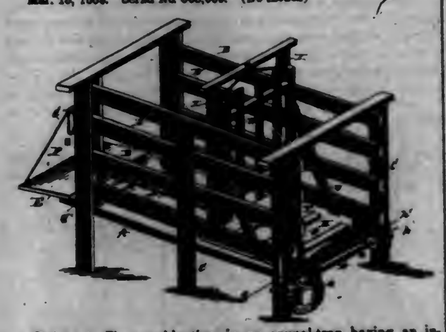
9. The combination, with the lock-casing and a support for the same, of the locking or dogging bolt, the catch controlling the same, and one or more clock-movements removably secured in the casing capable of being removed independent of the bolt or locking mechanism, and connections, substantially as described, between the movement and catch, as set forth.



10. The combination, with the lock-casing and a support for the same, of the locking or dogging bolt, the catch controlling the same, and one or more clock movements removably secured in the casing capable of being removed independent of the bolt or locking mechanism, connections, substantially as described, between the movement and catch, and a bolt or bolts in engagement with the support, arranged to act directly upon the movement or movements and force them from their seats upon the approach of the lock-support and casing, as set forth.

11. The combination, with the lock-casing having apertures at opposite ends, of a laterally-movable locking-bolt, a catch, and one or more clock-movements for controlling it, whereby the lock is adapted for either right or left handed safe bolt-works, substantially as described.

12. The combination, with the lock or dogging bolt and the catch controlling the same, of the clock-movement having the winding-arbor, the stop-works embodying the disk and pin and the wheel *f*, the pin on the wheel, the arm journaled loosely on the arbor of the wheel *f*, the gears *c g h i*, and pointer *j*, substantially as described.

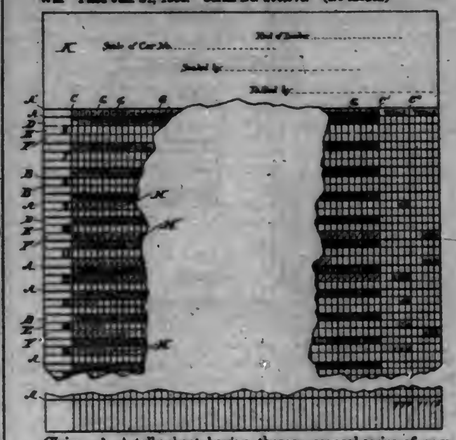


13. The combination of the pivoted lock or dogging bolt having the web or extension I, the pivoted latch having the pin K' engaging the bolt, the spring K^2, spring J^2, the slide G, having the lower extension, the spring G^2, and means, substantially as described, for operating said slide, as set forth.

409,221. VAPOR-BURNER STOVE. GEORGE B. MCCLELLAND, Cleveland, Ohio. Filed Dec. 2, 1887. Serial No. 256,782. (No model.)

Claim.—The combination, with two burners of the generating variety, of a generator located in position to receive heat from the first burner, said generator being provided with tube for conveying gas to the second burner for supplying initial heat to the latter, substantially as set forth.

409,222. GANGWAY FOR LOADING OR UNLOADING STOCK-CARS. JAMES W. MCIVER and JOHN H. MCIVER, Houston, Tex. Filed Mar. 13, 1889. Serial No. 303,092. (No model.)

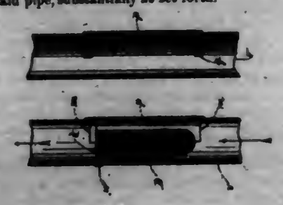


Claim.—1. The combination, in an animal-trap having an inclined bottom and opposite sides, of a winch journaled at one end thereof, a movable platform mounted on the bottom and provided with opposite posts at its front end, a gate hinged to one of said posts, and opposite chains connected to the winch at one end and passing over drums located at the opposite ends of the sides, the opposite terminals of the chains being connected to the opposite posts, substantially as specified.

2. The combination, with the opposite side frames B and the bottom A, mounted between the same, of the winch, consisting of the shaft P, journaled in the rear ends of the frames and provided with the drums *p p* and gear Q, the pinion R, and the drums N, mounted at the opposite end of the frame, the platform H, provided with rollers *n*, mounted for movement on the floor, and the posts I, extending vertically at the opposite sides and at the front end of the platform, the gate K, pivoted to one post and closing between the posts, and the chains M, having one of their ends connected with the drums *p* and passed over the drums N and connected with one of the posts I, substantially as specified.

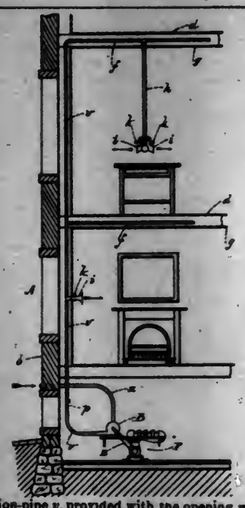
3. The animal-gangway having the inclined bottom and opposite sides, in combination with a movable platform mounted on the bottom and provided with posts, a gate hinged to the posts, said platform being designed to drop down at one end of the trap and form an inclined plane, up which the animals can walk, and the operating means to move the platform and gate along the bottom of the gangway, substantially as specified.

409,223. TALLY-SHEET. BENJAMIN F. MCMILLAN, McMillan, Wis. Filed Jan. 21, 1889. Serial No. 296,970. (No model.)



Claim.—1. A tally-sheet having thereon several series of numbers in arithmetical progression, one of which series is headed by a small number, and each succeeding series of which several series is headed by the number next larger than the one at the head of the preceding series, in combination with blank spaces adjoining and corresponding with the several numbers in each series of numbers, substantially as described.

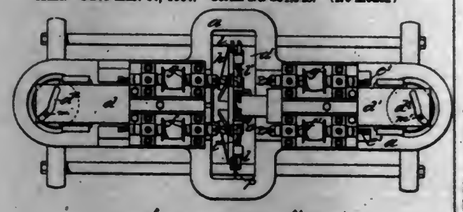
2. A tally-sheet having several series of numbers in arithmetical progression, in each of which series the progression is by the amount of a corresponding number placed in larger character at or near the head of the column of the series, which numbers in large characters occur in the regular order of numeration, and the same numbers appear at the head of each of the corresponding columns of figures in arithmetical progression, in combination with one or more blank spaces opposite to and corresponding with the figures in the columns in arithmetical progression, substantially as described.

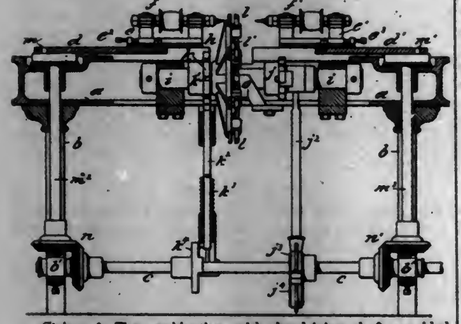


3. A tally-sheet having thereon several successive columns of figures, in each of which columns the figures are in arithmetical progression, and each successive column commencing with the next succeeding number in the order of numeration, in combination with spaces opposite to the numbers in said columns for receiving checks therein, and spaces at the ends of such series of spaces for checks for entering therein the totals indicated by such figures, substantially as described.

409,224. VENTILATOR. WILLIAM Y. OSGOOD, Lynn, Mass., assignor to the Standard Mining and Ventilating Company, Portland, Me. Filed Feb. 8, 1889. Serial No. 299,166. (No model.)

Claim.—1. In a ventilator, the combination of a rotary blower provided with an induction-pipe for supplying fresh air thereto, an eduction-pipe connecting said blower with different stories of the building, said eduction-pipe being provided with a side opening and with a door for closing said opening, branch pipes leading from the eduction-pipe into the different rooms of the building and provided with mouth-pieces having valves for closing the same, and a receptacle detachably disposed in said eduction-pipe opposite said opening, and adapted to contain disinfecting material for impregnating the air as it passes through said pipe, substantially as set forth.

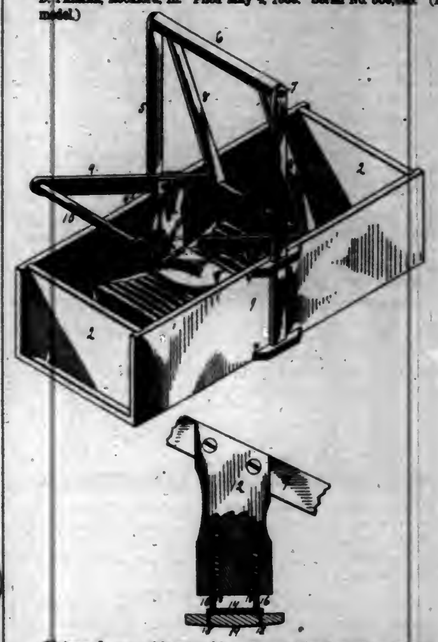




409,224.

2. The eduction-pipe *v*, provided with the opening *m*, door *p*, and studs *w*, in combination with the reticulated holder D, adapted to contain disinfecting material and provided with the plate *t*, and adjunctive mechanism for forcing air through said pipe, substantially as described.

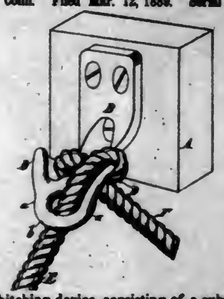
409,225. BUTTON-MAKING MACHINE. PHILIP A. OTIS, Leeds, Mass. Filed Mar. 17, 1887. Serial No. 231,343. (No model.)



Claim.—1. The combination, with the driving-shaft provided with gears on its ends and the revolving head having blank-holding jaws, of the vertical shafts m^3 and m^4, having gears to mesh with the gears on the driving-shaft and provided with eccentrics on their upper ends, and the reciprocating beds d', carrying the rotatable shapers *f*, all substantially as described.

2. The combination, with the driving-shaft having the cams h^2 and j^2, and the revolving head mounted on the shaft *i*, of a locking-disk *k*, mounted on the shaft of the revolving head and provided with indentations *k'*, the vertically arranged and reciprocating pawl k^3, connected to the cam k^4 on the driving-shaft and provided with the spiral spring k^5, arranged about the body of the pawl, the vertically-arranged pawl j^3, connected to the cam j^2 on the driving-shaft, and the ratchet *j* on the shaft *i*, substantially as and for the purpose specified.

3. The combination, in a button-making machine, of the vertically-arranged rotatable shafts carrying eccentrics on their upper ends, the reciprocating tables connected to the eccentrics, the adjustable tables carrying the cutters, and the intermitting rotatable holding-head, all substantially as described.

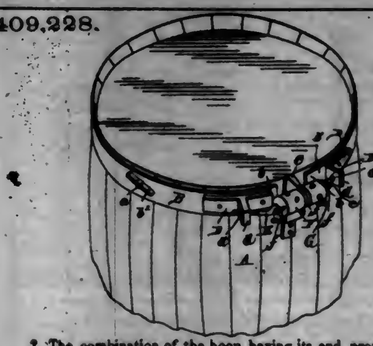


4. The combination, with the rotating head carrying the spring-actuated clamping-jaws, of the cam *o*, to open the said jaws, and the clearer *p*, to push the pieces from the jaws, all substantially as described.

409,226. WASHING-MACHINE. HENRY H. PALMER and SAMUEL D. PALMER, Rockford, Ill. Filed May 4, 1888. Serial No. 309,823. (No model.)

Claim.—In a washing-machine, the combination of an operating-handle, a lower rubbing-surface, a rubbing-board, said rubbing-board having a yielding connection with the operating-handle, said yielding connection consisting of a metallic plate secured to the rubbing-board, arms projecting from the plate and entering recesses in the pendent support, springs in the recesses against which the arms press, and stops for holding the arms of the plate in the recesses, substantially as set forth.

409,227. HITCHING DEVICE FOR ROPES. ISAAC R. PALMER, Middletown, Conn. Filed Mar. 12, 1889. Serial No. 303,009. (No model.)

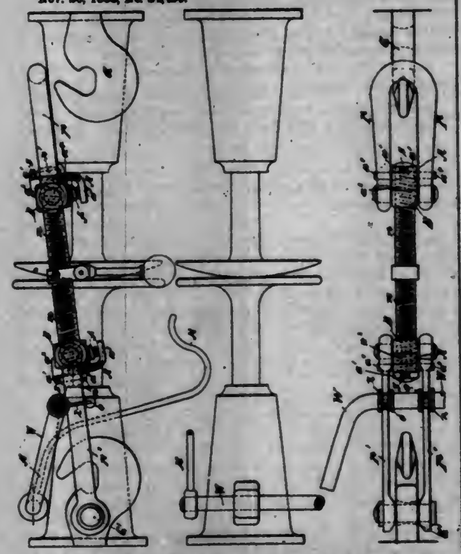


Claim.—A hitching device consisting of a substantially straight stem having a bifurcated forward end and two upwardly-extending horns—one upon each of the bifurcations—said horns diverging laterally from each other, and also extending rearwardly at an incline, substantially as specified.

409,228. BARREL-HOOP. GEORGE W. PARRISH, Salem, Va. Filed June 1, 1888. Serial No. 312,858. (No model.)

Claim.—1. A contractile hoop provided with a series of inclined slots designed to be engaged by screws or the like projecting from the side of a barrel, whereby, when it is contracted, it will be drawn farther on a barrel, substantially as described.

409,228.



2. The combination of the hoop having its end provided with plates having threaded openings, the screws provided with eyes and engaging the threaded openings, and the bar having rings at its ends to receive the eyes of said screws, whereby a flexible connection is formed, substantially as described.

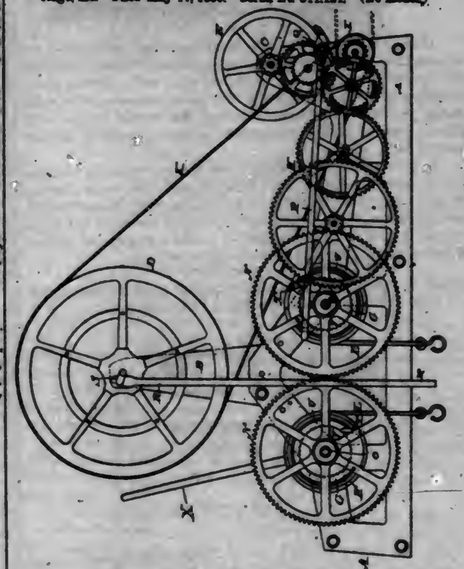
3. The combination of the hoop provided with end plates having threaded openings, the screws provided with eyes and engaging the threaded openings, the bar having rings at its ends engaging the eyes of said screws, and an annular groove intermediate of said ends, and the central plate designed to be carried by a barrel, provided with the curved recess for engaging the annular groove, substantially as and for the purpose described.

4. The combination of the hoop provided with end plates, the screws having eyes and engaging threaded openings in said plates, the bar provided with rings to receive said eyes and having a series of transverse perforations, and a locking-screw passing through one of the perforations and adapted to engage a barrel, substantially as described.

409,229. CAR-COUPLING. ALBERT PAUL, Berlin, Germany, assignor of two-thirds to Simon Ehrenwerth, same place. Filed Nov. 22, 1888. Serial No. 291,614. (No model.) Patented in England Nov. 7, 1888, No. 14,137; in France Nov. 12, 1888, No. 194,063; in Belgium Nov. 13, 1888, No. 83,934; in Switzerland Nov. 15, 1888, No. 36, and in Italy Nov. 30, 1888, No. 24,439.

Claim.—1. In car-couplings, the combination of an ordinary car-coupling with shaft W, hand-lever H, and carriers A A, substantially and for the purpose as described.

2. In car-couplings, the combination of links *p' p' p p*, screw *n*, with projection *s*, nuts B B, carriers A A, with slots *t' t'*, and springs *f f*, links *z z*, with rollers *o o*, substantially and for the purpose as described.



3. In car-couplings, the combination of the carriers A A, having the arms a^4 a^4, flanges a' a^3 a^3, the flange a' having a slot *t'*, nuts B B, springs *f f*, right and left hand screw *n*, with the heads *n'*, having the projections *s s*, links *p p' p'*, cranked shaft W, hand-lever H, and lifting-links *z z*, which carry the rollers *o o*, substantially and for the purpose as described.

409,230. PROCESS OF MAKING FERTILIZERS. CARMEN C. PECK, New York, N. Y. Filed Feb. 6, 1889. Serial No. 298,176. (No specimens.)

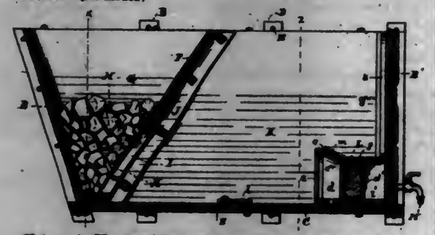
Claim.—1. The process herein described of manufacturing fertilizing material, consisting in concentrating the water resulting from rendering processes to a semi-liquid condition, and then mixing it with infusorial earth for the purpose and substantially in the manner described.

2. The process herein described of manufacturing fertilizing material, consisting in concentrating the water resulting from rendering processes to a semi-liquid condition, mixing the same with infusorial earth, and drying the compound thus formed, substantially in the manner and for the purpose described.

409,231. MOTOR. JOSEPH R. PECK and MARION ROBERTS, Breckenridge, Mo. Filed May 17, 1889. Serial No. 311,121. (No model.)

Claim.—The combination, with the main frame having the upward projections B and C, of the drums, their cords and weights, the two large gear-wheels N N, connected by ratchets and pawls with the drums, the train of gears H, the fly-wheel, the two hand-wheels and band, and the pitman for connecting with machinery to be driven, substantially as set forth.

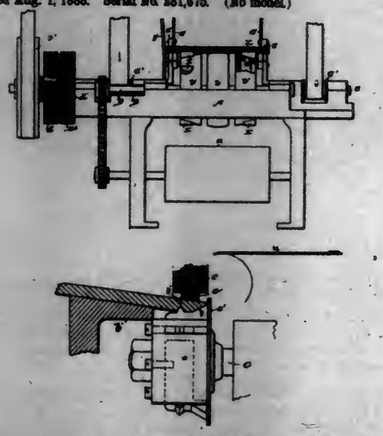
409,232. LOOM-SHUTTLE. CHARLES G. PEYSOLD, Lawrence, Mass., assignor to the Arlington Mills, same place. Filed Feb. 16, 1884. Serial No. 120,864. (No model.) Patented in England Nov. 4, 1884, No. 14,574.



Claim.—The body of the shuttle, the spindle-receiving block provided with a notch 4, a co-operating spring, the pin *b'*, by which the said block is pivoted in the shuttle-body, and the pin *m*, combined with the headed spindle *c*, having the aligning surface *c* and the notch 3 to co-operate, respectively, with the pins *b'* and *m*, substantially as shown and described.

409,233. HARROW. SOLOMON L. POWELL, Centre Town, Mo. Filed Mar. 5, 1888. Serial No. 302,472. (No model.)

Claim.—The combination, with a harrow-frame composed of a series of flexibly-connected toothed bars, of a bolt secured centrally to and extending upwardly from one of the bars, a flanged plate mounted upon the said bolt, and a longitudinal stiffening-bar adapted to be secured detachably thereto, substantially as set forth.

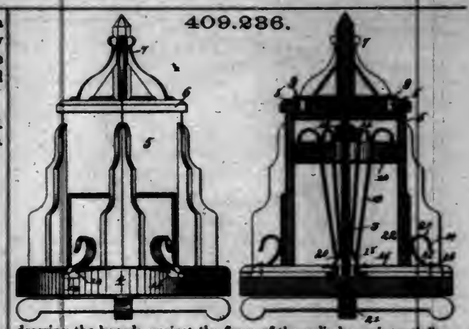


409,234. APPARATUS FOR MAKING AND FILTERING BRINE. BARTHOLOMEW B. GUINN, Cleveland, Ohio. Filed Apr. 27, 1889. Serial No. 308,780. (No model.)

Claim.—1. The combination, in an apparatus for making and filtering brine, of a vertically-tapering depositing-compartment for the rock or coarse salt, having a screen and rack, and a filtering device consisting of a compartment-box with flaring canvas-covered inlet, having perforated partitions traversing the interior thereof, with filtering material between the same, substantially as and for the purpose set forth.

2. In an apparatus for making and filtering brine, the combination of the screen H, the rack I, arranged in relation to and forming the lower part of the partition F, and the tapering compartment G and the filter L, with canvas *e* and perforated partitions *d d'* in the interior thereof, forming chambers *d'*, *f*, and *i*, constructed and arranged substantially as and for the purpose set forth.

409,235. CROZING-MACHINE. LEMON M. REED, Cleveland, Ohio. Filed Aug. 1, 1888. Serial No. 281,675. (No model.)



Claim.—1. In a stave-crozing machine, the combination, with a former made up of center and end sections, the latter having projections thereon for engaging the staves and adjustably secured on the shaft, whereby they can be moved toward and away from the central section, curved presser-bars located at one side of the vertical center of the former, and standards for supporting a series of staves, the said standards being located adjacent to and in front of the upper ends of the presser-bars, of cutter-heads for crozing and dressing the ends of the staves and cutting the latter into lengths, substantially as set forth.

2. The combination, with a sectional former and cutter-heads for cutting and dressing the ends of the staves, of the presser-bars located wholly to one side of the vertical center of the former, and standards also located on the same side of the vertical center of the former and adapted to support a number of staves, substantially as set forth.

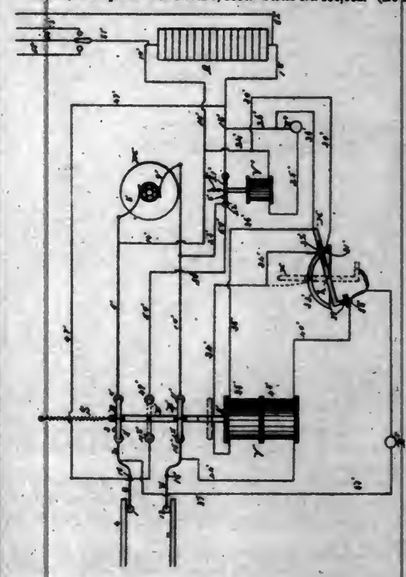
409,236. DOCUMENT-FILE. ROBERT S. RICE, Kaufman, Tex. Filed Jan. 24, 1889. Serial No. 297,405. (No model.)

Claim.—1. In a file, the combination, with a lower disk or base having a series of radiating ways each provided with a sliding block and clamp-board, of a polygonal cylinder mounted on the disk and having its faces parallel with the clamp-boards, and of springs for

409,236.

drawing the boards against the faces of the cylinder, substantially as described.

2. In a file, the combination, with a lower disk or base provided with a series of radiating grooves, of a centrally-arranged polygonal-faced cylinder having springs, and of a series of sliding blocks mounted for movement in the grooves and connected each to one of the springs, and each provided with a clamping-board adapted for closing against the adjacent faces of the cylinder, substantially as specified.



3. In a file, the combination, with a base or disk having a series of radiating grooves provided with sliding blocks, and with a cylinder mounted on the disk, of a clamping-board extending vertically from each of the blocks, and a flat spring serving as a pull connected to the block and to the board, substantially as specified.

4. The combination, with the disk 4, having the grooves 13 and blocks 15, and the cylinder, of the clamping-boards 17, terminating in the pulls 24, secured to the clamp-boards, as at 22, and slotted at their lower ends, as at 25, and loosely secured to the blocks by pins 26, substantially as specified.

5. The disk 4, in combination with the polygonal-faced cylinder 5 and the radial braces 23, arranged to embrace each of the angles of the cylinder, substantially as specified.

6. The disk 4, having the recesses 13, shouldered, as at 14, in combination with the cylinder 5, having the internal rings 10, carrying the depending series of springs 19, terminating in hooks 20, and with the sliding blocks 15, shouldered, as at 16, to ride in the recesses 13, and provided with tongues 18, connected with the hooks 20 and the clamp-boards 17, and the spring-draw 21, slotted, as at 25, and connected to the block by pins 26 and to the board by pin 22, and terminating in the curved pull 24, substantially as specified.

409,237. ELECTRICAL-RAILWAY SYSTEM. ELIAS E. RIES, Baltimore, Md., assignor, by direct and mesne assignments, to Ries & Henderson, same place. Filed Jan. 9, 1886. Serial No. 188,062. (No model.)

Claim.—1. In an electrical-railway system, the combination, with the conducting-rails and automatic switches for cutting sections of said conducting-rails out of circuit, of one or more cars arranged to run upon the railway, a motor upon each of said cars connected with its wheels for propelling the same, one or more collectors arranged to communicate electrical current from the conducting-rails to the motor, secondary or accumulating batteries located on the cars, switching devices and conductors arranged to connect the collectors with said secondary or accumulating batteries for charging the same, automatic devices for disconnecting said batteries from the charging-circuit when fully charged, and automatic switching devices for connecting said secondary or accumulating batteries with the motor when the supply of current from the conducting-rails is cut off, essentially as set forth.

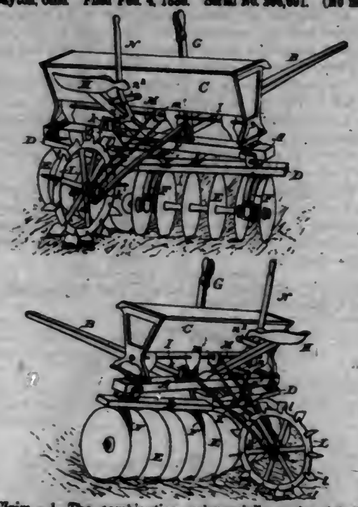
2. In an electrical railway, the combination of the main charged circuit formed in part by the conducting-rails, the car having the motor and secondary batteries mounted thereon and connected with the charged circuit in multiple arc, and automatic switch devices for cutting out the batteries when charged and for reconnecting said batteries in the charged circuit when wholly or partly exhausted by leakage or use, substantially as described.

3. In an electrical railway, the combination of the main charged circuit formed in part by the conducting-rails, the car having the motor and secondary batteries mounted thereon and connected with the charged circuit in multiple arc, automatic switch devices for cutting out the batteries when charged, a working-circuit containing the batteries and motor, and switching devices for cutting said motor out of the charged circuit and placing it in the working-circuit, substantially as described.

4. In an electrical railway, the combination of a main circuit, part of which is formed by the conducting-rails electrically charged from a stationary source of electricity, a motor-car having collectors mounted thereon for connecting the motor with and disconnecting it from the main circuit, with secondary batteries arranged upon the car to be charged from a branch of the main circuit, an electrically-operated switch controlled by currents from the main circuit and from the secondary battery for connecting the latter with the motor when the main current fails, a switch connected with the collectors for withdrawing the currents from the electrically-operated switch when the main circuit is broken, and another electrically-operated switch for simultaneously disconnecting the motor from the secondary battery, substantially as described.

5. In an electrical railway, the combination of the main circuit, the conducting-rails forming a part thereof, the car, the secondary batteries and motor mounted thereon, a switch, and a double solenoid for operating the same to cut the batteries and motor out of the main circuit upon a failure of current, one coil of said solenoid being in the main circuit and the other in a derived circuit with the secondary batteries, substantially as described.

6. The combination, with the main charging-circuit, a secondary battery or batteries, and an electromotor interposed therein in multiple arc, of a switch in said circuit arranged to interpose the batteries in the circuit with the motor and to sever the main circuit, and an electro-magnetic device operating upon a failure of current in the main charging-circuit to operate the switch and cause the operations mentioned, substantially as described.



7. The combination, with the main charging-circuit, the motor and a secondary battery or batteries coupled therein, and a switch arranged when operated to break the main circuit and couple the motor and batteries in circuit together, of a double solenoid for controlling said switch, one coil of said solenoid being coupled in the main circuit and the other in a circuit from the secondary battery, whereby upon a failure of current in the main charging-circuit the switch will be operated and the operations mentioned will take place, substantially as described.

8. The combination, with the main charging-circuit, the motor and secondary battery or batteries coupled therein, and a switch arranged when operated to break the main circuit and couple the motor and batteries in circuit together, of a double solenoid for controlling said switch, each coil of said solenoid being coupled in an independent circuit, a switch controlling both the solenoid-circuits, so that they may both be manipulated simultaneously, thus preventing the operation of the main-circuit switch.

9. In an electrical railway, the combination, with the main charging-circuit formed in part by the conducting-rails, the motor and secondary battery or batteries coupled therein, and a switch arranged when operated to break the main circuit and interpose the motor and battery in circuit together, of a double solenoid for controlling the said switch, each coil of said solenoid being coupled in an independent circuit, the current-collectors, and switches connected with the current-collectors arranged in both said circuits, so that when the collectors are moved out of contact with the rails the solenoid-circuits will be simultaneously operated and the switch controlled thereby remain undisturbed, substantially as described.

10. The combination, with the main charging-circuit, of the motor and secondary battery or batteries coupled in said circuit in multiple arc, automatic switch devices for cutting out the batteries when charged, a working-circuit containing the batteries and motor, and switching devices for cutting said motor out of the charging-circuit and placing it in the working-circuit, substantially as described

409,238. ATTACHMENT FOR DISK HARROWS. SEBASTIAN RITTY, Dayton, Ohio. Filed Feb. 4, 1889. Serial No. 298,691. (No model.)

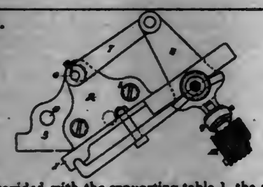
Claim.—1. The combination, substantially as hereinbefore set forth, of the cross-head, the disk-gangs carried thereby, the floating frame, and the paddle-wheel mounted in bearings in the rear end of said frame behind the disk-gangs and centrally thereof.

2. The combination, substantially as hereinbefore set forth, of the seeder-shaft having a sprocket about centrally of its length, the cross-head, the disk-gangs, the floating frame hinged to said cross-head, the paddle-wheel mounted in bearings at the rear end of said frame behind the inner ends of the disk-gangs and having a sprocket on its hub, and the chain connecting said sprocket with the sprocket on the seeder-shaft.

3. The combination, substantially as hereinbefore set forth, of the seeder-shaft having a sprocket about centrally of its length, the cross-head, the disk-gangs, the floating frame hinged to said cross-head, the paddle-wheel mounted in bearings at the rear end of said frame behind the inner ends of the disk-gangs, and having a sprocket on its hub, the chain connecting said sprocket with the sprocket on the seeder-shaft, and the lever connected with said floating frame to raise the paddle-wheel from contact with the ground.

4. The combination, substantially as hereinbefore set forth, with the driver's seat, of the floating frame, the paddle-wheel carried thereby, and the shield or guard carried by said frame between the wheel and the seat-standard.

409,239. SUSPENSION-HOOK. LOUIS P. ROLLER, Rutledge, Pa. Filed Mar. 22, 1888. Serial No. 304,200. (No model.)



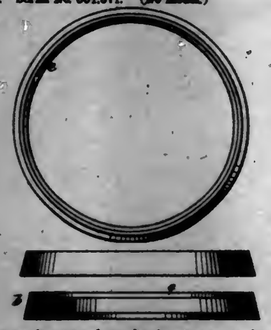
Claim.—A strap having a buckle, in combination with a hook having a loop in its upper end through which the strap passes, and a plate secured to the back of the loop end of the hook and adapted to be in contact with the said strap, substantially as described.

409,240. SHOE-BURNISHING MACHINE. SIMON ROSE, Jr., Linwood, Ohio. Filed Dec. 19, 1888. Serial No. 294,102. (No model.)

Claim.—1. The combination of the swinging bracket 2, adjustable to different angles and provided with the supporting-table 1, the vibratory arm 7, and the oscillating arm 8, carrying a burnisher and connected with and operated by the vibratory arm, substantially as described.

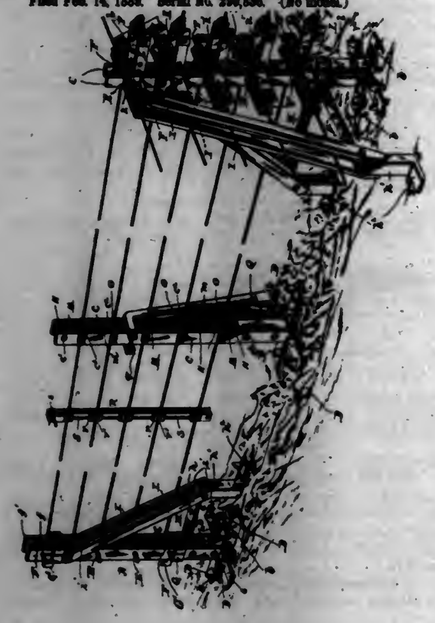
2. The combination of the driving-shaft 6, having an eccentric, the swinging bracket 2, hung on the shaft, adjustable to different

409,240.



angles, and provided with the supporting-table 1, the vibratory arm 7, connected with the eccentric of the driving-shaft, and the oscillating arm 8, carrying a burnisher and connected with and operated by the vibratory arm, substantially as described.

3. The combination of the bracket 2, adjustable to different angles and having the supporting-table 1, the shaft 11, carrying a beader, the oscillating arm 8, carrying a burnisher and secured to the beader-carrying shaft, the vibratory arm 7, connected with the oscillating tool-carrying arm, and the driving-shaft 6, for operating the vibratory arm, substantially as described.



4. The combination, with a stationary bracket 3, of a swinging bracket 2, adjustable thereupon to different angles and carrying a table provided with a shaft having a beader and an oscillating arm having a burnisher and secured to said beader-carrying shaft, substantially as described.

409,241. TRUSS-HOOP. LAWRENCE ROTH, Cincinnati, Ohio. Filed Mar. 5, 1889. Serial No. 301,571. (No model.)

Claim.—A tapering truss-hoop having the upper inner edge cut away or beveled off, as shown, as and for the purpose set forth.

409,242. WIRE FENCE. THOMAS I. ROBERTS, Centre Valley, Ind. Filed Feb. 14, 1889. Serial No. 299,836. (No model.)

Claim.—1. The combination of the stock provided with horizontal feet, which are anchored to the surface of the ground, the vertical parallel side straps bolted to the stock and provided with horizontal feet bearing on the surface of the ground, and the winding-spools arranged between the straps to receive the wire, substantially as specified.

2. The combination of the vertical stock secured to the ground, the side straps bolted to the stock, the lower brace having a vertical standard bearing on the ground and a horizontal portion secured at its ends to the stock, and the inclined braces bolted at their upper ends to the side straps and at their lower ends to the lower brace, substantially as specified.

3. The combination of the stock having side straps bolted thereto, the lower brace having a vertical standard provided with a foot which bears on the ground, and a horizontal portion which extends between the side straps, and is provided with a depending arm b^3, which is bolted to the stock, and the inclined braces bolted to the side straps and the lower brace and provided with shoulders on their inner sides to engage the same, substantially as specified.

4. The combination, with the side straps having registering perforations, of the bolt inserted in said perforations and having one end angular to be engaged by a wrench, and provided with a tightening-nut on its other end adapted to be turned up against the side straps, the winding-spool secured rigidly on said bolts between the straps and having ratchet-wheels at their ends, and the pawls pivoted to the straps above the spools and engaging the ratchet-wheels, as set forth.

5. The combination, with the parallel side straps secured at their lower ends to a stock and having tightening-spools mounted therebetween, of the clips G G, arranged in contact with opposite sides of the straps, the hinge provided with a shouldered shank engaging perforations in the said clips, and the nut engaging the free threaded end of the said shank, substantially as specified.

6. The combination, with the vertical parallel straps having winding-spools arranged therebetween, and the braces connected to the said straps, of the horizontal plates bolted to opposite edges of the straps, and the winding-spools arranged between the adjacent free ends of the plates to engage the ends of the wires of an intersecting fence, substantially as specified.

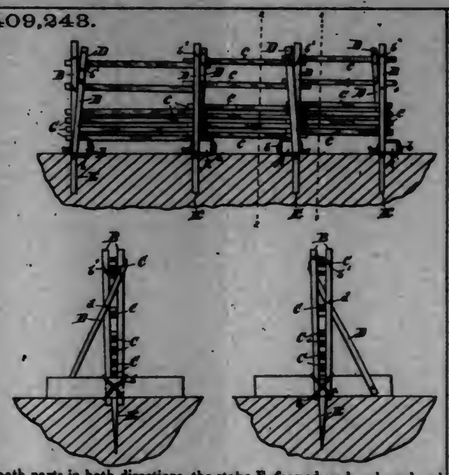
7. The combination, with a post comprising vertical parallel straps having winding-spools arranged therebetween to engage the fence-wires, of the transverse horizontal parallel plates K K, bolted to opposite sides of the post and provided at their extremities with winding-spools to engage the wires of the intersecting fence, and the yokes L L, bolted to the centers of the plates K and having winding-spools arranged between their free ends to engage the wires of the main fence, substantially as specified.

8. The combination, with the posts provided with wire-stretching spools, of the intermediate post having the parallel vertical straps, and the clevises or guides arranged between the said straps to guide the wire, substantially as specified.

9. The combination, with the posts provided with wire-stretching spools, of the intermediate post having parallel side straps, and the guiding-spools arranged at suitable intervals between the straps to guide the wire around a curve or over uneven ground, substantially as specified.

10. The combination, with the posts provided with wire-stretching spools, of the intermediate posts having the parallel vertical straps provided with recesses c^2 in their inner sides, the U-shaped clevises fitting in said recesses and the guiding-spools arranged in said clevises, as set forth.

11. The combination, with the posts provided with wire-stretching spools, of the intermediate post having parallel side straps secured at their lower ends to a stock, the transverse bolt connecting the upper ends of the said straps, the guides or clevises M M, arranged between the side straps and provided with vertical perforations, the vertical rod fitting in the said perforations and perforated at its upper end to receive the said transverse bolt, and the loop-shaped brace Q, passing at its free ends on opposite sides of the straps and provided with a transverse bar to bear against the same, and the bolt engaging the free ends of the brace, substantially as specified.

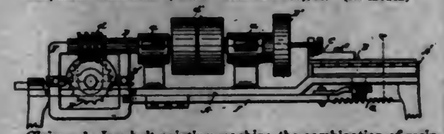


12. The base for fence-posts, consisting of the stock B, and the metallic foot extending horizontally from the upper end of the stock and having one end bolted to the stock and its other end resting on and anchored to the ground, as set forth.

13. The combination of the stock, the side straps bolted to the stock and having their lower ends bent horizontally outward therefrom, and the foot bolted to the stock and extending therefrom at right angles to the lower ends of the side straps, as set forth.

409,243. FENCE. WILLIAM V. RUSSELL, Greenville, Ohio. Filed Mar. 8, 1889. Serial No. 302,603. (No model.)

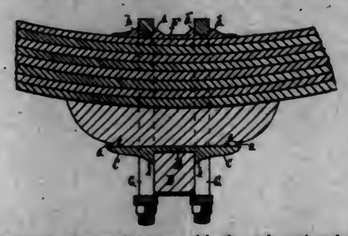
Claim.—1. The combination, in a fence, of the foot A, the pair of uprights B, secured thereto by a tie-wire passing diagonally around



409,243.

both parts in both directions, the stake E, formed wedge-shaped and driven between the lower ends of said uprights under said tie-wire, the rails C, and the tie-brace D, inserted in the tie-wire b' at its top and secured to the foot at its bottom, substantially as set forth.

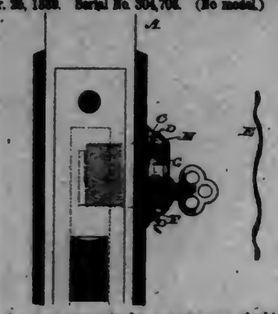
2. In a fence, the combination of the foot A, the uprights B, secured to said foot, as described, the stake E, also arranged as described, the tie-wire b' at the top of said uprights, the rails C, and the tie-brace D, inserted in said tie-wire b' at one end and secured to the foot at its other, said brace being secured to the side of the uprights which is adjacent to said foot, and having a pin, nail, or similar device inserted through it and one or both of said uprights where they cross, substantially as set forth.



409,244. BOLT-POINTING MACHINE. FRANK R. SCHIELD, Cleveland, Ohio. Filed Feb. 7, 1889. Serial No. 299,061. (No model.)

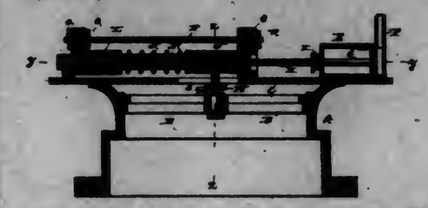
Claim.—1. In a bolt-pointing machine, the combination of reciprocating carriage bearing bolt-holder and cams for reciprocating the carriage, and a sliding bar and cam-yoke connecting the carriage and cams, substantially as set forth.

2. In a bolt-pointing machine, the combination, with a reciprocating carriage and cams for reciprocating the carriage, of a sliding bar and cam-yoke connecting the carriage and cams, and a spring for assisting the carriage in its movements away from the cutter-head, substantially as set forth.



409,245. SPRING BEARING-BLOCK FOR VEHICLES. FERDINAND SEILER, Akron, Ohio. Filed Dec. 26, 1888. Serial No. 294,712. (No model.)

Claim.—1. The combination, with the axle and spring, of the bearing-plate B, having the lugs i, arms C, provided with flanges e, and depending ribs b, block D, having shoulders f, saddle-plate F, convex in cross-section upon its upper face and provided with the parallel transverse ribs A, and the retaining-clips G, the parts being constructed and arranged substantially as and for the purpose described.



2. The combination, with the axle and spring, of the bearing-plate B, having an extension c, convex in cross-section upon its upper face and provided with the parallel transverse ribs d, lugs i, arms C, provided with flanges e, and depending ribs b, block D, having shoulders f, saddle-plate F, convex in cross-section upon its upper face and provided with parallel transverse ribs A, and the clips G H, the parts being constructed, arranged, and operating substantially in the manner and for the purpose set forth.

409,246. ROSE FOR LOCKS. ALVIN A. SILVERMAN, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Mar. 26, 1889. Serial No. 304,703. (No model.)

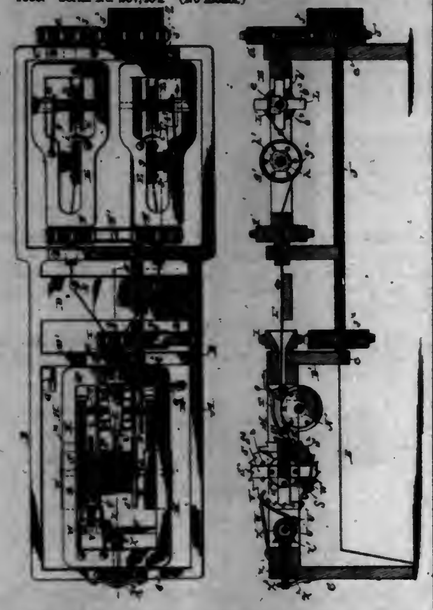
Claim.—A rose composed of two parts, one of which is adapted to bear against a door and the other against a knob, escutcheon, or the like, and a spring operating upon one of said parts and permitting motion of it relatively to the other part, so as to expand or contract the thickness of the rose, substantially as set forth.

409,247. AUTOMATIC DAMPER FOR BOILER-FURNACES. FREEMAN R. SHANK, Trotwood, Ohio. Filed Apr. 25, 1889. Serial No. 308,499. (No model.)

Claim.—1. The combination of the valve-case, the cylinder mounted upon the same, the piston working in said cylinder, a pipe connecting the outer end of said cylinder with the steam-boiler, the rotary valve, a lever connected with said valve, and the cross-head at the outer end of the piston-rod, working between suitable guides and having a stud working in a slot in the valve-operating lever, substantially as and for the purpose set forth.

2. The combination of the valve-case, the rotary valve, the steam-cylinder, the piston working in the latter, the cross-head at the outer end of the piston-rod, a spring bearing against the said cross-head, and a lever connecting said cross-head with the rotary valve and having slots working upon studs extending from said cross-head and valve, substantially as and for the purpose set forth.

3. The combination of the valve-case, the rotary valve, the steam-cylinder, the piston working in the latter, the cross-head at the outer end of the piston-rod, a lever connecting said cross-head with the rotary valve, and a spring arranged to bear against the outer end of the cross-head and against a cross-head adjustable between suitable guides, substantially as and for the purpose set forth.



4. The combination of the valve-case, the rotary valve, the guides, the bridge-piece connecting the same, the cross-head adjustable between the outer and inner ends of said guides, the adjusting-rod connecting said cross-head with the bridge-piece, the steam-cylinder, the piston, the cross-head at the outer end of the latter, the spring interposed between the cross-heads, and the lever connecting the cross-head at the outer end of the piston-rod with the rotary valve, substantially as and for the purpose set forth.

5. The combination of the valve-case, the rotary valve, the steam-cylinder, the piston working in the latter, the cross-head at the outer end of the piston-rod, the rod extending forwardly from said cross-head, the spring coiled upon the said rod and bearing against an adjustable cross-head, and a lever connecting the cross-head at the outer end of the piston-rod with the rotary valve, substantially as set forth.

6. In an automatic damper, the combination, with a rotary valve, of a steam-actuated cross-head connected with and adapted to operate the same, a spring arranged to force the said cross-head against the pressure of the steam, and mechanism for regulating the tension of the said spring, substantially as and for the purpose set forth.

7. In an automatic damper, the combination of the valve-case provided with a suitable door, the rotary valve, a steam-actuated cross-head, a lever connecting the latter with a rotary valve for the purpose of operating the same, a spring arranged to force the said cross-head against the pressure of the steam, an adjustable cross-head to regulate the tension of said spring, and a scale secured upon one of the guides of the sliding cross-head, substantially as and for the purpose herein shown and specified.

409,248. MACHINE FOR MAKING WIRE CABLES FOR PENCILS, &c. HENRY C. SIMS and JONAS T. WILEY, Lincomb, Iowa. Filed Oct. 6, 1888. Serial No. 287,404. (No model.)

Claim.—1. In a wire-twisting machine, the combination, with a series of revoluble frames carrying reels for wire and a separate revoluble frame carrying a receiving-reel, of gearing for revolving all of said frames in the same direction, a feeding and tension reel mounted in the frame carrying the receiving-reel, and mechanism for intermittingly stopping and releasing said tension-reel, substantially as set forth.

2. The combination, with suitable frame-work, of a series of revoluble frames mounted therein and carrying reels for wire, a frame revolubly mounted in the frame-work and carrying a reel for the reception of twisted wires, a ratchet-wheel and dog, means for actuating said dog for rotating said reel to wind the wire cable and draw said wires through the machine, and gearing for rotating all of said frames in the same direction and operating the ratchet mechanism, substantially as set forth.

3. The combination of a tension device consisting of a screw-threaded shaft made conical at its ends to form journals, two disks having outwardly-flanged peripheries mounted on said shaft, one rigidly and the other loosely, pins secured to one of said disks and passing through perforations in the other, a nut on the shaft, and a spring encircling the shaft between said nut and the loosely-mounted disk, substantially as set forth.

4. The combination, with a frame, a two-part reel, one part of which is movable toward and away from the other part, and a rest for the roll of wire secured to one of said parts, of an arm carried by the frame for locking the movable parts of the reel in operative position with relation to the other part, substantially as set forth.

5. The combination of a reel consisting of two shafts, two collars carrying outwardly-projecting arms, one of said collars being loosely mounted on its shaft and the other revoluble with its shaft, pins fixed to the arms of one collar and projecting into perforations in the other set of arms, and an arm on the frame in which the reel is mounted to maintain the parts in position, substantially as set forth.

6. The combination, with suitable frame-work, of a series of revoluble frames mounted therein, reels for carrying wire mounted in said frames, tension devices also carried by said frames, a revoluble frame mounted in the frame-work, bearings yieldingly mounted in said frame, a reel carried by said yielding bearings for receiving twisted wires, and gearing for revolving all of said frames in the same direction and operating the receiving-reel, substantially as set forth.

7. The combination, with suitable frame-work, of a series of revoluble frames mounted therein, reels for carrying wire mounted in said frames, tension devices also mounted in said frames, a revoluble frame mounted in the frame-work, sliding bearings carried by said frame, a reel for receiving twisted wires mounted in said sliding bearings, springs also mounted in said revoluble frame and bearing on the sliding bearings to maintain the same in a normal rearward position, and gearing for rotating all of said frames in the same direction and operating the receiving-reel, substantially as set forth.

8. The combination, with suitable frame-work, of a series of revoluble frames mounted in the frame-work, reels and tension devices mounted in said frames, a single frame revolubly mounted in the frame-work and carrying a reel for receiving twisted wires, a tension-reel mounted in said single frame in advance of the receiving-reel, a toothed wheel mounted on the same shaft with said tension-reel, a spring-actuated lever pivoted to the frame and adapted to engage said toothed wheel, an arm on the main frame with which the pivoted lever makes contact to periodically release the toothed wheel, and gearing for rotating all of said frames in the same direction and operating the receiving-reel, substantially as set forth.

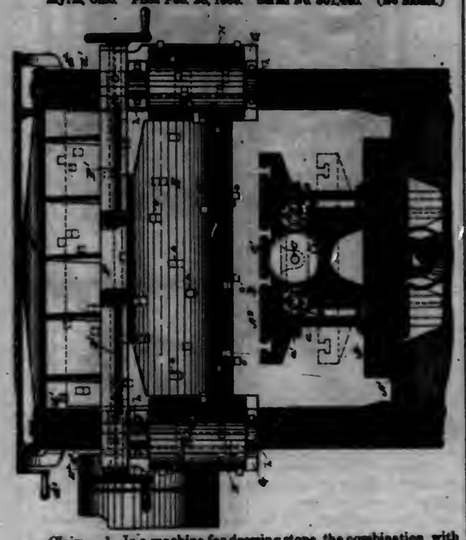
9. The combination, with suitable frame-work, of a series of revoluble frames mounted therein, reels and tension devices mounted in said frame-work, a single revoluble frame mounted in the frame-work, sliding bearings mounted in said frame, a reel journaled in said sliding bearings for receiving twisted wires, springs also mounted in said single frame and bearing on the sliding bearings of the receiving-reel, a tension-reel mounted in the single revoluble frame, a toothed wheel on the same shaft with the tension-reel, a spring-actuated lever pivoted to the frame-work and engaging the toothed wheel, an arm secured to the main frame with which the pivoted lever makes contact to periodically release the toothed wheel, and gearing to rotate all of said frames in the same direction and operate the receiving-reel, substantially as set forth.

10. In combination, a tension-reel consisting of two disks mounted on a screw-threaded shaft and connected near their peripheries by a series of bars, nuts on said shaft to retain said reel in a fixed position on the shaft, a ratchet-wheel on the shaft, a spring-sustained lever to engage the ratchet-wheel, and an arm on the frame with which said lever engages to intermittingly release said tension-reel, substantially as set forth.

11. The combination of a receiving-reel mounted on a loose shaft, a ratchet-wheel mounted loosely on said shaft, pins on the face of the ratchet-wheel to engage the reel, a spring-sustained pawl to engage said ratchet-wheel, and mechanism to actuate said pawl to rotate the ratchet-wheel and reel, substantially as set forth.

12. The combination, with suitable frame-work, of a series of revoluble frames having hollow journals at one end for the passage of wire mounted therein, reels and tension devices mounted in said frames, a revoluble frame mounted in the frame-work, having a hollow journal at its inner end for the passage of the wires from the reels on the series of revoluble frames, a tension-reel mounted in said single frame, over which the wires pass after being twisted, a guard secured to the revoluble frame to prevent the twisted cable crossing on the tension-reel, a receiving-reel in rear of said tension-reel, and gearing to rotate all the frames in the same direction and operate the receiving-reel to wind the twisted cable and draw the wires through the machine, substantially as set forth.

13. The combination, with a frame and a reel mounted therein, of a guard-plate secured to the frame and pins projecting from said guard-plate in advance and in rear of the reel, so that a wire passing over the reel will pass on one side of one pin before reaching the reel and on the other side of the other pin on leaving the reel, substantially as set forth.



14. The combination, with a revoluble frame, a reel for wire mounted therein, and a tension-reel also mounted in said revoluble frame, of a guard-plate secured to the frame and extending in proximity to the tension-reel, and pins projecting from the guard-plate, one in advance and one in rear of the tension-reel, substantially as set forth.

15. The combination, with a revoluble frame, a reel for wire mounted therein, and a tension-reel also mounted in said revoluble frame, of a guard-plate secured to the frame and extending in proximity to the tension-reel, pins projecting from said guard-plate, one in advance and the other in rear of the tension-reel, and grooved rollers mounted on said pins, substantially as set forth.

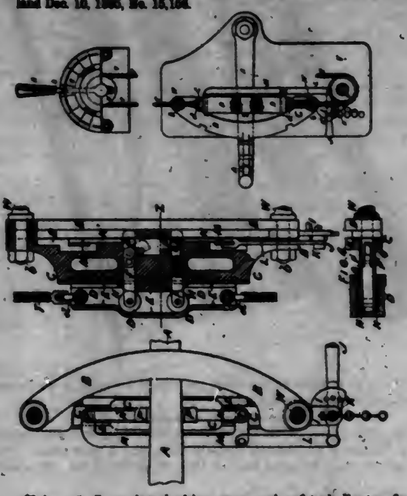
16. The combination, with suitable frame-work, of a series of revoluble frames mounted therein, reels and tension devices mounted in said frames, a single revoluble frame mounted in the frame-work, a receiving-reel in said single frame, a ratchet-wheel mounted on the same shaft with the receiving-reel, a crank-shaft mounted in said revoluble frame, a dog attached to the crank-shaft and engaging with the ratchet-wheel, a spring to maintain the dog in contact with said wheel, a pinion on the crank-shaft, a pinion on a shaft fixed to the frame-work and meshing with the pinion on the crank-shaft, and gearing for rotating all of said reels in the same direction, substantially as set forth.

17. In a wire-twisting machine, the combination, with suitable frame-work, of a series of revoluble frames mounted in said frame-work, the journal at one end of each revoluble frame being made hollow for the passage of wire and having teeth on a portion of its periphery to produce sprocket-wheels, sprocket-wheels on the journals at the opposite end of said frames, a single revoluble frame having a hollow journal, sprocket-teeth on the periphery thereof, and a shaft mounted in the frame-work carrying sprocket-wheels gearing with the revoluble frames, and means for transmitting motion to said shaft, substantially as set forth.

409,249. STONE-PLANING MACHINE. EDWARD SMALLWOOD, Elyria, Ohio. Filed Feb. 28, 1889. Serial No. 301,440. (No model.)

Claim.—1. In a machine for dressing stone, the combination, with a base having ways and side frames secured to said base, of a car mounted to move on said ways, a platform carried by the car and adjustable to and from the car, and a rotary cutter mounted in the side frames and above the car, substantially as set forth.

2. In a machine for dressing stone, the combination, with a frame carrying fixed ways, of a car mounted to move on said ways, a platform on said car and adjustable to and from the same, a cylinder mounted in fixed bearings above the platform, and cutting-tools fixed in said cylinder, substantially as set forth.



3. In a machine for dressing stone, the combination, with a frame carrying fixed ways, of a car mounted to reciprocate on said ways, a platform mounted on screw-rods carried by the car, worm-wheels on the screw-rods, worms for operating the worm-wheels to raise and lower the platform, gear-wheels carried by the worms, and a shaft carrying gear-wheels meshing with the worm gear-wheels, whereby all the worms may be operated simultaneously, and a rotary cutter mounted in fixed bearings above the platform, substantially as set forth.

4. In a machine for dressing stone, the combination, with a frame, of a cylinder mounted therein in fixed bearings, cutting-tools projecting from said cylinder, a cross-head carrying a yoke at each end, a vertical cylinder having cutting-tools mounted in each yoke, and mechanism for operating the cutting-cylinders, substantially as set forth.

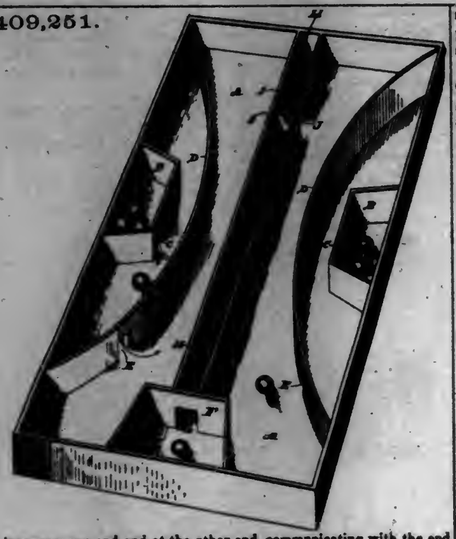
5. In a machine for dressing stone, the combination, with a frame, of a cylinder mounted therein in fixed bearings, cutting-tools projecting from said cylinder, a cross-head having dovetailed grooves at each end, yokes, each having a dovetailed tenon to enter said grooves, cylinders carrying cutting-tools mounted in said yokes, and screws for moving said yokes lengthwise the cross-head, substantially as set forth.

6. In a machine for cutting stone, the combination, with a frame, of a horizontal cylinder mounted therein in fixed bearings and carrying cutting-tools, a vertically-movable cross-head, mechanism for raising both ends of the cross-head simultaneously, yokes carried by the cross-head at its ends, mechanism for moving said yokes lengthwise of the cross-head, and rotary cutters carried by said yokes, substantially as set forth.

409,250. NAUTICAL SIGNALING APPARATUS. THOMAS SMITH, 74 Cyprus Road, Beetle-Cum-Lindow, County of Lancaster, England. Filed Oct. 3, 1887. Serial No. 251,248. (No model.) Patented in England Dec. 10, 1885, No. 15,198.

Claim.—1. In an interlocking gear and safety-indicator for reversing-gear for steam-engines, the combination of the deck-dial Q with handle R, pointer S, chain-pulleys U and chain T, the base V in the engine-room, reversing-lever A, pivoted to same and connected to engine, quadrant B, secured to said base to hold said lever in position, cross-slide C, held on said base over said lever and provided with pointer, slide-box D, with graduated index-face, having camway E and connected to the chains T, knuckle-jointed stop-bars F F', having ends P P', bedded to slide in the cross-slide C, and provided with rollers or bowls H, bearing in the camway E, hand-lever J, pivoted to an extension of the quadrant-support and provided with means of locking the same, link L, pivoted to said hand-lever, frame M, connected to the link L, and push-pieces N N', sliding in grooves of the cross-slide C, opposite to the jointed ends P of the stops F F', and secured to the frame M, substantially as set forth.

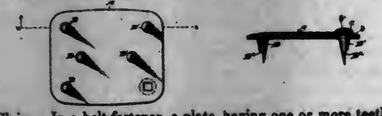
2. In combination with the reversing-lever A, pivoted to a base, the quadrant B, held on said base and adapted to lock said lever, the cross-slide C, held on said base over said quadrant, the stops F F', sliding in said cross-slide and having knuckle-jointed ends P P', adapted to project in the way of the reversing-lever, and the slide-box D, sliding on the cross-slide C and operated by the chains T, and having camway E, operating the ends of the stops F F', substantially as set forth.



3. The combination of the reversing-lever A, pivoted to a base, the quadrant B and cross-slide C, held on said base, the hand-lever J, pivoted to an extension of the quadrant and provided with means of locking the same into position, the link L, pivoted to said hand-lever, a frame M, connected to said link, and the pushers N N', connected to said frame and sliding in the cross-slide and adapted to operate the jointed ends P P', held slidingly in the cross-slide C, substantially as set forth.

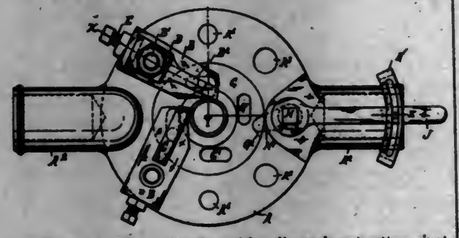
409,251. GAME-BOARD. JOSHUA SWELL, Little Falls, N. Y. Filed May 14, 1888. Serial No. 310,767. (No model.)

Claim.—1. A game-board consisting of a rectangular surface, pockets on two sides of the surface opposite each other, having each an opening near one end thereof, curved walls inclosing said pockets and having each an opening near one end thereof, a pocket on one end of the surface, having an opening in the front thereof, and a passage formed of two parallel strips communicating with the said pockets and openings in one end of the strips opposite each other, substantially as described.



2. A game-board consisting of a surface having an end pocket and two side pockets provided with openings, curved walls inclosing the side pockets provided with openings, and a passage formed by two parallel strips arranged between the said inclosing-walls having open-

409,251.



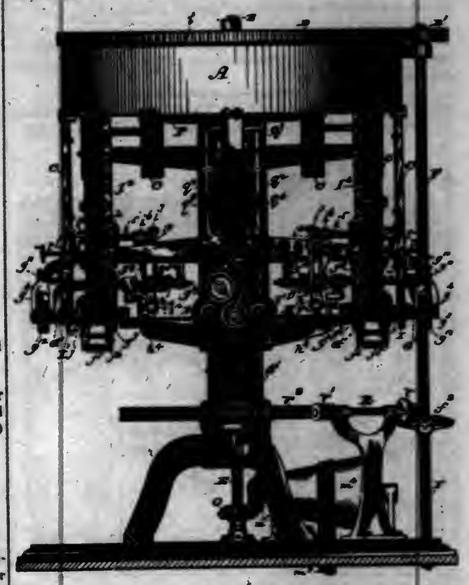
ings near one end and at the other end communicating with the end pocket, substantially as described.

409,252. BELT-FASTENER. JAMES SNOW, Cleveland, Ohio, assignor to William H. H. Peck and Sarah R. Snow, both of same place. Filed June 21, 1888. Renewed June 13, 1889. Serial No. 314,105. (No model.)

Claim.—In a belt-fastener, a plate having one or more teeth integral therewith and projecting from one side thereof, and one or more detachable teeth each having an angular portion adapted to be removably secured in an angular opening formed in the plate, the rigid and detachable teeth each having a chamfered side, the said chamfer commencing midway of a tooth and extending to the point thereof, and located on the side of the tooth opposite to where the draft of the belt comes, substantially as set forth.

409,253. SCREW-CUTTING DIE-STOCK. JAMES H. STERNBERGH and ROBERT PENNINGTON, Reading, Pa. Filed Apr. 19, 1888. Serial No. 307,883. (No model.)

Claim.—1. The combination, with a die-stock and cutters pivotally secured to the front face of said stock, of a sliding plate located within a recess in said front face and engaging each of said cutters and means for sliding the plate.



2. In a screw-cutting die-stock, the combination, with the cutter-holders pivoted to the front face of the die-stock, of a plate located within a recess in the front face of the die-stock and provided with eccentric slots, each of which engages a pin projecting rearwardly from the holders, and means for sliding said plate, all substantially as set forth.

3. The combination, with a die-stock having a recess in the front face thereof and a movable plate located within said recess, of cutters pivotally secured to the front face of the die-stock and engaging the movable plate and a rotary shaft for actuating said plate, substantially as set forth.

4. The combination, with a die-stock, movably-secured cutters, a sliding plate engaging each of said cutters, and means for sliding said plate, of the removable guide-thimble passing through the plate, substantially as set forth.

5. In a screw-cutting die-stock, the combination of the movable cutter-holders, the recessed plate engaging the holders, the removable guide-thimble, and means for sliding said plate, all arranged and adapted to operate substantially as set forth.

409,254. MACHINE FOR GRINDING SHEAVES, &c. HERMAN C. STUPP, St. Louis, Mo. Filed Nov. 27, 1888. Serial No. 292,010. (No model.)

Claim.—1. The combination of the hopper, the series of chutes, the shafts E F, the pinion D', and the gear D, having the fingers *d d*, substantially as described.

2. The combination of the chute, the shafts G G' g^3, the pinion g', the bracket g^4, the gear H, and the gears g^7 g^8 g^{11} g^{12}, substantially as described.

3. The combination of the gear H, the cam A, the roller A', the stud A^1, the box A^2, the shaft g^6, the arm g^{10}, the bracket g^4, and the spring g^{13}, substantially as described.

4. The combination of the chute, the wheels I I', and the journaled arms I^3 I^3, substantially as described.

5. The combination of the clamping-shafts G G' and the grinding-wheels, one of said shafts being adjustable toward and from the other and both of them being rotatory, and said wheels being held in arms capable of being moved toward and from each other, substantially as described.

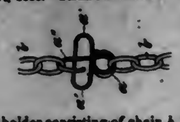
6. The combination of the chute, the grinding-wheels and their journaled arms, the spring i^3, and the cam i^4 and its shaft, substantially as described.

7. The combination of the chute, the grinding-wheels and their journaled arms opening apart from and closing toward each other, as described, the clamping-shafts, and the chute-gate, one of said shafts being adjustable toward and from the other, and both of the shafts being rotatory, and said gate being made to close and open said chute, substantially as described.

8. The combination of the gear H, the cam A^4, the roller i^{12}, the bell-crank i^9, the journaled arms I^3 I^3, the rock-shaft i^5, the cam i^4, the spring i^3, the crank i^7, and the rod i^8, substantially as described.

9. The combination of the gear H, the cam j', the thrust-bolt j^3, the spring j^5, the gate J, and the chute, substantially as described.

10. The combination of the grinding-wheels and their arms, the adjustable shoulders L, and the rock-shaft and cam i^4, and spring i^3, substantially as described.



11. The combination of the arm I^3, the adjustable shoulder L, the shaft I', the worm l^3, the nut l^4, and the screw l^5, substantially as described.

12. The combination of the grinding-wheels and the arms I^3 I^3, one of said wheels being adjustable laterally to enable it to wear evenly, substantially as described.

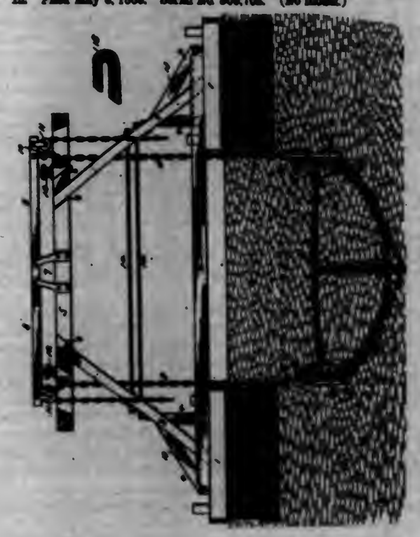
13. The combination of the shaft E, the gears P q, the shaft Q, the pulley q' q^3 q^4, the belts q^3, and the arms P P, substantially as described.

14. The combination of the shafts R F, the gear r^6 g^{10} H, the pinion r, the worm r', and the sleeve S and its bearing, substantially as described.

409,255. KEY-HOLDER. CHARLES H. VAN NORMAN, Waltham, Mass. Filed Jan. 24, 1889. Serial No. 297,341. (No model.)

Claim.—The key-holder consisting of chain *b*, the locking device, as described, having an eye *a* attached to one end of said chain, a cross-bar or lateral extension *a'*, and a spring bail or hook *a''*, adapted to be locked to the opposite end of the said chain, substantially as and for the purpose set forth.

409,256. GRAIN AND SEED SEPARATOR. NICHOLAS J. VENARD, Vinton, Va. Filed Feb. 23, 1889. Serial No. 300,966. (No model.)

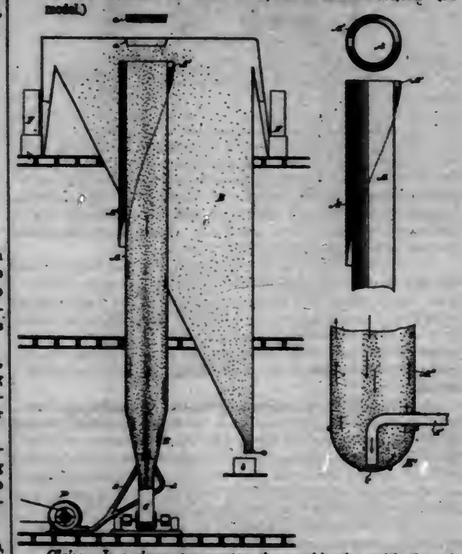


Claim.—1. In a portable grain-separator, the combination, with the blast-fan, its casing, and the feed-board, of the grading device comprising the trestles B, having the perforations *a'*, the removable wings or dividers A, having the trunnions *a*, and the separate receptacles D, adapted to be placed beneath the dividers, substantially as and for the purpose set forth.

2. In a portable grain-separator, the combination of the blast-fan, the feed-board, the trestles perforated as described, the wings having each one or more aprons or dividers C, and the boxes D, made narrower at the top than at the bottom, substantially as shown, and for the purpose set forth.

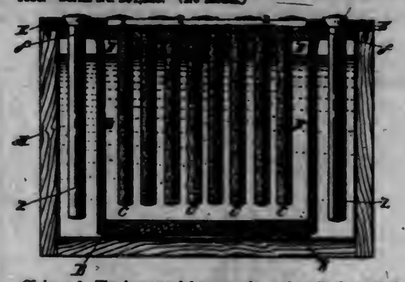
3. In a portable grain-separator, the combination, with the blast-fan, its casing, and the feed-board, of the grading device comprising the trestles B, having each an inclined series of perforations *a'*, the removable wings or dividers A, having trunnions *a*, and the receptacles D, substantially as set forth.

409,257. RAISING SUNKEN VESSELS. JULIUS WARNER, Chicago, Ill. Filed May 6, 1889. Serial No. 309,702. (No model.)



Claim.—1. The combination, substantially as set forth, of the scows in parallel proximity to each other, the uprights 3, supported upon said scows, a cap 5, supported upon said uprights and bridging the space between the scows, levers 8, fulcrumed on the cap and provided with hooks 10, chains 9, for connecting the vessel to be raised with the hooks upon the levers, and jacks 12, bearing upon the cap and the levers, for working the levers and raising the vessel.

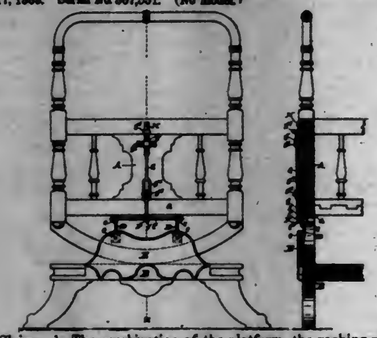
2. The combination, substantially as set forth, of the two scows in parallel proximity to each other, the uprights 3, supported thereon, the cap 5, supported upon said uprights and bridging the space between the scows, the levers 8, fulcrumed on said cap and provided with pulleys 11, the lifting-chains and the windlasses 13 upon the scows in position to receive said chains as they pay through the pulleys.



3. The combination, with the lifting-chains 9 and the mechanism for raising said chains, of hooks 15 upon the lower ends of the chains to engage the feeder-strips of the vessel, and latches 17 upon the shanks of said hooks to engage the vessel's rails, and provided with dogs to lock them to said shanks, substantially as set forth.

409,258. POWDER-SEPARATOR. EDWIN P. WARD, New York, N.Y. Filed Oct. 24, 1887. Renewed Feb. 25, 1889. Serial No. 301,164. (No model.)

Claim.—In a pigment-separator, the combination, with the pulverizer and fan-blower, of a shaft above the exit-shaft of the pulverizer, said shaft having openings for the admission of air above the pulverizer-shaft, a continuous funnel surrounding same and brought to a point at one side thereof, a receiving-chamber, and a deflector secured to the top of said chamber and having a surface, which reflects the coarser material into the shaft, located above the shaft A, as and for the purpose set forth.



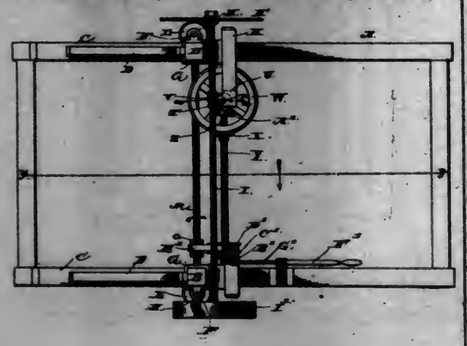
409,259. GALVANIC BATTERY. GEORGE C. WARD, Boston, Mass., assignor to the Advance Electric Company, Saco, Me. Filed Nov. 19, 1888. Serial No. 291,288. (No model.)

Claim.—1. The improved battery above described, consisting of a zinc element in a solution of sodium hydrate and a carbon element in a porous cell containing a bath composed of trioxide of chromium, an alkaline chloride, nitric acid, and water, substantially as set forth.

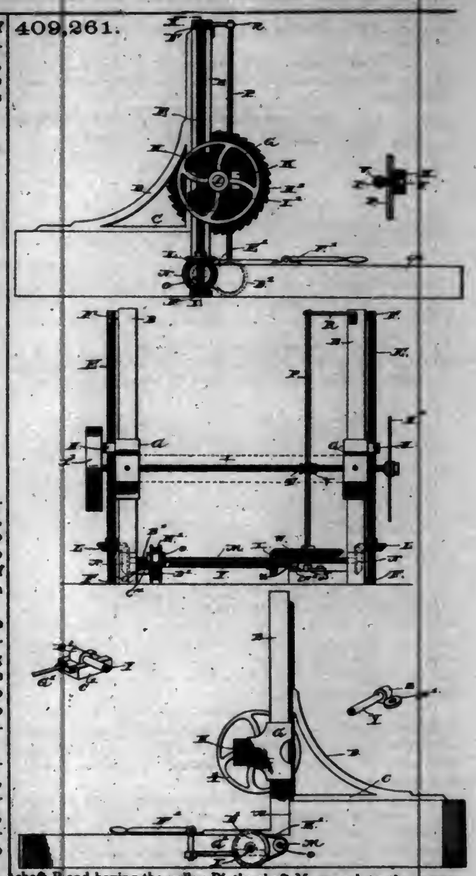
2. In combination, the outer cell A, its cover E, the series of rods Z, arranged in cell A and projecting through cover E, substantially as shown, inner cell B, its cover D, and the series of rods C, arranged in cell B and projecting through cover D, substantially as shown, each cover sustaining its series of rods, and all the elements being combined substantially as set forth.

409,260. CRADLE. JOHN H. WIGGINS, Cincinnati, Ohio. Filed Apr. 17, 1888. Serial No. 307,531. (No model.)

Claim.—1. The combination of the platform, the rocking member mounted thereon, a rock-shaft journaled to the rocking member, dogs D and ratchets F, secured upon said shaft, sockets in the base to receive the ends of said dogs, and a vertically-sliding rod, as G, to engage said ratchet, rotate and release said shaft for the purpose of locking the base and rocking member, or releasing the rocker from the base, substantially as and for the purpose set forth.



2. In a cradle or platform-rocker of the character described, the combination of a rock-shaft secured to the rocking member and carrying dogs to engage sockets upon the platform, a vertically-sliding rod sliding in guides secured to the rocker and adapted to rotate the shaft when depressed and release the dogs from the base and to release the said shaft when drawn up, and thus allow the said dogs to drop into their sockets in the base, substantially as shown and described.



3. In a cradle of the character described, the combination, substantially as specified, of the rocker A, the base B, mounted thereon, the shield E, secured to the base and having the sockets *e*, the rock-shaft C, journaled in bearings secured to the rocker A, the dogs D, ratchet F, secured upon said shaft, and the vertically-sliding tappet-rod G, arranged on the end of the rocker-frame in a position to engage the said ratchet F, for the purpose set forth.

4. The combination, substantially as specified, of the platform and rocking member, the shield E, secured to the platform and extending above the curved rocker, the metal sockets *e* let into said piece E, the shaft C, the dogs D, and ratchets F *f f'*, secured upon said shaft, the rod G, having projections *g g'*, the guide g^3, screw g^4, and spring H, for the purpose set forth.

409,261. CIRCULAR-SAW MILL. EDGAR C. WILEY, Independence, Va. Filed Dec. 1, 1888. Serial No. 292,261. (No model.)

Claim.—1. The combination, in a saw-mill, of the vertical standards the blocks sliding thereon, the screws to raise and lower the blocks, the beam K, connecting the blocks together, the saw-arbor journaled in the said blocks and having the worms V, the shaft P, the loose worm-wheel T thereon engaging the worm V and supported by beam K, the shaft Y, journaled in movable bearings geared to the

shaft P and having the pulley D', the shaft M, geared to the screws and having the pulley O, and the belt connecting the pulleys O and D', substantially as described.

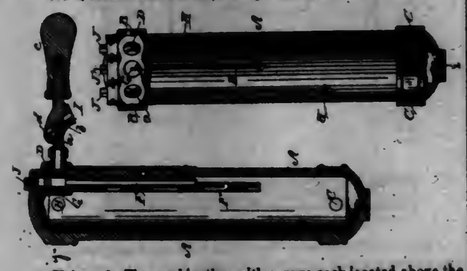
2. The combination, in a saw-mill, of the vertically-movable bearing-blocks carrying the saw-arbor having a worm formed thereon, the transverse beam connecting the bearing-blocks and having a recess, a worm-wheel supported in said recess engaging the worm upon the saw-arbor and moving vertically upon an angular shaft, the vertical screws supporting and extending through threaded openings in the bearing-blocks, and mechanism for transmitting rotary motion in either direction to said screws from the angular shaft carrying the worm-wheel, substantially as herein set forth.

3. The combination of the shaft P, having gear W, the shaft Y, journaled in movable bearings and having the pinion X engaging wheel W and the pulley D' the elevating-screws, the shaft M, geared thereto and having the pulley O, the endless belt connecting the pulleys O D', and the lever to engage the pulley D' with pulley O and slacken the belt and to move pulley D' from pulley O and tighten the belt, whereby the screws may be rotated in either direction, substantially as described.

4. The combination of the vertical angular shaft having the vertically-movable worm-wheel engaging a worm upon the saw-arbor, a counter-shaft having its inner end journaled in a pivoted and its outer end in a sliding bearing, a pinion near the inner end of said counter-shaft meshing with a bevel-gear upon the lower end of the angular shaft, a transverse shaft geared to the lower ends of a pair of screws having vertically-movable blocks in which the saw-arbor is journaled, drums or pulleys upon the said transverse shaft and near the outer adjustable end of the counter-shaft, and a lever to adjust the sliding bearing of said counter-shaft, substantially as and for the purpose set forth.

409,262. FOLDING COT-BED. GEORGE H. WILSON, Utica, N. Y. Filed Mar. 6, 1888. Serial No. 266,160½. (No model.)

Claim.—1. In a cot-bed, the combination, with the oppositely-



disposed legs, of the interlocking-braces 3^a, 3^d, 4, and 5, each of which is pivoted at one extremity to the legs and the braces 3^a and 3^d to each other, and 3^d having a slotted opening 18, and the braces 4 and 5 pivoted to each other at 5^b, and the brace 5 engaging 3^a in the slotted opening therein, substantially as set forth.

2. In a cot-bed, the combination, with the side rails and the folding legs, of the bolster-frames pivoted to the side rails, and hooks sliding in the bolster-frames and connecting the latter to the legs, substantially as described.

3. In a cot-bed, the combination, with the folding legs, of pivoted bars secured to the side rails and serving as braces for the legs, and hooks connecting the legs and bars and sliding in grooves in the latter, substantially as described.

409,263. GAGE-COCK. AMASA WORTHINGTON, Brooklyn, N. Y. Filed Oct. 4, 1888. Serial No. 287,295. (No model.)

Claim.—1. The combination, with a gage-cock located above the maximum liquid-level of a vessel wherein liquid is contained under pressure, of a downwardly-extending passage communicating between said gage-cock and the said vessel at a level occupied by said liquid, and of an independent passage communicating between said gage-cock and the said vessel at a level above that occupied by said liquid, said independent passage having a capacity minor to that of the said gage-cock and that of the said downwardly-extending passage, the whole adapted to operate as set forth.

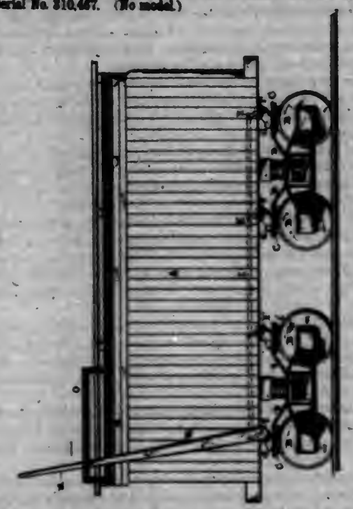
2. The combination of a plurality of gage-cocks located above the maximum liquid-level of a vessel wherein liquid is contained under pressure, downwardly-extending passages severally communicating between said gage-cocks and the said vessel at a designated series of different levels in the range of variation of the liquid-level, and independent passages severally communicating between said gage-cocks and the said vessel at a level or levels that are above that occupied by said liquid, each said independent passage having a capacity minor to that of the gage-cock to which it connects and to that of the downwardly-extending passage to which it connects, the whole adapted to operate as set forth.

3. The combination, with a gage-cock located above the maximum liquid-level of a vessel wherein liquid is contained under pressure, of a chamber projecting within the vessel opposite the gage-cock and to which the latter connects, a depending tube extending from said chamber to a testing-point in the range of variation of the liquid-level, and a passage connecting said chamber with the space above the maximum liquid-level, said passage having a capacity minor to that of the said gage-cock or of the said depending tube, and adapted for the purposes set forth.

4. The combination, with a vertical stand-pipe connected at its upper and lower portions, respectively, with the gaseous and the liquid spaces of a vessel containing liquid under pressure and located horizontally opposite to and including the range of variation to which the liquid-level is subject, of gage-cocks severally connected with chambers within said stand-pipe above the maximum liquid-level, depending tubes severally communicating from said chambers to various testing-points in the range of variation of the liquid-level, and the described passages of minor capacity connecting said chambers severally with the space above the liquid, arranged as and for the purposes described.

5. The combination, with the herein-described stand-pipe, of a plurality of gage-cocks extending radially in a common horizontal plane from a concentrated series of chambers located within the upper portion of said stand-pipe, depending tubes severally communicating from said chambers to various testing-points in the range of variation of the liquid-level, and the cramped passages connecting said chamber severally with the interior of the stand-pipe located in line with the radiating passages of the gage-cocks, as and for the purposes specified.

409,264. CAN. HENRY R. WEBBER, Boston, Mass. Filed Sept. 10, 1888. Serial No. 284,982. (No model.)

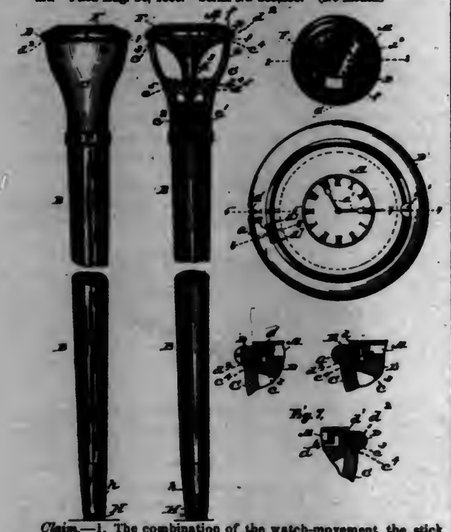


Claim.—The combination, with a can provided with a lip or rim and a handle and a stopper or cover therefor provided with a loop b^3, of an arm bent to form a ring to encircle said handle and also to pass through said loop, the arm extending substantially across the stopper or cover when in position to close the can and provided at its end with a finger or hook to engage said rim to lock said stopper in operative position, substantially as described.

409,265. PIPE CASING OR CONDUIT. ABSALOM WYCKOFF and ERNEST I. WYCKOFF, Elmira, N. Y. Filed Oct. 30, 1888. Serial No. 289,836. (No model.)

Claim.—As a new article of manufacture, the herein-described casing for pipes, consisting of a tube composed of an inner and an outer shell each built up of strips of wood united to form a hollow cylinder, and a layer of non-conducting material interposed between said shells.

409,266. CAR-BRAKE. WILLIAM R. ZEISLER, Waverly, N. Y., assignor of one-half to Miles S. Hoadley, same place. Filed May 11, 1888. Serial No. 310,467. (No model.)



Claim.—1. A car-brake consisting, essentially, of a pivoted truck having axles and wheels of usual character, and brake-shoes yieldingly supported on the truck above the car-wheels, a rock-shaft ex-

tending across the car-body above the shoes, cams on this rock-shaft in position to be rocked down upon the shoes however the truck may swing within its limit of movement, and a lever firmly connected to the rock-shaft, all combined substantially as described.

2. The combination, in a car-brake, of a brake-shoe yieldingly held above each wheel, a rock-shaft over each axle having a cam over each brake-shoe in position to rock onto the shoe, an arm on each rock-shaft and bars connecting all the arms, and a lever firmly connected to one of the rock-shafts at the side of the car and extending upward to a ratchet with which it may engage, all combined and relatively arranged substantially as described.

3. The combination, with a freight-car, of a rock-shaft extending across the car-body and bearing cams in position above the brake-shoes, a lever extending up at the side of the car and above the top, a ratchet at the top of the car to hold the lever, and a guard-bar outside the lever and above the car-top to protect the lever and the operator, all substantially as described.

409,267. CANE OR PARASOL WATCH. JAMES W. ALLEN, St. Louis, Mo. Filed Aug. 20, 1888. Serial No. 283,239. (No model.)

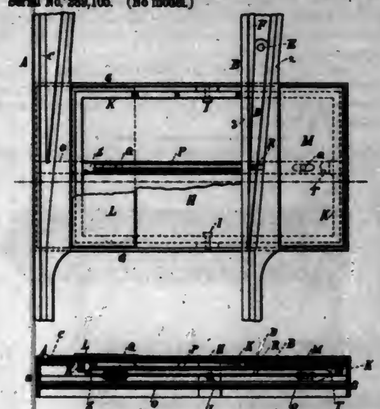
Claim.—1. The combination of the watch-movement, the stick, the cap, the holder, the pinion, the bezel, and the push-pin, said cap having the crown-wheel, partition, and socket, and said holder inclosing the watch-movement and having the stem journaled in and held beneath said partition, substantially as described.

2. The combination of the watch-movement, the pinion, the cap having the crown-wheel and the partition, and the holder having the stem, said stem being held longitudinally in said partition, substantially as described.

3. The combination of the watch-movement, the pinion, the cap having the crown-wheel, and the holder having the stem, said watch-movement being secured to said holder, and said holder-stem being held longitudinally in said cap, substantially as described.

4. The combination of the watch-movement, the stick, the cap, the holder, and the pinion, said watch-movement being attached to said holder, said cap having the crown-wheel and socket, and said holder at its rim turning upon the upper end of the cap and having a stem which is held longitudinally in the cap, substantially as described.

5. The combination of the watch-movement, the holder, and the cap, said watch-movement being held in said holder, and said holder turning upon the upper end of the cap, inclosing said watch-movement beneath and having a stem held longitudinally within said cap, substantially as described.

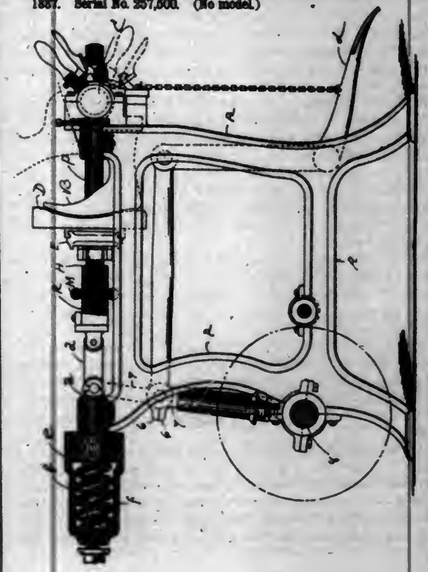


6. The combination of the watch-movement, the holder, and the cap, said holder inclosing said watch-movement beneath, and said cap sustaining said holder and inclosing it beneath, substantially as described.

7. The combination of the cap having the partition and socket, the holder having the stem passing through said partition and confined beneath it, and the stick detachably held in said socket, substantially as described.

8. The combination of the stick, the watch-movement, and the cushion, said watch-movement being connected with the upper end of said stick, and the cushion being applied to the lower end of said stick, substantially as described.

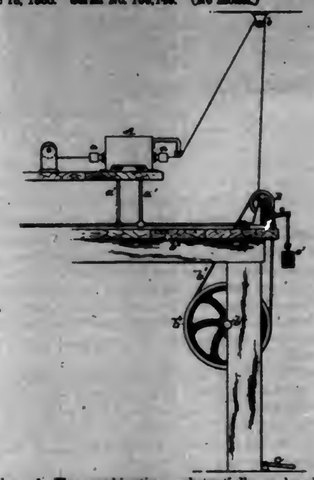
9. The combination, in a cane or parasol watch, of the watch-movement, the watch-movement holder, and the cane or parasol stick, said cane or stick at its end being attached to a part which is journaled in said watch-movement holder and in engagement with the watch-winding mechanism for the purpose of effecting the winding of the watch-movement.



409,268. AUTOMATIC SWITCH FOR HORSE-RAILWAYS. DAVID W. BIRNS and CHARLES WOLFF, Brooklyn, N. Y. Filed Oct. 25, 1888. Serial No. 289,105. (No model.)

Claim.—1. The frame or box G and the central longitudinal bar O, in combination with the switch-changing bar P and anti-friction balls Q within longitudinal grooves or recesses in the respective bars O and P, the pivoted frame K and platforms L M, the switch D and connection between the same and the bar P, and the inclines between the pivoted frame K and the ends of the switch-changing bar P, substantially as and for the purposes set forth.

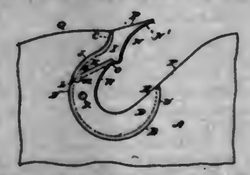
2. The frame or box G and the central longitudinal bar O within the same, in combination with the switch-changing bar P above the bar O, the frame K, pivoted at I to the box G, the platforms L and M, resting upon the pivoted frame, the switch D, connected to the bar P, and the inclines between the pivoted frame and the bar P, substantially as set forth.



409,269. SOLE-SHAPING MACHINE. TIMOTHY A. BRENNAHAN, Lynn, Mass., assignor to Brennahan Bros., same place. Filed Dec. 10, 1887. Serial No. 257,500. (No model.)

Claim.—1. In a machine for shaping boot and shoe soles, a form, as B, for supporting the shoe, a mold, as D, for shaping the sole, toggle-levers *a a*, means for operating them, a barrel *b* in rear of one of the levers, a spring inclosed in said barrel, and a plunger in connection with the lever *a*, fitting said barrel and adapted to be acted upon by the spring therein, substantially as described.

2. In a boot and shoe sole shaping mechanism of substantially the construction described, and in combination, the described form for supporting the shoe, a mold, as D, for shaping the sole, a movable block for supporting the mold and adapted to permit a rocking movement, as described, a rod, as H, adapted to bear upon and press forward the block, said block and rod having their contiguous faces rounded, and connecting and operating mechanism, substantially as described.



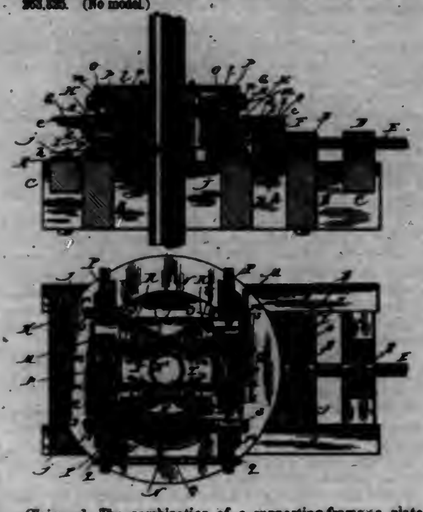
409,270. MACHINE FOR WAXING THREAD AND WINDING THE SAME ON SHUTTLE-BOBBINS. DUNCAN H. CAMPBELL, Pawtucket, R. I., assignor to the Campbell Machine Company, same place. Filed June 16, 1885. Serial No. 169,149. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a heated wax-pot, and a bobbin-winding machine having a presser-bar of a length exactly corresponding to the length of the thread-space of the bobbins to be wound, and means for heating said presser-bar, said bar operating to compress and heat the waxed thread as it is laid upon a bobbin and also causing the initial return movement of the thread after completing each coil in contact with either head of the bobbin.

2. The combination, substantially as hereinbefore described, of the driven bobbin-chuck, the sliding spindle, the revolving bobbin-chuck thereon, and a heated presser-bar having a length equal to the space between the flanges of bobbins to be wound.

409,271. REMOVABLE SAW-TOOTH. PATRICK CARDIFF, Astoria, Oreg. Filed Mar. 6, 1888. Serial No. 302,063. (No model.)

Claim.—1. The combination, with a saw A, having the bearing-edges B C, of a locking-plate D, having a bearing-edge D' of the contour of edge B, and a straight edge H, and the tooth I, having ogee-curved edge J and the straight edge K, said parts being adapted to fit together in the manner described, and for the purposes specified.



2. The combination, with a saw A, having the bearing-edges B C, of the locking-plate D, having a bearing-edge D' of the contour of edge B, and a straight edge H, and the notch or recess M, the tooth I, having the ogee-curved edge J, the straight edge K, and a tenon adapted to fit within said notch or recess, substantially as specified.

3. The combination, with a saw A, having bearing-edges B C, of the locking-plate D, having bearing-edge D' of the contour of edge B, a straight edge H, and a notch or recess M, and the tooth I, having ogee-curved edge J, the straight edge K, a tenon adapted to fit within said notch or recess, and a shoulder O, which abuts against the nose of the locking-plate, substantially as specified.

4. The combination, with a saw A, having bearing-edges B C and a V-shaped tenon along said edges, of the locking-plate D, having bearing-edges D' H and a V-shaped groove along said edges, and the tooth I, having the grooved ogee-curved edge J and straight edge K, provided with a tenon, said parts being adapted to fit together as specified.

5. The combination, with a saw A, having the bearing-edges B C, of a locking-plate D, having a bearing-edge D' of the contour of edge B, a straight edge H, and the curved bearing-edge W, and the tooth I, having ogee-curved edge J and straight edge K, and the cutting edge N', projecting beyond the edge W of the locking-plate, for the purpose specified.

409,272. APPARATUS FOR OPERATING ROTARY DRILLS. MATTHEW T. CHAPMAN, Aurora, Ill. Filed Feb. 13, 1888. Serial No. 263,835. (No model.)

Claim.—1. The combination of a supporting-frame, a plate J thereupon, the ring I, having the fixed inwardly-projecting pins *g*, and the rollers J, loosely mounted on the pins, with the plate G, having the gear *d*, and the shaft E, having the driving-pinion F, substantially as described.

2. The combination of a supporting-frame, a plate J thereupon, having the annular groove *b*, the ring I, having the inwardly-projecting pins *g*, the rollers H, loose on the pins, the top plate G, having the gear *d* and provided with the pendent annular flange *i*, entering between the pins to retain the rollers thereupon and the shaft E, having the driving-pinion F, substantially as described.

3. The combination of a frame, a supporting-plate J, a series of anti-friction rollers H, resting on the plate, the rotating top plate G, resting on the rollers, and a clamp mounted on the top plate for clamping a drill-tube, substantially as described.

4. The rotating plate G, having an annular groove *f*, with an inclined bearing-face, in combination with the beveled anti-friction rollers H, and bottom plate J, having the annular groove *h*, with an inclined bearing-face for giving the plate G a free support for rotating purposes, substantially as specified.

5. The combination, with the supporting-plate J, of the ring I, carrying a series of beveled pins *g*, and the anti-friction rollers H, carried by the pins, substantially as described.

6. The combination, with the supporting-plate J, having a groove *b*, of the anti-friction rollers H, resting on the supporting-plate, and the rotating plate G, having the depending flange *i*, for preventing inward end movement of the rollers, substantially as described.

7. The rotating top plate G, having a central opening, and the parallel guide-plates M, secured to the top plate at opposite sides of the central opening, and provided with turned-up edges *l*, to provide grooves between such edges and the face of the top plate, adjustable plates N, having flanges *n*, engaging said grooves, clamping-jaws carried by the adjustable plates, and screws P, for adjusting the plates and their jaws, substantially as described.

8. The rotating plate G, having guideways, in combination with the plates N, carrying clamping-jaws and adjusting-screws P, for ad-

vancing and receding the plates N, substantially as and for the purpose specified.

9. The plates N, having at each end a head O to receive a nut *r* and carrying clamping-jaws, in combination with the adjusting-screws P, substantially as and for the purposes specified.

10. The plates N, having at each end a head O and carrying clamping-jaws, in combination with the adjusting-screws P, chain Q, and sprocket-wheels *q*, substantially as specified.

11. The guide-plates M, having ears *m*, and screws P, having the ring *p*, in combination with sliding plates N, carrying clamping-jaws, substantially as and for the purposes specified.

12. The combination of a rotating top plate G, the plates N, sliding on and rotating with the top plate and having at each end a head O, and carrying clamping-jaws for rotating a drill-tube, with the adjusting-screws P and rubber cushions *r*, substantially as described.

13. The combination, with the rotating top plate G, of the plates N, sliding on and rotating with the top plate, the shafts S, carried by the sliding plates, the clamping-jaws T, loose on the shafts for rotating a drill-tube, and adjusting-screws P, engaging the sliding plates, substantially as described.

14. The rotating plate G, guide-plate M, having the ears *m*, and sliding plates N, having at each end a head O, in combination with the adjusting-screws P, each having a ring *p*, ears R, shafts S, and gripping-jaws T, substantially as and for the purpose specified.

15. The combination, with a cylinder E, having a fluid-supply, of a hollow piston communicating with and raised by the fluid entering the cylinder, and a rotated drill-tube connected and communicating with the piston for raising the drill-tube when the drill becomes clogged to remove the clog, and at the same time relieve the piston from the fluid-pressure and permit the piston and drill-tube to descend, substantially as described.

16. A well-sinking mechanism comprising a cylinder having a fluid-supply, a hollow piston communicating with and raised by the fluid entering the cylinder, a drill-tube rotating in the cylinder and communicating with the piston, and a clamp for rotating the drill-tube while it moves endwise for raising the drill-tube while it rotates when the drill becomes clogged to remove the clog, and at the same time relieve the fluid-pressure on the piston and permit the piston and drill-tube to descend, substantially as described.

17. The combination, with a tubular drill-rod and a shut-off, of the stem R', wheel S', and lever T', for operating and closing the valve from the rotation of the drill-rod, substantially as specified.

18. The combination, with a water-cylinder having a water-supply chamber, a piston, and a rotating drill-tube receiving water from the cylinder, of an indicator on the water-supply chamber which indicates the quantity of water flowing from the water-supply chamber toward the drill-tube, substantially as described.

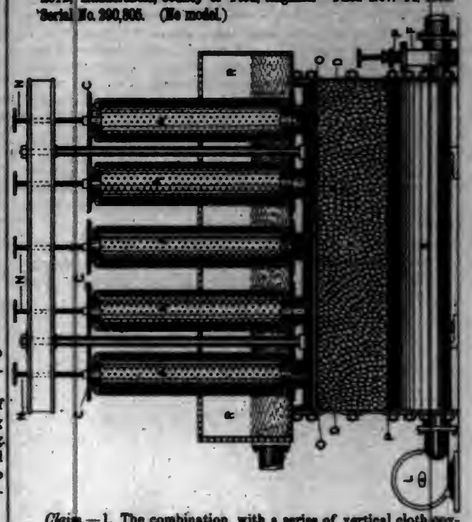
19. The case A^3, having an inlet c^3 and an outlet b^3 and a chamber D^3, in combination with an arm E^3, rock-shaft F^3, rod G^3, carrying the valve c^3, spring H^3, pointer I^3, and scale J^3, substantially as and for the purposes specified.

20. The combination, with a drill-tube and a water-supply therefor, of an indicator on the water-supply which automatically indicates the decrease and cessation of the flow of water through the drill-tube to the drill, substantially as described.

21. The combination, with the drill-tube, cylinder, piston, and pipe or hose for supplying the cylinder with water to pass to the drill, of an indicator located between the cylinder and the supply pipe or hose which automatically indicates the decrease and cessation of the flow of water through the drill-tube to the drill, substantially as described.

22. The combination, with a supply-head A' and cylinder E', of a case A^3, having an inlet and an outlet port and a chamber D^3, a rock-shaft F^3, having an arm E^3, a rod G^3, provided with a valve c^3, seating on the inlet-port of the case, a spring H^3, acting on the arm to press the valve to its seat, a pointer I^3 on the rock-shaft, and a scale J^3, substantially as described.

23. The combination, with a rotating plate G, of the plates N, the shafts S, and the rotary clamping-jaws journaled thereupon, of the adjustable collars U, adapted to the shafts between the plates and clamping-jaws, and the right and left hand screws P, for adjusting the plates and clamping-jaws, substantially as described.

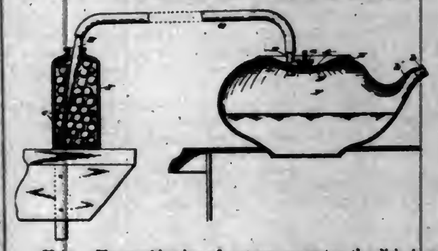


24. A drill-tube and a pressure-piston therefor, in combination with a shut-off valve in the drill-tube for regulating the water-supply and governing the pressure on the drill, substantially as specified.

25. The combination, with a cylinder, of a pressure-piston, a drill-tube, and a shut-off in the drill-tube, substantially as and for the purpose specified.

26. The clamping-jaws T, composed of separate and independent reversible rings, substantially as described.

27. The combination of the clamping-jaws T, each composed of a series of independent removable and replaceable rings, with the adjusting collars U, for setting the rings to grip objects of varying diameter, substantially as described.



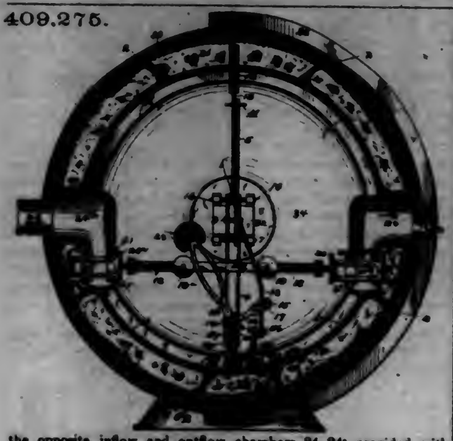
409,273. FILTER. HERBERT F. CLAYTON and GEORGE H. HOLROYD, Huddersfield, County of York, England. Filed Nov. 14, 1888. Serial No. 290,805. (No model.)

Claim.—1. The combination, with a series of vertical cloth covered filtering-tubes, of a primary filtering-chamber communicating therewith and located beneath the same, and having at its under part a channel to receive the sediment, and provided with top and bottom gratings and a blow-out valve for discharging the sediment accumulated in said channel, a girder and standards to support the filter-tubes, and a receiving-tank through which the tubes pass and into which the water from the tube falls, all substantially as and for the purposes set forth.

2. In combination, a primary filtering-chamber having a sediment-channel, top and bottom gratings, inlet-pipe and drain-pipe, a series of vertical filter-pipes connected to and surmounting said chamber and provided with filter-cloth, as described, and a horizontal receiving-tank R, into which the water filtered through such filter-pipes falls, all substantially as shown and described.

409,274. STEAM FRUIT-CANNER. THOMAS P. CORBETT, Canton, Ohio. Filed Mar. 21, 1889. Serial No. 304,173. (No model.)

Claim.—The combination of a steam-generator, the disk A, provided with the short metallic tube B, extending above and below the disk A, and below the retaining-bar D, to form a stop for said retaining-bar, the retaining-bar D, provided with the screw-threaded post C, the nut *a*, and the steam-conveying tube G, provided with the nozzle H, substantially as and for the purpose specified.



409,275. GAS-METER. JOHN W. CULMER, New Brighton, Pa., assignor to John H. Logan, same place. Filed Mar. 26, 1888. Serial No. 305,092. (No model.)

Claim.—1. In a gas-meter, the combination, with a detachable sectional case, of an independent central bellows-ring provided with an inflow and an outflow chamber at diametrically-opposite points of the ring, and peripheral projections for maintaining said ring centrally within the case, substantially as and for the purposes specified.

2. In a gas-meter, the combination, with an outer case, of an independent central ring provided with inflow and outflow chambers at diametrically-opposite points in said ring, and with a peripheral perforated web for maintaining said ring centrally within the case, substantially as and for the purposes specified.

3. In a gas-meter, the independent central bellows-ring 1, having

409,275.

the opposite inflow and outflow chambers 24 24^a, provided with threaded openings at diametrically-opposite points in the periphery of said ring, and with valve-openings on both sides of said ring, in combination with a suitable outer shell or case, said bellows-ring being independent of the outer shell or case, substantially as and for the purposes specified.

4. In a gas-meter, the combination, with an outer shell or case, of a ring 1, having inflow and outflow chambers 24 24^a, provided with ports within and ports without the said ring, said ports being arranged in a horizontal line and having their faces parallel, and connected valves for controlling said ports, said bellows-ring being independent of the outer shell or case, substantially as and for the purposes specified.

5. In a meter, the combination, with a suitable case, of a ring adapted to support the operative parts of the meter, said ring having oppositely-placed inflow and outflow chambers and an intermediate guide, a standard arranged within the ring for the attachment of said operative parts, and a rod which moves in said guide and is connected with the operative mechanism, substantially as and for the purposes specified.

6. In a meter, the combination, with a suitable case, of a foundation-ring for the operative mechanism of the meter, said ring having inflow and outflow chambers provided with ports on both sides of said ring, a rod-guide at right angles to said ports, a standard diametrically opposite to said rod-guide for attachment of the operative mechanism, valves, mechanism for actuating said valves, and a rod which moves in said guide and is connected with the valve-operating mechanism, substantially as and for the purposes specified.

7. In a gas-meter, the combination, with the valves thereof, of a weighted drop or trip arm having a tail-piece, a pivoted crank-lever having fingers which inclose the tail-piece of the drop or trip arm and provided with a slot for the reception of an actuating pin or stud, and a rod connected with the disks or pistons of the meter and provided with a pin or stud which engages in the slot of the crank-lever, substantially as and for the purposes specified.

8. In a gas-meter, the combination, with a case, of an independent central ring provided with oppositely-placed inflow and outflow chambers and valves therefor, said valves connected by a suitable rod, a drop or gravity arm for actuating the valves, and a crank-arm for actuating the gravity or drop arm, said drop-arm and crank-arm pivoted to a standard on said central ring, substantially as and for the purposes specified.

9. In a meter, the combination, with the disks or pistons, of spiders attached thereto, levers 4 4^a, pivoted, as at 37 37^a, on a standard 3, and levers 5 5^a, pivoted on the levers 4 4^a, as at 9, and on a vertical rod which communicates motion to the valves, as at 11, said levers 5 5^a being pivoted on the spiders, as at 7, and intermediate levers 6 6^a, which connect the levers 4 4^a with said spiders or disks, substantially as and for the purposes specified.

10. In a meter, the combination, with a central ring, of two vertical parallel levers, each pivoted on said ring at one end and to the meter disk or piston at the other by an intermediate lever or link, a rod which actuates the valve mechanism, two levers, each of which is pivoted at one end to the rod which actuates the valve mechanism and at the other to a disk or piston of the meter, and also pivoted to the first-mentioned levers at an intermediate point, as at 9, substantially as and for the purposes specified.

11. In a meter, the combination, with a central ring and the valves of the meter, of two levers, each of which is pivoted at one end on the central ring or a standard supported thereby and at the other to a piston of the meter by an intermediate lever or link, a rod for communicating motion to the valves, two levers, each of which is pivoted to said rod at one end, to a meter-piston at the other, and to one of the first-recited levers at an intermediate point, a fixed guide for one end of the rod, which communicates motion to the valves, and an adjustable guide for the other end of said rod, substantially as and for the purposes specified.

12. In a meter, the combination, with the meter pistons and valves, of two parallel levers, each pivoted at one end to the meter-ring and at the other to the meter-piston by an intermediate lever, a rod which communicates motion from the meter-piston to the valves, two levers, each pivoted to the meter-piston at one end, to the said rod at the other, and to one of the first-recited levers at an intermediate point, a gravity or drop arm for actuating the valves, and a crank-lever for actuating the gravity or drop arm from the before-recited rod, substantially as and for the purposes specified.

13. In a gas-meter, the combination, with the valve mechanism and a rod for actuating the same from the meter-pistons, of an adjusting mechanism composed of a lever 25, attached at its hub to a standard 3 by a shouldered or pivot screw 26, having its upper portion bent and recessed to form a guide for the before-recited rod and its lower portion slotted to receive an adjusting-screw 27, and the adjusting-screw 27, substantially as and for the purposes specified.

14. In a gas-meter, the combination, with the meter-pistons, of two parallel levers, each of which is pivoted at one end to a standard arranged within the meter and at the other to one of the meter-pistons by an intermediate lever or link, two levers, each of which is pivoted on one of the first-recited levers, also to one of the meter-pistons, and to a rod which communicates motion to the meter-valves, and an adjusting-guide composed of a pivoted lever 25, having its upper portion bent and slotted for the reception of the above-recited rod and its lower portion slotted to receive an adjusting-screw 27, and said adjusting-screw 27, substantially as and for the purposes specified.

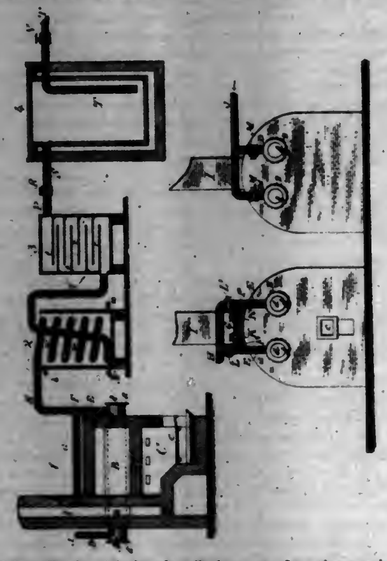
15. In a dry gas-meter, the combination, with the bellows piston or disk, of a detachable spider, as at 32, provided at its opposite edges with bearings for the attachment of the operative mechanism of said meter, substantially as and for the purposes specified.

16. A sheet-metal band for securing the bellows to its disk or to the meter-frame, said band having perforated angle-pieces adapted to receive a threaded clamping-bolt, and a lap-piece or extension end, substantially as and for the purposes specified.

17. In a dry gas-meter, the combination of central ring 1, bellows-leather 31, strap or band 72, provided with perforated angle-pieces 75 75, adapted to receive a threaded clamping-bolt and lap 76, and a bolt and nut for tightening the band, substantially as and for the purposes specified.

18. A gas-meter casing composed of two interchangeable halves, each having the approximate form of a slightly-conated cylinder, with its base diagonal to its axis and its small end closed, the diagonal open end having a flange for attachment to its complementary half and provided in its longest side with a port or opening at or near a point corresponding to the middle of the case, substantially as and for the purposes specified.

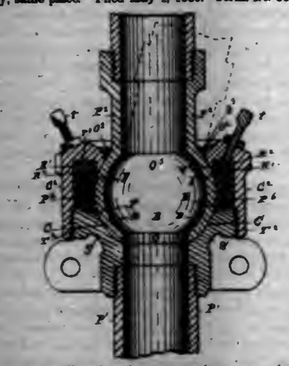
19. In a gas-meter, the combination of two interchangeable sections having oblique flanged open ends, said sections constituting a case, a base provided with a diagonal slot for the reception of the flange of the case-sections, and means for connecting the parts, substantially as and for the purposes specified.



20. In a gas-meter, the combination of an independent central ring for the support of the operative mechanism, said ring having threaded inflow and outflow ports at opposite points, and a case composed of two cylinder-sections having diagonal flanged open ends provided with ports corresponding to the ports of the central ring, substantially as and for the purposes specified.

21. In a meter, the combination of an independent central ring for the support of the operative mechanism, said ring having inflow and outflow ports at opposite points, a case composed of two diagonal flanged open-ended sections, a base having a diagonal slot or seat for the flange of the case, and means for connecting the several parts, substantially as and for the purposes specified.

22. The combination, in a gas-meter, of a central bellows-ring having diametrically-opposite inflow and outflow chambers with threaded ports and with valve-ports on both sides of said rings, a tubular guide at right angles to said valve-ports, a standard diametrically opposite to said guide, two levers pivoted on the standard and to the meter-pistons by interposed links or levers, two levers pivoted on the first-named levers and also on the meter-pistons, a rod which moves in the tubular guide and to which the last-recited levers are pivoted, an adjustable lever pivoted on the standard and having a slot to receive the rod, a slotted crank-arm having projecting fingers and actuated by a pin on the rod, a gravity-lever or drop-arm actuated by the fingers of the crank-arm, a stem which connects the valves of the meter and

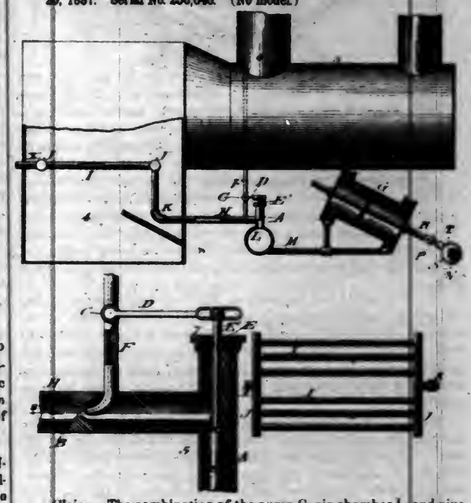


which is actuated by the drop-arm, and a sectional meter-case adapted to be secured to said central bellows-ring which supports the hereinbefore-recited mechanism, substantially as and for the purposes specified.

409,276. PROCESS OF PREVENTING THE OXIDATION OF METALS WHILE IN A HEATED CONDITION. GEORGE W. CUMMINS and JAMES H. COLEMAN, New Haven, Conn. Filed July 14, 1888. Serial No. 279,990. (No model.)

Claim.—The hereinbefore-described process of treating metals to prevent their oxidation while in a heated state, consisting in subjecting such metals to an atmosphere composed of nitrogen and carbonic oxide, with or without carbonic acid, the carbonic oxide being in sufficient excess to overcome any tendency of the carbonic acid, if present, to oxidize the metal, substantially as set forth.

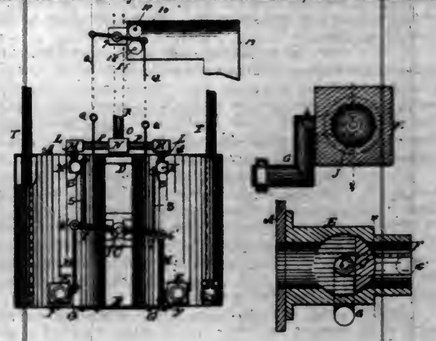
409,277. BALL-AND-SOCKET JOINT FOR STEAM-PIPE CONNECTIONS. THOMAS CURLEY, Troy, N. Y., assignor of one-half to William Bailey, same place. Filed May 1, 1889. Serial No. 309,158. (No model.)



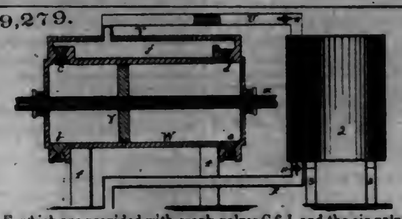
Claim.—1. In a ball-and-socket steam-pipe connection, the combination, with a socket proper having a central passage and an annularly and interiorly arranged concave made with a beveled edge and encircling said passage, of a cap constructed to make a threaded connection with said socket proper, said cap being made with a central passage and a concave encircling said passage, and a packing-ring recess encircling said concave, a metal packing-ring having a beveled inner face arranged in said recess, set-screws in said cap arranged to engage with said packing-ring, a pipe having a ball-form end adapted to make a rotating engagement with the concaves of the socket and cap, and a ring-form packing arranged between said ring and the bevel upon the interior of the socket proper, substantially in the manner as and for the purposes set forth.

2. The combination, with the pipe P³, made with the ball-form end B, of the socket proper S, made with the central passage O, encircling concave C, beveled face F, and connecting-pipe P', the cap C², constructed to make a threaded connection with said socket proper, and having the central passage O², encircling concave O², annular recess R', and set-screws *t*, the ring R, made with the bevel *b'*, and the packing P⁴, all constructed and arranged to operate substantially in the manner as and for the purposes set forth.

3. In a ball-and-socket steam-pipe connection, the combination, with a socket proper made with a central passage and an annular concave encircling the same, of a cap constructed to make a threaded connection with said socket proper, said cap having a central passage, an annular concave encircling said passage, and an annular packing-recess made therein, a pipe having a ball-form end adapted to make a rotating engagement with the annular concaves of said socket proper and cap, and a packing arranged within said packing-ring and between the interior annular edges of the socket proper and cap, substantially in the manner as and for the purposes set forth.



409,278. APPARATUS FOR HEATING CARS. ISAAC T. DYER, Chicago, Ill., assignor to himself and Peter Fish, same place. Filed Nov. 25, 1887. Serial No. 256,040. (No model.)



Claim.—The combination of the pump G, air-chamber L, and pipe M, connecting said pump and air-chamber, cylinder A, open at its top and communicating with chamber L, pipe H, communicating with cylinder A midway thereof, piston 5, operating in cylinder A and provided with an operating-rod E', injector F, communicating with pipe H, the cock C, located in said injector F, lever D, connecting cock C with the piston 5 by means of rod E', and pipes K I J, communicating with pipe H, substantially as shown and described.

409,279. APPARATUS FOR ELEVATING WATER. ISAAC T. DYER, Chicago, Ill., assignor to himself and Peter Fish, same place. Filed June 6, 1888. Serial No. 276,290. (No model.)

Claim.—An apparatus for elevating water, consisting of the cylinders A, provided with water-exit pipes T T, extending down to near the bottom of said cylinders and inside thereof, the water-induction

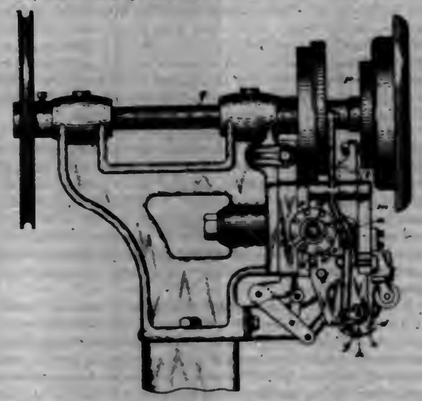
409,279.

pipes F, which are provided with crank-valves G G J, and the air-valves S K, communicating with the cylinders, in combination with the walking-beams 1 and 9, having suitable connecting-rods, the air-receiver 2, and a branch pipe R M N, leading therefrom to and communicating with the air-valves S K, and an air-pump having its exit-pipe communicating with the air-receiver 2, and mechanism for driving the upper walking-beam, substantially as specified and shown.

409,280. DEVICE FOR PROTECTING GAGE-GLASS TUBES. EMIL ENGELS, Engelskirchen, near Cologne, Germany. Filed Dec. 3, 1888. Serial No. 292,454. (No model.) Patented in Germany Sept. 16, 1886, No. 39,068.

Claim.—1. In apparatus for the protection of gage-glasses, a thick and transparent glass casing, such as H, having a section approximately of the form of a horseshoe, substantially as herein described and illustrated.

2. In apparatus for the protection of gage-glasses, a thick and transparent glass casing, such as H, having a section approximately of the form of a horseshoe with its ends turned slightly outward, substantially as herein described and illustrated.



3. The combination, with a gage-glass-protecting casing, of shoes, such as U O, provided with noses K for securing them to the gage-cocks, substantially as herein described and illustrated.

4. The combination, with a gage-glass, a protecting casing or glass having one side open to permit of its removal, and the shoes at the ends of said protecting-casings, of the wires D, having the bent ends for clamping the protecting casing or glass and shoes together, substantially as described.

5. As a new article of manufacture, the apparatus for protecting gage-glasses, consisting of a glass casing H, shoes U O, having noses K, and enlargements B, and wires D, and chain *k*, substantially as herein described and illustrated.

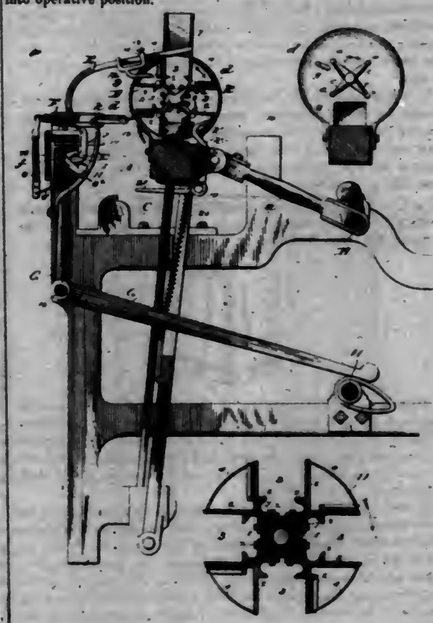
6. The combination, with a gage-glass, the protecting-casing having one side open to permit of its removal, and the shoes at the ends of said protecting-casing engaging the gage-glass fitting to hold the protecting-glass in place, of the wires D, passing through said shoes at the rear edges of the casing and having the bent ends engaging said shoes to clamp the casing and shoes together, substantially as described.

409,281. SHOE-SEWING MACHINE. ANDREW EPTLER, Jr., Boston, Mass. Filed Apr. 25, 1888. Serial No. 271,833. (No model.)

Claim.—1. In a curved-needle sewing-machine, the combination, with the needle, looper, and work-holding devices, of the cast-off, the rock-shaft supporting the same, a spring and connecting devices between the same and the said rock-shaft, whereby a yielding pressure is imparted to said rock-shaft and cast-off in one direction, and means, substantially as described, whereby the rock-shaft and cast-off are positively impelled in the opposite direction, as set forth.

2. In a curved-needle sewing-machine, the combination, with the needle, looper, and work-holding devices, of the cast-off, the rock-shaft supporting the same, a cam, as o, the slide reciprocated by said cam, means for connecting said slide and rock-shaft, and a spring and devices connecting the same with the rock-shaft, whereby a yielding pressure is imparted to said slide, rock-shaft, and cast-off, as set forth.

3. In a curved-needle sewing-machine, the combination, with the needle, looper, and work-holding devices, of the cast-off, the rock-shaft *i*, supporting the same, the cam o, the slide *l*, engaged with said cam, the rod *k*, connecting the slide with an arm *j* on the rock-shaft, and a spring and devices connecting the same with the rock-shaft, whereby a yielding pressure is exerted on the slide, the cast-off, and the intermediate devices, as set forth.



4. In a curved-needle sewing-machine, the combination, with the needle, looper, and work-holding devices, of the cast-off, the rock-shaft *i*, supporting the same, the cam o, the slide *l*, engaged with said cam, the rod *k*, connecting the slide with an arm *j* on the rock-shaft, a pivoted arm *u*, bearing at its free end on the rod *k*, and a spring *r*, bearing upon the arm *u*, whereby said arm is pressed downwardly upon the rod, as set forth.

5. The combination, with the needle, looper, and work-holding devices, of the cast-off, a rock-shaft upon which it is mounted, a cam, and loose connections between the rock-shaft and cam, a spring interposed in such loose connections to impart a yielding pressure to the rock-shaft and cast-off, a stud *s*, supporting the spring, and the plate *t*, engaged with one end of the spring and pivoted with means for holding it in different positions, substantially as set forth.

6. The combination of the fixed channel-gage and the oscillating looper, arranged at one side of the material, and the curved needle, the back-gage, and the oscillating cast-off arranged on the other side, loose connections for said cast-off and its source of motion, and a spring interposed therein to impart to said cast-off a yielding pressure toward the point of the needle, substantially as and for the purposes set forth.

409,282. SHUTTLE-SUPPLYING MECHANISM FOR LOOMS. JAMES M. EVANS, Providence, R. I., and JEREMIAH M. SHAY, Fall River, Mass. Filed Mar. 29, 1888. Serial No. 268,705. (No model.)

Brief.—When the weft-thread breaks or runs out, the ordinary weft-fork is operated, and through connected devices the means whereby the shuttle-box is turned at the next beat of the lay is thrown into operative position.

Claim.—1. In combination, a movable receptacle for holding the shuttles carried by the lay, a movable operating-arm at the breast-beam, weft-fingers, operating devices for acting upon the weft-fingers, connections from said weft-fingers to the movable arm for changing the position of the same when the weft-thread breaks, and an operating device in connection with the movable receptacle, whereby, when the position of the movable arm is changed, a part of said operating device will be in line therewith and will be moved to operate the shuttle-box by contact with the movable arm at the breast-beam.

2. In combination, a movable receptacle for holding the shuttles carried by the lay, a movable operating-arm at the breast-beam, weft-fingers, operating devices for acting upon the weft-fingers, connections from said weft-fingers to the movable arm for changing the position of the same when the weft-thread breaks, and an operating device in connection with the movable receptacle, whereby, when the position of the movable arm is changed, a part of said operating device will be in line therewith and will be moved to operate the shuttle-box by contact with the movable arm at the breast-beam, and a catch for holding the receptacle in its moved position, said catch being positively operated when the movable arm is thrown into operative position.

3. In combination, a movable receptacle for holding the shuttles carried by the lay, an operating-arm E at the breast-beam for moving the receptacle, the weft-fingers, operating devices for acting upon the weft-fingers, and connections between said weft-fingers and the operating-arm, whereby the receptacle will be moved as the lay beats forward when the weft-thread breaks, substantially as described.

4. In combination with the lay, a cylindrical receptacle for holding the shuttles carried by said lay, an operating-arm on the breast-beam for moving the receptacle, weft-fingers, connections between said fingers and arm operated automatically for causing the arm to rotate said receptacle when the weft-thread breaks, and operating devices for the weft-fingers, substantially as described.

5. In combination with the lay, a movable receptacle for the shuttles, the arm E, and a catch for holding the receptacle in its moved position, said catch being in position to be struck by the arm when it operates, substantially as described.

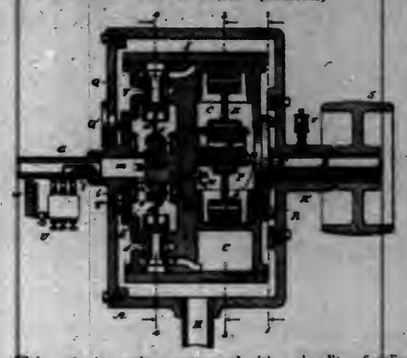
6. In combination, the lay, the cylindrical receptacle provided with compartments, and the casing extending around said receptacle for completely inclosing the same, said cylindrical receptacle being provided with an opening at the top and bottom, substantially as described.

7. In combination, the lay, the movable receptacle having the radial arms, the arm E on the breast-beam provided with the finger, the weft-fork, operating devices therefor, and the automatically-operating connections between the arm E and the fork, substantially as described.

8. In combination, the lay, the movable receptacle, the operating device *c*, the rock shaft, the arm E, loosely mounted on the rock-shaft, the spring, the arm on the rock-shaft adapted to engage with the arm E, the catch, and the weft-fingers and connections for moving the rock-shaft.

9. In combination, the revoluble cylinder having a series of compartments for the shuttles, each compartment having a binder-arm, the casing inclosing the cylinder and having openings in its top, front, bottom, and rear, and a lever having its end extending through the opening in the rear and bearing upon the binder-arms in succession, substantially as described.

409,288. DEVICE FOR CARRYING AND APPLYING POSTAGE-STAMPS. John H. Hagen, Marietta, Mich. Filed Nov. 23, 1888. Serial No. 292,102. (No model.)



Claim.—1. The combination of the casing, the stem secured therein and having a stationary ejector on its inner end, the sliding shell fitting within the casing and around the ejector and provided with a bottom fitting upon the stem, and a spring coiled around the stem between the bottom of the casing and the bottom of the shell, as set forth.

2. The combination of the casing, the shell within the casing, the stem passing through the bottom of the shell and having a threaded portion projected through the bottom of the casing, the ejector secured to the end of the stem within the casing, the nuts mounted on the stem and bearing against the opposite sides of the bottom of the casing, the spring mounted on the stem to project the shell, and the nut mounted on the stem to adjust the tension of the spring, as set forth.

3. The combination of the casing, the shell sliding therein and having a rib on its side, the removable bottom for said shell, and the button on said bottom adapted to engage said rib, as set forth.

409,284. STEAM-ENGINE. Milan W. Hall, Brooklyn, N. Y. Filed Jan. 24, 1888. Serial No. 261,787. (No model.)

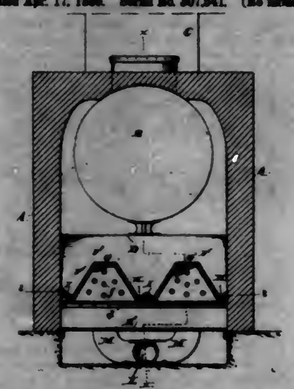
Claim.—1. An engine constructed with a plurality of cylinders arranged radially around a common axis, with an equal number of valve-chests having ports communicating with said cylinders, and with a concentric revolving steam-chest between said valve-chests, in combination with an axial rotative shaft on which said cylinders and valve-chests are mounted, a crank arranged eccentrically to said axis, pistons in said cylinders, pitmen engaging said crank and connecting with said pistons, valves in said valve-chests, a valve-gear for moving said valves, and a steam-inlet communicating with said concentric steam-chest.

2. An engine constructed with a plurality of cylinders arranged radially around a common axis, and with an equal number of radially-arranged valve-chests having ports communicating with said cylinders, and a concentric revolving steam-chest between and communicating with said valve-chests, in combination with an axial rotative shaft on which said cylinders and valve-chests are mounted, pistons in said cylinders, pitmen engaging said crank and connecting with said pistons, balanced tubular piston-valves in said valve-chest, whereby the steam passes from said steam-chest through said valves to the cylinder-ports, and a valve-gear in said steam-chest for moving said valves.

3. In an engine, the combination of an inclosing-case, a stationary shaft, and a crank formed on said shaft, with a rotary shaft in line with the axis of said stationary shaft, a plurality of radially-arranged cylinders fixed to said rotative shaft and having a bearing upon said stationary shaft and formed with valve-chests having ports communicating with the cylinders, and a steam-chest concentrically embracing said stationary shaft, a steam-inlet passage through said stationary shaft opening into said steam-chest, valves in said valve-chests, and a valve-gear in said steam-chest for moving said valves.

4. In an engine, the combination of an inclosing-case, a stationary shaft, a crank formed on said shaft, and a steam-inlet passage through said shaft, with a rotary shaft in line with the axis of said stationary shaft, a plurality of radially-arranged cylinders fixed to said rotative shaft and formed with a steam-chest concentrically embracing and bearing on said stationary shaft, and into which said steam-inlet passage opens, pistons in said cylinders, pitmen engaging said stationary crank and connecting with said pistons, and packings applied at the bearing-joints between said steam-chest and stationary shaft to prevent escape of steam from said chest through said joints.

5. In a revolving-cylinder steam-engine, the combination of a relatively rotary shaft and steam-chamber, the one having rotative bearings upon the other and the one part formed with a face substantially perpendicular to the axis of rotation, with a packing for said bearings, consisting of a ring arranged concentrically against said perpendicular face, and an annular diaphragm fastened to said ring at one margin, bridging the bearing-joint to be packed, and fastened at its opposite margin to the other part, whereby the steam-pressure against said ring and diaphragm acts to press said ring against said perpendicular face.



6. In an engine, the combination of an inclosing-case constructed with a removable cover, and with a stationary shaft fixed to said cover, and a crank formed on said shaft, a rotary shaft in line with said stationary shaft, a plurality of radially-arranged cylinders fixed to said rotary shaft, pistons in said cylinders, and pitmen engaging said stationary crank and connecting with said pistons.

7. In an engine, the combination of a stationary shaft and a crank formed thereon, a rotary shaft in line with the axis of said stationary shaft, a plurality of radially-arranged cylinders fixed to said rotative shaft and formed with a steam-chest concentrically embracing and bearing on said stationary shaft, pistons in said cylinders, pitmen engaging said stationary crank and connecting with said pistons, a stationary eccentric fixed on said stationary shaft, valves for admitting steam from said steam-chest to said cylinders, and eccentric straps and rods connecting to said valves.

8. An engine constructed with a plurality of radially-arranged cylinders mounted to rotate around an axis, in combination with pistons in said cylinders, a crank arranged eccentrically to said axis, mechanical connections between said crank and said pistons, and one or more adjustable counter-weights applied to said cylinders, whereby the latter may be adjusted to a correct balance around the axis of rotation.

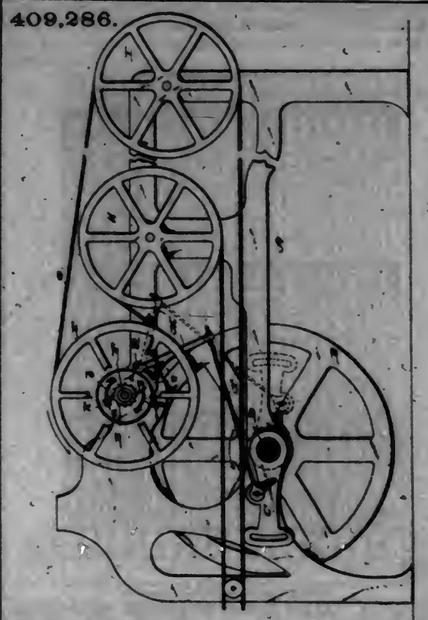
9. An engine constructed with a plurality of radially-arranged cylinders mounted to rotate around an axis, in combination with radial screws attached to said cylinders and adjustable counter-weights mounted on said screws and adjustable toward and from the axis of rotation.

409,285. SAWDUST-BURNER. Henry I. Hildreth, Saginaw, Mich. Filed Apr. 17, 1888. Serial No. 307,541. (No model.)

Claim.—1. In a sawdust-burner, the combination, with the fire-box, of a grate for the sawdust supported in said fire-box, having raised portions provided with holes or perforations, and having its edges in contact with the sides of said fire-box luted to make a tight joint, substantially as and for the purpose specified.

2. In a sawdust-burner, the combination, with the fire-box, of a grate consisting of a number of sections supported in the fire-box, said sections being provided with raised perforated portions and overlapping each other on adjacent edges to form substantially air-tight contact.

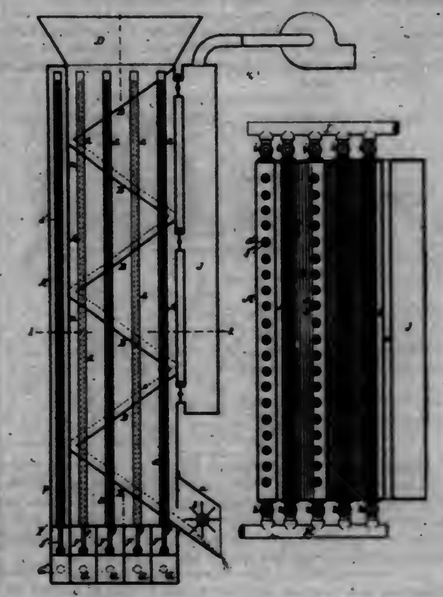
3. A grate-section for a sawdust-burner, consisting of a hollow box adapted to be supported over the hearth and having its bottom open thereto, provided with upwardly-inclining side walls and a flat top to support the fuel during combustion, and provided with holes or perforations in said side wall opening into the body of the fuel supported upon the section, said section being closed to the passage of air except through said holes, substantially as and for the purpose specified.



4. A grate-section for a sawdust-burner, consisting of a hollow box having upwardly-inclining side walls and a flat top, holes or perforations in said side walls, and a rim or flange about the base of said grate-section for the purpose of supporting it within the fire-box.

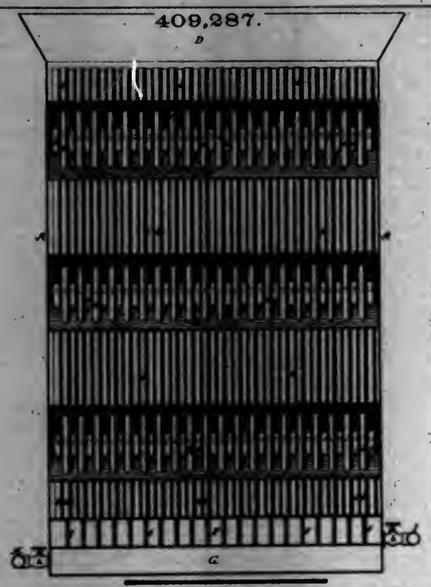
5. A grate-section for a sawdust-burner, consisting of a hollow box, upwardly-inclining side walls, and a flat top, holes or perforations in said side walls, a rim or flange about the base of said grate-section for the purpose of supporting it within the fire-box, and a projecting ledge upon one side of said rim or flange adapted to fit over the rim or flange of the adjacent grate, to form substantially air-tight connection between them.

409,286. SPINNING-MULE. Howard Hinds, Woonsocket, R. I. Filed June 5, 1889. Serial No. 313,114. (No model.)

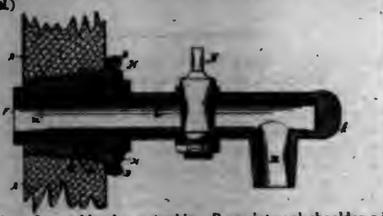


Brief.—The object of the invention is to provide a brake mechanism to check the momentum of the machinery as the carriage is reversed for the run in.

Claim.—In a cotton-mule, the combination, with the roller clutch-arm and the score-pulley, of a brake-pulley on the drive-shaft, a ratchet-wheel on the hub of the score-pulley, a spring-backed pawl or pawls on the web of the brake-pulley, a brake having one end adapted to engage the periphery of the brake-pulley, and a rod connecting the opposite end of the brake with the roller clutch-arm, substantially as specified.

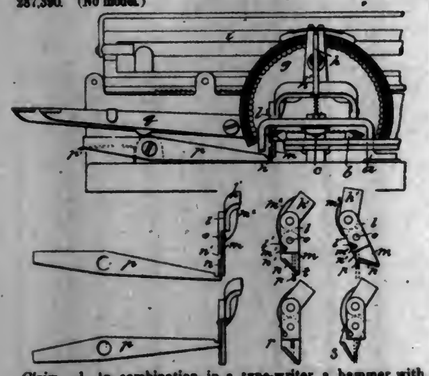


409,287. GRAIN-DRIER. George H. Isherwood, Philadelphia, Pa. Filed June 4, 1887. Serial No. 240,575. (No model.)



Claim.—The combination of the casing having a series of shelves inclined alternately in opposite directions, and each, except the discharge-shelf, terminating within a short distance of the shelf below, with a discharge regulator at the bottom shelf, and a series of longitudinal rows of heated and imperforate tubes passing upward through each of the inclined shelves of the casing, the tubes of one row being in line with the spaces between the tubes of the adjoining rows and being of a diameter substantially equal to the width of said spaces, all substantially as specified.

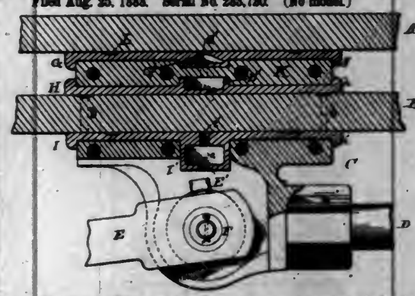
409,287.



409,288. TAP AND BUSHING FOR BARRELS. GEORGE W. JACKSON, Philadelphia, Pa. Filed Mar. 9, 1887. Serial No. 230,172. (No model.)

Claim.—In combination, a bushing B, an internal shoulder *a* in said bushing, a locking-joint G at the end of said bushing, a tap C, a projection F on said tap, a collar H, and a cap D.

409,289. PRINTING MECHANISM FOR TYPE-WRITING MACHINES. ARTHUR I. JACOBS, Hartford, Conn., assignor to the Tilton Manufacturing Company, Portland, Me. Filed Oct. 6, 1888. Serial No. 287,390. (No model.)



Claim.—1. In combination, in a type-writer, a hammer with a projecting arm, pivoted to which is a plate having an inclined rib, which when forced in one direction moves the arm and hammer, but when forced in the opposite direction moves independently, and a printing-lever adapted to move the plate by contact with the inclined rib, substantially as described, and for the purpose specified.

2. In combination, in a type-writer, a type-wheel, a hammer with a projecting arm, to which is pivoted a plate bearing an inclined rib, with a channel above the end of the rib, which when forced in one direction moves the arm and hammer, but when forced in the opposite direction moves independently, and a lever with one end adapted to move the plate by contact with the incline, substantially as described, and for the purpose specified.

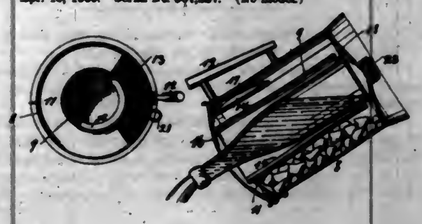
3. In combination with a type-writer, a type-wheel, a hammer with a projecting arm, to which is pivoted a plate bearing an inclined rib for a part of its length, which plate when forced in one direction moves the arm and hammer, but when forced in the opposite direction moves independently, and a lever with one end adapted to move the plate by contact with the incline and the other end bent into the path of a key-lever, substantially as described, and for the purpose set forth.

4. In combination with a type-writer, a type-wheel, a hammer with a projecting arm, to which is pivoted a plate bearing an inclined rib, said plate bearing also a pin that projects into a slot in the arm, so that when the plate is forced in one direction it moves the arm and hammer, but when forced in the opposite direction moves independently, and a lever with one end adapted to move the plate, substantially as described, and for the purpose set forth.

409,290. CROSS-HEAD. LOWELL H. KENYON, Allegheny, Pa. Filed Aug. 25, 1888. Serial No. 283,730. (No model.)

Claim.—1. The combination, with a cross-head guide having two bars arranged one above the other, of a cross-head provided with three gibs arranged one above the other in a vertical tier, two of them bearing against one of the bars and the third against the other bar, substantially as described.

2. The combination, with a two-bar guide, of a cross-head having three gibs, two of which bear against the under sides of said bars, respectively, the third bearing upon the upper side of one of the bars, substantially for the purpose set forth.



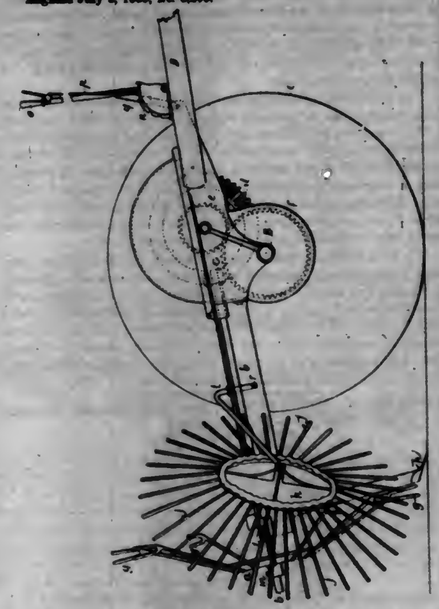
3. The combination, with the guide-bars A and B, arranged one above the other, of the cross-head C, having the three gibs G, H, and I, arranged and operating substantially as and for the purpose set forth.

409,291. PROCESS OF MAKING SOLUTION COMPOUNDS FOR GALVANIC BATTERIES. WILLIAM P. KOOKOGEY, Brooklyn, N. Y., assignor to the Kookogey Electric Company. Filed July 3, 1888. Serial No. 316,441. (No specimens.)

Claim.—1. The process of making a chromic-battery compound, consisting of the following steps: first, taking bisulphate of soda and trioxide of chromium manufactured separately; second, dissolving the crystals of the bisulphate by heat without the addition of water, and, third, adding thereto the trioxide of chromium, stirring, substantially as described.

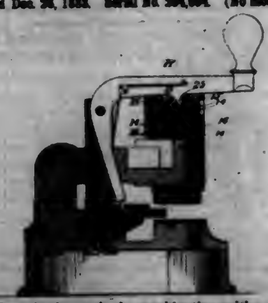
2. The process of making a chromic battery compound, consisting of the following steps: first, adding an excess of sulphuric acid to sulphate of soda, allowing it to cool, and collecting the crystals of bisulphate of soda thus produced; second, dissolving the bisulphate of soda by heat without the addition of water, and, third, adding trioxide of chromium thereto, stirring, substantially as described.

409,292. BOTTLE-COOLER. LEON LEVY, Nashville, Tenn. Filed Apr. 15, 1889. Serial No. 307,227. (No model.)



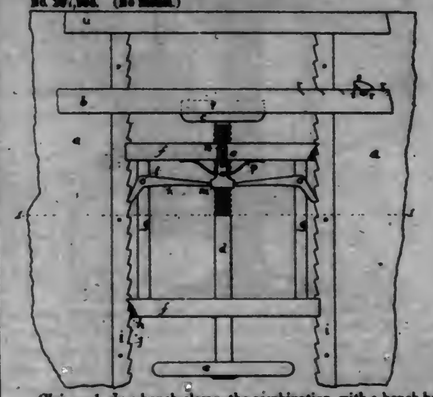
Claim.—1. In a bottle-cooler, the combination of an outer shell, an inner one receiving the bottle, a space between the two to be filled with refrigerant, a flange 11, connecting outer and inner shell and partly closing up the space between them, and a perforated lid, all as shown and described.

2. In a bottle-cooler, the combination of an outer shell, an inner one receiving the bottle, a space between the two to be filled with refrigerant, a flange 11, connecting outer and inner shell and partly closing up the space between them, a perforated lid, and a spiral spring 19, all as shown and described.



3. In a bottle-cooler, the combination of an outer shell, an inner one receiving the bottle, a space between the two to be filled with refrigerant, a flange 11, connecting outer and inner shell and partly closing up the space between them, a perforated lid, an auxiliary lid 14, and a stopper 20, attached to the cooler, all as shown and described.

409,293. POTATO-DIGGER. JAMES A. LEWIS, Hazzall, near Sandbach, assignor to Powell Brothers & Whitaker, Wrexham, England. Filed Jan. 30, 1889. Serial No. 298,101. (No model.) Patented in England July 6, 1888, No. 8,393.

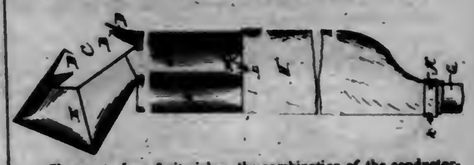


Claim.—In a machine for digging potatoes, the combination, with a share, of a pronged separating-wheel, and a digging-wheel adjustable relatively to the separating-wheel and provided with a series of terminal forks, these wheels being arranged with their axes at an angle to each other and to the same vertical plane, as shown, to spread the ridge made by the share and also to separate the potatoes from the soil, substantially as hereinbefore described.

409,294. CHECK-PUNCH. FREDERICK J. LOCKWOOD, Bridgeport, Conn. Filed Dec. 26, 1888. Serial No. 294,094. (No model.)

Claim.—In a check-punch, the combination, with a series of independently-operating punches having heads extending in the arc of a circle in the same horizontal plane, and a single operating-lever adapted to swing from the center of said arc, of a hook depending from said lever to a normal position immediately beneath said heads, substantially as set forth.

409,295. BENCH-CLAMP. GEORGE A. LOUDEN, Portland, Me., assignor to Philip J. Larrabee, same place. Filed Jan. 29, 1889. Serial No. 297,982. (No model.)

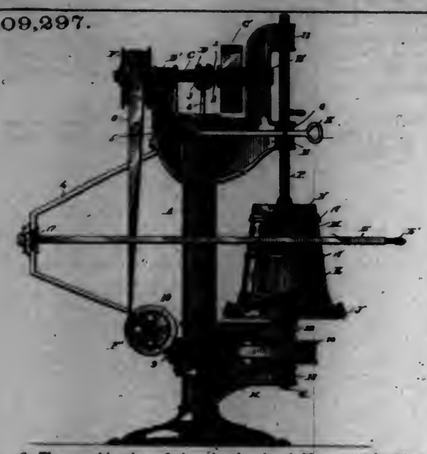


Claim.—1. In a bench-clamp, the combination, with a bench having a stationary jaw at or near one end and projecting above the plane of the top of the bench and a central longitudinal slot therein with ratcheted sides of a carriage adapted to move in said slot, pawls pivoted to the carriage and adapted to engage the ratcheted sides of the slot, a spring constantly tending to hold the pawls in engagement with the ratchet, and a screw-threaded rod adapted to travel in a female screw in the cross-bars of the carriage, and having on the end a swiveled jaw adapted to slide upon and over the top of the bench, as set forth.

2. In a bench-clamp, the combination, with a bench having a stationary jaw at or near one end projecting above the plane of the top of the table, and central longitudinal slot with ratcheted sides, a carriage adapted to move in said slot and carrying a screw-threaded bolt having on the end a swiveled jaw adapted to slide upon and over the top of the table, of pawls pivoted to the carriage, a link connecting the ends of said pawls and having a slot therein through which passes a spur set in the cross-bar of the carriage, and a spring, substantially as set forth.

3. In a bench-clamp, the combination, with a bench having a stationary jaw at one end, central longitudinal slot with ratcheted sides, a carriage adapted to slide in said slot and carrying a screw-threaded rod having on the end a swiveled jaw adapted to slide upon and over the top of the bench, and pawls adapted to engage with the said ratchets, of a brace-block having a spur adapted to enter any one of a series of holes in the clamping-face of the jaws, substantially as set forth.

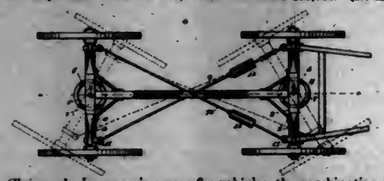
409,296. FRUIT-PICKER. JOHN R. MARSHALL, Sunnyside, N. J. Filed Mar. 22, 1889. Serial No. 304,256. (No model.)



Claim.—1. In a fruit-picker, the combination of the conductor-tube, the receiver affixed thereto and provided with an opening in its side having serrated upper and lower edges, the chute secured to the conductor-tube, and the handle secured to one side of said tube, as set forth.

2. The combination of the chute and the conductor-tube, having the tongues L engaging the upper edge of the chute to secure it to the conductor-tube, as set forth.

409,297. HOOP-DRIVING MACHINE. GEORGE W. PACKER, Rock Falls, Ill. Filed Aug. 28, 1888. Serial No. 283,867. (No model.)

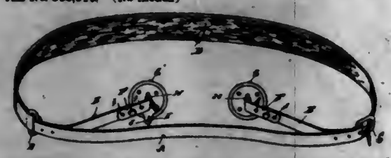


Claim.—1. The combination of the standard A, provided with brackets H and B, vertical shaft G, suitably journaled to said standard, driving-shaft C, driving-pulley C', belt S, table J, lever L, and wheel M, substantially as shown, and for the purpose described.

409,297.

2. The combination of the circular head N, provided with an upward and inward sloping periphery in substantial prolongation of the cask K, the standard A, vertical shaft G, journaled to said standard, driving-shaft C, driving-pulley C', belt S, table J, lever L, and wheel M, substantially as shown, and for the purpose described.

409,298. RUNNING-GEAR FOR VEHICLES. FRANK B. PARKER, St. Joseph, Mo. Filed Jan. 31, 1889. Serial No. 298,186. (No model.)

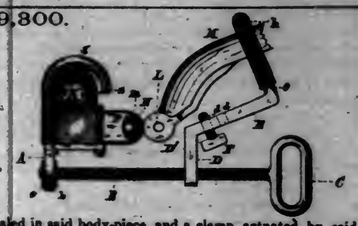


Claim.—1. In a running-gear for vehicles, the combination of the adjustable front and rear axles and the longitudinally-extensible connecting-rods intermediate of the axles, and a take-up spring connecting the sections of each rod together, substantially as described.

2. In a running-gear for vehicles, the combination of the adjustable front and rear axles and the longitudinally-extensible connecting-rods arranged diagonally between said axles, and each having a take-up spring for relieving said rod of undue strain, substantially as described.

3. In a running-gear for vehicles, the combination of the adjustable front and rear axles, the sectional extensible connecting-rods intermediate of said axles, a tubular case fixed to one of said rod-sections and having the other rod-section movable longitudinally thereon, and a take-up spring housed in said case and connected to the approximate ends of the rod-sections, substantially as described.

409,299. TRUSS. JONAH J. PELTON, Miles' Grove, Pa., assignor of one-half to Frank Spanikling, same place. Filed Mar. 29, 1889. Serial No. 305,316. (No model.)



Claim.—The combination, in a truss, of an inwardly-curved spring A and a strap D, secured to the ends thereof, with the inwardly-projecting springs E, secured to the inner faces of the ends of the spring A, and pad-holders F, adjustably secured to the ends of the springs E E', and pads G G', hinged to the pad-holders, substantially as and for the purpose set forth.

409,300. DEVICE TO ASSIST IN THE INSERTION OF VEHICLE-THILLS INTO COUPLINGS. FRANK J. PORTER, Willsh, N. Y. Filed Mar. 27, 1889. Serial No. 304,923. (No model.)

Claim.—1. A device for assisting in inserting the eyes of thills and poles into the couplings on the axle of vehicles, consisting of a body-piece having hooks to engage the said axle, a screw-spindle

409,300.

journaled in said body-piece, and a clamp actuated by said spindle and adapted to engage the thill, the whole being constructed and combined substantially as and for the object specified.

2. In a device to assist in the insertion of vehicle-thills into couplings, a body-piece A, having hooks *a a'*, in combination with a screw-threaded spindle having a handle C, collar *b*, and washer *c*, and a clamping-piece *D'*, having a hook *e*, substantially as described.

3. In a device to assist in the insertion of vehicle-thills into couplings, a body-piece A, provided with a hole near its lower extremity for the reception of the screw-spindle B, and hooks *a a'*, in combination with a screw-spindle B, having a handle C, collar *b*, and washer *c* and a clamping device with a downwardly-projecting piece *D'*, obliquely-arranged middle piece E, and upwardly-projecting hook *e*, as and for the purpose stated.

4. In a device to assist in the insertion of vehicle-thills into couplings, a body-piece A, provided with a hole near its lower extremity for the reception of the screw-spindle B, and hooks *a a'*, covered with rubber tubing *g g'*, in combination with a screw-spindle B, having a handle C, collar *b*, and washer *c*, and a clamping-piece D, provided with a downwardly-projecting piece *D'*, obliquely-arranged middle piece E, having screw-threaded holes *d d'* for the reception of thumb-screw F, and an upwardly-projecting hook *e*, being covered with rubber or other material A, as and for the purpose stated.

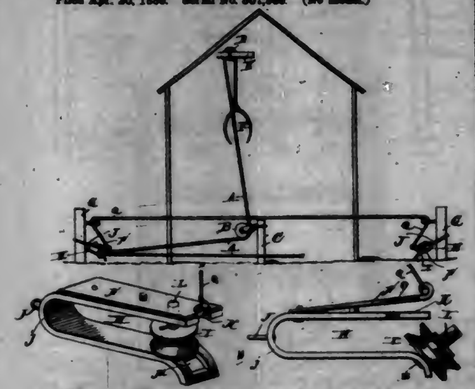
5. In a device to assist in the insertion of vehicle-thills into couplings, a body-piece A, provided with a hole near its lower extremity, and hooks *a a'*, covered with rubber tubing *g g'*, in combination with a screw-spindle B, having a handle C, collar *b*, and washer *c*, and a clamping-piece *D'*, provided with a screw-threaded hole near its lower extremity to fit and receive the screw-threaded spindle B, whereby said clamping-piece may be moved along said spindle B by revolving the latter, in a manner substantially as described.

409,301. BARREL-HEATER. JOHN RATH, Chicago, Ill. Filed Apr. 27, 1889. Serial No. 308,877. (No model.)

Claim.—The apparatus herein shown and described, consisting of an annular basin for water and for receiving one end of the assembled staves of a barrel and of a central fire-pot for heating such barrel on its inward surface, substantially as and for the purpose set forth.

409,302. WEIGHING-MACHINE. ERNST REICH, Rhodez, France. Filed Sept. 12, 1887. Serial No. 249,478. (No model.) Patented in France Jan. 22, 1887, No. 180,990.

Claim.—1. In a weighing-machine, the combination of a scale-beam, the pendulum-weight thereon counterweighted to normally assume an inclined position when in the condition of equilibrium, with a pointer and scale-plate for indicating positions of the beam on either side of the horizontal, substantially as described.



2. In a weighing-machine, the combination of a pendulum scale beam weighted to normally assume an inclined position when in the condition of equilibrium, with a tare-weight movable upon the beam, and an index and scale-plate, substantially as described.

3. In a weighing-machine, the combination of a pendulum-scale beam weighted to normally assume an inclined position when in a condition of equilibrium, with a weight movable upon said beam to both sides of the pivot of the latter, and an index and scale-plate for indicating positions of the beam on either side of the horizontal, substantially as described.

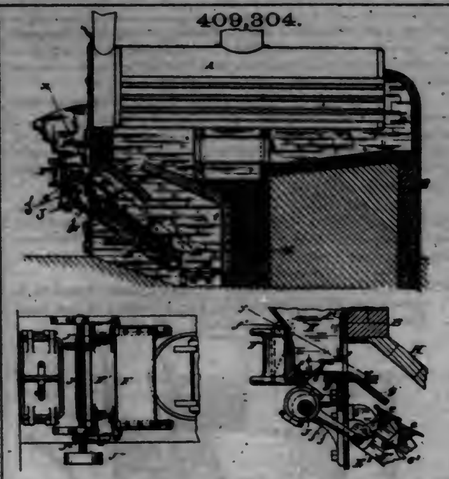
4. In a weighing-machine, the combination of a pendulum-scale beam weighted to normally assume an inclined position when in a condition of equilibrium, with a tare-weight movable on the beam, an index and scale-plate for determining disturbing weights, and a cursor on the scale-beam, substantially as described.

5. In a weighing-machine, the combination of a pendulum-scale beam extended on both sides of its pivot-point and composed of a main beam and two side beams and weighted to normally assume an inclined position, with a sliding tare-weight on one side beam, a cursor on the other side beam, and an index and scale-plate for indicating positions of the scale-beam on either side of the horizontal, substantially as described.

409,303. HAY-ELEVATOR. WILLIAM ROSMAN, Shullsburg, Wis. Filed Apr. 20, 1889. Serial No. 307,982. (No model.)

Claim.—1. The combination of the frame having its lower arm provided with a downwardly-curved end and having a notch in the end of its upper arm, the roller having the lower end of its shaft mounted in the curved end of the lower arm of the frame and adapted to play longitudinally therein, and having the upper end of its shaft adapted to engage the notch in the upper arm of the frame, and the latch mounted on the upper arm of the frame and adapted to engage the end of the roller-shaft, as set forth.

2. The combination of the frame having its lower arm provided with a longitudinally-slotted downwardly-curved end, and having its upper arm provided with a notched end, the roller having the lower end of its shaft provided with a T-head engaging the slotted curved end of the lower arm of the frame, and having the upper end of its shaft engaging the notched end of the upper arm of the frame, and a latch mounted on the upper arm of the frame and engaging the upper end of the roller-shaft, as set forth.



3. The combination of the frame, the roller having its shaft mounted in the lower arm of the frame and adapted to engage the upper arm of the same, a latch mounted on the frame and adapted to engage the shaft of the roller to hold it within the frame, and a cord secured to the latch to release the roller, as set forth.

4. The combination of the frame, the roller-shaft having its lower end loosely mounted in the frame, and a latch mounted on the frame and adapted to engage the upper end of the roller-shaft, as set forth.

409,304. STEAM-BOILER FURNACE OR OTHER FURNACE. WILLIAM R. ROBEY, Chicago, Ill., assignor to the Westinghouse, Church, Kerr & Company, of New Jersey. Filed Sept. 23, 1886. Serial No. 214,304. (No model.)

Claim.—1. The combination, with a furnace fire-box provided with an inclined grate, of an arch projecting from the front wall of the fire-box above the grate and extending in a position substantially parallel with the grate over the upper part only thereof, and forming a coking-chamber practically distinct from the hopper and over the head of the grate only, while the lower part of the same inclined grate beyond the arch affords room for a bed of incandescent fuel external to the coking-chamber, substantially as described.

409,304.

2. The combination, with a furnace fire-box provided with an inclined grate, of an external feed-hopper arranged to deliver upon the extreme upper end of the grate, an arch or hood H, projecting from the front wall of the fire-box over the grate and extending rearwardly and downwardly over the upper part of the grate and forming an interior coking-chamber practically distinct from the hopper, and an arch I, projecting forwardly from the rear of the fire-box above and clear of the arch H and terminating forward of the rear margin of the said arch H and at a distance from the front wall of the fire-box, substantially as described.

3. An inclined furnace-grate composed of a series of rocking transverse non-fingered bars having wide and flat upper surfaces and provided with trunnions which rest upon suitable supports, said rocking bars being arranged with the rear edge of each bar overhanging the front edge of the bar beneath it, with a vertical space between the lapping portions of adjacent bars to allow of the desired rocking motion, and altogether forming a series of horizontal steps or shelves adapted to be tilted on their trunnions to advance the fuel, substantially as described.

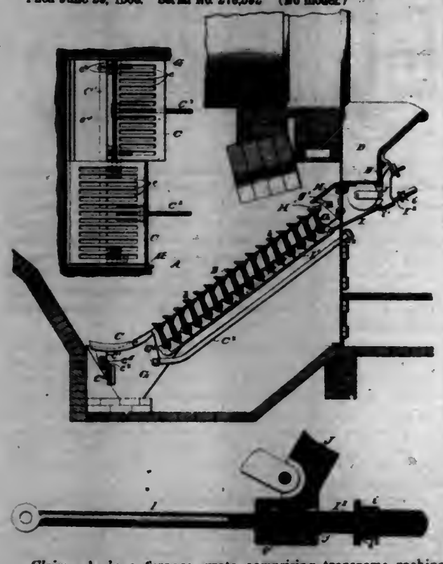
4. An inclined furnace-grate composed of a series of transverse bars having flat and broad upper surfaces mounted in position wherein the rear edge of each bar overhangs the front edge of the subjacent bar, a vertical space being provided between the overlapping portions of the bars affording room for the desired rocking movement, and the front edges of the underlapping bars being provided with an upwardly-projecting rib, substantially as shown.

5. The combination of an inclined grate composed of transverse rocking bars provided with depending arms c^2, a magazine arranged to feed upon the upper end of the grate and provided with a vibrating follower, a rotating eccentric or crank-shaft, a bar F^2, connecting the grate-bar arms c^2, a pitman connecting the crank or eccentric with the bar F^2, and a connection uniting the crank or eccentric with the vibrating follower, substantially as described.

6. The combination, with an inclined grate composed of transverse rocking bars and a magazine arranged to deliver upon the upper part of the grate, and having a vibrating follower, substantially as described, of a rotating eccentric or crank-shaft, an adjustable connection of the crank or eccentric with the magazine-follower, and an adjustable connection of the crank or eccentric with the grate-bars, substantially as described.

7. The combination, with an inclined grate having movable bars and with a magazine arranged to deliver upon the upper part of the grate, and provided with a vibrating follower, of a rotating crank or eccentric shaft having actuating connection with the grate-bars, a vibrating vertical lever, as J^3, Fig. 13, an adjustable connection of said lever with the follower, and an actuating-connection of said crank-shaft with the vibrating lever, substantially as described.

8. The combination, with the rocking bars of an inclined furnace-grate and a feed-magazine provided with a vibrating follower, of a rotating crank or eccentric shaft, a vibrating vertical lever, as J^3, Fig. 13, an adjustable connection of said lever with the follower, a connection of the lever with the crank-shaft, and an adjustable connection of the crank-shaft with the grate-bars, substantially as described.



9. The combination, with the rocking bars of an inclined grate and with a feed-magazine provided with a vibrating follower, of a

rotating crank or eccentric shaft, a vibrating vertical lever connected with both the follower and with the crank-shaft, and an adjustable actuating-connection of the crank shaft with the grate-bars, substantially as described.

10. The combination, with an inclined furnace-grate having transverse rocking bars, an elevated magazine, and a fixed cross-plate at the head of the grate, of a follower located opposite the feeding-opening of the hopper and pivoted at its upper part, and a bottom plate of the hopper flexibly connected with the follower and resting movably upon said fixed plate, substantially as described.

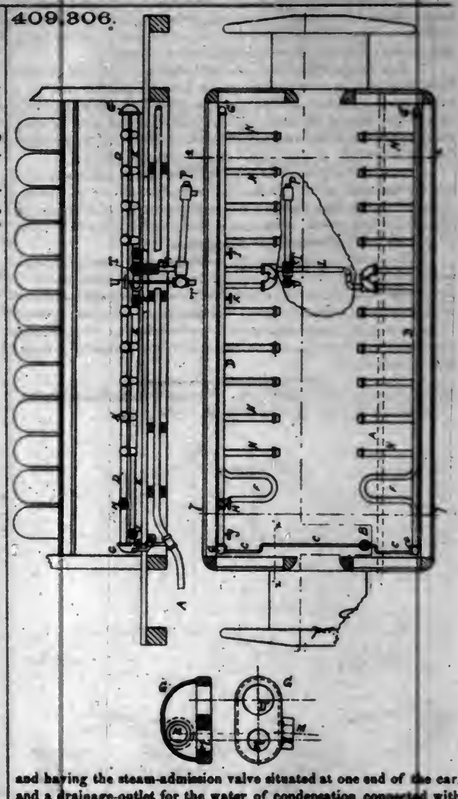
11. The combination of an inclined furnace-grate, a pivoted foot-grate D, located below the level of the lower end of the inclined grate, and a fixed vertical grate or slotted bar D' between the inclined grate and the foot-grate, substantially as described.

409,305. **FURNACE-GRATE.** WILLIAM R. ROBEY, Chicago, Ill., assignor to the Westinghouse, Church, Kerr & Company, of New Jersey. Filed June 20, 1888. Serial No. 278,592. (No model.)

Claim.—1. In a furnace-grate comprising transverse rocking grate-bars, inclined supporting-bars for said grate-bars, and supports for the inclined bars, the said inclined bars being provided at their upper ends with hinged connections with their support.

2. The combination of hinged bars G, rocking grate-bars *b b*, connecting-bar I', vibrating lever J, and connecting-rod I, provided with adjusting-nuts for engagement with the lever J.

3. The combination, with an inclined grate B, of a foot-grate C, which is concaved from front to rear, and has its front and discharging portion practically in line with the grate B, said grate C being supported on a transverse axis arranged to allow the front of said grate to be lowered and raised, substantially as described.



4. The combination, with an inclined grate B, of a grate C, which is concaved from front to rear, and is supported on a transverse axis beneath and at the rear of the middle of the grate, substantially as described.

5. The combination, with an inclined grate B, of a foot-grate C, which is concaved from front to rear, a cross-beam C' beneath and pivotally supporting the foot-grate, an arm C^3, connected with the grate C, and a connecting-rod C^2, whereby the grate may be operated at pleasure.

6. The combination, with rocking grate-bars, a lever J, provided with an aperture *j*, and a screw-threaded connecting-rod I, passing through the aperture *j*, and provided with adjustable nuts on opposite sides of the lever, of a sleeve I^3, embracing the rod I between the nuts thereon.

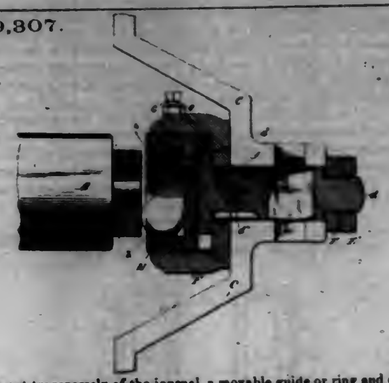
409,306. **APPARATUS FOR HEATING CARS.** JAMES B. SAGUR, Buffalo, N. Y. Filed Sept. 14, 1888. Serial No. 285,306. (No model.)

Claim.—1. In a system of steam heating for cars, the combination of two main radiating pipes extending longitudinally through the car at the side thereof—one arranged above the other—fittings by which the upper and lower main pipes are connected to each other at each end of the car, an admission-pipe leading from the source of supply and joined to one of such fittings at or near the bottom thereof,

and having the steam-admission valve situated at one end of the car, and a drainage-outlet for the water of condensation connected with the lower of the longitudinal pipes at a point situated between the center of the car longitudinally and the end at which the steam is not admitted, the lower of the main radiating-pipes being made to incline from both ends of the car toward the drainage-connection, substantially as and for the purpose described.

2. In a system of steam heating for cars, the combination of two main radiating-pipes extending longitudinally through the car, fittings connecting such main radiating-pipes together at each end of the car, an admission-pipe joined to one of such fittings and admitting steam thereto at one end of the car, and a drainage-outlet connecting with the lower of such radiating-pipes, the inlet for steam to such lower radiating-pipe being made smaller than the inlet to the other radiating-pipe to allow of the drainage-outlet being placed at the most convenient point between the two ends of the car, substantially as and for the purpose described.

3. In a system of steam-heating for cars, the combination of two main radiating-pipes extending longitudinally through the car, the lower one thereof being inclined from each end of the car toward the drainage-outlet, fittings connecting such main radiating-pipes at each end of the car, a main admission-pipe opening into one of such fittings at such point that the lower edge of the opening by which the admission-pipe connects with the fitting is about on a line with the center of the opening from such fitting into the lower longitudinal pipe, and a drainage-outlet situated between the center of the car longitudinally and the other end of the car from that at which the steam-distributing fitting is situated, substantially as and for the purpose described.



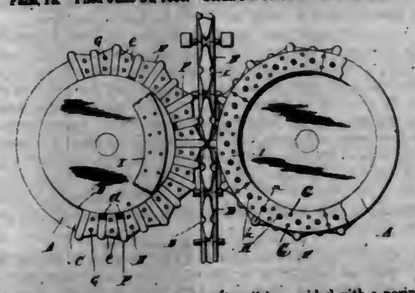
409,307. **ANTI-FRICTION JOURNAL-BOX.** WILLIAM S. SHARPNECK, Chicago, Ill. Filed Nov. 23, 1888. Serial No. 291,573. (No model.)

Claim.—1. The combination, with a journal, of a rolling end bearing therefor, a cup having a lateral adjustment transversely of the journal, and a movable guide or ring held by said cup and receiving said rolling end bearing, substantially as described.

2. The combination, with a journal, of a cup having a lateral adjustment transversely of the journal, a movable guide or ring held by said cup, and a ball held in the guide, substantially as described.

3. The combination, with a journal, of a cup having a lateral adjustment transversely of the journal, a movable guide or ring and disk held in said cup, and means, as the bolt D and nut E, for adjusting said cup, substantially as described.

409,307.



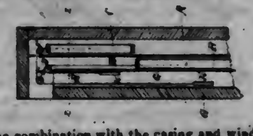
409,308. **CAGE FOR JOURNAL-BOXES.** WILLIAM S. SHARPNECK, Chicago, Ill. Filed Jan. 9, 1889. Serial No. 296,855. (No model.)

Claim.—1. The combination, with rods B, of two disks, and wedges for giving one of said disks a rotary motion around the other, thus gripping the rods, substantially as described.

2. The combination of the rods B and the end pieces A, each formed of two disks *a a'*, provided with rivets C for holding them together, with the wedges D, set in keyways formed in said disks, substantially as described.

409,309. **DIE-BEARING DISK.** MICHAEL M. SHELLABERGER, Beaver Falls, Pa. Filed June 24, 1888. Serial No. 315,342. (No model.)

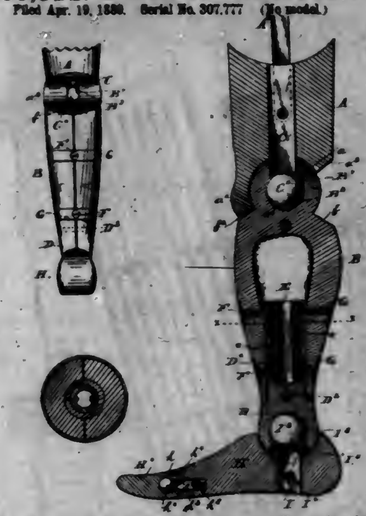
Claim.—1. The combination, with a disk provided with a peripheral shoulder and carrying a removable plate provided with threaded perforations, of the independent dies bearing at their ends against the shoulder of the disk, and set-screws mounted in the perforations of the said plate and engaging said dies, substantially as specified.



2. The combination, with a disk bearing stationary block-dies arranged at intervals to form spaces having parallel sides, of the parallel-sided male dies fitting in said spaces and engaged by set-screws, substantially as specified.

3. The combination, with a disk provided with a peripheral seat or recess and a peripheral shoulder adjacent thereto, of alternate block-dies having convergent sides, and male dies having parallel sides fitting in said seat or recess and bearing at their inner ends against said shoulder, substantially as specified.

4. The combination, with die-bearing disks provided with peripheral seats or recesses, of the block-dies fitting in said seats or recesses and secured by screws or bolts G, the male dies fitting between the block-dies, the covering-plate arranged on the upper sides of the block and male dies and secured in place by the bolts or screws G, and the set-screws mounted in the said plate and engaging the male dies, substantially as specified.



5. The combination, with a die-bearing disk, of the block-dies fitting in a peripheral seat or recess therein, the adjustable male dies fitting between said block-dies, and the covering-plate secured to the block-dies and carrying set-screws to engage and lock the male dies in position, substantially as specified.

409,310. **WINDOW.** CHARLES A. SIGLE, Youngstown, Ohio. Filed Dec. 20, 1888. Serial No. 294,201. (No model.)

Claim.—The combination, with the casing and window-sashes, of a pulley, as D, arranged above the lower sash, two pulleys, as E and F, arranged above the other pulley on the same plane, the pulley F being over the upper sash, a boxing, as G, having a center opening admitting of the free movement of two weights, said boxing fitting in the corner formed by the sash and casing, and cords passing over the pulleys, having weights attached to their ends inside the boxing and connected with the sashes, substantially as described.

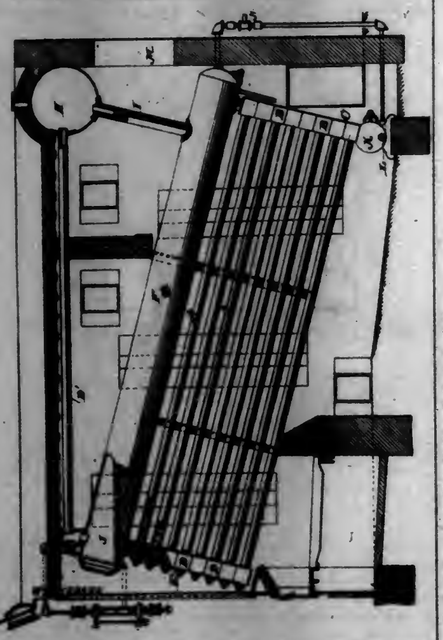
409,311. **ARTIFICIAL LEG.** WILLIAM L. SNYDER, Denver, Colo. Filed Apr. 19, 1889. Serial No. 307,777. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the upper leg portion formed with a curved recess and face-plate, a shank secured thereto and carrying at its lower end a socket-ball, and the lower leg portion formed with a curved socket-piece at the top and fitting in the curved recess in the upper leg portion, and also having a socket for the ball secured to the shank, and a recess in which the shank is free to move.

2. The combination, substantially as hereinbefore set forth, of the lower leg portion formed with an opening in its lower end, the ankle-piece divided longitudinally and secured together and adjustably secured in the lower leg portion, and the foot-piece having a ball-joint resting in a recess or socket in the lower end of the ankle-piece, said foot-piece being also provided with a curved recess into which the curved lower end of the ankle-piece extends.

3. The combination, substantially as hereinbefore set forth, of the lower leg portion, the ankle-piece having a shank projecting into the lower leg portion, the foot-piece having a curved recess into which the curved or rounded lower end of the ankle portion projects, the shank I, secured to the foot-piece, and the ball I^3, secured to the end of the shank and resting in a recess or socket in the ankle-piece, which is also provided with a recess I^4, for the purpose specified.

4. The combination, substantially as hereinbefore set forth, of the lower leg portion, the ankle-piece formed with a cylindrical hollow shank extending into the lower leg portion, the metallic cylinder



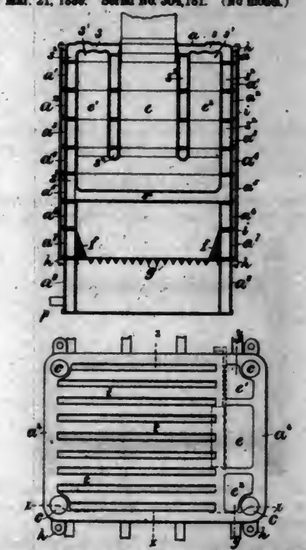
E, arranged centrally within the shank and provided with perforations *e*, the metallic bands or straps secured around the lower leg portion, and the screws extending through the lower leg portion into the perforations in the shank and in the metallic cylinder carried thereby.

409,312. **FIRE-EXTINGUISHER.** SAMUEL H. TIMMONS, Evansville, Ind. Filed Nov. 15, 1888. Serial No. 290,965. (No model.)

Claim.—In a fire-extinguisher, an ejector composed of a cylinder having a piston-head and a piston-rod projecting from one end, said cylinder being hinged at one end to a handle-bar, and a lever centrally hinged to the piston-rod and its forward end hinged to the bar, and suitable flexible tubes from the reservoir having valves, and the terminating-nozzle, substantially as herein set forth.

409,313. **STEAM-BOILER.** ROBERT R. BELL, Baltimore, Md., assignor to Joseph V. Campbell, same place. Filed Apr. 3, 1888. Serial No. 269,494. (No model.)

Claim.—1. In a sectional steam-boiler, the combination of the inclined tubes expanded into headers or boxes at both ends, a water-drum at same inclination connected at its lower sides with the front and rear headers or boxes, and connected on the front top side with a manifold and on the rear top side with a steam-drum, said steam-drum being connected with the manifold on front end by tubes, substantially as and for the purpose set forth.

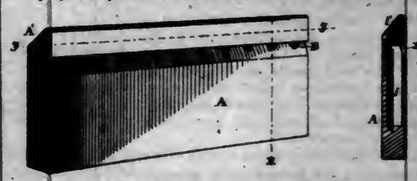


2. The combination, in a water-tube boiler having headers and inclined connecting-tubes, of a water-circulating and steam drum connected to said headers and arranged parallel to the said tubes, and a steam pipe or pipes connecting the upper inclined end of the drum with a steam-drum, all arranged within the furnace, substantially as set forth.

3. The combination, in a water-tube boiler having headers and inclined connecting-tubes, of a water-circulating and steam drum connected to the upper ends of said headers and parallel to the connecting-tubes, and a steam pipe or pipes connecting the upper inclined end of said drum with a steam-drum, substantially as described.

4. In a water-tube boiler, the combination, with the headers and inclined connecting-tubes, of a steam and water drum, as described, connected to the said headers and arranged parallel to the connecting-tubes, a manifold in communication with the upper inclined end of said drum, and a steam pipe or pipes connecting said manifold with a steam-drum, all as set forth.

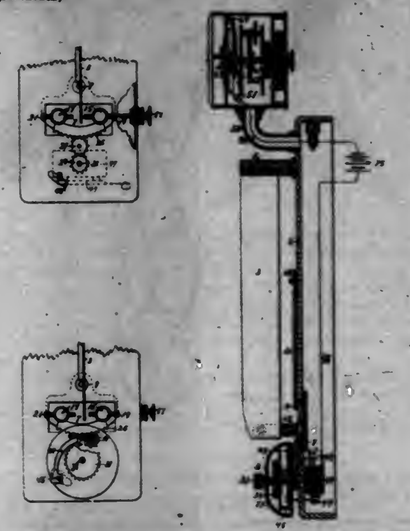
5. The combination, in a water-tube boiler having headers and inclined connecting-tubes, of a steam-separating and water-circulating drum connected to the upper ends of said headers and parallel to the connecting-tubes, a manifold in communication with the upper inclined end of said drum, and a steam pipe or pipes connecting said manifold with a steam-dome, substantially as set forth.



409,314. **WATER-HEATER.** GEORGE C. BLACKMORE, Newark, N. J. Filed Mar. 21, 1888. Serial No. 304,181. (No model.)

Claim.—1. A hot-water heater provided with a fire-space at the top, two return-flues leading downwardly therefrom, a main flue interposed between and connected at the bottom with such return-flues and leading to the chimney, the said flues being inclosed within the water-space of the heater, and an opening between the said fire-space and the main flue, having a damper operated from without the heater to open and close the same, as and for the purpose set forth.

2. A hot-water heater comprising a series of parallel sections having inlet and outlet apertures and arranged vertically, each section being provided on one side with apertures at both ends and on the other side with apertures at one end only, the alternate sections having the apertures at opposite ends on the side containing apertures at one end only, and the sections intermediate thereto having apertures on their upper and lower sides corresponding in position and number with those in the sides adjacent thereto of the sections directly above and below the same, the top and bottom sections having apertures only on the sides in contact with the adjacent sections, and provided, respectively, with supply and distributing pipes, as and for the purpose set forth.



409,315. **MUSICAL INSTRUMENT.** CHARLES W. BURGESS, Norwalk, Ohio, assignor to the Bostwick & Burgess Manufacturing Company, same place. Filed Jan. 14, 1889. Serial No. 296,333. (No model.)

Claim.—A piece of wood having a series of graduated holes bored therein of proper depth and diameter, a triangular-shaped kerf cut longitudinally into the series of holes to form the lips of the pipes, which pipes have their outer ends filled with flattened plugs, whereby the air blown into them will impinge upon the lips, the upper part of

said board being beveled to form the mouth-piece, all constructed substantially as and for the purpose described.

409,316. **THERMOSTAT.** ALBERT M. BUTZ, Minneapolis, Minn., assignor, by mesne assignments, to the Consolidated Temperature Controlling Company, of Minnesota. Filed May 10, 1887. Serial No. 237,709. (No model.)

Claim.—1. The combination, with a thermostat provided with adjustable contact-points, of an electro-magnet, an electric circuit, and a circuit-closer, whereby when said circuit is closed the relative position of said contact-points is changed, substantially as described.

2. The combination, with a thermostat provided with a thermostatic bar, as 3, and posts carrying contact-points, as 19 and 21, the free end of said bar and said contact-points being relatively adjustable, of an electro-magnet, an electric circuit, and circuit-closer, whereby when said circuit is closed the relative position of said bar and contact-points is changed, substantially as described.

3. The combination, with a thermostat having a thermostatic bar 3, and a movable plate 7, carrying the posts 15 and 17 and contact-points 19 and 21, of an electro-magnet controlling the position of said plate, an electric circuit, and a circuit-closer, substantially as and for the purpose set forth.

4. The combination, with a thermostat having relatively-adjustable contact-points and thermostatic bar, of an electro-magnetic mechanism for changing the adjustment of said parts, and a clock mechanism provided with a circuit-closer controlling said electro-magnetic mechanism, substantially as described.

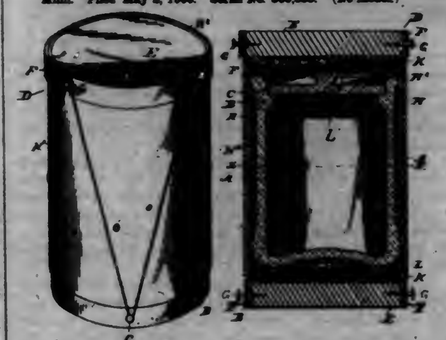
5. The combination, with a thermostat, of an electro-magnetic device for changing the position of its contact-points, a clock mechanism, a circuit-closer on said clock mechanism, and means for predetermining the time at which said circuit-closer will be operated, substantially as described.

6. The combination, with a thermostat provided with a movable plate 7, carrying contact-points, of mechanism for moving said plate in one direction, mechanism for automatically moving said plate in the opposite direction, an electro-magnet for releasing said automatic mechanism, a circuit, and a circuit-closer, substantially as described.

7. The combination, with a thermostat provided with a movable plate 7, and contact-points carried by said plate, of mechanism for moving said plate in one direction, automatic mechanism for moving said plate in the opposite direction, an electro-magnet controlling said automatic mechanism, an electric circuit, and a clock mechanism provided with a circuit-closer for closing said circuit, substantially as described.

8. The combination, with a thermostat provided with movable contact-points, and mechanism for moving said points, of an electro-magnet controlling said mechanism, a clock mechanism carrying a circuit-closer in circuit with said magnet, and an alarm arranged to be operated by the mechanism for moving the contact-points of the thermostat.

9. A thermostat having movable contact-points, in combination with an electro-magnetic mechanism for changing the position of said points.



409,317. **SHOE FOR SLED-RUNNERS.** JOHN R. CAMPBELL, Clyde, Minn. Filed June 10, 1889. Serial No. 313,646. (No model.)

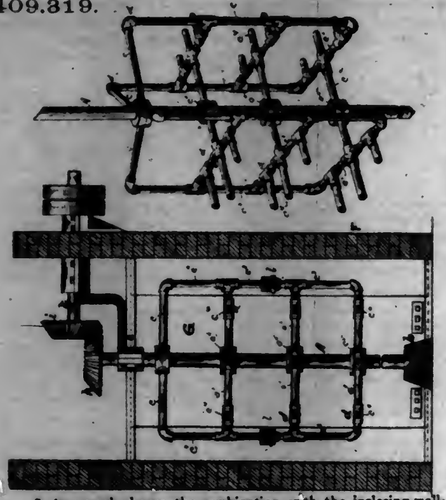
Claim.—1. The combination, with the sleigh-runner, its narrow bearing-shoe, and the bolts confining said shoe to the runner, of an independent wide metallic plate interposed as a snow-shoe between the runner and its bearing-shoe to extend the length thereof and having elongated apertures formed longitudinally therein to register with the bolt-holes in the runner, substantially in the manner and for the purpose herein set forth.

2. The combination, with a sleigh-runner and its narrow bearing-shoe, of an independent wide metallic plate interposed as a snow-shoe between the runner and its bearing-shoe, bolts confining the bearing-shoe and interposed snow-shoe jointly to the runner, and lateral brackets secured to the runner to bear upon and re-enforce the top of the snow-shoe, substantially in the manner and for the purpose herein set forth.

409,318. **BUTTER-PACKAGE.** SIMEON CRITTENDEN, Chatfield, Minn. Filed May 2, 1888. Serial No. 309,355. (No model.)

Claim.—1. The combination of an earthenware jar or crock having an interior flange or shoulder, a cover placed upon the latter, the heads or caps having radially-extending studs, packing material interposed between the top and bottom of the jar and said heads or caps, a layer of paper interposed between the cover of the jar and the packing material, and a fastening-cord laced around the studs of the heads or caps, substantially as and for the purpose set forth.

2. The combination of the earthen jar, the telescoping paper wrappers or jackets surrounding the same and having their ends interposed between the disks E and their encircling hoops or rims composing the heads or caps, the studs extending radially from the latter, packing material placed between the top and bottom of the jar and said heads or caps, a layer of paper interposed between the cover of the jar and the packing material, and a fastening-cord laced around the studs of the caps or heads, substantially as and for the purpose set forth.



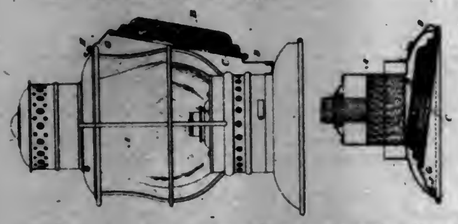
3. In a butter-package, the herein-described heads or caps, consisting of wooden disks having the telescoping paper or straw-board jackets secured thereto by sheet-metal rims or hoops and provided with radially-extending studs, and a fastening-cord laced around the studs, substantially as and for the purpose herein set forth.

4. The combination, with a jar or similar breakable package, of the herein-described heads or caps, consisting of wooden disks having the telescoping paper or straw-board jacket secured thereto by sheet-metal rims or hoops, and having radially-extending studs and a fastening-cord, substantially as and for the purpose herein shown and specified.

409,319. **SMOKE-HOUSE.** EDWARD C. FORD, Washington, D. C., assignor of one-half to Andrew Lotter, same place. Filed Jan. 11, 1889. Serial No. 296,057. (No model.)

Claim.—1 In a smoke-house, the combination, with the inclosing-walls, of the rotatable reel having the shaft A, provided with the radial arms *c*, the uprights c^1, carried at the extremities of said arms, and the horizontal parallel supporting-rods *d*, carried by and between said uprights at a distance from the shaft of the reel, substantially as set forth.

409,319.

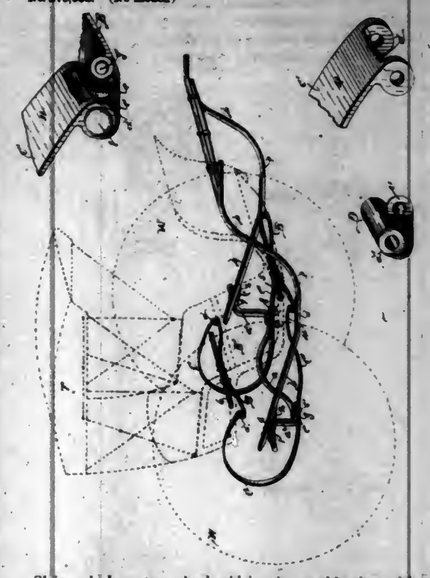


2. In a smoke-house, the combination, with the inclosing-walls, of the rotatable reel having the shaft A, provided with the radial arms c, the uprights c^3, carried at the extremities of said arms, the horizontal supports c', carried by and between said uprights at a distance from the shaft of the reel, and supplemental radial arms c^3 at right angles with and connecting said supports c' with the shaft, substantially as set forth.

3. In a smoke-house, the combination, with the inclosing-walls of the rotatable reel having the shaft A, provided with the radial arms c, the uprights c^3, carried at the extremities of said arms, and the horizontal supports c', carried by and between said uprights at a distance from the shaft of the reel, and the outward extensions c^4 at right angles to and carried by the supports c', substantially as set forth.

4. In a smoke-house, the combination, with the inclosing walls or casings, of the reel having the vertical shaft A, diametrical arms c^3 and parallel supports c', situated upon opposite sides of the shaft and at right angles to and carried by said arms, and the removable sausage-sticks m, arranged parallel with said arms and supported by said parts c', substantially as set forth.

409,320. SIGNAL ATTACHMENT FOR LAMPS OR LANTERNS. ALBERT L. FRANCE and ALBERT E. YELTON, Millsdale, Ky. Filed Jan. 7, 1889. Serial No. 295,712. (No model.)



Claim.—1. A signal attachment for lanterns, consisting of a supplementary glass arranged to be supported in an upright position at the side of the lantern when in use and to be folded under the same when not in use in the manner and for the purpose substantially as described.

2. A signal attachment for lanterns, consisting of a supplementary glass hinged to the outside of the lantern in such a manner as to be folded under the same when not in use, substantially as and for the purpose described.

3. In a signal attachment for lanterns, a supplementary glass located upon the exterior of the globe and having its lower part hinged to the lantern-frame, and its upper part provided with a latch, whereby it is held in position when in use and folded under the bottom of the lantern when not in use in the manner substantially as described.

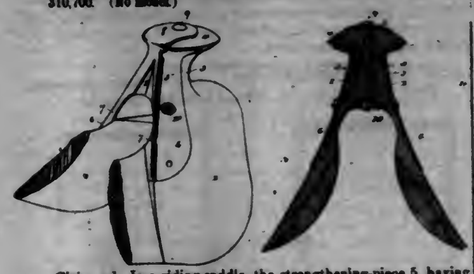
4. In an attachment for lanterns, a glass surrounded by a suitable rim or frame, in combination with a double hinge connecting its lower portion to the lantern and by means of which it is folded up into the same, and a hasp or its equivalent by means of which it is held in elevated position at the side of the lantern, substantially as described.

409,321. TWO-WHEELED VEHICLE. GEORGE GIDDOM, Fair Mount, assignor to Culver Gilman Thyng, Olean, N. Y. Filed July 3, 1888. Serial No. 278,962. (No model.)

Claim.—1. In a two-wheel vehicle, the combination, with the body thereof, of the crank-arm axle, substantially as described, the front and rear cross-springs, and the side springs clipped to the drop part of the axle and having one end C-shaped and shackled loosely to a rear cross-spring secured to the body, and the other end slightly curved in an upward and downward direction and shackled loosely to a front cross-spring secured to said body, substantially as and for the purpose set forth.

2. In a two-wheel vehicle, the combination, with the body thereof, of the crank-arm axle, as described, the side springs c', clipped to the drop part of the axle and having the rear end C-shaped and shackled loosely to a rear cross-spring secured to the body, and the forward end slightly curved in an upward and downward direction and shackled loosely to a front cross-spring, the drop-shafts clipped to the arm of the bent axle and braced thereto at a point above that where the side springs are clipped, and the braces for securing the shafts against lateral movement, substantially as shown and described.

409,322. WIRE-TIGHTENER. JOSHUA S. GUTTON, Granger, Mo. Filed June 19, 1889. Serial No. 314,836. (No model.)

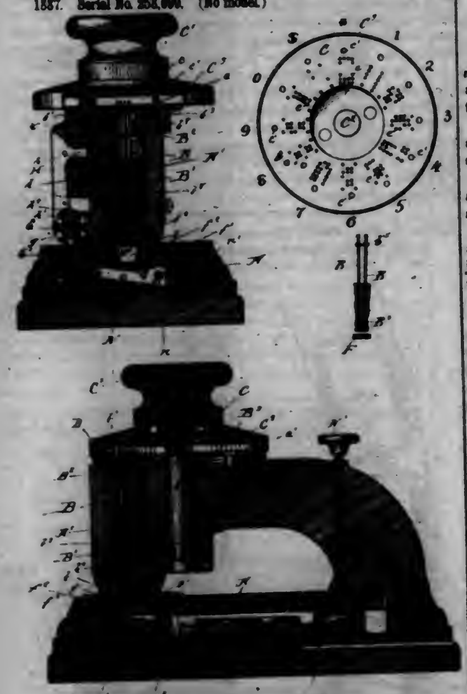


Claim.—1. A wire-tightener consisting of a main bar provided with a ring or ferrule at its end, a link sliding through said ring and provided with a hook adapted to engage the wire, and a lever pivoted to the main bar and the link, as set forth.

2. A wire-tightener consisting of a main bar having a ring at one end, an L-shaped lever pivoted to said main bar, and a link pivoted at one end to the lever, moving through the ring and provided with a hook at its free end adapted to engage the wire, as set forth.

3. A wire-tightener consisting, essentially, of two levers hinged together, one of said levers being provided with a longitudinally-disposed ring at its end, and the other one carrying a hook adapted to slide longitudinally through said ring, as set forth.

409,323. RIDING-SADDLE. SAMUEL HAENSEL, Quincy, Ill., assignor of one-half to Louis Wolf, same place. Filed May 14, 1889. Serial No. 310,700. (No model.)



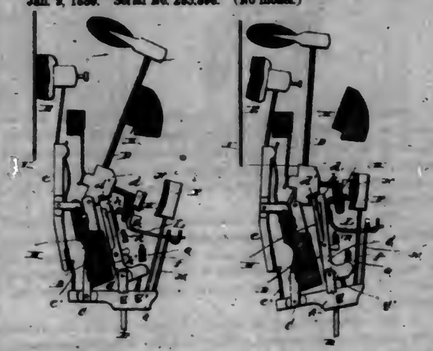
Claim.—1. In a riding-saddle, the strengthening-piece 5, having the wings 6 6, the short projecting flanges 7 7, and the broad overhanging flange 8, substantially as described.

2. The combination, with the frame of the saddle-tree and the cap-piece, of the metallic strengthening-piece having the wings 6 6, short flanges 7 7, broad overhanging flange 8, and the vertical bolt 9 and cross-bolt 10, for securing the parts together, substantially as described.

3. The combination, with the wooden saddle-tree frame made in two parts, as described, and with the wooden cap-piece, of the metallic strengthening-piece having the wings, the short flanges, the broad overhanging flange, and the vertical and horizontal bolts, substantially as described.

409,324. PERFORATING-STAMP. CHRISTIAN C. HILL, Chicago, Ill., assignor to the Hill Manufacturing Company, same place. Filed Dec. 22, 1887. Serial No. 258,090. (No model.)

Claim.—1. The hand perforating-stamp having, in combination, a series of independently-movable punches B, converging guides in which said punches are mounted, consisting of a shell or case having a molded filling in which the guide-holes are formed, a corresponding female die for said punches, and a reversely-socketed revolvable plunger for operating only those punches necessary for making the character required, substantially as specified.



2. The combination, with a series of independently-movable punches B and their female die, of revolvable reversely-socketed plunger C, a registering-pin, said plunger C having registering-sockets to engage said registering-pin, and indicator spring-pin a', substantially as specified.

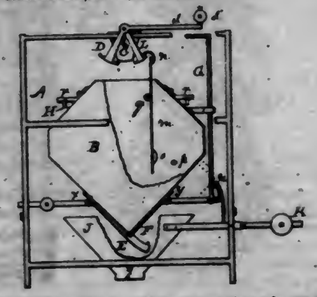
3. The combination, with a series of independently-movable punches B, of a guide-case therefor having perforated heads or ends through which the punches pass, the interior of said guide-case being filled with soft metal to form continuous and independent guides for each of said punches, substantially as specified.

4. The combination of frame A, punches B, guide-case $B' B^3$, said part B^3 being movable, perforated heads $b\ b'$, soft metallic filling b^4, and a socketed plunger C, substantially as specified.

5. The combination of frame A, punches B, guide-case $B' B^3$, said part B^3 being movable, perforated heads $b\ b'$, soft metallic filling b^4, a socketed plunger C, and a perforated guide-plate D, substantially as specified.

409,325. PIANO-ACTION. HARRY L. HOSE, Lexington, Ky. Filed Jan. 9, 1889. Serial No. 295,996. (No model.)

Claim.—1. The combination, with a jack, of a fly or supplemental jack pivoted in a recess formed in the rear face thereof and adapted to engage the knuckle of the hammer, substantially as e for the purpose specified.

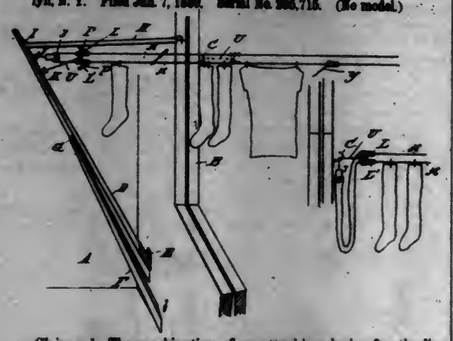


2. The combination, with a jack, of a fly-jack pivoted thereto and terminating at its upper end below the upper end of the jack, substantially as specified.

3. The combination, with a jack, of a fly-jack pivoted thereto and the spring connected to the latter to normally draw its upper end away from the jack, substantially as specified.

4. The combination, with a jack, of the fly-jack pivoted thereto and fitting at its upper end between rearwardly-extending ears on the jack, whereby, when the jack is in engagement with the knuckle of the hammer, the fly-jack is held out of contact therewith, substantially as specified.

5. The combination, with the jack connected to the jack-lever and adapted to engage a shoulder on the knuckle of the hammer and the stop Q to engage the toe of the jack, of the fly-jack pivoted to the jack and normally held out of contact therewith at its upper end and the stop R to engage the toe of the fly-jack, substantially as specified.



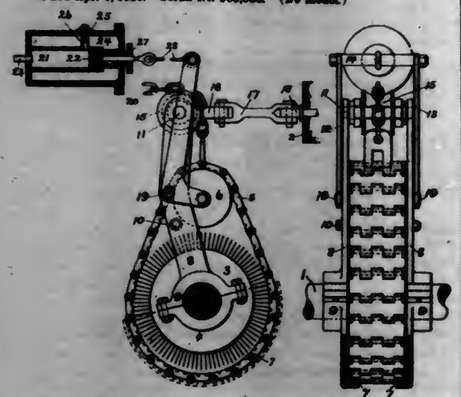
409,326. AUTOMATIC GRAIN-WEIGHER. ELIAS A. HOOVER, West Milton, assignor of one-half to John R. Fouts, Troy, Ohio. Filed Nov. 26, 1883. Serial No. 291,852. (No model.)

Claim.—The combination, in an automatic grain-weigher, of the auxiliary or partial cut-off valve L, cut-off valve D, both of said valves being centrally pivoted to the sides of the chute, the pivotal plate m,

suspended in the weighing-receptacle, and the curved arm *n* of said cut-off valve L to engage the top of said plate, substantially as described.

409,327. CLOTHES-LINE ATTACHMENT. HENRY MASHER, Brooklyn, N. Y. Filed Jan. 7, 1889. Serial No. 295,715. (No model.)

Claim.—1. The combination of an attaching device for the line located on the outside of the window, clamps adapted to hold both strands of the line and sliding thereon, constructed and arranged to engage with the attaching device on the outside of the window, and a support for the line within the room and in line with the window, substantially as set forth.



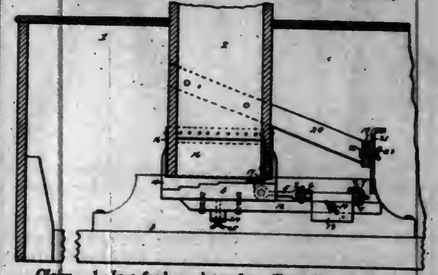
2. The combination of an attaching device for the line located outside of the window, clamps adapted to hold both strands of the line and sliding thereon, constructed and arranged to engage with the attaching device on the outside of the window, and a removable support for the line within the room and in line with the window, substantially as set forth.

3. The combination of an attaching device for the line located on the outside of the window, clamps adapted to hold both strands of the line and sliding thereon, constructed and arranged to engage with the attaching device on the outside of the window, a support for the line within the room in line with the window, and a clamp constructed and arranged to slack and to take up the slack of the line, connecting the ends of the line, substantially as set forth.

4. The combination of an attaching device for the line located on the outside of the window, clamps adapted to hold both strands of the line and sliding thereon, constructed and arranged to engage with the attaching device on the outside of the window, and a support for the line within the window, said support being provided with an adjustable attaching device, whereby the line may be slackened, substantially as set forth.

5. The double clamp above described, consisting of two separate clamps, each provided with its own clamping-lever, and a connecting-bar pivoted to each of the clamps, whereby they may be moved toward and from each other, substantially as set forth.

409,328. CAR-BRAKE. ALBERT P. MASSEY, Watertown, N. Y. Filed Apr. 1, 1889. Serial No. 305,530. (No model.)

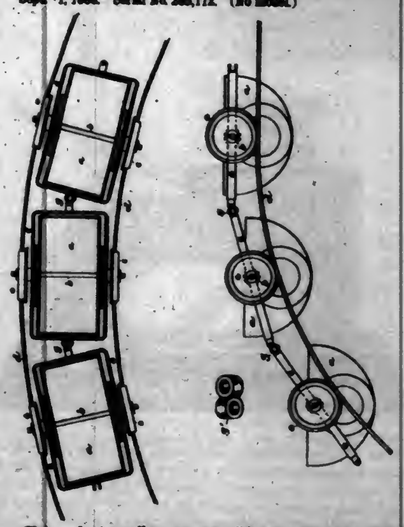


Claim.—1. In a car-brake, a friction wheel or disk one surface of which is composed of a large number of wires, in combination with a car-axle for the purpose set forth.

2. In a car-brake, the friction-wheel 3 4, endless chain 5, and tightener 6, combined with a swinging frame for actuating the tightener, supported on a frame having bearings on the axle, substantially as set forth.

3. In a car-brake, a friction-wheel one surface of which is composed of a large number of wires, an endless chain surrounding said wheel, a tightener, a swinging frame, and a piston and cylinder arranged substantially as set forth.

409,329. FEED-REGULATOR. JOHN A. MCAHREY, Minneapolis, Minn. Filed Sept. 27, 1888. Serial No. 286,504. (No model.)



Claim.—1. In a feed-regulator for mill machinery, the combination, with a hopper, a shaker-frame, a feed-shelf pivoted in said frame, and two counterbalanced arms secured to the under side of said shelf near the sides of the same, of a brace-bar secured at its ends to the inner ends of said arms and provided with screws which project upwardly therefrom and bear against the under side of said shelf, substantially as described.

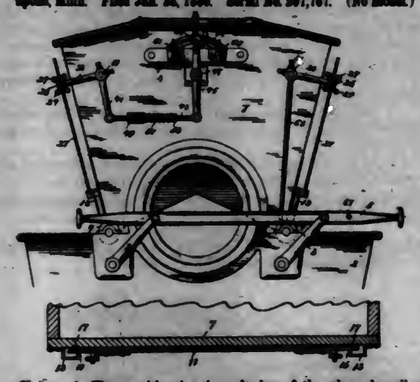
2. In a feed-regulator for mill machinery, the combination, with the hopper 1, the shaker-frame 3, the pivoted feed-shelf 4, the horizontally and vertically adjustable arms 5, and the arms 12, provided with the weights 13 and secured to the under side of said shelf, of the brace-bar 24, secured at its ends to the inner ends of said arms and provided with the set-screws 25, which bear adjustably with their ends against the under side of said shelf, substantially as described.

3. In a feed-regulator for mill machinery, the combination, with the hopper 1, the shaker-frame 3, the pivoted feed-shelf 4, the slotted arms 5, formed with the circular holes 8 and provided with the slotted cups or disks 9, the screws 11, and the arms 12, provided with the weights 13, of the brace-bar 24, secured at its ends to the inner ends of said arms and provided with the set-screws 25, which bear adjustably with their ends against the under side of said shelf, substantially as described.

409,330. CONVEYER. GEORGE W. MCCASLIN, New York, assignor to the McCaslin Machine Company, West New Brighton, N. Y. Filed Sept. 11, 1888. Serial No. 285,112. (No model.)

Claim.—1. An endless non-extensible conveyer composed of elements consisting each of a gravity-bucket hung between the rigid side bars of a distancing and coupling link, the said link, and substantially

at the middle of the same, and a suitable axle and supporting-wheels, the coupling-links of the several elements of the conveyer being connected together by non-yielding couplings.

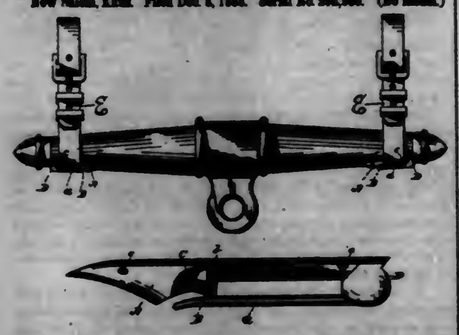


2. An endless conveyer composed of elements consisting each of a gravity-bucket, a coupling-link surrounding said bucket and between the side bars of which the bucket is hung, and a suitable axle and wheels, the coupling-links of the adjacent elements being connected together in the longitudinal axis of the conveyer by a non-yielding coupling.

3. An endless conveyer composed of elements consisting each of a gravity-bucket, a distancing and coupling link surrounding said bucket, and between the side bars of which said bucket is hung, and a suitable axle and wheels for supporting the bucket, and a universal coupling connecting the coupling-links of adjacent elements.

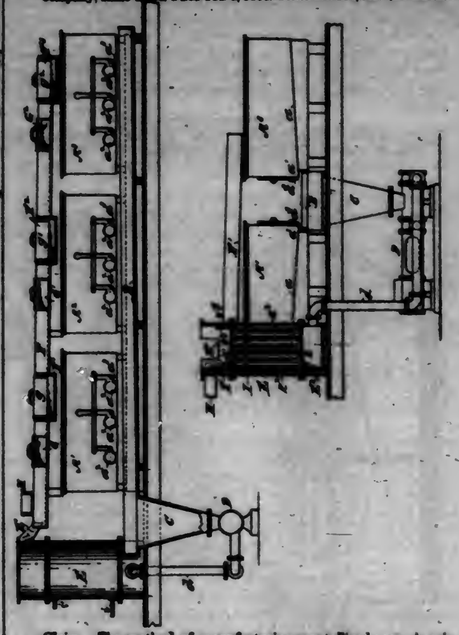
4. An endless conveyer composed of a series of frame-like rigid links united by non-yielding couplings, supporting-wheels, one pair to each link, and a gravity-bucket pivotally hung in each of said links.

5. An endless conveyer composed of elements consisting each of a gravity-bucket, a rigid coupling-link, an axle, and supporting-wheels, said bucket being pivotally hung between the side bars of the link and between the points where the conveyer elements are coupled together.



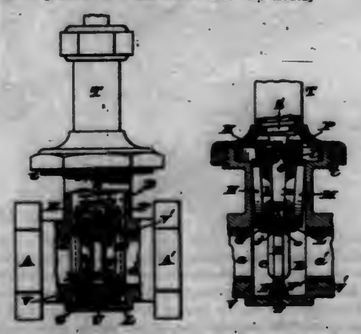
409,331. AUTOMATIC FEEDER. CHARLES H. MCFARLAND, Minneapolis, Minn. Filed Jan. 28, 1888. Serial No. 267,767. (No model.)

Claim.—1. The combination, in a device of the class described, with the feed rolls and hopper, of the sliding gate arranged upon the outside of the hopper, the angle-irons 13, secured to the outside of the hopper and provided with the knife-edges 15, bearing upon said gate, substantially as described.



2. The combination, with the hopper and feed-roll, of the shaft 19, mounted in said hopper, the plate 31, arranged within said hopper and secured upon said shaft, the arms 23 upon said shaft, the rod 25, supported by said arms, the sliding gate 11, and the adjustable rods connecting said gates and said rod 25, the pivoted lever 45, connected with said shaft 19, and provided with a locking device, substantially as described.

409,332. ATTACHMENT FOR NECK-YOKES. ENOS W. MCMASTER, New Salem, Kans. Filed Dec. 6, 1888. Serial No. 292,989. (No model.)



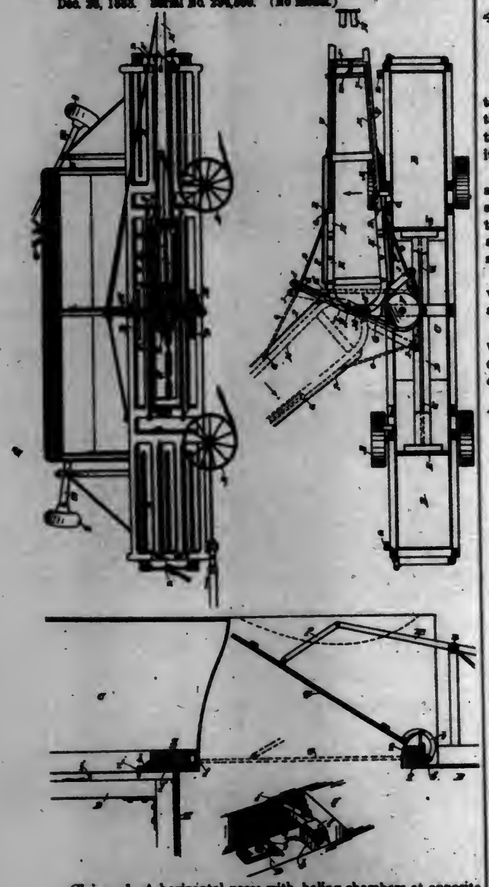
Claim.—In an attachment for neck-yokes, the body A, having the concave surface on its back throughout its entire length and provided near its inner end with a recess in which is the pivotally-attached button B and the spiral spring *b*, located in the outer part of said recess, the shoulder D on the outer end of the body A, and the inwardly-reaching arm *a*, secured to the said shoulder, substantially as and for the purpose set forth.

409,333. PROCESS OF REFINING SUGAR. HENRY H. HIMES, Jersey City, N. J., assignor to the F. O. Matthiessen and Wiechers Sugar Refining Company, same place. Filed Oct. 6, 1888. Serial No. 287,413. (No model.)

Claim.—The method of manufacturing crystallized sugar herein described, which consists in maintaining the magma in the crystallizing-tank at a temperature approximating 120° Fahrenheit during the process of crystallization by from time to time removing from the tank more or less of the liquid magma which is found to have risen to or above said temperature and introducing into the tank magma of lower temperature.

409,334. COCK OR VALVE. JAMES POWELL, Cincinnati, Ohio. Filed Aug. 31, 1888. Serial No. 284,236. (No model.)

Claim.—1. The combination, in a cock or valve, of a shell having a pair of channels and opposing valve-seats, inclined bearings within the shell above and below the axis of said valve-seats, and a pair of valves which are forced outwardly against said seats by sliding contact with said inclined bearings, substantially as described.



2. The combination, in a cock or valve, of a shell having a pair of channels and opposing valve-seats, a removable expansion-plate fitted within a chamber of said shell and provided with a port, a ridge, and a pair of inclined bearings, and a pair of valves which are forced outwardly against said seats by contact with said ridge and inclined bearings, substantially as described.

3. The combination, in a cock or valve, of a shell having a pair

of channels and opposing valve-seats, a removable expansion-plate fitted within a chamber of said shell and provided with a port, a ridge, and a pair of inclined bearings, a pair of valves loosely coupled to carriers having inclined bearings and chamfered edges, and means for coupling said carriers to the operating-stem, substantially as described.

4. The combination, in a cock or valve of a shell having a pair of channels *a a'* and opposing seats V V', a removable expansion-plate O *o o'*, fitted within a valve-chamber B of said shell and provided with a port D, ridge E, and inclined bearings F F', a pair of valves H M, loosely coupled to carrier G L, having inclined bearings J O and chamfered edges *j o*, and means, as the sockets K P, for coupling said carriers to the disk R of an operating-stem, substantially as herein described.

409,835. BALING-PRESS. JACOB PEIRS, San Leandro, Cal. Filed Dec. 26, 1888. Serial No. 294,869. (No model.)

Claim.—1. A horizontal press with baling-chambers at opposite ends, followers fitting said chambers, and an intermediate connecting-beam, in combination with chains attached to the beam or followers, a direction drum or pulley around which the chains pass, a sweep or power lever fulcrumed at the side of the press, supplemental levers fulcrumed at the inner end of the sweep and having points of attachment for the outer ends of the chains, and links connecting the outer ends of said levers with the sides of the sweep, substantially as described.

2. A horizontal baling-press with end chambers and followers chains, guide-drum, sweep, and supplemental levers, to which the outer ends of the chains are connected, as shown, in combination with the links O, guides P, and the catches Q upon the sides of the sweep to engage the link, substantially as herein described.

3. The sweep fulcrumed at the side of the press and having the supplemental levers fulcrumed to and projecting from the rear end, links extending from the outer ends of these levers to the sides of the sweep, guides upon which the ends of the links travel along the sweep, and catches Q, with which they engage, in combination with the angularly-slotted detaching-plates R, connecting-rods U, and the oscillating lever by which they are simultaneously reversed, substantially as herein described.

4. In a baling-press, the combination of the horizontally-closing feed-door having the curved hinges, the pintles of which are fixed at a distance from the edge of the door-opening, the curved guide-plate against which the rear edge of the door travels when opening or closing, and a support for the hinge-pintle and guides, substantially as herein described.

5. In a baling-press, the horizontally-closing feed-door, the holding-latch, with the shank sliding through the frame-timbers, the lever *j*, and the holding-spring, in combination with the plate *i*, actuated by the movement of the follower, so as to withdraw the latch and release the door, substantially as herein described.

409,836. CHROME-TANNED LEATHER AND PROCESS OF PREPARING THE SAME. LEON RAFFE, Newark, N. J., assignor, by mesne assignments, to Linde S. Pierson, Wilmington, Del. Filed Sept. 24, 1887. Serial No. 250,604. (No specimens.)

Claim.—1. The process herein described of treating leather after tanning for the purpose of softening, coloring, and fixing the color thereof, the same consisting in subjecting the leather to a cold solution of sesquioxide of chromium, (chromic hydrate,) then subjecting it to the action of a bath of logwood, substantially as described.

2. The process herein described of successively restoring the cold solution of sesquioxide of chromium (chromic hydrate) by agitating a surplus body thereof at the bottoms of said cold solution previous to treating each batch of leather, so that the cold solution will reabsorb and hold in solution the proper proportion of chromic hydrate, substantially as specified.

3. As a new article of manufacture, a skin previously tanned with vegetable tanning-matter and impregnated with the oxide of chromium, as set forth.

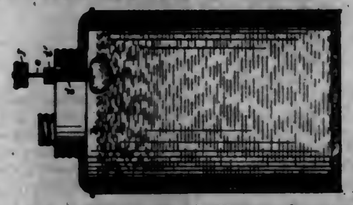
4. As a new article of manufacture, a skin previously tanned with vegetable tanning-matter, having its pores impregnated with oxide of chromium and dyed with a color partly combined with the chromium oxide as a mordant, as set forth.

409,837. SCARFING-MACHINE. ELISHA B. RICE, Boston, Mass. Filed Jan. 9, 1888. Serial No. 260,234. (Model.)

Claim.—1. In a machine for lap-grinding, the combination of the grinding-wheel and its supporting-shaft, with a frame upon which the shaft may reciprocate, and which frame is formed to slide in the direction at right angles to the shaft, with two handles, one on the frame and one connected to the shaft, so that a compound motion can be given to the grinding-wheel, and a vertically and angularly adjustable table beneath said grinding-wheel to support the saw, and an auxiliary table attached to said last-mentioned table and adapted to hold circular saws, so that the machine may be used to bevel circular saws or lap-grind band-saws.

2. The combination of a grinding-wheel and stand, with a table secured to the latter and vertically and angularly adjustable thereon, with an auxiliary table secured to the outer end of the latter table and provided with a central securing device, so that by the co-operation of the two tables either band or circular saws may be brought under the grinding-wheel to be beveled.

3. The combination of a grinding-wheel and a frame on which it is supported, with a table secured thereto, so as to be vertically and angularly adjustable, an auxiliary table attached to said first-mentioned table and provided with a central clamp to hold circular saws, a friction-plate on the first-mentioned table provided with rollers radial to the clamping device on the auxiliary table, and a clamp upon said first-mentioned table, so as to hold the edge of a circular saw upon such friction-plate.



409,838. SUSPENDER-END. EDWIN B. STEARNS, Brooklyn, N. Y. Filed Oct. 25, 1888. Serial No. 289,115. (No model.)

Claim.—1. In a strap, the combination, with a main or body portion folded on itself, the adjacent edges of which are secured by rows of stitching, of a button-hole tab, said tab being secured to the main or body portion by the rows of stitching previously referred to, which also form the work of the button-hole, and by rows of stitching along the side edges of the main or body portion, substantially as specified.

2. In a strap, the combination, with a main or body portion folded on itself, the adjacent edges being secured by rows of stitching, of a button-hole tab, a strengthening-piece upon the rear side of the tab, said tab portion and strengthening-piece being secured to the main or body portion by the rows of stitching previously referred to, which also form the work of the button-hole, and by rows of stitching along the side edges of the main or body portion, substantially as specified.

409,839. INDICATOR TO PREVENT OVERFLOW OF LIQUIDS IN CLOSED VESSELS. WILLIAM S. SCUTCHFIELD, St. Louis, Mo. Filed Jan. 21, 1889. Serial No. 296,980. (No model.)

Claim.—1. In combination with a liquid-receptacle, a stem-tube which projects through the walls thereof into the liquid-chamber, a float arranged in said chamber and provided with a stem whose length exceeds that of the stem-tube and which projects through said tube, and a cap secured to the end of the float-stem and adapted to close the stem-tube, substantially as and for the purposes described.

2. In combination with a closed liquid-receptacle, a tube which projects through the walls thereof, a float having a stem whose cross-sectional area is less than the bore of the tube for purposes of venting the receptacle, and a cap on the outer end of the float-stem adapted to close the stem-tube, substantially as and for the purposes described.

3. In a tank or vessel for holding oil or other liquids, the combination of a tube formed through the top of the vessel and having a screw-threaded portion extending above the tank and a rod working freely through said tube, said rod having a float secured at its lower end inside the tank, and a screw-threaded cap secured to its upper end and adapted to engage the screw-threaded tube and hold the float in its depressed position, substantially as and for the purposes described.

409,840. COMBINED STAND AND PAD OR TABLET. HENRY H. URE, Philadelphia, Pa. Filed Mar. 6, 1888. Serial No. 302,490. (No model.)

Claim.—1. As a new article of manufacture, a stand provided with an inwardly-extending wing, said wing being provided at its inner end with a downward projection.

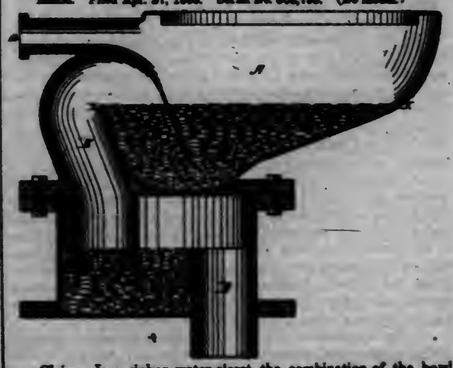
2. In combination, a pad or tablet, a base upon which said pad or tablet rests, an inwardly-extending overhanging wing, said wing being provided at its inner end with a downward projection, the pad or tablet being provided with a projecting surface which will pass under the wing and be held in position by the downward projection of the wing.

3. As a new article of manufacture, a pad or tablet provided with a downwardly-extending surface projecting from the pad or tablet, said projecting surface being adapted to hold the pad or tablet in place on a stand or base.

4. As a new article of manufacture, a pad or tablet provided with upwardly or downwardly projecting surfaces, said projecting surfaces being adapted to hold the pad or tablet in place on a stand or base.

5. As a new article of manufacture, a stand provided with an inwardly-extending overhanging wing and a recess in its upper surface extending entirely across the stand.

6. As a new article of manufacture, a stand provided with an inwardly-extending wing, said wing being provided at its inner end with a downward projection and a recess in the upper surface of said stand.



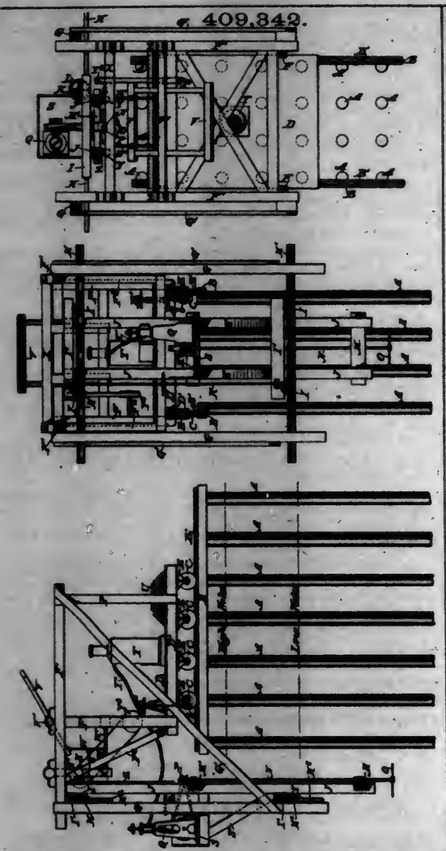
7. In combination, a stand provided with a recess in its upper surface and a pad having a downwardly-projecting surface adapted to rest in the same recess.

8. In combination, a stand provided with a recess in its upper surface and inwardly-projecting wings or lips, and a pad or tablet having a downwardly-projecting surface adapted to rest in said recess in the stand.

9. In combination, a stand provided with an inwardly-extending overhanging wing, said wing being provided at its inner end with a downward projection and a recess in the upper surface of said stand, a pad or tablet having upwardly and downwardly projecting surfaces, the upward-projecting surface being adapted to pass under the wing and be held in position by the downward projection of the wing and the downwardly-projecting surface of the pad or tablet being adapted to rest in the upper surface of the stand.

10. As a new article of manufacture, a pad or tablet provided with an upwardly-extending surface projecting from the pad or tablet, said projecting surface being adapted to hold the pad or tablet in place on a stand or base.

409,841. SIPHON-CLOSET. HENRY C. WEBBER, Boston, Mass., assignor to the Wooden Sanitary Manufacturing Company, of Rhode Island. Filed Apr. 27, 1889. Serial No. 308,702. (No model.)



Claim.—In a siphon water-closet, the combination of the bowl A, the siphon-formed outlet B B', a water-chamber surrounding and sealing the mouth of said outlet, and a waste-pipe whose outer wall forms a portion of the wall of said chamber, all substantially as described.

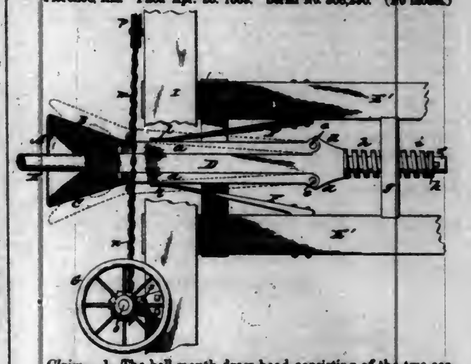
409,842. MACHINE FOR CUTTING OFF PILES. EDWIN J. WESTON, San Francisco, Cal. Filed May 1, 1889. Serial No. 309,211. (No model.)

Claim.—1. The combination, in a pile-cutting machine with its carriage moving upon a tramway, of a movable saw-frame and saw supported by the carriage and traversing its line of movement, a motor carried on the saw-frame and geared to the saw, and independent mechanism, substantially as described, for actuating the carriage and saw-frame, whereby the one is made to move at a right angle to the other for adjustment or feed, substantially in the manner and for the purpose herein set forth.

409,342.

2. The combination, in a pile-cutting machine, of a carriage mounted upon wheels to run upon a tramway, a frame-work upon said carriage constructed to project beyond and overhang its front end, a fixed frame depending vertically from said frame-work in front of the carriage, a movable frame traversing the front of the carriage upon said dependent fixed frame, and a saw mounted upon said movable frame and geared to a motor carried upon the same frame, substantially in the manner and for the purpose herein set forth.

3. The combination, in a pile-cutting machine, of a carriage mounted upon wheels to run upon a tramway, a frame-work upon said carriage constructed to project beyond and overhang its front end, a fixed frame depending vertically from said frame-work in front of the carriage, a movable frame traversing the front of the carriage upon said dependent fixed frame, a saw mounted upon said movable frame and geared to a motor carried upon the same frame, and a counterbalancing-weight upon the carriage, substantially in the manner and for the purpose herein set forth.



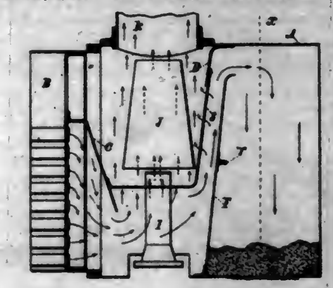
4. The combination, in a pile-cutting machine with a carriage having a frame-work thereon made to project and overhang its front end and a vertical frame fixed to the outer end of the projecting frame-work to depend therefrom in front of the carriage, of parallel transverse rails secured to the uprights of the dependent vertical frame, a saw-frame mounted upon wheels running upon said rails, a motor supported upon said frame, and a circular saw fixed upon a vertical shaft rotating in bearings in said saw-frame and geared to the motor, substantially in the manner and for the purpose herein set forth.

5. The combination, in a pile-cutting machine with a carriage having a frame-work thereon made to project and overhang its front end and a vertical frame fixed to the outer end of the projecting frame-work to depend therefrom in front of the carriage, of parallel transverse rails secured to the uprights of the dependent vertical frame, a saw-frame mounted upon wheels running upon said rails, a saw carried thereby, a vertical actuating-shaft rotating in bearings in said frame, and worm-gear interposed between each end of said shaft and one of the wheels on each rail, substantially in the manner and for the purpose herein set forth.

6. The combination, in a pile-cutting machine, of a carriage, a frame-work mounted thereon to project and overhang its front end, a fixed frame depending vertically from said frame-work in front of the carriage, a movable saw-frame mounted upon said fixed frame, racks fitted to the uprights of said movable saw-frame, a swinging frame pivoted to the frame-work in front of the racks, pinions upon an actuating-shaft mounted in said swinging frame to engage the racks, levers interposed between the swinging frame and the frame-work to form a toggle, and a lever coupled to the toggle to move it and thereby actuate the swinging frame to throw the pinion into and out of gear, substantially in the manner and for the purpose herein set forth.

7. The combination, in a pile-cutting machine with the carriage and the saw carried thereby, substantially in manner as described, of the driving-axle and wheels under the carriage, the vertical shaft rotating in bearings on the carriage and fitted with a hand-wheel, and the worm-gear coupling the shaft to said axle and wheels to facilitate the movement of the carriage and the feed of the saw, substantially in the manner and for the purpose herein set forth.

409,343. CAR-COUPLING. JAMES ALLEN and EDMOND HACKETT, Florence, Ala. Filed Apr. 23, 1889. Serial No. 308,290. (No model.)

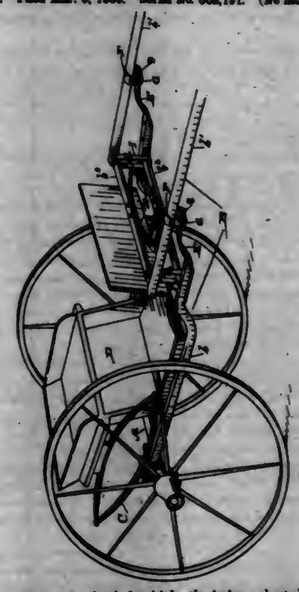


Claim.—1. The bell-mouth draw-head consisting of the two sections B C, having shoulders *b*, and the shanks *a*, hinged at their rear ends, as shown, in combination with the central bar D, having shoulders *d*, and pin *f*, and the spiral springs *h i*, encircling the pin, and the flat springs F, connected at one end to the beams E and their free ends bearing against the shanks *a*, substantially as and for the purpose set forth.

2. The sectional draw-head composed of the sections B C, hinged shanks *a*, and the central bar D, pin *f*, and springs *h i*, and the springs F, in combination with the spring-brace J for supporting the draw-head, having shoulders *u* at its ends and loosely supported in hangers or loops *t*, whereby it is enabled to have a longitudinal play when the draw-head presses upon it, substantially as and for the purpose specified.

3. The sectional draw-head constructed substantially as shown, and having its shanks *a* hinged to a central bar D, which terminates in a pin *f*, in combination with the springs *h i*, and the springs F, and the spring-brace J, rod *o*, chains *m n*, connected thereto and to the draw-head sections, said rod having a hand-wheel at its upper end and a crank at its lower end, substantially as and for the purpose set forth.

409,344. SPARK-ARRESTER. JOSHUA B. BARNES, Springfield, Ill. Filed July 8, 1889. Serial No. 316,852. (No model.)

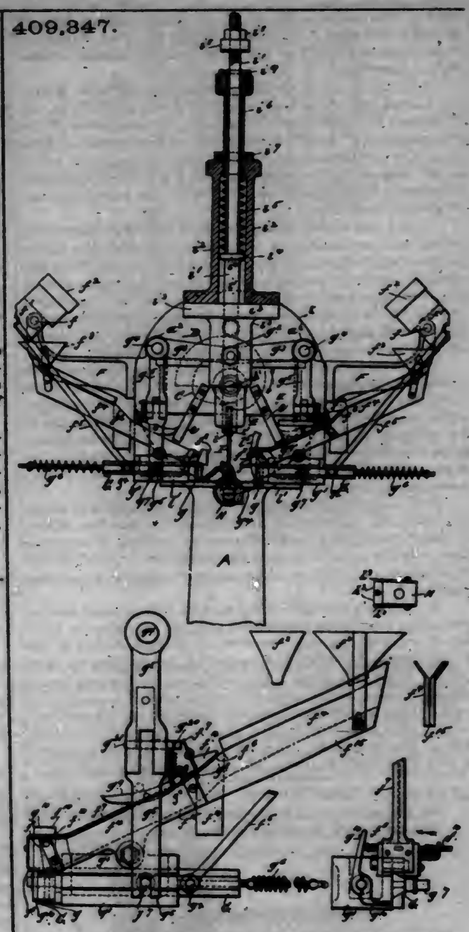


Claim.—In a smoke box of a locomotive or other boiler provided with one or more blast or exhaust pipes, a baffling-plate C, and a transverse partition F, the combination, with said parts, of a screen S, the rear and lower part thereof encircling the exhaust-pipes and located horizontally in the lower part of the smoke-box near the lower edge of the baffling-plate and secured thereto, the forward part being turned upward a little way rearward of the partition F at an inclination nearly coincident therewith, a curved deflector D, secured to the upper part of the smoke-box and joined to the upper edge of the screen S, and a petticoat-pipe reaching down from a little below the base of the smoke-stack to a plane a little above the exhaust-nozzles, the latter projecting vertically through the central portion of the horizontal part of the screen, all of said parts constructed and positionally located with reference to each other for co-operative effect, substantially in the manner and for the purpose herein set forth.

409,345. PROCESS OF PRINTING PYROXYLINE COMPOUNDS. CHARLES F. BRADY, Brooklyn, N. Y. Filed Apr. 26, 1888. Serial No. 271,962. (No model.)

Claim.—1. The above-described process of imprinting pyroxyline compounds with indelible pigments or colors, consisting in first applying the pigment or coloring-matter to the sheets of such compounds by pressure and subsequently subjecting them to the direct action of steam in a suitable chamber to render the colors or effects indelible.

2. The above-described process of imprinting pyroxyline compounds with indelible pigments or colors, which consists in first applying the pigments or colors to the sheets of such compounds by pressure, subsequently subjecting them to the direct action of steam in a suitable chamber to render the colors or effects indelible, and afterward smoothing the sheets by calendering or other well-known means, substantially as set forth.



409,346. TWO-WHEELED VEHICLE. RAMON A. BRIGHAM, Gilroy, Cal. Filed Mar. 6, 1889. Serial No. 302,191. (No model.)

Claim.—In a two-wheeled vehicle, the independent shaft-sections *b* and *b'*, in combination with the shaft-irons E, bolted to the forward ends of the rear shaft-sections and having the hook upon their forward ends, the clips seated upon the forward shaft-sections near their rear ends, and having cross-bolts upon which the hooks of the rear shaft-section irons are hung, whereby a hinged connection is formed between the two sections of the shafts, the independent cross-bars extending between the forward ends of the rear sections and between the rear ends of the forward sections, one above the other, and the elliptic spring H between the two cross-bars and clipped to each, substantially as described.

409,347. MACHINES FOR RIVETING BOOTS OR SHOES. THOMAS BEDDOE, Leeds, County of York, assignor of one-half to George Lister Hemingway, Leeds, England. Filed Feb. 12, 1889. Serial No. 299,793. (No model.) Patented in England Oct. 4, 1887, No. 13,260.

409,347.

Claim.—1. A boot or shoe riveting machine comprising a standard, a horizontal shaft carrying at one end a friction clutch and at the other two cams, the setting-tool, a cylinder containing an adjustable spring and piston, the setting-tool, two oscillating boxes arranged one on each side of the setting-tool over fixed inclined chutes, said chutes delivering the rivets into reciprocating slides, a spring die-box, a feed-wheel and tappet arrangement, and an adjustable jack for supporting the work during the riveting operation, but allowing it to be raised, lowered, or moved in any required direction, substantially as described.

2. In a boot or shoe riveting machine, the combination of framing A, shaft A', cam D, setting-tool I, nipple i', cylinder i^2, barrel i^3, piston i^4, spring i^5, adjusting-screw i^6, nut i^7, lock-nuts i^8, india-rubber packing i^9, with a driving-pulley B keyed on said shaft, and friction-clutch *b*, substantially as herein described.

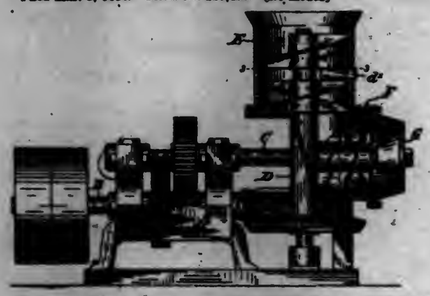
3. In a boot and shoe riveting machine, the combination of the setting-tool I and mechanism, substantially as herein described, for raising and imparting the required pressure to said tool for driving in the rivets, with the pulley B, having a notch in its rim, friction-clutch *b*, bifurcated lever b', rod b^2, arm b^3, lever b^4, and weighted treadle b^5, pivoted to frame A, whereby the setting-tool may be brought into action and its motion arrested, substantially as described.

4. In a boot or shoe riveting machine, the combination of framing A, shaft A', setting-tool I, with the duplicate mechanism, substantially as described, for supplying rivets to said setting-tool, arranged one set on each side of the setting-tool, each consisting of an oscillating box, hopper, chute, slide G, and mechanism for actuating the same, substantially as specified.

5. In a boot or shoe riveting machine, the combination of oscillating box f^3, pivoted to arm F, hopper f^2, chute f^4, slide G, spring g^4,

block g', with spring-pins f^{10} and f^{11}, and double-ended cam-lever g^{16}, pivoted to said block g' and actuated by said slide G for allowing one rivet to pass at a time from said chute into the feed-slide, substantially as described.

6. In a boot or shoe riveting machine, the combination of framing A, brackets F, oscillating boxes f^3, pivoted to said brackets; rods f^8, hoppers f^9, inclined chute f^4, cover f^7, incline projection f^{12}, box f^{13}, spring-pins f^{10} and f^{11}, double-ended cam-lever g^{16}, slide G, block g', spring g^6, jointed levers g^2, shafts g^4, levers g^5, runners g^8, cam C, pin g^{17}, shaft A', driving-pulley B, friction-clutch b, and mechanism, substantially as specified, for throwing the friction-pulley in and out of gear, all as set forth.



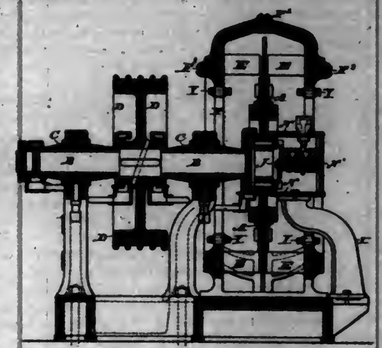
7. In a boot or shoe riveting machine, the combination of the setting-tool I, and mechanism, substantially as specified, for actuating the same, oscillating boxes f^3, brackets F, rods f^8, hoppers f^9, inclined chutes f^4, covers f^7, spring-pins f^{10} and f^{11}, and mechanism, as specified, for actuating said block g', slides G, and mechanism, substantially as described, for reciprocating same, with feeder E, incline e, double-ended cam g^{16}, jointed lever g^2, spring g^{20}, pin g^{21}, and spring g^6, whereby the rivets are propelled forward, substantially as described.

8. In a boot or shoe riveting machine, the combination of the framing A, setting-tool I, mechanism, as specified, for actuating the same, slide G, and mechanism, substantially as described, for reciprocating same and for supplying the rivets thereto, die-box H, dies h^3, flat springs h^5, plate i', pipes g^{12}, with feed-wheel L, shaft l, ratchet-wheel l^3, pawl l^2, bell-crank lever l^4, tappet-lever l^5, cam D, and mechanism, as described, for actuating the same, spring l^5, and adjusting-screw, as and for the purposes set forth.

9. In a boot or shoe riveting machine, the combination of the setting tool I, and mechanism for operating same, as described, die-box H, dies h^3, feed-wheel L, and mechanism, as described, for operating same, with the runner n, plate N, adjusting-screw n', nut n^3, bracket M, set-screws m m', cam-lever m^2, and spring m^3, as and for the purposes specified.

10. In a boot and shoe riveting machine, the combination of the setting-tool I, and mechanism, as described, for operating the same, slide G, and rivet-supplying mechanism, as specified, die-box H, dies h^3, feed-wheel L, and mechanism, as specified, for operating the same, plate N, armed with runner n, and mechanism, as described, for adjusting the same, with the means for supporting and presenting the work to the action of the setting-tool, comprising the adjustable pillars J J', slide j, block j', ball-joint j^3, connecting-rod j^2, pivoted to lever K, bifurcated bearing a^5, weighted lever K, pivoted to framing A, rack K', pawl K^3, and spring K^2, as and for purposes set forth.

409,848. **BRICK-MACHINE.** WILLIAM R. CUNNINGHAM, Frankfort, Ind., assignor to the Wallace Manufacturing Company, same place. Filed Mar. 3, 1887. Serial No. 229,699. (No model.)



Claim.—1. A clay-working machine comprising the casing provided with the forcing-screw and die, a hopper communicating with said casing, a revolving auger-blade gathering and forcing screw mounted in the top of said hopper, another gathering and forcing screw mounted beneath the first, and a stationary diagonally-set retarding-bar interposed between said gathering and forcing screws, substantially as set forth.

2. A clay-working machine comprising the casing, a shaft mounted therein carrying the forcing-screw, a tempering-blade mounted on said shaft behind said forcing-screw, a hopper communicating with said casing, a series of gathering and forcing screws mounted in said hopper, and a diagonally-set retarding-bar interposed between them, substantially as set forth.

3. A clay-working machine comprising the casing, the mechanism therein, the hopper communicating therewith, the shaft in said hopper, a single-winged screw mounted thereon at the top, a stationary diagonally-set retarding-bar mounted beneath said single-winged screw, and a double-winged screw mounted beneath said retarding-bar, all arranged and operating substantially as set forth.

4. In a clay-working machine, the combination of the casing, a series of screws arranged to receive the clay one from another successively, and a stationary retarding-bar diagonally set at an angle and interposed between said screws, whereby the clay is maintained in a solid mass, from which the next screw takes its supply by shaving therefrom, substantially as set forth.

409,849. **DYNAMO-ELECTRIC MACHINE.** SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Jan. 14, 1889. Serial No. 296,226. (No model.) Patented in England Jan. 15, 1887, No. 702.

Claim.—1. In a dynamo-electric machine, the combination of the sliding frame-sections moving at right angles to the armature-axis and carrying the field-magnets, and the extended foundation plate or bed upon which the frame-sections slide, substantially as set forth.

2. A dynamo-electrical machine in which the armature is at the end of an axle which has a driving-pulley fixed upon it, situated between two bearings in which the axle is supported, in combination with a collector carried concentrically with the armature by arms projecting from the armature, and rubbers or brushes bearing on the collector, substantially as set forth.

3. In a dynamo-electrical machine, the combination of a revolving armature and a circle of field-magnets on either side of it, each carried by a frame divided vertically into two sections which can be slid away from one another along the bed or foundation plate of the machine in a direction at right angles to the armature-axis.

4. In a dynamo-electrical machine, the combination of a revolving armature, a circle of field-magnets on either side of it, each carried by a frame divided vertically into two sections which can be slid away from one another along the bed or foundation plate of the machine at right angles to the armature-shaft, toothed racks on the foundation plate or bed, and a lever linked to the sections to engage with the racks and slide the sections along the bed.

5. In a dynamo-electrical machine, the combination of a revolving armature, a circle of field-magnets on either side of it, each carried by a frame divided vertically into two sections which can be slid away from one another, and spring contact-pieces on the sections, which, when the sections are brought together, complete an electrical circuit through the exciting-coils of all the magnets.

6. In a dynamo-electrical machine, a collector composed of a revolving ring from which current is to be led away, and a pair of rubbers, one pressed by a spring against the ring and both attached together by springs which draw them one toward the other and make them to bear against opposite sides of the ring.

7. In a dynamo-electrical machine, a collector composed of two rings or sets of rings side by side, but separated from one another, a conductor passing to each ring or set of rings, one conductor passing centrally through the other with a space between them, and arms extending from each conductor and secured to the side of the armature.

8. The combination, with the armature, of the concentric collector-conductors insulated from each other and connected with and carried by the armature by means of arms J' K', substantially as set forth.

9. In a dynamo-electric machine for producing currents of high tension, the combination, with the collector or like parts, (such, for instance, as switches or fuses,) of an inclosing box or casing and circuit connections and contacts controlled by the closing of the box to complete the field-magnet circuit, whereby said circuit is only completed when the box is closed.

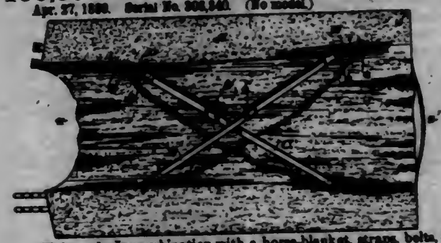
10. In a dynamo-electric machine for producing currents of high tension, the combination, with the collector or like parts, (such, for instance, as switches or fuses,) of an inclosing box or casing, circuit-connections controlled by the closing of the box to complete the field-magnet circuit, and electro-magnetic locking devices which lock the box when it is closed and the circuit thereby completed.

409,850. **SPOUTED CAN.** REUBEN F. DEFFEBACH, Cleveland, Ohio. Filed June 20, 1888. Serial No. 314,905. (No model.)

Claim.—1. The combination of the can having an open-top dome, the sealing-washer resting on the edge of said dome, the spout having an end flange resting on said washer, and the perforated top through which the spout passes, said top bearing directly on the flange of the spout, all in combination, substantially as described.

2. In an oil-can, the combination of an open-top dome, a nozzle having a flange resting on said dome, a sealing-disk bearing on the flange of the nozzle, a strengthening-disk above said sealing-disk, and a perforated cap engaging the dome and bearing on the strengthening-disk to press the same against the flange and hold the same tightly to the dome, substantially as described.

409,851. **INKSTAND.** GEORGE A. FIELDS, Dubuque, Iowa. Filed June 10, 1889. Serial No. 313,903. (No model.)

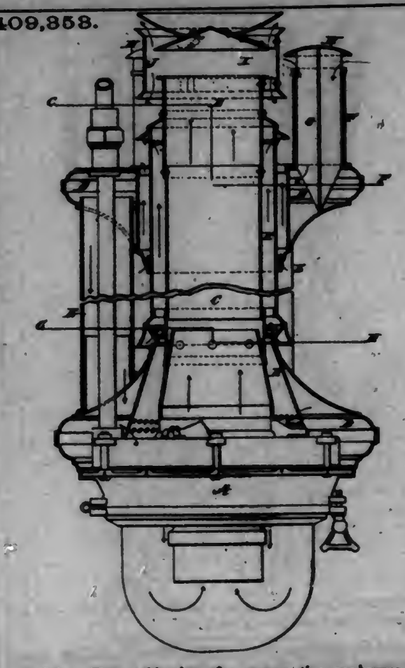


Claim.—1. In an inkstand, the combination, with an ink-receptacle, of a shield or casing pivoted with relation thereto and each having a coincident opening therein, said ink-receptacle or said shield being movable, substantially as herein set forth.

2. In an inkstand, the combination, with an ink-receptacle, of a shield or casing pivoted with relation thereto and each having a coincident opening therein, and a pen-rack e e, secured to the movable portion of said pen-holder, substantially as described.

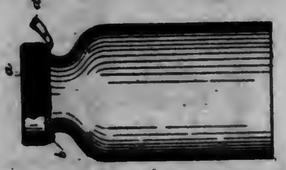
3. In an inkstand, the combination, with an ink-receptacle, of a shield or casing pivoted with relation thereto and each having a coincident opening therein, and a pen-rack e e and counterbalancing-weight g, or its equivalent, secured to the movable part of said inkstand, substantially as set forth.

409,852. **HORSE-BLANKET.** JOHN B. FOSTER, Ferndale, Cal. Filed Apr. 27, 1888. Serial No. 308,340. (No model.)



Claim.—1. In combination with a horse-blanket, straps, belts, or bands secured by one end to the under side and near the opposite ends of the blanket and crossing each other near the center of the blanket, said straps having connecting devices on their other ends, and the plates secured to the outer side of the blanket and with which the connecting devices of the straps engage, substantially as described.

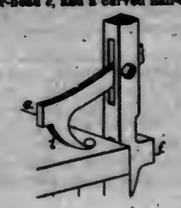
2. In combination with a horse-blanket, straps, belts, or bands secured at one end thereto on the same side of the longitudinal central line of the blanket, one near the neck portion and the other near the tail portion of said blanket, said straps crossing each other near the center of the blanket, and fastening devices secured to the blanket, with which the other ends of the straps engage, and arranged both on the other side of the longitudinal center of the blanket, one near the neck portion and the other near the tail portion of said blanket, substantially as described.



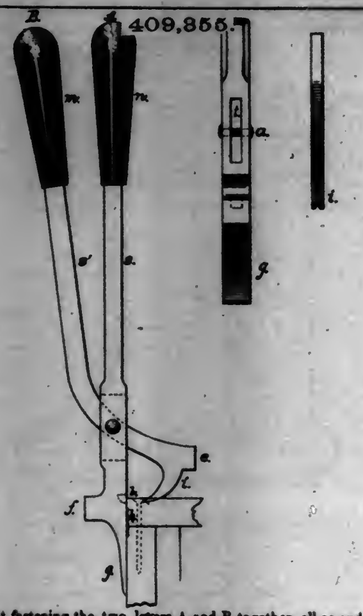
409,853. **LAMP.** THOMAS GORDON, Philadelphia, Pa. Original application filed Sept. 3, 1887, Serial No. 249,511. Divided and this application filed Jan. 25, 1888. Serial No. 261,912. (No model.)

409,853.

Claim.—The combination of a regenerative gas-burner, an approximately air-tight chamber surrounding the burner, air-tubes leading upward from said chamber, an equalizing air-chamber surrounding the escape-flue of the burner, into which said air-tubes open through its lower surface, air-tubes opening into said equalizing-chamber through its upper surface and extending upward, division-plates extending downward within said upper air-tubes, and horizontal plates located some distance above the ends of said tubes, substantially as shown and described.



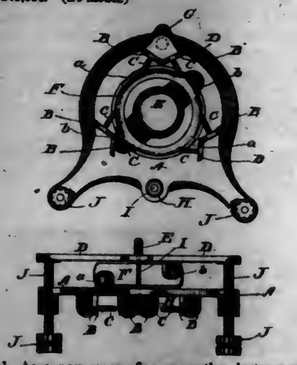
409,854. **SELF-ADJUSTING COVER FOR VESSELS.** SARAH F. GREEN, Brooklyn, New York. Filed Feb. 21, 1889. Serial No. 300,709. (No model.)



Claim.—The combination, substantially as shown and described, consisting of the gauze a, elastic cord b, and loop or lifter d, the whole forming a complete device.

409,855. **COMBINED NAIL-EXTRACTOR AND BOX-OPENER.** DAYTON C. HAWKINS, Terre Haute, Ind., assignor to Richard W. Ripster, same place. Filed Feb. 4, 1889. Serial No. 298,980. (No model.)

Claim.—The combination of the lever A, consisting of a handle n, a shank o, a hammer-head f, and a chisel-blade g, said chisel-blade having upon its back side the incision or notch b, also the roughened surface h, with the lever B, said lever B consisting of a handle m, a shank s', a hammer-head c, and a curved nail-claw i, and the pivot a, substantially as and for the purpose set forth.

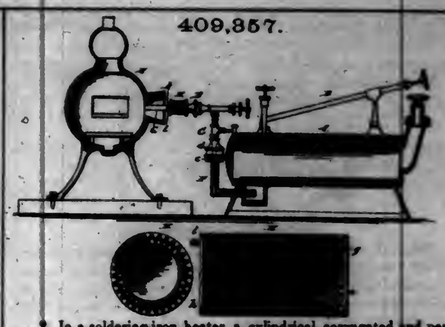


409,355.

said pivot fastening the two levers A and B together, all as and for the purpose herein described and specified.

409,356. LEVELING ATTACHMENT FOR TRIPOD-HEADS. HENRY A. HOUSE and HENRY A. HOUSE, Jr., Bridgeport, Conn. Filed June 4, 1888. Serial No. 275,988. (No model.)

Claim.—1. As a new means for supporting instruments on tripods and the like, the combination, with the platform which supports the camera and the head for the tripod, of a ring interposed between said platform and head and pivoted thereto in axial lines which are at right angles to each other, substantially as set forth.



2. The combination, with the head and platform pivoted to an intermediate ring in axial lines which are at right angles to each other, of a spring adapted to normally depress the platform at one side and two leveling-screws adapted to rock said platform against the resiliency of said spring, as and for the purposes set forth.

3. The combination, with the head and platform pivoted to an intermediate ring in axial lines which are at right angles to each other, of a spring adapted to normally tilt said platform and two leveling-screws adapted to operate said platform on opposite sides of the direct line of action of said spring, substantially as and for the purposes hereinbefore described.

409,357. SOLDERING-IRON HEATER. JOHN S. HULL, Baltimore, Md. Filed Mar. 22, 1889. Serial No. 304,251. (No model.)

Claim.—1. In a soldering-iron heater, the combination of a reservoir, a well at one end of and communicating with the reservoir and having an internal screw-thread at its upper end, a supply-tube externally screw-threaded and extending into the well, a gland and a suitable packing, and a burner, substantially as described.

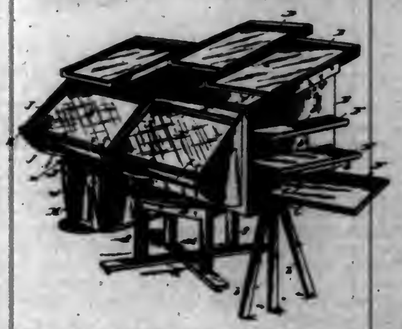
409,357.

2. In a soldering-iron heater, a cylindrical corrugated and perforated shield or guard, in combination with a perforated retort-tube, the shield being secured to the tube around the perforations, substantially as described.

3. In a soldering-iron heater, a corrugated shield or guard provided with perforations in the angular walls of the corrugations and arranged to cross the currents of air, in combination with a perforated retort-tube, substantially as described.

4. In a soldering-iron heater, a perforated retort-tube, in combination with a detachable corrugated sheet-metal shield or guard having perforations in its angular walls and secured to the tube around the perforations, substantially as described.

409,358. TINNER'S FIRE-POT. JOHN S. HULL, Baltimore, Md. Filed Mar. 22, 1889. Serial No. 304,252. (No model.)

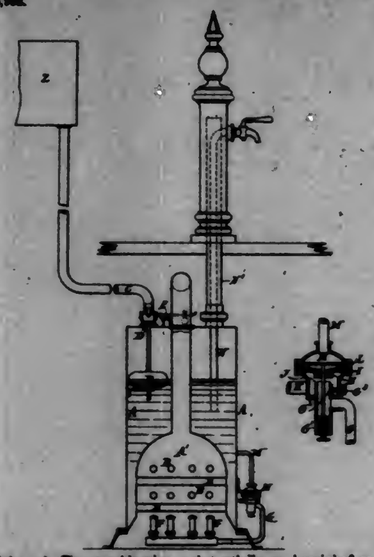


Claim.—1. A tinner's fire-pot having a bearing-bar to support and direct a soldering-iron, in combination with a slab or body of non-combustible material constructed to prevent the point of the soldering-iron from penetrating the slab and being projected against the metallic surface of the pot, substantially as described.

2. A tinner's fire-pot having a bearing-bar to support and direct a soldering-iron, and provided with an extension on its rear side, in combination with a slab of soapstone or its described equivalent constructed to prevent the point of the soldering-iron from penetrating the slab and being projected against the metallic surface of the pot, substantially as described.

3. A tinner's fire-pot provided with a bar or support I and an extension F, having a slot in the upper side thereof, in combination with a shield C, insertible and removable through said slot, substantially as described.

409,359. DRIER. JOHN R. JOHNSON, Newton, Ill. Filed Feb. 20, 1889. Serial No. 300,535. (No model.)



Claim.—1. The combination, in a drier, of the hinged sash E and the reflector connected with the said sash and movable therewith, substantially as and for the purpose described.

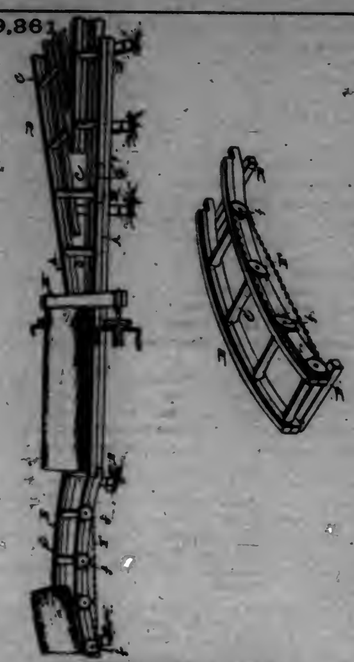
2. The combination, in a drier, of the hinged sash E and the reflectors loosely connected with the said sash and movable therewith, substantially as described, for the purpose specified.

3. The combination, in a drier, of the hinged sash E, the reflector connected to and movable with the said sash, and the sections J, substantially as and for the purpose set forth.

4. The herein shown and described drier, having its top closed by sliding sashes and having its front closed by sashes that are hinged at their upper edges, and having openings in its ends, the openings in one end corresponding and coinciding with the openings in the other end, the rails extending from one end of the drier to the other end, the trays having perforated bottoms and adapted to be inserted through the said openings, the doors for closing the openings, the reflectors loosely connected to the lower ends of the said hinged sashes, the sections J, the stand having the body of the drier mounted thereon and connected therewith by a bolt, and the double-walled furnace suspended from one end of the drier, substantially as described, for the purpose specified.

409,360. APPARATUS FOR MAINTAINING A SUPPLY OF BOILING WATER OR STEAM, OR BOTH. CHARLES JONES, Woodford, assignor to James Childs, London, England. Filed Apr. 22, 1889. Serial No. 308,086. (No model.) Patented in England Oct. 31, 1884, No. 13,902.

Claim.—1. The combination, substantially as hereinbefore set forth, of the boiler, a heater below the boiler, the automatic regulator for controlling the heat, the water-supply cistern at a higher level than the boiler, a pipe connecting the boiler with the cistern, a float-valve controlling the supply of water to the boiler from the cistern, a supply-pipe extending from the boiler and provided with a draw-off cock, and a steam-jacket for said pipe.



2. The combination, substantially as hereinbefore set forth, of the closed gas-heated boiler, means for automatically regulating the heat, the pipe N, extending into the boiler and having a draw-off cock at its upper end, and a pipe of larger diameter than the pipe N surrounding said pipe and connected with the boiler to form a steam-jacket for the pipe to keep the water in the pipe at a high temperature.

409,361. LOG-CONVEYER. EVAN S. JONES, Sylvester, Dak. Filed Apr. 11, 1889. Serial No. 306,763. (No model.)

Claim.—1. In a log conveyor or tramway, the combination of the double-inclined rail-section E, the concaved rollers journaled between the rails and having their journals extended, the sprocket-wheels on the said journals, and the sprocket-chain connecting the said wheels, whereby the load descending on the said section will assist the load up on the rising incline, substantially as described.

2. The herein shown and described log-conveyor, comprising the rails A, mounted on the ties B, the concaved rollers journaled between the rails, the section G, for holding the journal in place, being pivoted at one end and fastened at its opposite end, and the double-inclined section having the journals of its rollers extended and geared together, whereby the descending load will assist the ascending load, substantially as hereinbefore specified.

409,362. VEHICLE-AXLE. JACOB G. KESTER, Fort Kearney, Cal. Filed Dec. 26, 1888. Serial No. 294,982. (No model.)

Claim.—1. In a vehicle the wheel and the axle secured thereto so that both rotate together, in combination with cushions in the wheel-hub for affording the wheel a slight play on the axle, substantially as herein described.

2. In a vehicle, the axle and the wheel having a hub through which the axle freely passes, in combination with cushions between the wheel-hub and axle, securing them to each other so that both

rotate together and the wheel may have a play on its axle, substantially as herein described.

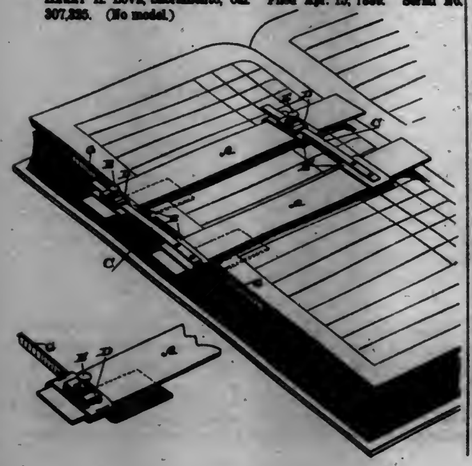
3. In a vehicle, the square-ended axle and the wheel having a hub through which the axle end passes freely, in combination with the square cushions C and D, seated in square sockets in the ends of the hub and squared upon the axle end, substantially as herein described.

4. In a vehicle, the square-ended axle and the wheel having a hub through which the axle end passes freely, said hub having square sockets in its ends, in combination with the cushions C and D in said sockets and squared on the axle end, the fixed collar on the axle bearing against the inner cushion D, and the nut on the outer end of the axle bearing against the outer cushion C, substantially as herein described.

5. In a vehicle, the opposing wheels A A', and the independent axles B B', in combination with the cushions C and D in the wheel-hubs securing the axles to the wheels, so that each wheel and its axle rotate together, and a common bearing for receiving and supporting the independent axles between the wheels, substantially as herein described.

6. In a vehicle, the independent axles B B', each having a wheel secured to it so that wheel and axle rotate together, in combination with the box G, confining the axles between the wheels and extending from hub to hub, a bearing at the middle of the box for the free ends of the axles, and a cushion or yielding bearing for the axles at each end of the box, substantially as herein described.

7. In a vehicle, the independent axles B B', each having a wheel secured to it so that wheel and axle rotate together, in combination with the box G, confining the axles between the wheels, a bearing at the middle of the box for the free ends of the axles, and a bearing for the axles at each end of the box, consisting of the gland-nut I, encircling the axle, and the cushion H, encircling the nut, substantially as herein described.



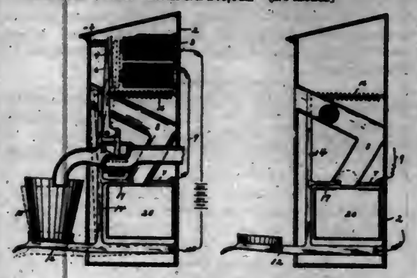
8. In a vehicle, the independent axles B B', each having a wheel secured to it so that wheel and axle rotate together, in combination with the box G, confining the axles between the wheels, a bearing at the middle of the box for the free ends of the axles, and a bearing for the axles at each end of the box, consisting of the gland-nut I, encircling the axle, the cushion H, encircling the nut, and the screw-cap J, of rubber, on the end of the nut and embracing the axle to prevent the entrance of dust to the journal, substantially as herein described.

9. In a vehicle, the independent axles B B', each having a wheel secured to it so that wheel and axle rotate together, in combination with the box G, confining the axles between the wheels and having a hinged side *g*, the cushion-bearings for the axles at the ends of the box, and the two-part bearing K at the middle of the box for the free ends of the axles, substantially as herein described.

10. In a vehicle, the wheels A A', the independent axles B B', the cushions C and D in the ends of the wheel-hubs, and the collar and nut on the axles bearing against the cushions, whereby wheel and axle are secured to each other and adapted to rotate together, in combination with the box G, confining the axles from hub to hub, the gland-nut I, cushion H, and screw-guard cap J in each end of the box forming bearings for the axles, and the bearing K at the center of the box for the free ends of the axles, substantially as herein described.

409,863. POSTING OR COPYING GUIDE FOR BOOK-KEEPERS.

HARRY H. LOVE, Sacramento, Cal. Filed Apr. 15, 1889. Serial No. 307,225. (No model.)



Claim.—1. The posting or copying guide consisting of the parallel opaque plates with the transverse rods extending between them, guides in which said rods slide so as to allow the plates to be moved with relation to each other, and set-screws whereby they are held at any given point, substantially as herein described.

2. The copying-guide consisting of the parallel opaque plates with the transverse adjusting-rods and set-screws and the hooks or guides fixed at one end of the plates, substantially as and for the purpose herein described.

409,864. AUTOMATIC ELECTRICAL FLUID-RELEASER.

RALPH S. MOLYNEUX, Minneapolis, Minn., assignor, by direct and mesne assignments, to the National Water Supply Company, of Minnesota. Filed June 4, 1888. Serial No. 276,041. (No model.)

Claim.—1. In a device of the class described, the combination, with a suitable magnet, of an armature operated by said magnet, a tube or pipe, a valve operated by said armature and intercepting said tube or pipe, a conduit for the reception of a coin, and contact-points in connection with the magnet and arranged to arrest the coin as it passes through the conduit and thereby to complete an electric circuit through said magnet, substantially as described.

2. In a device of the class described, the combination, with the magnet 3 and armature 4, of a lever 6, upon which said armature is located, a tube or pipe, a valve 18, connected with said lever and intercepting said tube or pipe, a conduit 8 for the reception of a coin, and contact-points arranged to hold the coin and complete an electric circuit to cause the operation of the valve and be released when said operation is completed, substantially as described.

3. In a device of the class described, the combination, with the electro-magnet and an armature, of a valve operated by said armature and the magnet, a conduit for the reception of a coin, a stationary contact-point, a pivoted support adapted to receive a suitable receptacle and to be turned upon its pivot when said receptacle has been filled by liquid passing through said valve, and a movable contact-point carried by said support, substantially as described.

4. In a device of the class described, the combination, with an electro-magnet and an armature, a lever 6, connecting said armature with a valve, said valve operated by said armature and the magnet, a lever 6, connected with said valve, a conduit 8 for the reception of a coin, a stationary contact-point 7, a pivoted support 12 for the reception of the material delivered from the valve, and the contact-point 17, secured to and operated by the pivoted support 12 to hold the coin and complete an electric circuit through the magnet until the weight of the material delivered by the valve shall be sufficient to release the coin and break the circuit, substantially as described.

5. In a device of the class described, the combination of a tube or pipe, a suitable valve intercepting said tube or pipe and controlling the passage of material, an electro-magnet arranged to operate said valve, a conduit adapted to receive a coin, and an electric circuit completed by a coin in said conduit, substantially as described.

6. In a coin-operated liquid-releasing device, the combination, with a valve for controlling the flow of the liquid, of a coin-conduit, mechanism to be acted on by a coin to open the valve, and a coin-releaser actuated on the delivery of a certain quantity of liquid to permit said valve to be closed to cut off the flow of the liquid, substantially as and for the purposes set forth.

7. The combination, in a coin-operated liquid-releasing device, of a valve for controlling the flow of the liquid, a coin-conduit, mechanism to be operated on the introduction of a coin to open the valve, a coin-releaser, and a support connected with said releaser and adapted to receive a receptacle and be moved by the gravity of the liquid delivered to the receptacle, whereby said valve is opened on the introduction of a coin and automatically closed on the delivery of a certain quantity of the liquid, substantially as and for the purposes set forth.

8. In a coin-operated liquid-releasing device, the combination of a valve for controlling the flow of the liquid, a coin-conduit, mechanism to be operated on the introduction of a coin to open the valve, and means, actuated by the gravity of the liquid delivered, for automatically closing said valve, substantially as and for the purposes set forth.

409,865. GAS-BATTERY.

LEWIS MOND, Northwich, County of Chester, and CARL LANGER, London, County of Middlesex, England. Filed Nov. 26, 1888. Serial No. 292,116. (No model.) Patented in England Feb. 17, 1888, No. 2,411; in France Oct. 6, 1888, No. 192,248; in Italy Oct. 13, 1888, XXII, 20,948, XLVII, 295; in Luxemburg Nov. 26, 1888, No. 1,066; in Turkey Nov. 26, 1888, No. 130; in Belgium Dec. 15, 1888, No. 84,102; in New South Wales Jan. 2, 1889, No. 1,132; in Brazil Feb. 1, 1889, No. 605, and in Spain Feb. 12, 1889, No. 8,265.

Claim.—1. In a gas-battery, a solid porous non-conducting substance impregnated with an electrolyte liquid at or near ordinary temperatures, and covered on each side with one or more substances capable of absorbing the gases employed and exposed on the one side to the one gas and on the other to the other gas used.

2. In a gas-battery, a solid porous non-conducting material impregnated with an electrolyte liquid at or near ordinary temperatures, and coated on each side by a conducting material capable of absorbing gases in its pores, such as described.

3. In a gas-battery, the combination of a solid porous non-conducting material impregnated with an electrolyte liquid at or near ordinary temperatures, with a porous conducting material covering the same, and a gas-absorbing material covering or impregnating the said porous conducting material, substantially as described.

4. In a gas-battery, in combination with a solid porous non-conducting substance impregnated with an electrolyte liquid at or near ordinary temperatures, and covered on each side with gas-absorbing material, a porous metallic conducting material in contact with or permeating the gas-absorbing material on each side and connected with the poles of the battery.

5. In a gas-battery, the combination of a porous non-conducting substance, a liquid electrolyte impregnating the same, a gas-absorbing coating on each side of said porous substance, with a good conductor of electricity on each side in the form of thin metallic foil, gauze or perforated plates permeable to the gases employed and in frequent contact with the absorbent coating over its whole surface, whereby the electricity is taken and conducted away from numerous points at small distance from each other, and thus the internal resistance is reduced and the work done by the battery is increased.

6. In a gas-battery, the combination of a non-conducting porous plate impregnated with an electrolyte, with a coating on each side of it of conducting and gas-absorbing material, such coatings being insulated from each other but connected with opposite poles of the battery, and an electro-negative gas bathing one side of the coating and an electro-positive gas the other side of the coating.

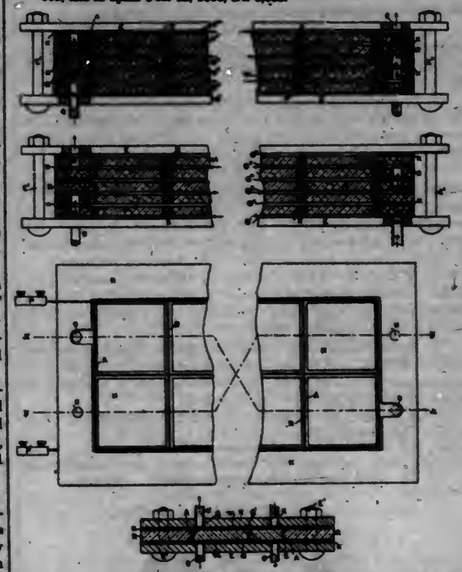
7. A gas-battery formed of porous non-conducting plates impregnated with an electrolyte coated on each side with conducting and gas-absorbing matter, the sides being insulated from each other and connected with opposite poles, and of chambers between the plates, each alternate chamber being filled with an electro-negative gas and the others with an electro-positive one.

8. In a gas-battery, in combination with a porous non-conducting plate impregnated with liquid electrolyte having two gas-absorbing electrically-conducting layers, one on each side of the porous plate, a conductor connected with one of the poles of the battery fixed on each side of the porous plate and electrically connected with the absorbing conducting layer nearly or quite all round.

9. In a battery having as its electrolyte a liquid permeating and absorbed by a porous non-conducting solid material, the combination of the said electrolyte with a coating on each side of gas-absorbing materials, a gas-chamber on each side of the said electrolyte supplied, respectively, each with one of the gases used.

10. The combination of the insulating-plates R, conductors A, embedded therein, and non-conducting panels M, impregnated with an electrolytic liquid and covered on each side with gas-absorbing and conducting material, said material on each side being in electrical contact with the conductor A on that side.

11. As an element of a gas-battery, the combination of a non-conducting frame R, porous non-conducting plates M, permeated by a liquid electrolyte and coated on each side by a gas-absorbing and conducting layer insulated from the layer on the other side, conductors A, respectively, all round the plates on each side and each connected with one pole, each in electrical contact with the conducting-layers on its own side, and said layers being exposed one to an electro-negative and the other to an electro-positive gas.



12. In a battery, a series of non-conducting frames R, non-conducting-plates M, impregnated with an electrolytic liquid, and having a conducting gas-absorbing layer on each side, conductors A on each side, each connected with its respective pole and with the absorbing conducting-layer on its own side, poles P P', positive gas-passages O and positive gas-spaces G^2 G^4 G^6, negative gas-passages H and negative gas-spaces G' G^3 G^5, outside inclosing-case E, and distance-pieces K, forming with frames R said gas-chambers G' G^6, all combined substantially as described.

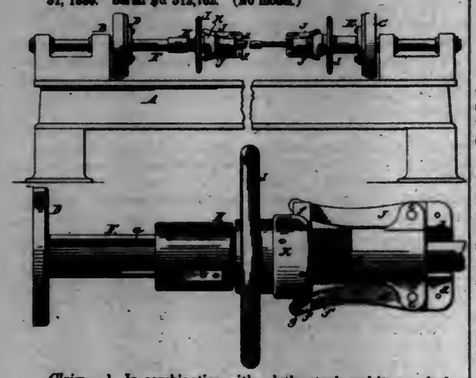
13. A battery composed of a series of porous plates M, permeated with an electrolyte liquid at or near ordinary temperatures and coated on each side with a gas-absorbing and conducting layer, the layers facing one way being insulated from the layers facing the other way, and a series of spaces between the plates, one alternate set of which is exposed to an electro-negative gas and the other to an electro-positive one.

14. In a gas-battery, the combination of a series of frames R, carrying the porous non-conducting plates M, impregnated with an electrolytic liquid, two alternating series of chambers between them, G' G^3, &c., and G^2 G^4, &c., passages Q, plaster ends V, and the outer frame-work Z'-Z^3, &c., permeated only by the gas-passages O H, substantially as described.

409,866. PROCESS OF OBTAINING ELECTRICITY FROM GAS-BATTERIES.

LEWIS MOND, Northwich, County of Chester, and CARL LANGER, London, County of Middlesex, England. Filed Mar. 15, 1889. Serial No. 303,743. (No model.) Patented in England Feb. 17, 1888, No. 2,411; in France Oct. 6, 1888, No. 192,248; in Italy Oct. 13, 1888, XXII, 20,948, XLVII, 295; in Luxemburg Nov. 26, 1888, No. 1,066; in Turkey Nov. 26, 1888, No. 130; in Belgium Dec. 15, 1888, No. 84,102; in New South Wales Jan. 2, 1889, No. 1,132; in Brazil Feb. 1, 1889, No. 605, and in Spain Feb. 12, 1889, No. 8,265.

Claim.—1. The process of obtaining electricity by means of two gases—such as oxygen and hydrogen—which consists in causing said gases to each come in contact at or near ordinary temperatures with a layer of gas-absorbing material itself in contact with the electrolyte, the two layers of gas-absorbing materials being each insulated from the other of them and each of them connected with one of the poles of the battery, the two gases being interchanged periodically, substantially as described.



2. The process of obtaining electricity by means of a gas-battery, which consists in passing at or about ordinary atmospheric temperature combustible gas and air, respectively, over opposite sides of an electrolyte in contact on both sides with gas-absorbing materials, and collecting the electricity at innumerable points on each side, respectively, by conducting matter connected with opposite poles of the battery.

3. The improvements in the process of obtaining electricity by means of a gas-battery, which consists in passing such a quantity of air or dry gas through the apparatus as to carry off the water or other easily-evaporated liquid formed by the action of the battery.

4. The improvement in the process of obtaining electricity, as described, which consists in periodically interchanging the air and combustible gas so that each shall occupy the position previously occu-

pied by the other, whereby the working-power of the electrolyte is restored and local action or polarization in great part prevented, substantially as described.

409,367. WORK-HOLDER. WALTER J. MUSGANTER, Cumberland, Md., assignor of one-half to Merwin McKaig, same place. Filed May 31, 1889. Serial No. 312,762. (No model.)

Claim.—1. In combination with a lathe-stock and its mandrel, a chuck or work-holder adjustable longitudinally with reference thereto.

2. In combination with a lathe-stock and with a mandrel thereof projecting beyond the stock, a chuck or work-holder mounted and arranged to be moved longitudinally upon said mandrel to and from the work.

3. In combination with a lathe-stock and a mandrel thereof projecting beyond said stock, a center spindle or point carried by the mandrel and a chuck or work-holder movable upon said spindle to cover or uncover the point or spindle and the end of the work.

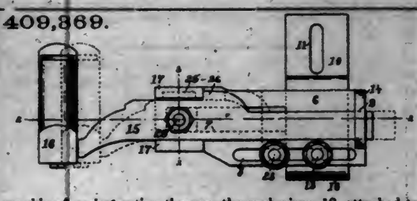
4. In combination with a lathe-mandrel, a shell or casing arranged to slide longitudinally thereon, but to rotate therewith, levers carried by said shell and provided with clamping-jaws, a collar arranged to move longitudinally upon said shell and to actuate said levers, and a nut screwing upon the shell and serving to move the collar relatively to the levers, substantially as described and shown.

5. In combination with a lathe-stock, the herein-described work-holder or chuck consisting of arbor F, shell H, wheel or nut I, threaded upon the shell, levers *j*, having clamping-jaws, and collar K, having a swivel-connection with nut I.

6. In combination with arbor F, longitudinally-adjustable shell H, nut I, collar K, and levers J, all constructed and arranged to operate substantially as set forth, and detachable jaws L, applied to the levers, substantially as shown and described.

7. In combination with arbor F, movable shell H, nut I, and levers J, and central spindle G, carried by the arbor F.

409,368. GLASS-MELTING POT. ASA G. NEVILLE, Lascarville, W. Va. Filed Nov. 23, 1888. Serial No. 292,063. (No model.)

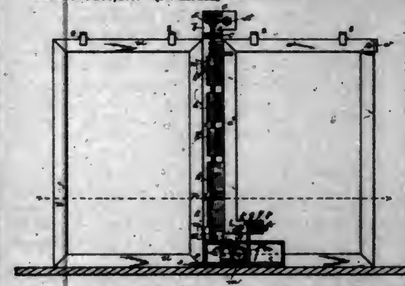


Claim.—The herein shown and described glass-melting pot, having a glory-hole, a flame-opening, an air-passage communicating with the flame-opening, and a hot-air-blast passage communicating with the crown of the pot at different points and having a series of escape-flues communicating with the pot at different levels and on the side thereof opposite the flame-opening, substantially as described.

409,369. LOOM-TEMPLE. JOSHUA B. NEWELL, Georgiaville, R. I. Filed July 19, 1887. Serial No. 244,704. (No model.)

Claim.—1. The combination, as hereinbefore set forth, with the bed-plate 6, provided with the slot 7, of the support-bar 15, provided with the grip-roller mechanism and mounted upon the bed-plate and

409,369.

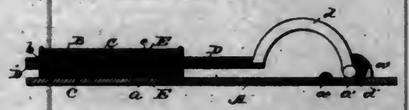


capable of reciprocating thereon, the push-piece 18, attached to the support-bar, the spring 20, engaging the push-piece, and the holder 22, mounted upon the bed-plate and having means for adjustment, substantially as and for the purpose herein described.

2. The combination, as hereinbefore set forth, with the bed-plate 6, provided with the slot 7 and the opening 8, of the support-bar 15, provided with the grip-roller mechanism and mounted on the bed-plate and capable of reciprocating thereon, the depending push-piece 18, attached to the support-bar and provided with the boss 19, the spring 20, engaging the boss, and the holder 22, having the cavity 21 and adjustably secured to the bed-plate by means of the bolt 23, substantially as and for the purpose herein described.

3. The combination, as hereinbefore set forth, with the bed-plate 6, provided with the slot 7 and the opening 8 and formed with the guiding projections 17, and the upright extension 14, having the guide-eye 9, of the reciprocating support-bar 15, provided with the grip-roller mechanism and mounted upon the bed-plate, the depending spring-actuated push-piece, the securing-plate 10, and the clamping-bolt 13, attached to plate 10 and extending through the opening 8, substantially as and for the purpose herein described.

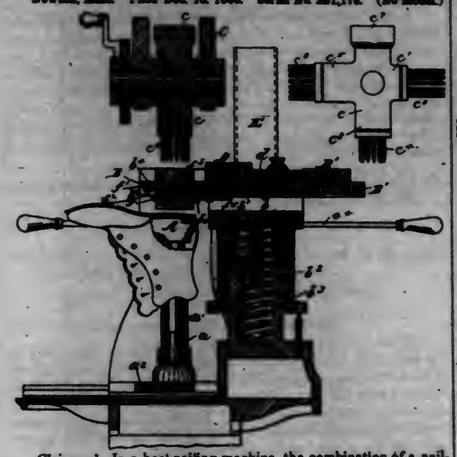
409,370. LEAF-TURNER. THOMAS J. PARKINSON, Pittsburg, Pa., assignor of one-fourth to J. B. Hyndman, same place. Filed Jan. 16, 1889. Serial No. 296,473. (No model.)



Claim.—1. In a leaf-turner, the combination, with the leaf-holders, of the key *h*, the bar *a*, carrying the finger *g*, and connections, substantially as described, between said bar and said key, substantially as and for the purposes set forth.

2. In a leaf-turner, the combination of the leaf-holder, the key *h*, carrying the pawl *h'*, pinion *p*, and rack-bar *c*, carrying the finger *g*, substantially as and for the purposes set forth.

3. In a leaf-turner, the combination of a series of spring-actuated leaf-holders journaled on a suitable shaft and having lips of different lengths, respectively, each provided with a stop-shoulder at a prescribed distance from the end thereof, and a finger engaging with said lips and directed to position by said stop-shoulders, substantially as and for the purposes set forth.



409,371. SPRING-HINGE. JESSE W. PIERCE, Belton, Tex. Filed May 31, 1889. Serial No. 312,739. (No model.)

Claim.—1. The combination of a hinge having one of its leaves provided with a casing and the other with projections c^3, a spring arranged within the casing, and the rod passing through the casing and engaging the spring and having trunnions at its ends removably engaging the said projections, substantially as described.

2. The combination of a hinge having one of its leaves provided with a casing and the other provided with curved projections, the spring arranged in the casing, and the rod engaging said spring and having the curved portion provided with trunnions engaging the said projections, substantially as described.

409,372. HEEL-NAILING MACHINE. FREDERICK F. RAYMOND, 2d Newton, Mass. Filed Dec. 10, 1888. Serial No. 291,176. (No model.)

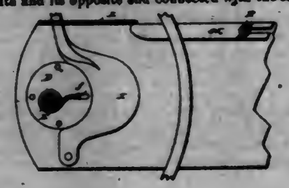
Claim.—1. In a heel-nailing machine, the combination of a nailing device, a rotary templet supporting heel-blank-holding devices, a box or receptacle for holding the heel-blanks in stack, and devices for feeding the heel-blanks in successive order to the templet when the templet has been rotated or turned to a position to receive them, comprising the sliding plate *d'* and the plate d^3, substantially as described.

2. The combination, in a heel-nailing machine, of the stack or box E, for holding heel-blanks, the slide-plate *d'*, and an actuating-lever d^4, having the arms d^5 d^6, as and for the purposes described.

3. The combination, in a heel-nailing machine, of a rotary top-lift-carrier plate B^3, having top-lift-holding devices, with a box or receptacle G for holding top lifts in stack, and top-lift-feeding devices for feeding top lifts from the box in successive order to said top-lift-carrier plate, comprising the slide-plate *g* and the plate g^3, substantially as described.

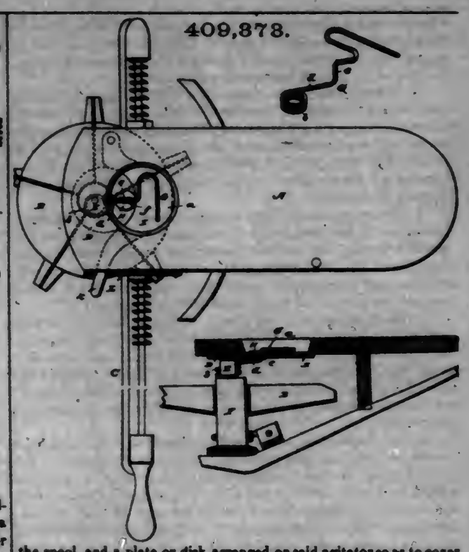
4. In an organized heel-nailing machine, the combination of the box G, for holding top lifts in stack, the slide-plate *g*, and lever g^4, having the arms g^4 g^5, substantially as described.

5. The combination of the templet with the heel-blank-grasping devices, comprising the vertically-movable spring-plate *f*, and the spring-actuated slide-plate f^4, substantially as described.



6. The combination of the top-lift-carrier plate with the spring-arms h h', having the bent ends h^2 h^3 and the shoulders h^4 h^5, substantially as described.

7. The combination, in a heel-nailing machine, of nailing devices, a rotary table supporting a heel-nailing templet and a top-lift-carrying plate, and heel-blank-holding devices carried by the heel-nailing templet, top-lift-holding devices carried by the top-lift-carrier plate, heel-blank-feeding devices for feeding the blanks to the heel-holding devices of the heel-templet, and top-lift-feeding devices, substantially as set forth, for feeding top lifts to the top-lift holder of the top-lift carrier, substantially as described.



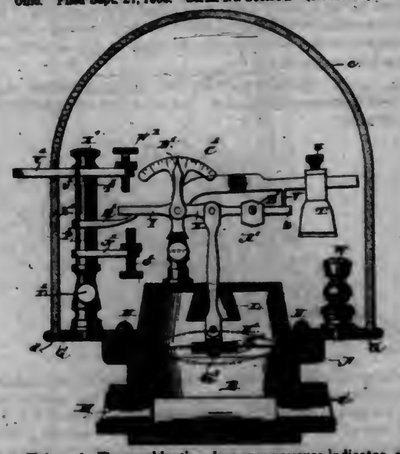
409,373. BROADCAST SEED-SOWER. HIRAM W. RU TOP and HENRY A. GORR, Goshen, Ind. Filed Apr. 26, 1889. Serial No. 308,716. (No model.)

Claim.—1. The combination, with the main frame, of the pivoted plate having its forward edge provided with a curvilinear recess and adapted to regulate the opening of the seed-aperture, the slotted plate having its curvilinear edge extending partly within said aperture, the agitator passing through the slot in said plate with its agitator branch above the plate, and its opposite end connected with the cam-shaft of the spool, substantially as specified.

2. The combination, with a seed-plate having an elongated slot, of the agitator passing through said slot with its agitating branch above the plate and its opposite end connected with the cam-shaft of

409,373.

the spool, and a plate or disk arranged on said agitator so as to cover the slot in the plate, substantially as specified.



409,374. BOTTLE-STOPPER. JONAS J. SANDS, Morton, Wis. Filed Apr. 2, 1889. Serial No. 305,995. (No model.)

Claim.—1. The combination, with the walls of a vessel-orifice having an internal shoulder or shoulders and with a stopper in the orifice, of a flexible metal holding-bar inserted over the stopper and engaged at its ends with the said shoulders, the said metal holding-bar having a central arch or U-shaped bend, and shoulders or transverse edges on its end portions for engagement with an expanding implement, substantially as described.

2. The combination, with a vessel the orifice of which is provided with a shoulder or shoulders and with a stopper in said orifice, of a flexible metal holding-bar provided with a central arch and with a slot running lengthwise of the holding-bar and terminating at points near the base of the arch, substantially as described.

409,375. GAS-PRESSURE INDICATOR. RICHARD L. SIDDON, Lima, Ohio. Filed Sept. 27, 1888. Serial No. 286,504. (No model.)

Claim.—1. The combination, in a gas-pressure indicator, of the

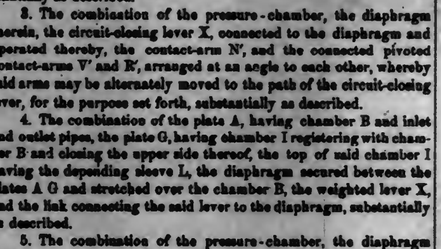
chamber, the diaphragm therein, the weighted lever X, connected to the diaphragm, the weighted lever R, having the stops adapted to engage the lever X, the dial, and the hand or pointer secured to and operated by the lever X, substantially as described.

2. The combination, in a gas-pressure indicator and alarm, of the electric circuit having the electrodes W' O' at one pole, the lever X, forming the electrode of the opposite pole, the chamber, the diaphragm therein, and connections between said diaphragm and the lever X, whereby the latter will play between the electrodes O' and W' and complete the electric circuit at abnormally high or low pressure, substantially as described.

3. The combination of the pressure-chamber, the diaphragm therein, the circuit-closing lever X, connected to the diaphragm and operated thereby, the contact-arm N', and the connected pivoted contact-arms V' and R', arranged at an angle to each other, whereby said arms may be alternately moved to the path of the circuit-closing lever, for the purpose set forth, substantially as described.

4. The combination of the plate A, having chamber B and inlet and outlet pipes, the plate G, having chamber I registering with chamber B and closing the upper side thereof, the top of said chamber I having the depending sleeve L, the diaphragm secured between the plates A G and stretched over the chamber B, the weighted lever X, and the link connecting the said lever to the diaphragm, substantially as described.

5. The combination of the pressure-chamber, the diaphragm therein, the weighted lever X, having the circuit-closing arm Y, the conducting-post M, carrying the fulcrum of said lever, the link connecting the lever to the diaphragm, the lever R, having the weight T and the stop V to engage lever C, for the purpose set forth, the conducting-post I', having contact-arm M', and the arms V' R', pivoted on said post, arranged at a suitable angle to each other and connected together, whereby the same are caused to move in unison, and either may be thrown into the path of contact-arm Y and the other thrown simultaneously out of the path of said arm, substantially as described.

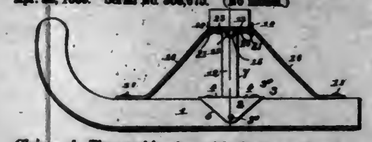


6. The combination, in a gas-pressure regulator, of the chamber, the diaphragm therein, the lever-arm connected to the diaphragm and operated thereby, the stops at the limits of the movement of said lever, and the intermediate stop, the same forming electrodes of an electric circuit, for the purpose set forth, substantially as described.

409,876. SASH-BALANCE. NEWTON J. SEAGER, Montgomery, Ala. Filed May 13, 1889. Serial No. 310,513. (No model.)

Claim.—The combination, with a window-frame, of the sashes arranged therein, the lower sash having apertures *d* formed in the face of its stiles, which apertures communicate with a reduced rectangular aperture *e* and open into mortises *a*, the cords secured to the upper sash and having a knot adapted to be placed in the apertures of the lower sash-stile, and the pivoted plates having a cut-away portion *g* and adapted to cover *d* and confine the knots of the cords therein, substantially as specified.

409,877. ELEVATOR ATTACHMENT FOR HARVESTERS. MARTIN B. STANBAUGH, Carthage, Dak. Filed Apr. 2, 1889. Serial No. 305,714. (No model.)

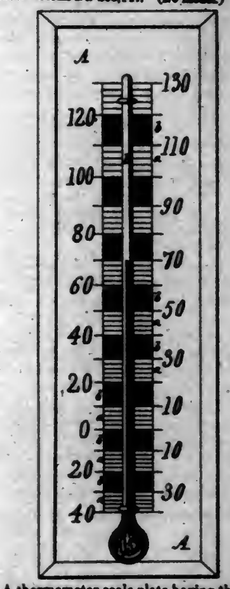


Claim.—1. The combination of the elevator-frame, the brackets A, secured to the same at an intermediate point of the height of the same, the carrier pivoted to said brackets A, the brackets E at the upper end of the elevator-frame, the rock-shaft journaled in said brackets and provided with crank-arms near its ends, the links connecting said crank-arms with the carrier, and means for rotating the rock-shaft, as set forth.

2. The combination, with the carrier, of the arms F, pivoted to the sides of the same and projecting beyond the end thereof, and the curved plate O, secured to the ends of said arms, as set forth.

3. The combination, with the carrier C and the curved bars rising from the side bars of said carrier, of the shield consisting of supporting-arms pivoted to the side bars of the carrier and a curved plate secured to the free ends of said arms, and the set-screws mounted in said supporting-arms and bearing against the curved bars, as set forth.

409,878. SLEIGH-KNEE. HERMAN P. TITUS, Lisbon, N. H. Filed Apr. 23, 1889. Serial No. 308,675. (No model.)

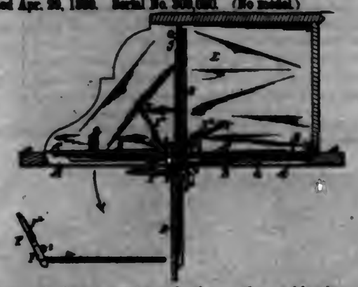


Claim.—1. The combination, with the runner having an embracing-plate, as 2, provided with the opposite embracing portions 5, the intermediate centrally-perforated plain portion 4, and the perforations 3, of the knee-casting 7, having the perforated ends 8 and 9, the opposite sides 12, and the vertical bolt 6, passing through the perforations 8 and 9 of the knee and through the central opening in the plate 2, and with the runner, substantially as specified.

2. The bolster having the casting 13 formed in a single piece and with the side flanges 14, the opposite eyes 15, and the intermediate transverse depression 20, having downwardly-projecting lugs or keepers 21, in combination with the knee-casting 7, having the trunnions 11, taking bearing in the eyes, and the curved strap 16, passing over the casting and bearing in the depression 20 and loosely embraced by the lugs, substantially as specified.

3. In a sleigh-knee, the bolster having the casting 13, upon its under surface, provided with the upwardly-projecting flanges 14 to embrace the sides of the bolster and the opposite shoulders or keepers for the reception of the brace-rods 16, whereby the bolster is supported upon the brace-rods, and the knee-casting having trunnions mounted in the bolster-casting and pivotally attached to the runner, as set forth.

409,879. THERMOMETER. JOHN D. WARD, Rochester, N. Y. Filed June 24, 1886. Serial No. 206,147. (No model.)



Claim.—A thermometer-scale plate having the degree-marks laid off in blocks or sections of contrasting colors, each block or section including a certain number of degrees, the degree-marks on the light-colored sections being black and those on the dark-colored sections being white, as set forth.

409,880. PENCIL-SHARPENER. BENJAMIN T. WHITEHOUSE, Dover, assignor of one-half to Christopher W. Jackson, Portsmouth, N. H. Filed Apr. 1, 1889. Serial No. 305,892. (No model.)

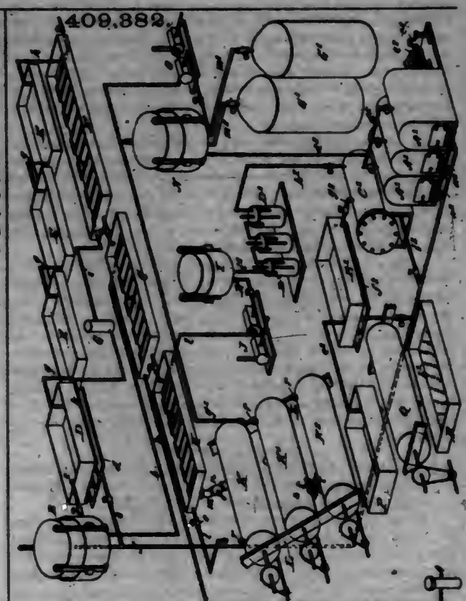
Claim.—The pencil-sharpener consisting of the tubular body *a*, the tapering spring-arms *b*, each arm having a cutter *c*, and a wing *d*, with a ring *e* arranged on said sharpener, said ring when pushed onto the wings forcing the spring-arms against the conical part of the pencil arranged therein and causing the cutters *c* to remove shavings therefrom when the pencil is revolved, substantially as shown and set forth.

409,881. ANIMAL-TRAP. ALEXANDER WOLSER, Petoskey, Mich. Filed Apr. 26, 1889. Serial No. 308,660. (No model.)

Claim.—1. In a revolving animal-trap, the combination, with a suitable inclosed case E and frame A, with opening A', of the series of platforms B, mounted upon an axle C, journaled in the frame A and having attached thereto means for turning said axle, and nose-pieces F, pivotally connected to said platforms B and having extensions F', bolts G, connected to said extensions F' of the pivoted nose-pieces F, which bolts pass beneath the platforms B and project beyond the front edge thereof and engage a catch H at the rear of the frame A, as described, for the purposes specified.

2. In a revolving animal-trap, in combination with the platforms B, the nose-pieces F, pivoted to said platforms, having extensions F', that project below said platform, and opening F^a for the bait, and bolts G, secured to the said extensions F' of the nose-pieces and extending beneath the platforms B, as described, for the purposes specified.

409,882. AMMONIA-SODA APPARATUS. JOSEPH F. BARNUM, Louisville, Ky., assignor to himself, Charles Goldsmith, and John S. Cain, same place. Filed Apr. 26, 1889. Serial No. 308,632. (No model.)

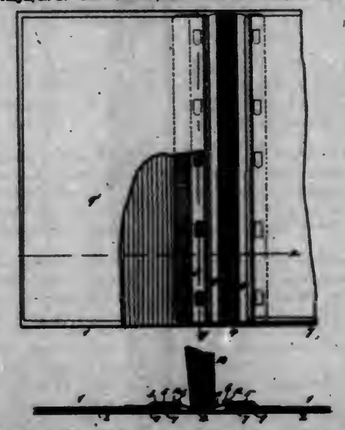


Claim.—1. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination of an elevated salt-water receiver and gasometer provided with a stand-pipe for the gas, a boiler into which the water is run from said receiver, a series of settling-pans in successive connection with each other and the boiler, an evaporating pan or vessel into which the brine is passed from the settling-pans, and a cooler connected with the evaporating pan or vessel, for operation in relation with each other, substantially as specified.

2. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination, with the settling-pan P, of the rotary agitator and washer Q, the drainer R, and the centrifugal drier S, essentially as specified.

3. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination of the elevated salt-water receiver and gasometer B, with its supply-pipe *b* and gas-pipe *f*, the boiling pan or vessel D, the settling-pans E, the evaporator F, the coolers C H, and the series of air-tight decomposing-cylinders K K' K^2, provided internally with reversely-rotating stirrers, and arranged one below the other and adapted to pass their charges one into the other, substantially as described.

4. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination with the decomposing-cylinders K K' K^2, of the ammonia-receiver I, the carbonic-acid-gas receiver N, the condensing-pumps J O, the pipes *l f'*, and the cooler H, essentially as specified.



5. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination of the settling-pan P, the concentrating-pan B', the ammonia-retort C', the washing-bottles D', the ammonia-receiver I, and the condensing-pump J, substantially as specified.

6. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination, with said apparatus, of the drying-ovens A', with their agitating-frames R', the pipe d^2, the carbonic-acid gas holder or receiver N, and the condensing-pump O, essentially as described.

7. In apparatus for the manufacture of bicarbonate of soda and other soda salts and compounds, the combination of the salt-water receiver B, arranged to occupy an elevated position for passage of the brine by gravity through the apparatus, the water-supply pipe *b* to said receiver, the stand gas-pipe *f*, extended downward and provided with attached gas-jet pipes for supplying the apparatus with fuel from said receiver, the boiler D, the settling-pans E, the evaporator F, with its heating-pipes *i*, the cooler C, having the water-supply pipe *b*, made to circulate through it, the ammonia-cooling pan or vessel H, the ammonia receiver I, and carbonic-acid-gas holder N, with their attached condensing-pumps J O and pipes *l f'*, the series of air-tight decomposing-cylinders K K' K^2, the settling-pan P, the concentrating-pan B', the ammonia-retort C', connected with the ammonia-receiver I, the rotary washer and agitator Q, the drainer R, and the centrifugal drier S, substantially as specified.

409,883. RENEWABLE MEMORANDUM-BOOK. JOHANN G. RAST, Brooklyn, N. Y. Filed Feb. 26, 1889. Serial No. 301,172. (No model.)

Claim.—1. A book of leaves secured together with lateral flanges or securing-strips on the back of the leaves where they are secured

together, in combination with detachable covers having their rear vertical edges connected together by flexible material, and metallic strips independently secured to the detachable covers at their joint formed by the flexible material and having interned edges forming grooves adapted to engage and retain lateral flanges on the back of the leaves and permit their insertion and removal endwise, substantially as shown and described.

2. In a book, substantially as described, having lateral retaining-flanges at the back of the leaves, a pair of detachable covers connected together at their rear vertical edges by flexible material, and metallic strips independently secured to the covers at their joint formed by the flexible material and having interned flanged edges forming retaining-grooves to receive endwise and retain the flanges on the back of a book of leaves, substantially as described.

3. In a book having detachable covers, the detachable covers 1, connected together at their rear vertical edges by a flexible connection 4 with the metallic strips 20, having slots 19 and extending along the rear vertical edges of covers 1, the flexible lining-strip 3, pasted thereto and to the covers, and the metallic retaining-strips 13, with the vertical portion 14, having the interned flanges 15, forming retaining-grooves for the flanges on the book of leaves, and the horizontal portions 16, extending lengthwise over the flexible lining-strip 3 and having lips 17 passing through the latter and through the slots 19 in strips 20, and secured to the latter, substantially as shown and described.

409,884. COMPOUND DYE. CHARLES S. BENNETT, Leeds, County of York, England. Filed Apr. 23, 1888. Serial No. 271,573. (No specimens.) Patented in England Sept. 19, 1887. No. 12,957.

Claim.—1. The improvement in the manufacture of coloring-matter, which consists in treating an aqueous extract of fustic dye-wood with a slightly-acid solution of a salt of one of the diazo compounds before mentioned—namely, diazo-benzene, diazo-toluene, diazo-xylene, and diazo-naphthalene—adding the requisite quantity of alkali, and separating the coloring-matter formed by mechanical means.

2. The improvement in the manufacture of coloring-matter, which consists in treating the comminuted fustic dye-wood with a slightly-acid solution of a salt of one of the diazo compounds above mentioned—namely, diazo-benzene, diazo-toluene, diazo-xylene, and diazo-naphthalene—until the wood is thoroughly permeated, and adding the requisite quantity of alkali, as described.

3. A coloring-matter consisting of the combination of the active principle of fustic dye-wood with a diazo compound, substantially as described.

409,885. WALKING-BEAM. JOHN BLY, Tiona, Pa. Filed Apr. 6, 1889. Serial No. 306,242. (No model.)

Claim.—1. A walking-beam comprising the beam A, a block arranged longitudinally under the beam at the center of the latter, and the truss-boards varying in length and having their centers secured to said block and their ends secured to the beam, substantially as described.

2. A walking-beam comprising the beam A, the block B, secured under the same at its center, and the truss-boards C D, arranged one on top of the other, having their central portions bolted to the block, and their ends bent upward and fitted in scarfs or recesses in the under side of the beam, substantially as described.

3. The beam, the block secured under the center of the same, said block being composed of one or more longitudinal boards or layers, and the truss-boards having their central portions bolted to and through the said block, and said beam and their ends fitted in scarfs or recesses in the under side of the beam near its ends, and bolted thereto, substantially as described.

4. A walking-beam comprising the beam A, the block secured under the center of the beam A, and being composed of one or more longitudinal boards or layers varying in length and having their central portions bolted to and through said block and beam A, and their ends fitted in scarfs or recesses in the under side of the beam near its ends, and bolted thereto, and the tapering blocks arranged between the truss-boards and the beam, substantially as described.

409,886. FOLDING CRATE. JAMES W. BROOK, Lynchburg, Va. Filed Apr. 26, 1889. Serial No. 308,743. (No model.)

Claim.—1. An improved crate provided with a hollow ventilating-partition L, consisting of the bars or posts *l*, and slats *l'*, nailed to the opposite sides of bars *l* and separated, providing spaces between them, substantially as set forth.

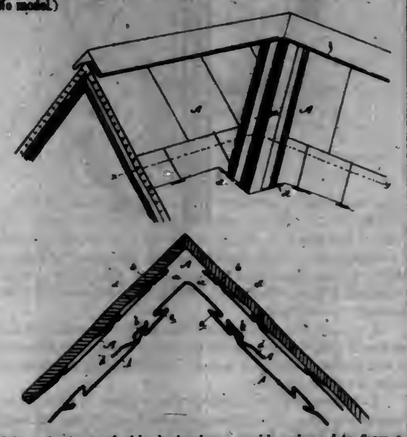
2. In a crate, substantially as described, the combination of the bottom, the sides having uprights F, and the hollow ventilating-partition formed of posts or uprights and slats, the slats being secured to the opposite sides of the said uprights and extended at their ends beyond the same whereby to lap on opposite sides of the uprights F, substantially as set forth.

3. In a crate, substantially as described, the combination, with the sides having uprights F and the top having beams or bars *j j*, of the ventilating-partition formed to fit between the bars *j*, and having slats arranged to extend on opposite sides of the uprights F, substantially as set forth.

4. The combination, in a crate, of the bottom, the ends hinged to said bottom, the side pieces fitted to said ends and bottom, inter-engaging dowels and sockets being provided on said parts, and connections between the opposite side pieces whereby to clamp them firmly together, substantially as set forth.

5. The bottom having dowels C, and the ends connected with the bottom and having the sockets *d*, combined with the sides having sockets c and dowels D to fit in the sockets *d* of the end pieces, and the connections between said sides, substantially as set forth.

6. As an improvement in crates, the combination, with the front side pieces having the eyes or staples, and the hooks A, entering said staples, of the top, and the fastening-rod by which to secure said top closed, such rod in its locked position being extended close to the hooks A, whereby to hold the same in their staples, substantially as set forth.



7. In a crate, substantially as described, the combination of the front and rear side pieces having near their ends uprights *f*, the top, the eyes or staples G, secured on the inner sides of the uprights *f* of the front section, and the rods H, secured at one end to the outside of the uprights *f* of the rear side section, and having at their other ends hooks engaging the eyes G of the front side section, whereby said rods H will extend diagonally and serve to fill in a measure the space at the end of the top, substantially as set forth.

8. In a folding crate, the combination of the front side piece, the end piece having a staple O, the top, and the lock-rod M, passed through coincident openings in the top and side piece, and having at its end a crank-like arm m, provided with a portion N, arranged to enter the staple O, substantially as and for the purposes set forth.

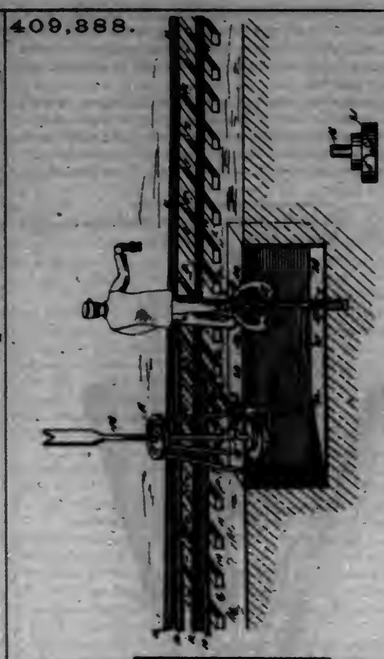
9. The improved crate herein described, consisting of the bottom having dowels C, the ends B, having sockets *d*, a staple O on one of said ends, the front side piece E, having eyes or staples G and hook-rods I and provided with dowels D and sockets *c*, the rear side section having dowels D and sockets *c*, the hook-rod H, connected with the rear side section, the top hinged to the rear side section, the partition, and the lock-rod M, having at one end a crank-like arm m, having a portion N, arranged to enter the staple O, substantially as set forth.

10. In a folding crate, substantially as described, the combination of the bottom piece or section A, having frame beams or sills *a*, and the end pieces B, hinged or pivoted to the bottom A and having frame beams or uprights *b* arranged to lie alongside the sills *a*, whereby the ends may be folded flat down against the bottom piece, all substantially as and for the purposes set forth.

409,887. SHEET-METAL SHINGLE. WILLIAM J. BROWN and JOHN O. THORN, Toronto, Ontario, Canada. Filed Apr. 8, 1889. Serial No. 306,296. (No model.)

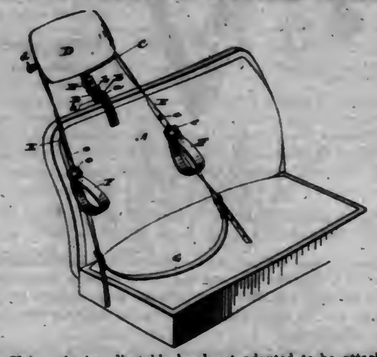
Claim.—1. A metal shingle having one side crimped to form a gutter with a nailing-edge extending beyond it, the inner wall of the said gutter being bent inwardly to form a recess, into which the straight edge of the adjoining shingle may fit to form a cap for the gutter and for the nailing-edge, and an angular overhanging wall, substantially as and for the purpose specified.

2. A series of metal shingles bent angularly to form a valley, the bottom of each shingle overlapping the top edge of the shingle below it, and the sides of each shingle being crimped to form an angular overhanging wall on each side of the valley, and on the outside of each wall a gutter with a nailing-edge extending beyond it, the inner wall of the said gutter being bent inwardly to form a recess, into which the straight edge of the adjoining shingle may fit to form a cap for the gutter and for the nailing-edge, substantially as and for the purpose specified.



409,888. SAFETY-LOCK AND SHACKLE FOR RAILROAD-SWITCHES. WILLIAM H. CAINE, Stillwater, Minn., assignor of one-half to Lyell T. Mead, same place. Filed Jan. 2, 1889. Serial No. 295,145. (No model.)

Claim.—1. The combination, with a switch-stand provided with a locking-bar, of a plunger, connections between the plunger and the bar, and shackles arranged in connection with the plunger, substantially as described.



2. The combination, with a switch-stand provided with a recessed disk, of a bar provided with a key or bit arranged to enter the recess of the disk, a lever connected to the bar, a plunger to which the lever is connected, and shackles arranged in connection with the plunger, substantially as described.

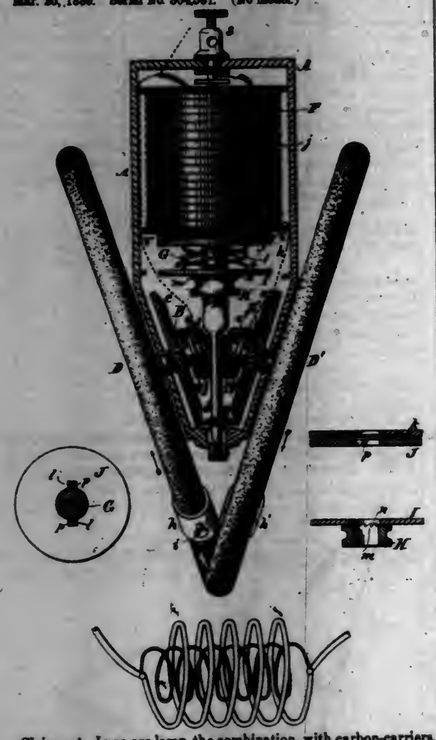
3. The combination, with a switch-stand provided with a vertical target-rod, of a case arranged beneath the stand, a disk formed with a recess and connected to the lower end of the target-rod within the case, a rod or bar 23, provided with a bit or key 23 and mounted to move vertically within the case, a lever connected to the rod, a plunger to which the lever is connected, a spring arranged in connection with the plunger, a step or table carried by the plunger, shackles pivotally mounted within the case and formed with slotted arms, and a pin carried by the plunger and arranged to enter said slots, substantially as described.

409,888.

409,889. HEAD-REST. JOHN W. CAMPBELL, Toronto, Ontario, Canada, assignor of one-third to John Francis Logan, same place. Filed Aug. 4, 1887. Renewed Dec. 14, 1888. Serial No. 293,656. (No model.)

Claim.—1. An adjustable head-rest adapted to be attached to the back of a seat having an adjustable supporting-strap connected at each side to the cushioned end of the rest, and held in place by the weight of the user, who sits on said supporting-strap, substantially as specified.

2. An adjustable head-rest adapted to be attached to the back of a seat having an adjustable supporting-strap connected at each side to the cushioned end of the rest and passing under the seat of the user, who sits thereon, and having adjustably attached to said supporting-strap loops which form arm-rests, substantially as specified.



3. The combination, with the back of a seat, of lower standard B, having sleeve *b* for lower end of the upper standard C, and adapted to receive in an elongated slot A thumb-screw H, which adjustably binds the upper standard C to said lower standard, the lower portion of said standards forming jaws which grip the back of seat, together with the frame C, air-cushion D, having screw-nozzle *d*, the side straps E, and seat-strap G, substantially as specified.

4. The combination, with the back of a seat, of lower standard B, and upper standard C sleeved thereon, the lower portions of said standards forming jaws which grip the back of said seat, the upper standard being held adjustably in position by means of thumb-screw H, which passes through said standards, together with the air-cushion

D, suitably attached to said upper standard and provided with means for inflating said cushion, the side straps E, having lugs *e* attached thereto, arm-rests F, and seat-strap G, substantially as described, and for the purpose specified.

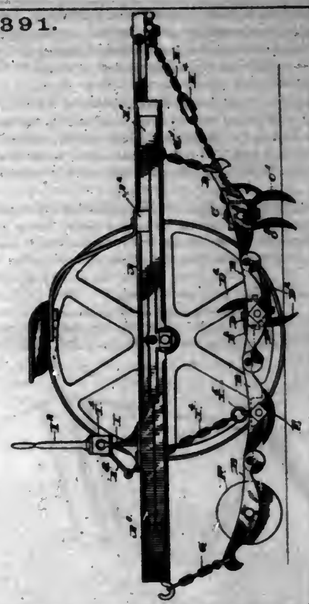
5. The combination, with the back of a seat, of lower standard B, and upper standard C sleeved thereon, adapted to be attached to the back of said seat and held adjustably in position, the upper standard C, to which is suitably attached the cushion D, together with the side straps E, lugs *e*, arm-rests F, and seat-strap G, substantially as specified.

409,890. ARC LAMP. ROBERT D. CARSON, Philadelphia, Pa. Filed Mar. 26, 1889. Serial No. 304,581. (No model.)

Claim.—1. In an arc lamp, the combination, with carbon-carriers, of a solenoid, a magnetic core entering the solenoid, a friction-disk carried by the core, a friction-flange adapted to be engaged by the friction-disk, and the spiral wings carried by the magnetic core, substantially as specified.

2. In an arc lamp, the combination, with rotating carbon-carriers, of a double solenoid formed of series and shunt coils, a magnetic core entering the solenoid, a friction-disk carried by the core and a friction-flange adapted to be engaged by the friction-disk, and the spiral wings *l*, substantially as specified.

3. In an arc lamp, the combination of the shafts B B', inclined to each other and provided with arms C C' and bevel-wheels *c c'*, the core G, carrying wings *l*, pinion *q*, friction-disk J, flange *k*, and solenoid F, substantially as specified.



4. In an arc lamp, the combination, with the core G, provided with carrying-wings *l*, and notched friction-disk J, of the supporting-disk I and springs *o*, substantially as specified.

5. In an arc lamp, the combination, with the core G, provided with the spiral wings *l*, of the friction-disk J, provided with the notches *p*, for receiving the wings *l*, and the yielding support formed of the springs *o* and disk I, substantially as specified.

6. In an arc lamp, the combination, with the threaded core G and friction-disk J, of the nut H, provided with ratchet-teeth *m*, the disk I, having ratchet-teeth *n*, and the springs *o*, substantially as specified.

409,891. COMBINED CUTTER, PULVERIZER, DRAG, AND ROLLER. ANDREW J. CASEY, Lewisburg, assignor of one-half to Andrew J. Casey, Russellville, Ky. Filed Apr. 20, 1889. Serial No. 308,001. (No model.)

409,891.

Claim.—1. A main frame mounted on wheels, in combination with a flexible frame composed of jointed links hung to said main frame, and a harrow beam and roller fastened between said links, substantially as described.

2. A main frame mounted on wheels, in combination with a flexible frame hung to said main frame, a harrow beam and roller fastened in said flexible frame, and means, substantially as described, for lifting said flexible frame.

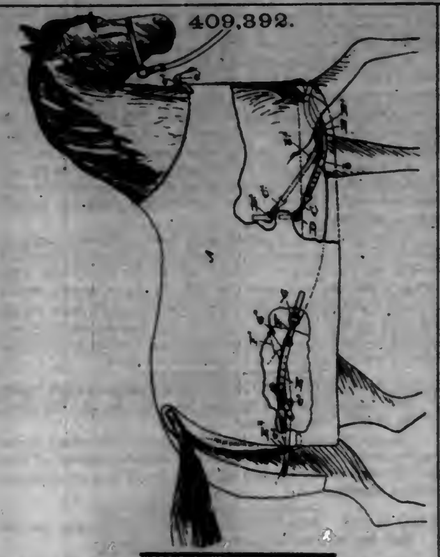
3. A main frame mounted on wheels and a flexible frame hung beneath the same, in combination with a harrow beam and roller fastened in said flexible frame, brackets on said main frame, a shaft journaled between said rollers, two levers fastened to said shaft, and a connection between one of said levers and the flexible frame, substantially as described.

4. A main frame mounted on wheels, a flexible frame hung beneath the same, and whiffletrees fastened to said main frame and directly connected with said flexible frame, in combination with a harrow beam and roller fastened in said flexible frame, and means, substantially as described, for raising the same.

5. A main frame mounted on wheels, in combination with a flexible frame hung beneath the same, a toothed cutter fixed in said under frame, a toothed pulverizer behind the cutter rotating therein, and a roller behind the pulverizer, also rotating therein, substantially as described.

6. A main frame on wheels, in combination with a flexible frame hung beneath the same, a toothed cutter fixed in said under frame, a toothed pulverizer behind said cutter, rotating therein, a drag fixed therein behind said pulverizer and a roller rotating therein behind said drag, substantially as described.

7. A main frame on wheels and a flexible frame hung beneath the same, in combination with a toothed cutter fixed within the latter frame and having a number of middle teeth removable therefrom, substantially as described.



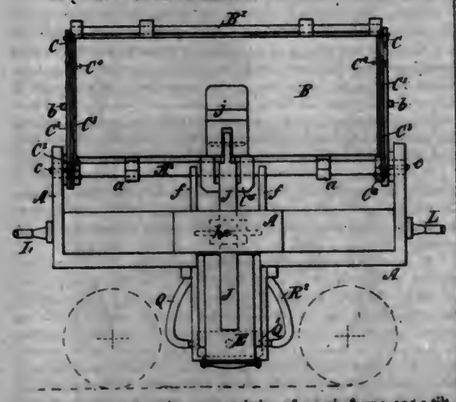
8. A main frame on wheels and a flexible frame hung beneath the same, in combination with a toothed cutter fixed within the latter frame and having a number of middle teeth removable therefrom, and a removable revolving pulverizer journaled back of said cutter within said frame, substantially as specified.

409,892. HORSE-BLANKET. JOSEPH I. OSBURN, Newmarket, Ontario, assignor to Naomi Coburn and Elizabeth Jane Martin, Toronto, Canada. Filed Dec. 1, 1888. Serial No. 292,371. (No model.)

Claim.—1. The combination, with a blanket A, of front straps B B', running buckles *b b'*, snaps C C', rings D D', rear straps E E', running buckles *c c'*, snaps F F', and rings G G', substantially as described, and for the purpose specified.

2. The combination, with a blanket A, of adjustable straps B B' and adjustable straps E E', designed to fasten onto rings or catches D D', the snaps on said straps, and rings or catches G G', substantially as described, and for the purpose specified.

409,892.



409,893. RIVETING-MACHINE. LÉON DELALOE and ALBERT PLAT, Paris, France. Filed May 20, 1887. Serial No. 239,594. (No model.) Patented in Belgium Aug. 25, 1885, No. 68,900; in France Dec. 7, 1885, No. 172,764; in Germany Mar. 13, 1886, No. 37,341; in Austria-Hungary Mar. 15, 1886, No. 11,600; in Luxemburg Mar. 15, 1886, No. 661; in Italy Mar. 31, 1886, No. 19,708, and in Spain Apr. 10, 1886, No. 9,550.

Claim.—In a machine for riveting, shearing, punching, &c., the combination, with a cylinder G and a reservoir G', of a piston D, working in the cylinder and provided with a rack *a*, a pinion *b*, engaging said rack and adapted to actuate the piston to perform the preliminary cutting or riveting operation, a valve-chamber E, provided with passages *g g'*, communicating with the cylinder, and a passage *d'*, communicating with the reservoir, an inlet *d*, and a valve *e*, adapted to connect the passages *d'* and *g'* and *d* and *g* alternately, all substantially as shown.

409,894. DUMPING-CAR. JOSEPH DUFF, Lansing, Ontario, Canada. Filed Dec. 17, 1888. Serial No. 293,735. (No model.) Patented in Canada Jan. 16, 1889, No. 30,568.

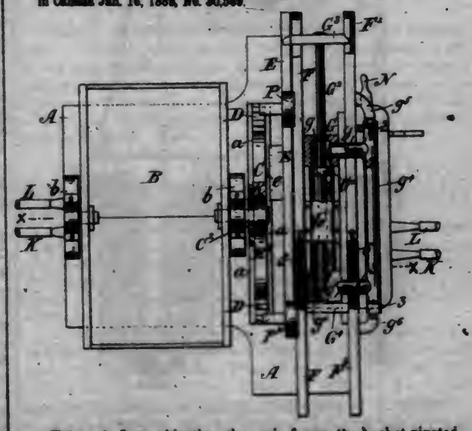
Claim.—1. A dumping-car consisting of a main frame, and a tilting body or box journaled therein, a compressed-air cylinder (carried by said frame) the piston of which causes said body or box to tilt, and an automatic catch for locking the latter in position, substantially as set forth and described.

2. In a dumping-car, the combination, with a main frame or platform, and a tilting box journaled therein, of a compressed-air cylinder the piston of which causes the box to tilt, a second cylinder having a sliding valve operated from an ordinary compressor and adapted to automatically supply the tilting-cylinder when the air-pressure is put on, and suitable connecting-pipes, substantially as described.

3. In a dumping-car, the combination, with a main frame or platform, and a tilting box journaled therein, of a compressed-air cylinder the piston of which causes the box to tilt, a second cylinder having a sliding valve and a reservoir, said second cylinder and reservoir being supplied with air from an ordinary compressor, a connection between the tilting-cylinder and the second cylinder, and also between the said second cylinder and the reservoir and pipes leading to a second car, substantially as and for the purpose specified.

4. In a dumping-car, the combination, with main frame or platform and a tilting box journaled therein, of a compressed-air cylinder the piston of which causes the box to tilt, a cylinder having a sliding valve and a reservoir, both supplied with air from an ordinary compressor, pipes connecting same together and with the tilting-cylinder, and an extra cylinder having a sliding valve, a handle for moving same in one direction and a spring for retaining it, said extra cylinder being also connected to the tilting-cylinder, whereby one particular car may be dumped, substantially as described.

5. In a dumping-car, the combination, with the frame and tilting box journaled therein, of the compressed-air cylinder E, having piston e^3, rod *d'*, and cross-head *e*, and lever d^3, pivoted to said cross-head and adapted to operate the tilting box, substantially as described.



6. The combination, with the frame and tilting box and with the tilting-cylinder, and means whereby said box is caused to tilt by the operation of its piston, of the frame H, carrying a locking-pin *h*, said frame and pin being drawn backward by the upward movement of the piston, the locking-bar J, pivoted to the box, and a spring for causing said locking-pin to engage with said locking-bar, substantially as and for the purpose specified.

7. The combination, with the frame A, box B, and tilting-cylinder E, the piston-rod of which has cross-head *e*, having inclines e^3, of the frame H, having locking-pin *h* and roller G, impinged upon by said inclines so as to force back said frame and pin, springs *k*, and the locking-bar J, all arranged and operated substantially as and for the purpose specified.

8. The combination, with the frame A, of the tilting box B, having swinging door B', and a system of levers connected to said door and to the frame and box to operate said door when the box is tilted, substantially as shown and described.

9. The combination, with the cylinder M, having an air-pipe connected thereto, and having ports *k'*, *m*, and *m'*, and waste-ports 1 2, of the sliding piston-valve P, having passage O, and waste-openings m^2 and m^4, and a spring for moving said piston-valve in one direction, the reservoir *n*, pipes L and m^3, the tilting-cylinder, the piston therein, and the tilting box, substantially as described.

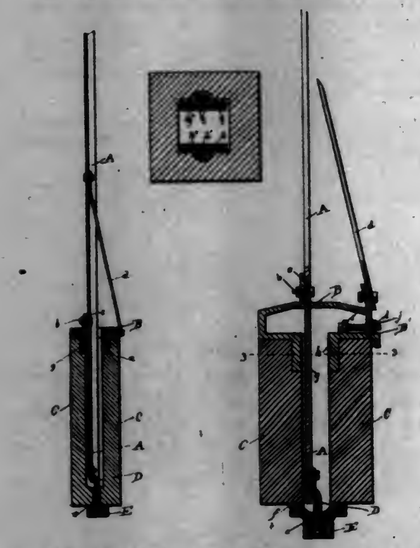
409,895. DUMPING-CAR. JOSEPH DUFF, Lansing, Ontario, Canada. Filed Dec. 17, 1888. Serial No. 293,736. (No model.) Patented in Canada Jan. 16, 1889, No. 30,569.

Claim.—1. In combination, the main frame, the bucket pivoted to tilt in either direction, a cylinder, a piston therein, pipe-connections from the ends of the cylinder to a suitable fluid-power supply, and operating-connections between the piston and the bucket, whereby

it may be tilted in either direction by the piston, substantially as described.

2. In combination, the main frame, the bucket pivoted to tilt in either direction, a cylinder, a piston therein having its piston-rod extending through the cylinder-head, pipe-connections from a source of power leading to the two ends of the cylinder, a sliding bar in connection with the piston-rod, and operating-connections between said bar and the pivoted bucket, substantially as described.

3. In a dumping-car, the combination, with a main platform and a box or bucket carried thereby and capable of being tilted in either direction, a compressed-air cylinder carried by such platform and having cross-heads in connection with its piston-rod operating said sliding frame, and adapted to move the latter in either direction longitudinally, an air-cylinder having a sliding valve and supplied from an ordinary compressor and connected to both ends of said operating-cylinder, substantially as and for the purpose described.



4. In a dumping-car, the combination, with the platform and a bucket adapted to be tilted in either direction, of the segmental gear C, connected with said box or bucket, sliding rack D, having slots *d d'*, sliding bar E, having pin *e* fitting into one of said slots, and compressed air-cylinder G, the piston-rod of which has cross-heads in connection with said sliding bar, substantially as and for the purpose specified.

5. In combination, the main platform, the bucket pivoted to tilt in either direction, locking-bars R R', for holding the bucket in position, a cylinder having pipe-connections from each end to a source of power, whereby the piston therein may be moved in either direction, and operating-connections from the piston to the bucket, said connections acting upon the bars R R' to withdraw one or the other to allow the bucket to turn, substantially as described.

6. The combination, with the segmental gear C, having projection C^3, and with the sliding bar E, of the rollers P P', vertical bars P^3 P^3, carrying said rollers, cross-heads or cranks Q Q', hung from the platform and connected with the lower ends of said bars, the locking-bars R R', adapted to lock the segmental gear, and suitable tension-springs, all substantially as and for the purpose specified.

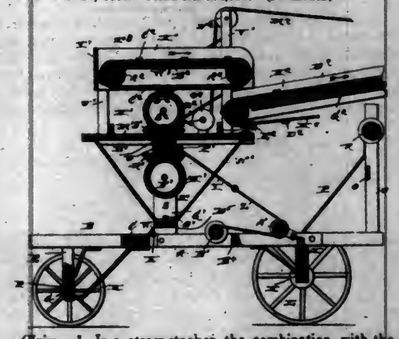
7. The combination, with the sliding bar E and cylinder G, having chambers *g* and *g'*, a single piston, and a piston-rod with cross-heads G^3 and G^4 on its ends, of the air-pipe g^4, connected to the chambers of said operating-cylinder and to the air-cylinders K' and M, and air-pipes K and L, all arranged substantially as and for the purpose specified.

409,396. FENCE-POST. FRANK L. FAIRCHILD, Mount Vernon, Ohio. Filed Nov. 14, 1888. Serial No. 290,856. (No model.)

Claim.—1. A fence-post comprising, in combination, the post-stem, the cap, the pottery or burnt-clay base, the screw-threaded stub end, and the internally-screw-threaded covering-cap applied to the stub end from the under side of the base, substantially as hereinbefore set forth.

2. The combination of the post-stem, the burnt-clay or pottery base, a separate or removable stub end for the stem, and a fastening device applied to the stub end from the under side of the base, substantially as hereinbefore set forth.

3. The combination, with the burnt-clay base, of the post-stem having a screw-threaded lower end, and the internally-screw-threaded covering-cap made of cast-iron or other practically non-corrosive metal applied to the said end of the stem from the bottom of the base, and acting to cover the exposed end of the stem and to close the base at the bottom, as and for the purposes hereinbefore set forth.



4. In combination with the base and the post-stem, the cap provided with bearings or projecting pieces adjustable to and from each other and adapted to take against opposite sides of the base, substantially as hereinbefore set forth.

5. The burnt-clay or pottery base made hollow and having an opening at its bottom, and the wrought-metal post-stem inserted in the base and projecting at its lower end through the opening in the bottom of the base, in combination with the cap or fastener applied to the said projecting end from the under side of the base, and the soft-metal washer interposed between said fastener and the base, whereby the stem is protected and the bottom is sealed air and water tight, as and for the purposes hereinbefore set forth.

409,397. COMPOUND FOR PREVENTING MORTAR FROM FREEZING. GUSTAVE GARRELL, Baltimore, Md. Filed Dec. 22, 1888. Serial No. 294,377. (No specimens.)

Claim.—The composition herein described for preventing mortar from freezing, consisting of common salt, saltpeter, sulphate of iron, and coal-ashes, or its described equivalent, mixed in or about the proportions described.

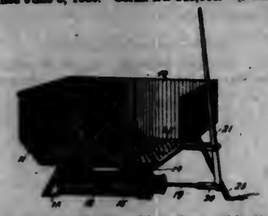
409,398. STRAW-STACKER. JEREMIAH P. GAUMER, Dow, Ind. Filed Mar. 27, 1889. Serial No. 304,967. (No model.)

Claim.—1. In a straw-stacker, the combination, with the main frame, of the frame S, hinged thereon, the turn-table pivoted on the frame S, the platform supported on said turn-table, the platform-conveyer, the frame D^2, pivoted to the turn-table frame and having the endless conveyer, the lower end of which is below the platform, the driving-shaft journaled in the frame S, and gears and connections between said driving-shaft and the endless conveyers, whereby the latter are operated, substantially as described.

2. In a straw-stacking machine, the rectangular turn-table pivotally mounted on the main frame, composed of the crossed beams L' and M', and provided with the rectangular frame K', and the vertical standards U' and V', rising therefrom and having the platform and the endless platform-conveyer, the pivoted conveyer-frame connected to the turn-table frame and having the endless conveyer, gears and connections, substantially as set forth, to operate the conveyers, the winch, and the elevating-ropes connected thereto and to the pivoted conveyer-frame to raise and lower the latter, substantially as described.

3. In a straw-stacker, the platform having the endless conveyer traveling horizontally over the same and the pivoted conveyer-frame D^2, with its lower end below the level of the platform, and the endless conveyer traveling over said conveyer-frame, substantially as described.

4. In a straw-stacker, the combination of the main frame having the vertical frame S, the driving-shaft journaled in said vertical frame, the vertical shaft P', journaled in frame S and geared to the driving-shaft, the turn-table pivoted on said vertical shaft, the frame supported on the turn-table and having the platform, the shaft S^2, journaled in bearings on said frame and geared to the vertical shaft, the endless conveyer operating on the platform, the conveyer-frame pivoted to the turn-table frame, the endless conveyer operating on the same, and the pulleys and belts connecting said conveyers to the shaft S^2, substantially as described.



5. The main frame mounted on wheels and having the supporting-frame at its rear end, the frame S, hinged on the main frame comprising the standards T, the plate U, connecting their outer ends and the beam B^2, connecting the standards near their inner ends, the turn-table pivoted on the frame S and having the frame supporting the platform, the conveyer-frame pivoted to said turn-table frame, and the endless conveyers on the platform and conveyer-frame, substantially as described.

6. In a straw-stacking machine, the main frame, the hinged frame S thereon, comprising the standards T, the plate U, and the beam B^2, having the stud O' rising from the center thereof, and the turn-table pivoted on the frame S by the vertical shaft P' and carrying the platform and pivoted conveyer-frame, said turn-table having the depending truss-yoke centrally pivoted on the stud O' of the beam B^2, substantially as described.

7. In a straw-stacker, the main frame, in combination with the frame S, hinged thereon, the turn-table pivoted on the frame S, and the horizontally-arranged platform supported on the turn-table, as set forth.

8. In a straw-stacker, the main frame, in combination with the frame S, hinged thereon, the turn-table pivoted on the frame S, the platform supported horizontally on the turn-table, and the conveyer-frame D^2, pivoted to the turn-table and having the endless conveyer, as set forth.

409,399. WASHING-MACHINE. HIRAM H. GUTFORD, Rossommon, Mich. Filed June 5, 1889. Serial No. 312,111. (No model.)

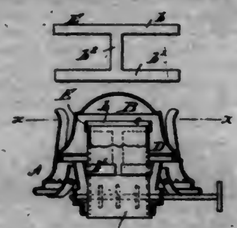
Claim.—1. In a washing-machine, the combination, with a body having ports in the bottom thereof, and a cylinder suspended beneath the bottom of the body and connected with the said ports, of a piston held to slide in the cylinder, provided with a piston-rod extending through one end of the said cylinder, and a lever connected with the outer end of the said piston-rod, substantially as shown and described.

2. In a washing-machine, the combination, with a body having ports formed in the bottom thereof and provided with a transverse partition separating the ports, of a cylinder held beneath the bottom of the body and connected with the ports of the latter, a piston held to reciprocate in the cylinder, provided with a piston-rod projecting through one end thereof, and a lever fulcrumed upon the body, connected with the said piston-rod, all combined for operation substantially as shown and described.

3. In a washing-machine, the combination, with a body provided with a partition secured to the bottom, dividing the same into two compartments, a port formed in each of the said compartments, and a cylinder supported beneath the said body connected with the ports of the body, of a piston held to reciprocate in the cylinder, provided with an attached rod extending through one end of the same, a lever fulcrumed to the body and connected with the piston-rod, and a perforated false bottom supported a distance above the main bottom of the body in each of the compartments formed therein, substantially as and for the purpose specified.

409,400. DRAPERY-TRIMMING. PAUL GUMBINNER, New York, N. Y. Filed Apr. 24, 1889. Serial No. 308,496. (No model.)

Claim.—1. A drapery-trimming comprising a series of sacks having shirred lower ends and a band to which the sacks are secured ranging at right angles to the said sacks, substantially as described.



2. A drapery-trimming comprising a series of connected sacks shirred near their lower ends and provided with puffy folds below the shirring, substantially as described.

3. A drapery-trimming comprising a series of connected sacks shirred near their lower ends and provided with puffy folds below the shirring, and with pendent ornaments below the puffy folds, substantially as herein shown and described.

4. A drapery-trimming comprising a band, a series of sacks depending from the band, shirred near their lower ends and provided with puffy folds below the shirring, and pendent ornaments secured to the band between the sacks, substantially as described.

5. A drapery-trimming consisting of a band, a series of sacks depending from the band, shirred near their lower ends and provided with puffy folds below the shirring, and with pendent ornaments below the puffy folds, and pendent ornaments secured to the band between the sacks, substantially as herein shown and described.

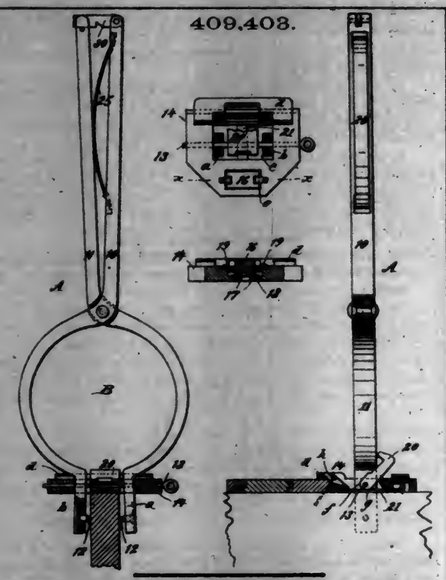
409,401. ATTACHMENT FOR LAMP-BURNERS. WILLIAM HOLMES, Ulster Park, N. Y. Filed Sept. 12, 1888. Serial No. 285,188. (No model.)

Claim.—1. An attachment for wick-tubes, consisting of parallel plates and connecting-strip, made substantially as herein described, and adapted for application to wick-tubes, as set forth.

2. The attachment E for wick-tubes of lamps, formed of sheet metal, with the parallel plates *b b'* and connecting-piece b^3, in combination with the wick-tube C, the attachment being bent around the same, substantially as described.

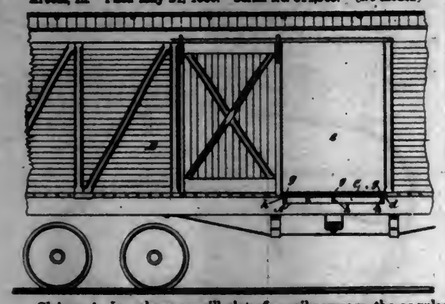
409,402. SEAT-BACK FOR ROAD-CARTS. JOHN D. HOUSE, Lowville, N. Y. Filed June 22, 1889. Serial No. 315,200. (No model.)

Claim.—The herein-described seat for vehicles, the same comprising in combination a seat proper, a back pivotally connected to the seat by means of the rods C, the spiral springs F, arranged upon said rods with one end attached to the seat-bottom and the other to the supporting-rods of the back, and a guard-strap connecting said back with the rear edge of the seat, all arranged and operating substantially as described.



409,403. FLOOR-JACK. WILLIAM W. IRWIN, Silver Lake, Oreg. Filed Nov. 13, 1888. Serial No. 290,053. (No model.)

Claim.—1. In a floor-jack, the combination, with a tongs-like lever, the sections of which spread to form an opening, as B, of clamping-points carried by the lever-sections, a rod or bolt passing through the lever-sections, a presser-foot loosely mounted on the rod or bolt, and a nail-set also mounted on the rod or bolt, substantially as described.

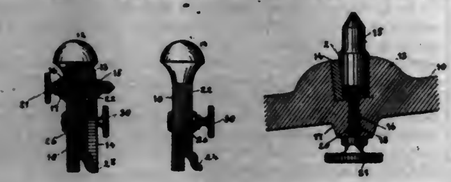


2. In a floor-jack, the combination, with a tongs-like lever, the sections of which spread to form an opening, as B, of clamping-points carried by the lever-sections, a presser-foot 14, carried by the lever-sections, said presser-foot being formed with a flange, as *d*, and a nail-set mounted between the lever-sections, substantially as described.

3. In a floor-jack, the combination, with a tongs-like lever provided with clamping-points, of a presser-foot, connection between the presser-foot and the lever-sections, a block carried by the presser-foot, a spring arranged in connection with the block, and spikes carried by the block, substantially as described.

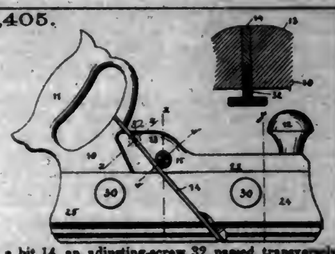
409,403.

409,404. SILL-PLATE FOR RAILWAY-CARS. ERNEST E. JACOBS, Arcola, Ill. Filed May 21, 1889. Serial No. 311,563. (No model.)



Claim.—1. In a doorway sill-plate for railway-cars, the angular plate consisting of floor and outside front portions recessed along their meeting surfaces and provided with a roller arranged to freely rotate within said recessed part of the plate and supported by suitable bearings therein, and having its body arranged to project beyond the exterior surfaces of the floor and outside portions of the plate, substantially as specified.

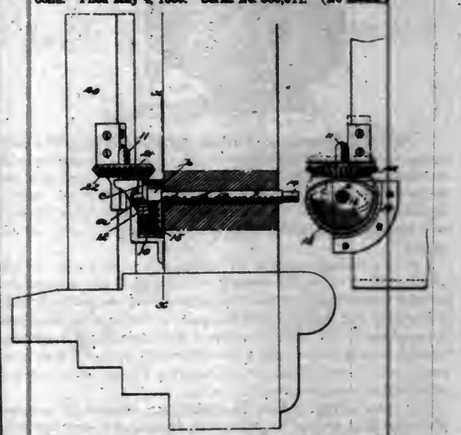
2. In a doorway sill-plate for railway-cars, the angular plate A, having floor and outside portions *b c*, provided with a longitudinal recess *f* where said portions meet, in combination with the roller C, arranged to freely rotate within said recess, with its body portion projecting beyond the exterior surfaces of the portions *b c* and constructed with intermediate and end journals, and detachable bearings *h*, constructed to occupy a sunken position within the body of the roller, essentially as shown and described.



3. As a new article of manufacture, a doorway sill-plate for railway-cars, provided with a projecting roller along its upper front marginal portion, substantially as set forth.

409,405. MOLDING-PLANE. EDWARD D. JOHNSON, Flagstaff, Ariz. Filed Sept. 19, 1888. Serial No. 285,735. (No model.)

Claim.—1. The combination, with a plane-body 10, of formers 24



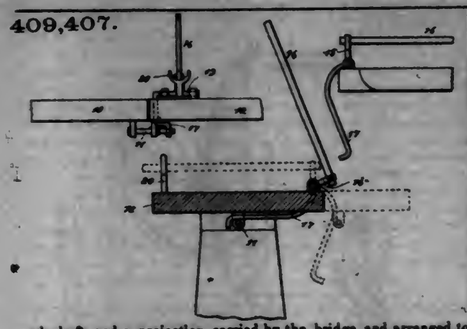
409,405.

and 25, a bit 14, an adjusting-screw 32, passed transversely through the body 10 into engagement with the inner edge of the bit, a wedge-faced clamping-bolt 15, and a screw arranged in connection with said bolt, substantially as described.

2. The combination, with a molding-plane back or body, of formers 24 and 25, formed with grooves that are adapted to receive flanges 26, which project from the plane-body parallel with its lower edge, set-screws by which the formers are clamped to the plane-body, a bit 14, which passes downward between the formers, a wedge-faced clamping-nut, an operating-screw arranged in connection with the nut, and a retaining-pin arranged in connection with the screw, substantially as described.

409,406. SHUTTER-WORKER. RALPH W. JOSLIN, Thomaston, Conn. Filed May 4, 1889. Serial No. 309,611. (No model.)

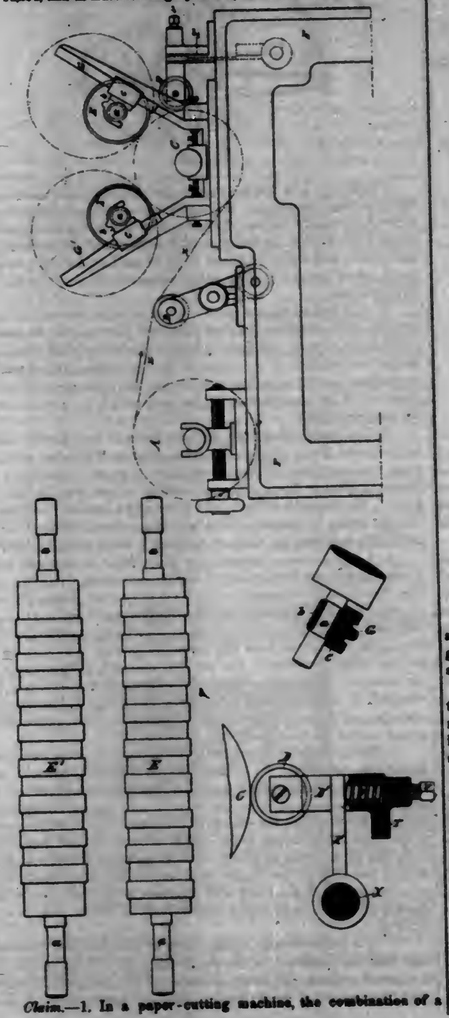
Claim.—1. In a shutter-worker, the combination, with a segmental gear arranged for connection with a shutter, of a shaft carrying a segmental gear for engaging the teeth of the segmental gear carried by the shutter, and an eccentric bearing-face opposite the segmental gear for engaging the under side of the said segmental gear carried by the shutter before and after the gears are in and out of engagement, whereby the shutter will be raised prior to being swung to a closed position and lowered when in the closed position, substantially as and for the purpose set forth.



2. In a shutter-operating device, the combination, with a disk formed with a segmental gear and arranged for connection with a shutter, of a bracket formed with an upwardly-extending pintle which passes through the shutter-disk at a point coincident with the axis of the gear, a shaft carrying a gear 15, having an eccentric-faced flange *e*, the outer end of the shaft being supported in a bearing formed in the bracket, substantially as described.

3. In a shutter-operating device, the combination, with a disk formed with a segmental gear and arranged for connection with a shutter, of a bracket formed with an upwardly-extending pintle which passes through the shutter-disk at a point coincident with the axis of the gear, a stop carried by the bracket, a shaft provided with a segmental gear, and an eccentric flange having a stop, the outer end of the shaft being supported in a bearing formed in the bracket, substantially as described.

409,407. BRIDGE-GATE. CHARLES KIRK, New London, Ohio. Filed May 3, 1889. Serial No. 309,421. (No model.)



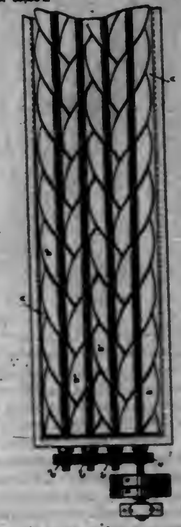
Claim.—In a gate for swinging bridges, the combination, with a rock-shaft provided with a standard 15, of a bridge bar or barrier rigidly connected to said standard, a lever rigidly connected to the

409,407.

rock-shaft, and a projection carried by the bridge and arranged to engage the lever, substantially as described.

409,408. MACHINERY FOR CUTTING AND WINDING STRIPS OF PAPER FOR CIGARETTES OR OTHER PURPOSES. LEONIDE LACROIX, Fils, Maubeuge sur Sabl, France. Filed Mar. 22, 1888. Serial No. 268,166. (No model.) Patented in France Jan. 5, 1887, No. 180,709; in Germany July 14, 1887, No. 42,263; in Spain Aug. 26, 1887, No. 11,251, and in Austria-Hungary Dec. 3, 1887, No. 37,604.

Claim.—1. In a paper-cutting machine, the combination of a feed-cylinder and cutting-disks with two winding-reels bearing on the feed-cylinder, and having on their peripheries rings at a distance apart equal to the width of the rings, and the rings on one reel being in line with the spaces on the other, substantially as described.



2. In a paper-cutting machine, the combination of a feed-cylinder with a cutting apparatus consisting of a cross-piece having guiding-partitions, forks movable therein toward and from the feed-cylinder, screws for adjusting the forks, springs between the forks and screws, and cutting-disks journaled in the forks, as and for the purpose set forth.

3. In a paper-cutting machine, the combination of the feed-cylinder and a series of cutting-disks with the two reels, upon which alternate strips are wound, and both cutting-disks and reels bearing upon the feed-cylinder, and movable bearings for the reels allowing movement away from the cylinder.

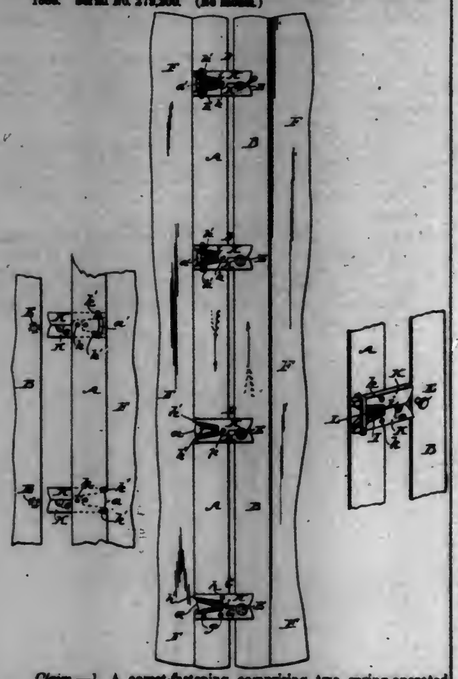
4. In a paper-cutting machine, the combination of a feed-cylinder with cutting apparatus consisting of a guide-piece, forks movable therein toward and from the feed-cylinder, movable plates or rods supporting the forks, and springs in the guide-piece bearing against the forks, and cutting-disks journaled in the forks.

5. In a paper-cutting machine, the combination of a feed-cylinder with cutting apparatus consisting of a guide-piece, forks movable in recesses therein, cutting-disks journaled in the forks, and spring-plates vibrating on a center and supporting the said forks, all substantially as described

409,409. APPARATUS FOR TREATING SOLIDS WITH GASES. CARL LAFFER, London, England. Filed June 20, 1887. Serial No. 241,984. (No model.) Patented in England June 21, 1886, No. 8,201; in Germany July 31, 1886, No. 39,061; in France Dec. 7, 1886, No. 167,701; in Belgium Dec. 30, 1886, No. 66,061, and in Austria-Hungary Dec. 2, 1887, No. 36,840 and No. 49,234.

Claim.—1. The combination of two or more approximately-parallel Archimedean screws having intersecting circles of rotation, and geared so as to rotate synchronously, and a trough A, substantially as and for the purposes described.

2. The combination of the trough A, having inlet E for materials to be mixed, and outlet F for the mixed materials, with two or more rotating conveying and mixing Archimedean screws B B' B², having intersecting circles of rotation and geared to rotate synchronously, substantially as described.



3. In apparatus for chemically treating solid materials with gases, the combination of a long closed chamber A, containing the gases and the materials to be treated therewith, with two or more parallel series of Archimedean screws having intersecting arcs of rotation, whereby the material is stirred up and acted upon by the gases contained in or passing through the upper part of the chamber.

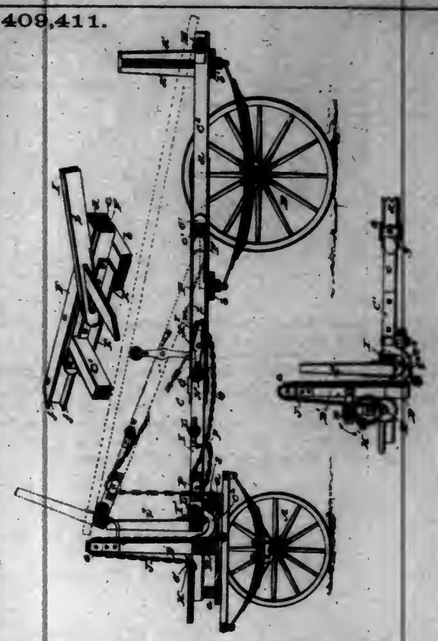
4. In an apparatus for exposing materials to the action of fluids, the combination of two or more lines of mixing, stirring, and conveying screws rotating synchronously among the material to be exposed to the fluid and having intersecting circles of rotation, a closed chamber having its bottom formed to closely follow and contain the cylinders of rotation of the revolving series of screws and contain the gases to which the material stirred is to be subjected, whereby so long as the stirrers in their revolution appear above the material every

part of the material must be violently stirred and thrown up into the gases.

5. An apparatus for treating materials with gases, comprising a closed chamber or trough, a plurality of intersecting spirals or Archimedean screws arranged in parallel positions within said chamber and having intersecting circles of rotation, the edges of the blades of one spiral extending into close proximity to the sides of the blades of the other, preventing adherence thereto of material being treated, substantially as described.

409,410. CORSET-CLASP. JOHN M. V. LE BEAU, New Orleans, La., assignor of one-half to Edward J. Buchinger, same place. Filed July 6, 1888. Serial No. 279,209. (No model.)

Claim.—1. A corset-fastening comprising two spring-operated jaws in vertical alignment, contacting at their adjacent straight longitudinal edges and beveled or inclined inwardly at their outer ends, one of said straight contacting edges being notched, as at *c*, and the stud, whereby the stud may be released by moving it out of the notch and against the adjacent straight edge of the other jaw, or moving the fastener bodily in the opposite direction, substantially as set forth.



2. The combination, with the busk B, having studs E, of the busk A, having fastenings consisting of spring-pressed jaws beveled or rounded at their outer ends toward their meeting edges to guide said studs, the lower jaw of one fastening being relatively fixed, the notches *c* in the upper edges of the several lower jaws, the lower edges of the upper jaws being plain or straight, whereby the studs will open the jaws by pressing against the ends thereof, substantially as set forth.

3. A corset-clasp comprising two busks, one provided with a series of fastenings having movable or spring-actuated jaws, and the other having a series of pins or buttons adapted for engagement with the fastenings, and the movable jaws of the fastenings having lips or guides which are hooked around at the back of the busk to which they are attached, the busk having curved surfaces at the points where the lips hook around it, substantially as herein set forth.

4. In a corset-clasp, the combination, with a busk A, of a fastening comprising a fixed jaw G, having a notch *c* in its upper edge, a movable jaw H, a spring closing said jaw, a series of fastenings comprising two movable spring-actuated jaws K K, the lower ones having notches *c*, and a busk B, provided with series of pins or buttons E, adapted to enter the notches *c* of the fastenings, substantially as described, for the purposes set forth.

409,411. LUMBER-WAGON. WILLIAM LOMBARDY and JOHN H. LOMBARDY, Baltimore, Md., assignors to the Lombardy Wagon Manufacturing Company, same place. Filed Dec. 12, 1888. Serial No. 293,267. (No model.)

409,411.

Claim.—1. In a lumber-wagon, the combination, with the main frame or body portion and the windlass mechanism secured thereto, of the supplemental frame I, having a movable bearing at its rear end on the body portion, its forward end connected with the said windlass mechanism, said frame I adapted to be moved forward while its front end is raised upward by the windlass, substantially as and for the purpose specified.

2. In a lumber-wagon, the combination, with the main or body portion, of the supplemental frame disposed between the side beams of the body portion, said frame having a movable pivotal bearing at its rear end on the said side bars of the main frame, and a windlass mechanism secured upon the main frame and connected to the forward end of the supplemental frame, substantially as shown, and for the purpose specified.

3. The combination, with the main frame or body portion, of the supplemental frame I, disposed between the side beams of the main frame, said supplemental frame consisting of parallel side bars *i i*, a forward cross-bar I', and transverse rollers L L, journaled in the side bars *i i*, the rear ends of said bars *i i* having a movable bearing in the side beams of the main frame, and means for elevating the front end of the supplemental frame, substantially as shown and described.

4. A lumber-wagon consisting of the trucks A B, the main frame C, consisting of the fixed portion C' and the rearwardly-extensible portion C², a cross-bar mounted on the front truck and connected with the fixed frame C', standards mounted on the cross-bars, and the supplemental frame I, disposed upon the fixed portion C', having a pivotal bearing at its rear end upon said frame, its forward end disposed to the rear of the cross-bar D, and windlass mechanism H', mounted to the cross-bar, and a chain connected to said windlass, passed over the standards D', and connected to the lower front edge of the frame I, whereby said frame may be elevated at its forward end, substantially as and for the purpose described.

5. The combination, with the truck-frames, the main frame supported thereon, pulleys *p p*, journaled in the forward portion of said frame, and the supplemental frame I, arranged as described, of the adjustable bearing secured to said frame I, said bearing consisting of the arms M, pivotal on the arms *i i* of the frame, a roller N, journaled in the upper ends of said arms, chains connected at one end to the lower end of the arms M, passed over the pulleys *p p*, and connected at their free ends to main frame when the bearing-rollers are in their lower position, and connected with the front truck-frame when said bearing-roller N is to be raised, substantially as and for the purpose set forth.

6. In a lumber-wagon, substantially as described, the combination, with the beams *c d*, of the clip device G for holding said beams in adjusted positions, said device consisting of the C-shaped clip passed about the beams *c d*, the cross-bar *g*, and the adjusting-screw *g*², passing through said bar and bearing against the bar *d*, substantially as and for the purpose described.

7. In a lumber-wagon, the combination, with the trucks A B, the cross-bar D, mounted thereon, the raising mechanism secured thereto, the main frame C, supported on the trucks, said frame consisting of the stationary portion C', composed of the side bars *c c* and the end bar *d*, said bars connected at their forward ends to the cross-bar D, the movable portion C², consisting of the side beams *d d*, embracing the beams *c c* of frame C', and a transverse roller-bearing R, journaled in the rear ends of said beams *d d*, of the supplemental frame I, consisting of the side beams *i i*, disposed within the forward ends of the beams *c c*, a transverse beam I', connecting the forward end of said beams *i i*, and roller-bearings L L, journaled transversely in said beams, said beams having a pivotal bearing at their rear ends upon the beams *c c* and connected at their forward ends with the raising mechanism, substantially as and for the purpose described.

409,412. TENSION-REGULATING DEVICE FOR DRIVING-BANDS OF SPINNING-MACHINES. EMILE MARESTAING, Providence, R. I. Filed Apr. 27, 1887. Serial No. 236,200. (No model.) Patented in England May 7, 1887, No. 6,749; in France Nov. 26, 1887, No. 187,264, and in Belgium Dec. 1, 1887, No. 79,749.

Claim.—1. The combination of a set of spindles comprising a row on each side of the machine, an intermediate driving-drum occupying a mid-plane in respect to the whirls, and a single band driving first one row and then the other row of said spindles, passing alternately around the drum and around a spindle-whirl and passing over and in contact with the drum in crossing from row to row at one end of the set and under and in contact with the drum in crossing from row to row at the opposite end of the set, and a tension device acting directly upon the band between two successive points of driving-contact of said band, substantially as specified.

2. The combination of a row of spindles, a driving-drum therefor, an endless band passing alternately around the drum and around a spindle-whirl, and having a special tension-loop formed by carrying the band outward from the drum and thence back to said drum, and a tension-pulley applied to said special tension-loop of the band, substantially as specified.

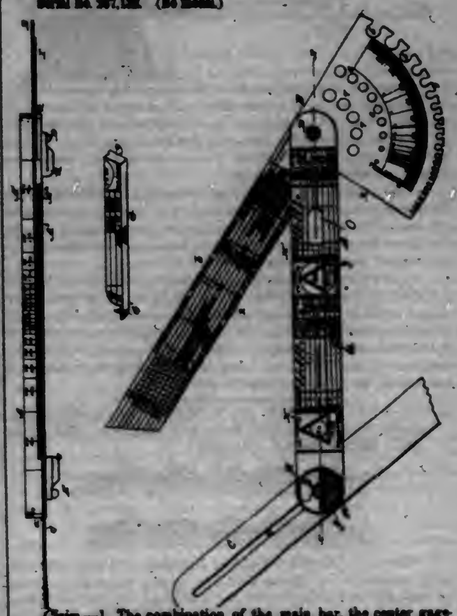
3. The combination of a row of spindles, a driving-drum therefor, a driving-band passing alternately around the drum and around a spindle-whirl, and a tension device located in a different horizontal plane from that of the drum and applied to the band in a loop extending from the drum, substantially as specified.

4. The combination of a series of spindles, a driving-drum therefor, a driving-band passing alternately around the drum and around a spindle-whirl, and a tension device applied to the band in a loop extending from the drum, the pulley of said tension device being inclined in respect to the axis of the drum, whereby it directs the band from the front of the drum at one end of the series of spindles to the rear of the drum at the opposite end of said series, substantially as specified.

409,413. END-GATE FOR WAGONS. SAMUEL J. MASON, Mead, Neb. Filed May 14, 1889. Serial No. 310,708. (No model.)

Claim.—1. The combination of the flat metal combined re-enforcing and hinge wagon-plate B, extending the full width of the rear end of the wagon and formed at its outer edge with the hinges B², and the gate hinge-plate D, having the hinges at its lower edge and hinged to said wagon-plate, substantially as set forth.

2. The combination, with a wagon-body having a hinged end-gate, of the levers G, pivoted near their lower ends to the wagon-body, and the connecting-rods I, pivoted at one end to the gate and at their other ends to the levers G, near the upper ends of the same, substantially as set forth.



3. The combination, with a wagon-body having a hinged end-gate, of the levers G, pivoted near their lower ends to the wagon-body and formed at their lower ends with the steps G', and the connecting-rods I, pivoted at one end to the gate and at their other ends to the levers G, near the upper ends of the same, substantially as set forth.

4. The combination, with a wagon, of the end-gate, the pivoted levers and pivoted connecting-rods, and the hinge formed of the wagon and gate hinge-plates, and the removable hinge-rod, substantially as set forth.

5. The combination, with a wagon, of the end-gate, the pivoted levers and pivoted connecting-rods and the gate hinge-plate, the wagon-plate hinged to the gate-plate and formed with the transverse slots, and the threaded bolts having the nuts, substantially as set forth.

6. The combination, with a wagon, of the end-gate, the pivoted levers and pivoted connecting-rods, the gate hinge-plate, the wagon hinge-plate formed with the transverse slots, the removable hinge-rod, and the threaded bolts having the nuts on their lower ends, substantially as set forth.

409,414. COMBINED BEVEL, PROTRACTOR, GAGE, CENTER-SQUARE, &c. ALPHEUS B. MIMS, Dallas, Tex. Filed Mar. 12, 1888. Serial No. 267,122. (No model.)

Claim.—1. The combination of the main bar, the center gage-plate having a recess formed with diverging walls, fastenings for securing the gage-plate to the main bar, with the side edge of such bar at right angles to a line equally dividing the angle between the walls of the recess in the gage-plate, and a blade B, connected with said main bar, all substantially as described, whereby when blade B is turned at right angles to the main bar one of the edges of said blade will equally divide the angle between the walls of the recess in the gage-plate, substantially as set forth.

2. The combination of the main bar having studs j^3, the plate J, having recess *j*, and openings j^3 to receive studs j^3, and the quadrant-plate having the edge of its blade equally dividing the angle between the walls of recess *j*, substantially as set forth.

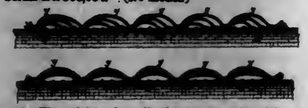
3. A compound tool, substantially as described, comprising the body A, having a level, the inclinometer-blade pivoted to such body, the pivoted pointer, the graduations along which said pointer registers, and the quadrant pivoted to said body, all substantially as set forth.

4. The compound tool comprising the body A, the plate C, having slot *c*, the screw connecting said plate C to the body, the pointer F, and the graduations *f*, along which said pointer registers, the quadrant-plate pivoted to the body and having its head formed with a curved edge, and having graduations forming a protractor, and having openings in said curved edge forming a metal gage, openings being made through said head, forming screw and head gages, substantially as set forth.

5. The compound tool herein described, comprising the body A, the quadrant-plate pivoted thereto, and the thread-gage I, pivoted to the body, substantially as and for the purposes specified.

6. The improved compound tool herein described, consisting of the body A, having slots *a a'* formed from its opposite ends, and having a socket F and graduations *f*, the level on said body, the plate C, the screw for pivoting said plate C to the body, the pivoted pointer registering along graduations *f*, the quadrant-plate having a head and a shank, the latter being fitted to slot *a*, and the head having wire and metal gage, the screw for pivoting the quadrant-plate to the body, and the thread-gage, also pivoted on said screw between the quadrant-plate and the strip A^3 of the body, all substantially as and for the purposes specified.

409,415. LIQUID BLACKING BOX. PAUL G. METZLER and RODERIC S. DAVIS, Leadville, Colo. Filed Jan. 4, 1889. Serial No. 295,425. (No model.)



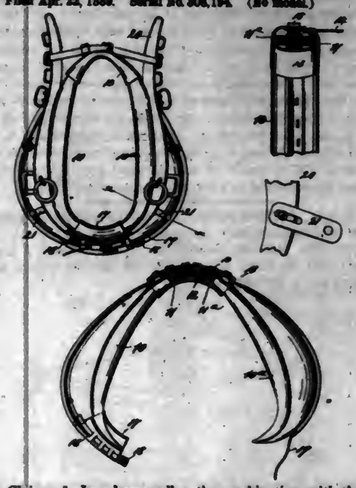
Claim.—1. The combination, with an ordinary dauber 11, having its handle and head in one piece and provided with a hole 13 through its head, of a box 10 on top of the head and provided with an outlet-tube 12, entering said hole, flexible clips or wings 19, bent around the edge of the head, and a valve operating over said outlet-let-tube, substantially as set forth.

2. As an improved article of manufacture, a liquid-blacking box for ordinary daubers, consisting in the box 10, having an outlet-tube 12, a valve therefor provided with an operating-rod extending through the top of the box, and a circularly-arranged series of flexible clips or wings 19, substantially as set forth.

3. As an improved article of manufacture, a liquid-blacking box for ordinary daubers, consisting in the box 10, having a circularly-arranged series of flexible attaching-clips 19, an outlet-tube 12, a crank-shaft 16, extending through the top and provided at its lower end with a horizontal arm having a valve 18 thereon and an operating-handle at its upper end, and a stop 18^a in the bottom of the box to one side of the tube 12, substantially as set forth.

409,416. TRIMMING FOR FABRICS. JOSEPH D. MORLEY, Philadelphia, Pa., assignor to Scott, Morley & Co., same place. Filed Apr. 26, 1889. Serial No. 308,964. (No model.)

Claim.—1. The within-described trimming for fabrics, said trimming consisting of a festoon border or edging composed of a row of overedge stitches applied to the raw or cut edge of the fabric, and festoon-loops confined to the fabric by certain of such overedge stitches, a series of stitches being formed between the successive points of connection of the festoon-loops, and these intervening stitches confining the raw or cut edge of the fabric between such points of connection of the festoon-loops, substantially as specified.



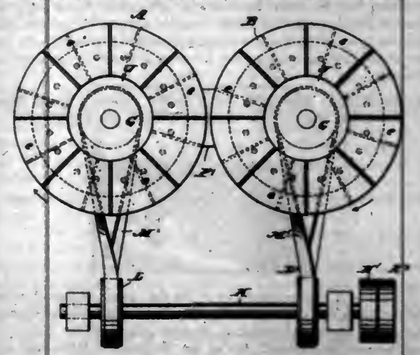
2. The within-described trimming for fabrics, said trimming consisting of a festoon border or edging composed of a row of overedge stitches and multiple-thread festoon-loops confined by said stitches to the edge of the fabric, the loops having their component threads spread, so as to be confined by different stitches of the binding row, substantially as specified.

409,417. PADDED HAT. JESSE H. MOYER, Temple, Tex. Filed Apr. 15, 1889. Serial No. 307,300. (No model.)

Claim.—The combination, with a hat, of the strip B, of fibrous material, arranged between the sweat-band and the body of the hat and provided with the hooks *c*, projecting from one edge and engaging the body of the hat to hold the said pad in position, substantially as herein shown and described.

409,418. HORSE-COLLAR. WILLIAM MEER, Fountain City, Wis. Filed Apr. 22, 1889. Serial No. 308,194. (No model.)

Claim.—1. In a horse-collar, the combination, with the sections 10 and 10^a, having their upper ends adjustably connected together, of the shield 13, receiving the said upper ends and provided with the flap 14, substantially as described.



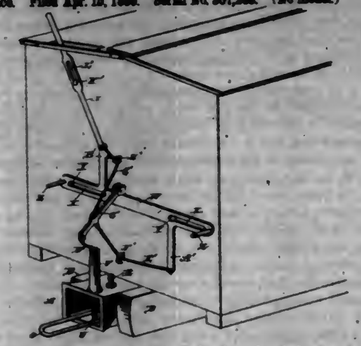
2. In a horse-collar, the combination, with the sections 10 and 10^a, having their upper ends adjustably connected together, of the shield 13, having its edges united by the lacing-strip 15, and provided with the flap 14, substantially as herein shown and described.

3. In a horse-collar, the combinations of the sections 10 and 10^a, provided with the apertured flaps 11 and 11^a, the lacing-strip 12, and the shield 13, substantially as described.

4. A horse-collar consisting of the sections 10 and 10^a, provided with the apertured flaps 11 and 11^a, the lacing-strip 12, the shield 13, the straps 16 and 19, secured to the lower ends of the sections, and the housing 17, receiving the said lower ends of the sections, substantially as herein shown and described.

5. The combination, with the collar herein described, formed of the sections 10 10^a, united at top and bottom, substantially as described, of the hames 20, the plates 21, secured to the hames, and the set-screws 22, substantially as set forth.

409,419. MACHINE FOR GRINDING AND POLISHING STONE. JOHN MCBERNEY, New York, N. Y., assignor of one-third to Moses Roth, same place. Filed July 18, 1888. Serial No. 280,301. (No model.)

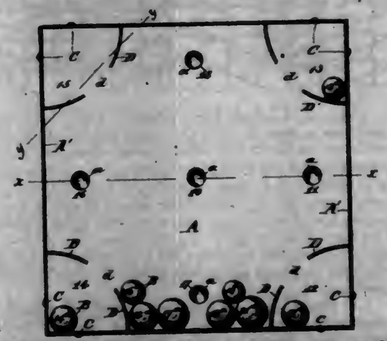


Claim.—1. In a machine for grinding and polishing stone, a grinding-disk consisting of a series of spaced segmental plates having beveled side edges, substantially as shown and described.

2. In a machine for grinding and polishing stone, a grinding-disk consisting of a series of segmental plates having beveled side edges, one edge of one plate overlapping but not touching the juxtaposed edge of the adjacent plate, substantially as shown and described.

3. In a machine for grinding and polishing stone, the combination, with two aligning vertical shafts mounted to turn in suitable bearings, and each provided with a belt-pulley, and disks rigidly mounted upon the upper ends of said shafts, of grinding-disks fixed to said rigidly-mounted disks, and consisting of a series of segmental plates having beveled side edges, one edge of one plate overlapping but not touching the juxtaposed edge of the adjacent plate, and means for rotating said shafts and disks, substantially as shown and described.

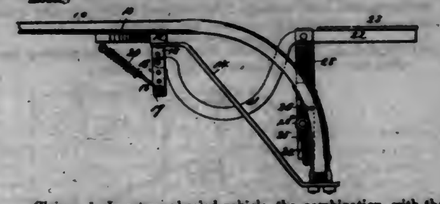
409,420. CAR-COUPLING. NELSON NEWMAN, Springfield, Ill., assignor of two-thirds to George A. Sanders and Samuel J. Willett, same place. Filed Apr. 15, 1889. Serial No. 307,982. (No model.)



Claim.—1. The combination of the draw-heads having the pairs of coupling-pins U R, one in advance of the other, the spring-pressed link-holders K, arranged in the draw-heads and having the transverse open slots N, to receive and retain the inner ends of the links, and vertical open slots for the pins R, to enable said pins to retain said inner ends of the links in the holders, said slots N being of greater depth than the said slots P, and the pair of coupling-links O, substantially as described.

2. In a car-coupling, the combination, with the draw-head and coupling-pin, of the longitudinally-movable bar W, the vertically-movable lever-arm C', the chain connecting the latter to the coupling-pin, the hand-lever I', connected to the bar W, and the chains connecting the lever-arm C to said bar at opposite ends of the latter and at points above and below the lever-arm C', respectively, substantially as described.

3. In a car-coupling, the combination, with the draw-head and coupling-pin, of the lever-arm C', the chain connecting the same to the pin, the longitudinally-movable rod W, having the arms A' B' extending from its lower and upper sides, the chains connecting the lever-arm C to the extremities of said arms A' B', and the guides for said chains, substantially as described.



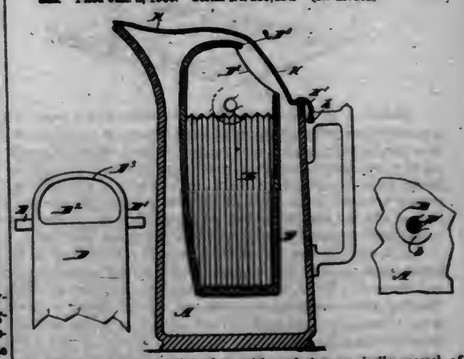
409,421. TOY. GEORGE W. HERRAUM, Lehighton, Pa. Filed Apr. 11, 1889. Serial No. 306,819. (No model.)

Claim.—1. The herein-described toy, consisting of the board having flanges or sides surrounding the same, pockets arranged at diagonally-opposite points, each pocket having an opening therein, depressions made in the board at the center and at diametrically-opposite points, said pockets and depressions being differently marked, and a series of balls corresponding in number to the number of pockets and depressions collectively, each ball having a mark corresponding to that of a certain pocket or depression, substantially as shown and described.

2. The herein-described toy, consisting of the rectangular board A, having the sides or flanges A', the pockets D at each corner, having openings *d* opening into the box-like structure, the depressions *a*, arranged between the pockets and at the center of the board, each pocket and depression having a certain mark, and a series of balls B, corresponding in number to the sum of the pockets and depressions, and each ball having a mark corresponding to the mark of a certain pocket or depression, substantially as shown and described.

409,422. TWO-WHEELED VEHICLE. JAMES R. PARRY and JESSE KIRKALL, New Madrid, Mo. Filed May 21, 1889. Serial No. 311,886. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination, with the thills and their cross-bars, of a bracket attached to one of the cross-bars near each end, apertured plates pivoted in said brackets, a spring connecting the plates and the forward thill cross-bar, and a curved seat-support pivoted at one end between the apertured plates and spring-supported near the opposite end, substantially as shown and described.



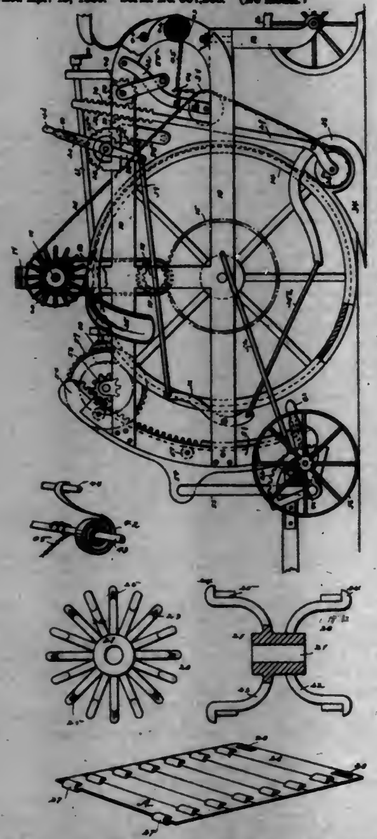
2. In a two-wheeled vehicle, the combination, with the thills and cross-bars connecting the same, apertured perpendicular plates pivoted in pairs beneath the rear cross bar of the thills, and a spring connecting each pair of plates with the forward cross-bar, of seat-supports, each comprising a forward curved section and a rearward horizontal section, the extremities of the forward curved sections being respectively pivoted between the apertured plates, and springs supported between the thills and attached to the horizontal section of each seat-bar, substantially as shown and described.

3. In a two-wheeled vehicle, the combination, with the thills, the axle, the thill cross-bars, seat-bars adjustably pivoted at their forward ends to the rear thill-bar, and springs connecting the pivotal support of the seat-bars and the forward thill-bar, of a rocking bolster and springs secured to the said bolster and to the rear portion of the seat-bars, substantially as shown and described.

4. In a two-wheeled vehicle, the combination, with the thills, the axle, the thill-bars, and seat-bars adjustably secured at their forward ends to the thill-bars, of a rocking bolster and springs attached to the said bolster and to the rear portion of the seat-bars, all combined for operation substantially as shown and described.

5. In a two-wheeled vehicle, the combination, with the thills and the thill cross-bars, of apertured plates pivoted in pairs near each end of one thill cross-bar, springs connecting each pair of plates with the forward thill cross-bar, and seat-supporting bars adjustably pivoted at their inner ends between the several pairs of apertured plates, substantially as and for the purpose specified.

409,423. ICE-PITCHER. EDWARD PLATTER, Ottawa, Ontario, Canada. Filed Jan. 2, 1889. Serial No. 295,124. (No model.)



Claim.—1. The combination, with a pitcher or similar vessel, of an ice receptacle or chamber detachably pivoted thereto, substantially as shown and described.

2. The combination, with a pitcher or similar vessel having sockets formed upon the inner face, of an ice-receptacle provided with trunnions adapted to be journaled in the sockets of the vessel, substantially as shown and described.

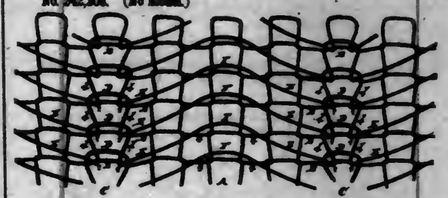
3. The combination, with a pitcher or similar vessel provided with sockets formed upon the inner face, of an ice-receptacle having an opening in the top at the rear, and trunnions attached to opposite sides of the said receptacle adapted to be journaled in the said sockets, all combined for operation substantially as shown and described.

4. The combination, with a pitcher or similar vessel provided with sockets formed upon the inner face and a cover detachably secured to said vessel, of a longitudinally-fluted ice-receptacle provided with an opening in the top at the rear, and trunnions attached to the said receptacle upon opposite sides, adapted to be journaled in the said sockets, substantially as shown and described.

409,424. TILE-DITCHER. HERMAN I. POTTER, Leonardsburg, Ohio. Filed Apr. 15, 1889. Serial No. 307,260. (No model.)

Claim.—1. In a tile-ditcher, the combination, with a frame, and a channeled elevating-wheel pivoted in said frame, of a belt-carrying wheel journaled in the frame above the elevating-wheel and consisting of a hub and two series of curved arms alternately arranged projecting from the said hub, each arm provided with an attached horizontally-arranged block, a belt passing over the carrying-wheel to a contact with the elevating-wheel, and adjustable friction-pulleys contacting with the said belt, substantially as shown and described.

2. In a tile-ditcher, the combination, with a frame and an elevating-wheel provided with a peripheral channel and journaled in the said frame, of a belt-carrying wheel journaled in the frame above the elevating-wheel, consisting of a hub and opposed series of curved arms radiating from the said hub and laterally arranged, each arm provided with a horizontal block having an angular surface, a belt passing over the carrying-wheel in contact with the elevating-wheel and consisting of a series of plates united by hooks integral with the edge of one plate and passing through apertures in the next plate, which hooks project from the inner surface of the belt, and friction or tension pulleys held in contact with the said inner surface of the belt, substantially as shown and described.



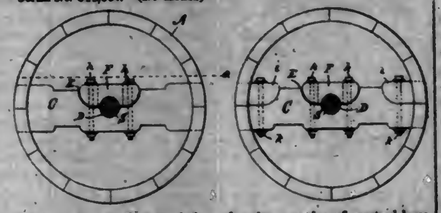
3. In a tile-ditcher, the combination, with a frame, an elevating-wheel journaled in the said frame and having a channeled periphery, and a carrying wheel or pulley journaled above the elevating-wheel, consisting of a hub and opposed series of curved arms radiating from the hub and laterally arranged, each arm provided with a horizontal block having an angular surface, of a belt consisting of a series of united plates having hooks projected from its under surface near its ends, said belt passing over the carrying-pulley in contact with the channel of the elevating-wheel, a friction-pulley contacting with the inner face of the belt at its lower end, a second friction-pulley contacting with the outer web of the belt at or near the center of its length, said pulley being journaled in a swinging hanger, a spring-actuated shaft journaled in the frame, and a chain attached to the said shaft and to the swinging hanger, all combined for operation substantially as shown and described.

4. In a tile-ditcher, the combination, with a frame, an elevating-wheel journaled in the said frame and provided with a channeled periphery, a belt-carrying pulley journaled in the frame above the elevating-wheel, and a belt passing over the said pulley in contact with the channel of the elevating-wheel, of a friction-pulley contacting with the belt at its lower end, a second friction-pulley contacting with the outer web of the belt at or near its center and journaled in the swinging hanger, a shaft journaled in the frame, a spring secured to the shaft, coiled around the same, and rigidly attached to the frame, and a chain attached to the spring-carrying shaft and to the said swinging hanger, all combined for operation substantially as shown and described, whereby the belt may be tightened or loosened, as desired, by lengthening or shortening the chain, as set forth.

5. In a tile-ditcher carrying an endless belt, the combination, with a pulley consisting of a hub and opposed series of outwardly-curved arms alternately arranged, each arm provided with a horizontal block having an angular face, of a belt adapted to travel over and be carried by the said pulley, said belt consisting of a series of plates, each plate being provided with hooks formed upon one edge near its outer end, and transversely-aligning horizontal slots in its opposite edge and united by the hooks of one plate passing through the slots in the next plate, all combined for operation substantially as shown and described.

6. In a tile-ditcher, the combination, with a forward arch having a segmental rack secured to each extremity, of levers pivoted to the extremities of the arch provided with latches engaging the segmental racks, and forward drive-wheels journaled upon the said levers, substantially as shown and described, whereby the forward wheels may be raised or lowered together or separately and without interfering with the body of the machine, substantially as and for the purpose specified.

409,425. KNITTED FABRIC. HENRY PERSEN, Philadelphia, Pa., assignor to Klauder & Brother, same place. Filed June 23, 1887. Serial No. 242,208. (No model.)



Claim.—1. A knitted fabric formed of two or more separate threads, one or more of which are knitted together for forming the body-loops, and the other or others of which threads are formed into pattern-loops and interlaced with the body portion to form a pattern, and in which the body-loops are grouped in horizontal rows of three or more loops, and the pattern-loops are one or more in number in the same horizontal line, those loops of the same line in different parts of the fabric being formed of the same thread, and the connecting threads of the pattern-loops being tied to the body portion by passing back of the body-loops and in front of the body-thread between the loops thereof.

2. A knitted fabric formed of two or more separate threads, one or more of which threads are knitted to form body-loops, and the other or others of which threads are knitted into figure or pattern loops in the same horizontal lines, the parts being interlaced together to form a single fabric having a figured face, and in which the threads connecting the isolated figure or pattern loops appear upon the back and are tied into the fabric at one or more places in their length by the threads forming the body portion.

3. A knitted fabric formed of two or more separate threads, one or more of which threads form the body-loops A and bars B, and the other or others of which form the pattern-loops C, consisting of the loops D, held in contact with each other by the bars B, whereby the said loops D are connected in line without passing through each other.

4. A knitted fabric formed of two or more separate threads, one or more of which are knitted together for forming the body-loops, and the other or others of which threads are formed into pattern-loops and interlaced with the body portion to form a pattern, and in which the body-loops are grouped in horizontal rows of three or more loops, which groups are separated by unlooped lengths of threads, and the pattern-loops are one or more in number in the same horizontal line, and are arranged in front of the unlooped lengths of thread connecting the groups of body-loops, these pattern-loops of the same line in different parts of the fabric being formed of the same thread, and the connecting threads of the pattern-loops being tied to the body portion by passing back of the body-loops and in front of the body-thread between the loops thereof.

409,426. WOODEN PULLEY. MILTON O. REEVES, Columbus, Ind., assignor to the Reeves Pulley Company, same place. Filed May 28, 1889. Serial No. 311,887. (No model.)

Claim.—1. A pulley consisting of a rim, a series of central bars secured to and extending diametrically from side to side of said rim, arranged side by side, and having open spaces between them parallel with the circumferential plane of the pulley, said central bars having a central hole passing transversely through them, and an open recess in one edge communicating with said central hole, a cap fitted in said edge opening, and clamping-bolts passing through said cap and between said bars, whereby said cap and bars may be drawn together and the pulley secured to a shaft, all combined substantially as set forth.

2. A pulley having a rim composed of several layers of wooden segments, a series of central bars extending diametrically from side to side of said rim and having their ends built into and forming a part of the rim, said bars having spaces between them parallel with the circumferential plane of the pulley, a central hole passing transversely through said bars, an open recess formed in one edge of the bars and communicating with the central hole, a cap fitted in said edge opening, and clamping-bolts passing through said cap and between said bars, all combined substantially as set forth.

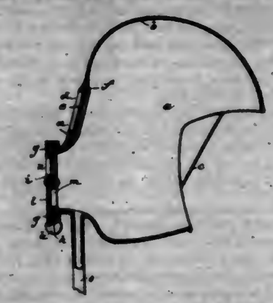
3. In a pulley, the combination of the segmental rim and the series of thin flat bars extending from side to side of the rim, with open spaces between them parallel with the circumferential plane of the pulley, and having their ends secured in the rim and forming therefor a compound diametrical cross-bar, as set forth.

4. In a wooden pulley, the combination, with the compound diametrical cross-bar consisting of a series of flat bars having their ends secured in the rim of the pulley and arranged side by side, with open spaces between them parallel with the circumferential plane of the pulley, and having a central hole adapted to receive a shaft, of the cap having a solid central portion provided with a groove adapted to co-operate with the hole in the cross-bar to receive a shaft, and provided at its ends with open slots which register with the spaces between the bars of the cross-bar, substantially as and for the purpose set forth.

5. In a separable pulley, the combination of a rim consisting of two substantially-equal diametrically-separable sections, means for securing said sections together, a cross-bar connecting the ends of one of said rim-sections, and having a central hole passing transversely through the cross-bar, and a recess in one edge communicating with said central hole, a cap fitted in said recess, and clamping-bolts arranged to draw said cap and cross-bar together, whereby one section of the rim may be first secured to a shaft and the other section of the rim afterward secured to the first, substantially as specified.

6. In a separable pulley, the combination of the rim consisting of two substantially-equal diametrically-separable sections, the compound cross-bar consisting of a series of thin flat bars having their ends secured to one of said rim-sections and arranged side by side, with open spaces between them parallel with the circumferential plane of the pulley, the series of short sections *i i*, secured to and projecting inward from the ends of the other rim-section, said sections *i i* having open spaces between them arranged to register with the open spaces in the cross-bar, and the bolts arranged in said open spaces and adapted to engage the cross-bar and the sections *i* and to clamp the two rim-sections together, all substantially as specified.

409,427. SPLIT PULLEY. MILTON O. REEVES, Columbus, Ind., assignor to the Reeves Pulley Company, same place. Filed Mar. 20, 1889. Serial No. 313,936. (No model.)

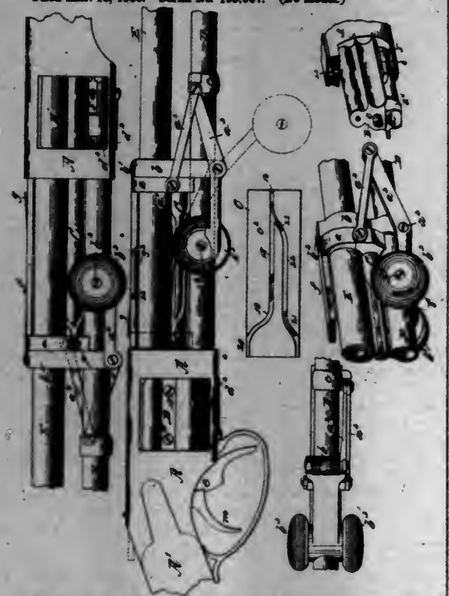


Claim.—1. In a split pulley, the two semicircular rim-sections each having a diametrical cross-bar, one of which cross-bars is provided with a groove adapted to receive a shaft, the cap having a semicircular groove and provided with a set-screw projecting into said groove, means for clamping said cap and cross-bar together, so as to embrace the shaft between them, and the bolts for clamping the two pulley-sections together, all combined and arranged substantially as specified.

2. In a split pulley, the two semicircular rim-sections each having a compound diametrical cross-bar, said bar consisting of a series of thin flat bars having their ends secured in the rim and arranged side by side, with open spaces between them parallel with the plane of the pulley, one of said compound cross-bars having a central groove adapted to receive one side of a shaft, a cap adapted to receive the opposite side of the shaft and provided with a set-screw, means for clamping said cap and cross-bars together so as to embrace the shaft between them, and bolts arranged in the spaces between the members of the compound cross-bars so as to engage the bars of both rim-sections and clamp them together, all combined substantially as specified.

3. In a split pulley having two sections each provided with a diametrical cross-bar, the combination, with one of said cross-bars having a central semicircular groove across its edge, of the semicircular bushing fitted in said groove and adapted to receive one side of a shaft, and the cap adapted to receive the opposite side of the shaft and to be clamped to the cross-bar and arranged to overlap the edges of the bushing so as to prevent it from turning, substantially as specified.

409,428. FIREMAN'S MASK. THOMAS E. REMEY, Portland, Oreg. Filed May 15, 1889. Serial No. 310,834. (No model.)



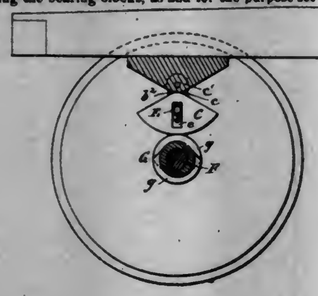
Claim.—1. The combination, with the body of the mask having a mouth-opening, of a shutter pivoted to the body and provided with two openings adapted to register with the mouth-opening, one of the said openings being fitted with porous material, substantially as and for the purpose set forth.

2. The combination, with the body of the mask having the mouth-opening *m* and provided with the flange *g* around the said opening, of the pivoted shutter *i*, having an internal groove to receive the said flange and provided with the openings *l n*, the opening *l* being fitted with porous material, substantially as herein shown and described.

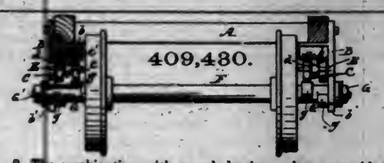
3. The herein-described mask, consisting of the body portion *a b*, provided with two sight-openings *d*, covered with glass or mica *c*, a mouth-opening *m* below the sight-openings, an apertured shutter *i*, pivoted above the mouth-opening and provided with two openings *l n*, the opening *l* being filled with sponge, and the flexible pipe *o*, connected to the lower part of the mask, as specified.

409,429. MAGAZINE-GUN. SYLVESTER H. ROPER, Boston, Mass. Filed Mar. 18, 1886. Serial No. 195,667. (No model.)

Claim.—1. In a magazine fire-arm, the rotatable carrier B and its rigidly-attached cam-rod C, and the sliding guided loop or block and stud *p* therein to engage the cam-rod, combined with a link pivoted to the said block and with a lever to effect the intermittent rotation of the cam-rod and carrier by the longitudinal movement of the said loop or block, substantially as described.



2. The rotatable carrier, its rigidly-attached cam-rod, the longitudinally-movable guided loop *a*, having a stud *p* co-operating with the said cam-rod, and the pivoted link a^3, attached to the said loop, combined with the lever a^2, connected to the link at one end, and provided with loose buttons at its unconnected end, substantially as described.

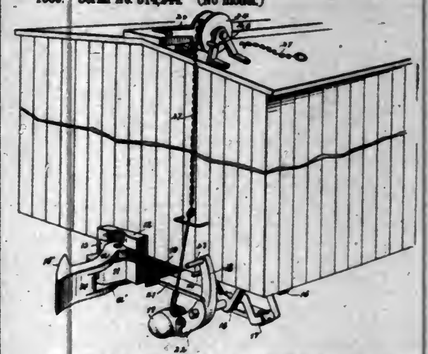


3. The rotatable cam-rod, a longitudinally-sliding block or loop thereon, having a stud to engage said cam-rod, a rotatable carrier rigidly attached to the cam-rod, and the fixed bracket *b*, combined with the lever a^2, fulcrumed upon said bracket and concaved at b^2, and a link connecting the said loop or block and lever, whereby movement of the lever imparts a longitudinal movement to the said loop or block, substantially as described.

4. In a magazine fire-arm, the rotatable carrier, its rigidly-attached cam-rod, the loop or block thereon, and the magazine having the lever-guard *c* attached thereto, combined with the bracket *b* and lever a^2, pivoted upon the lower end thereof and connected with the said loop or block, the guard preventing displacement of the lever a^2, substantially as described.

409,430. ANTI-FRICTION-BEARING. WILLIAM H. ROSS, Sparta, N. J. Filed June 26, 1889. Serial No. 315,622. (No model.)

Claim.—1. The combination, with an axle provided with two or more sectors, of bearing-blocks pivotally secured to a car-hanger and having curvilinear bearing-faces, and a horizontally-swinging lever engaging the bearing-blocks, as and for the purpose set forth.



409,430.

2. The combination, with an axle having a sleeve provided with two or more sectors, of bearing-blocks pivotally secured to a hanger and having curvilinear bearing-faces, and a horizontally-swinging lever engaging the bearing-blocks, substantially as shown and described.

3. The combination, with the hangers B, of the bearing-blocks C, having ears *c*, the lever E, engaging in slots in the blocks C, and the sleeve G, provided with sectors *g* on the axle, substantially as shown and described.

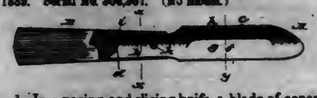
409,431. CAR-COUPLING. JOHN H. SMITH, JULIUS F. KNOTH, GEORGE THOMPSON, and JULIUS EWALD, Fairchild, Wis. Filed June 14, 1889. Serial No. 314,244. (No model.)

Claim.—1. In a car-coupler, the combination, with a draw-head, of a knuckle having a bifurcated inner end pivoted upon the draw-head to have lateral movement thereon, and a counterpoise trip-lever connected with the said knuckle, substantially as shown and described.

2. In a car-coupler, the combination, with a draw-head and a knuckle pivoted thereon capable of lateral movement, of a crank-shaft, a link-connection between the crank-shaft and the inner end of the knuckle, and a counterpoise trip-lever secured upon one end of the crank-shaft, all combined for operation substantially as shown and described.

3. In a car-coupler, the combination, with a draw-head provided with a link-opening, and a knuckle having a bifurcated inner end pivoted upon the draw-head and capable of lateral movement, of a crank-shaft journaled beneath the car, a link connecting the crank-shaft and inner end of the knuckle, a trip-lever weighted at its lower end secured to one end of the crank-shaft, and means, substantially as shown and described, for elevating the weighted end of the lever from the top of the car, as set forth.

4. In a car-coupler, the combination, with a draw-head and a knuckle having a bifurcated inner end, the lower member whereof is longer than the upper, both of said members being pivoted to the draw-head, one above and the other beneath, of a crank-shaft, a link connecting the crank-arm of the shaft with the lower member of the knuckle, a trip-lever secured to the outer end of the crank-shaft having a weighted lower extremity, and means, substantially as shown and described, for manipulating the said lever from the sides or top of the car, as set forth.

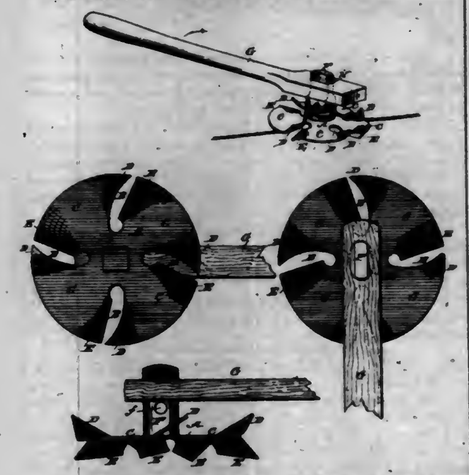


409,432. BASKET. IRWIN H. SPELMAN, Cortland, Ohio. Filed Oct. 11, 1888. Serial No. 287,808. (No model.)

Claim.—A splint basket composed of two series of interwoven splints formed into polygonal shape, and having at the corners reverse-

forcing splints whose lower ends are interwoven with and placed upon the main splints of the basket-body at the lower corners, and whose upper ends are extended between the divergent main splints of the basket-body to fill the interstices between the same, substantially as shown and described.

409,433. GAGE-KNIFE. CHARLES F. STERY, Hermann, Mo. Filed Apr. 8, 1889. Serial No. 306,267. (No model.)

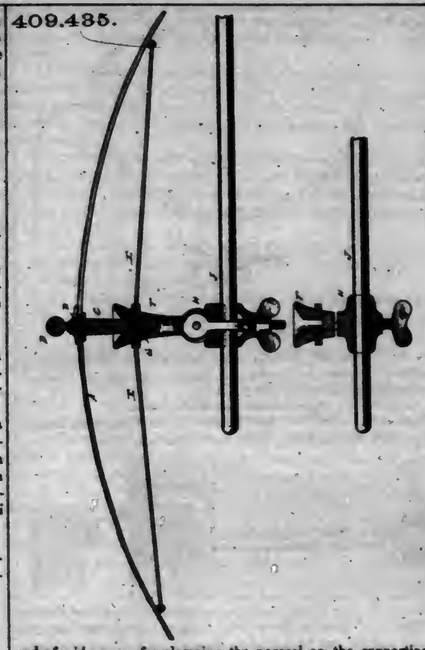


Claim.—1. In a paring and slicing knife, a blade of concavo-convex form in transverse section, pointed at its outer end, and provided with a cutting-edge *c*, said blade having a slot formed intermediate its edges and having the portion *g* bent out beyond the convex surface of the blade, thus forming an opening *h* for the passage of the parings, the edge of said portion *g* being sharpened to form a cutting-edge, substantially as and for the purpose described.

2. In a paring and slicing knife, the blade A and its shank *b*, both of concavo-convex shape in transverse section, and having a wedge-shaped recess *d* in the rear end of the shank, essentially as and for the purpose herein set forth.

3. In a paring and slicing knife, the knife-handle B, having a saw-cut in it from its inner end of curvilinear form in transverse section, and terminating in the rear in a wedge-shaped projection *i*, in combination with the shank *b* of the blade, of like curvilinear form in transverse section as the saw-cut, and provided with a wedge-shaped recess *d* at its rear end adapted to receive the projection *i* within it, substantially as specified.

409,434. WIRE TIGHTENER AND SPLICER. SHAPLEY P. R. TAYLOR, WILLIAM T. SHARMAN, and JOSEPH L. JAMISON, Denison, Tex. Filed Feb. 12, 1889. Serial No. 299,662. (No model.)



Claim.—1. A device for tightening and splicing wires, consisting of a disk slotted to form wings the points of which are bent up out of the plane of the disk, and having a perforated stem and adapted to be rotated to secure it in position.

2. The combination of the disk slotted to form wings the ends of which are bent out of the plane of the disk, and having the perforated flattened stem, and the lever having the slotted end, substantially as set forth.

3. The disk slotted to form the wings C, having their points bent up out of the plane of the disk, and having their squared rear ends E curved down below the plane of the body-plate, the disk having a stem by which it is rotated, substantially as set forth.

409,435. PARASOL FOR BABY-CARRIAGES. GEORGE W. TRAVERS, Hoboken, N. J. Filed May 20, 1889. Serial No. 311,408. (No model.)

Claim.—In a baby-carriage, the combination, with the body, of a parasol-supporting rod, notched ribs hinged to the same, which notch has a knob or head on its upper end and a spindle or stem on its lower end, a runner having a socket or aperture in its upper end, to which runner the stretchers are hinged, and a clamping device on the lower

409,435.

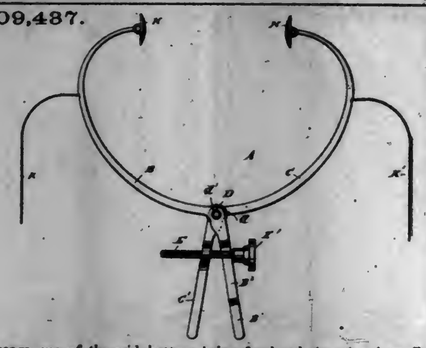
end of said runner for clamping the parasol on the supporting-rod which is located below the parasol, substantially as set forth.

409,436. COFFIN-FASTENER. BERT VAN HORN, Oneida, and JAMES R. LATHE, Vernon, N. Y. Filed Apr. 15, 1889. Serial No. 307,217. (No model.)

Claim.—1. In combination with the body C, lid D, and T-headed key *d*, pivoted to the lid, the plate A, having the longitudinal slot *f* extending through one end thereof and formed with the lugs *l l* on the back of said end and respectively at opposite sides of the slot, substantially as described and shown.

2. In combination with the body C, lid D, and T-headed key *d*, pivoted to said lid, the plate A, attached to the body, and having the slot *f* extending through one end of the plate and formed at the under side of said end with the lugs *l l* and pendent lips *n n*, and the groove *k*, formed in the top of the casket-wall in front of the open end of the slot *f*, and extending part way under the plate and terminating with the widened portion *k'* back of the aforesaid lugs, substantially as described and shown.

409,437. ELECTRIC DENTAL INSTRUMENT. FRED VERDITTE, Hannibal, Mo. Filed June 15, 1889. Serial No. 314,745. (No model.)



Claim.—1. A dental instrument comprising adjustable prongs pivotally connected at their lower portions and connected with an electrical battery at their upper portions, and buttons held on the said prongs, substantially as shown and described.

2. A dental instrument comprising adjustable prongs connected with an electrical battery and buttons held on the said prongs, and means, substantially as described, for adjusting said prongs so as to press the buttons with more or less force against the human face on which the instrument is to be applied, as set forth.

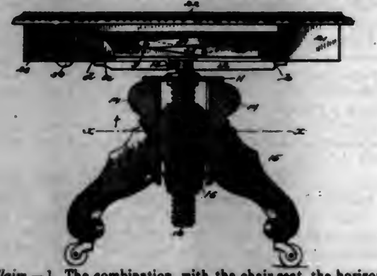
3. A dental instrument comprising pivoted prongs, a screw for adjusting said prongs, and buttons held on the outer end of the said prongs, substantially as shown and described.

4. A dental instrument comprising pivoted prongs, a screw for adjusting said prongs, buttons held on the outer ends of the said

409,437.

prongs, one of the said buttons being fixed and the other laterally adjustable to increase or diminish the distance between the two buttons, substantially as shown and described.

409,438. SHUTTER-FASTENER. LEWIS WHITEHOUSE, Easton, Md. Filed May 16, 1889. Serial No. 311,063. (No model.)



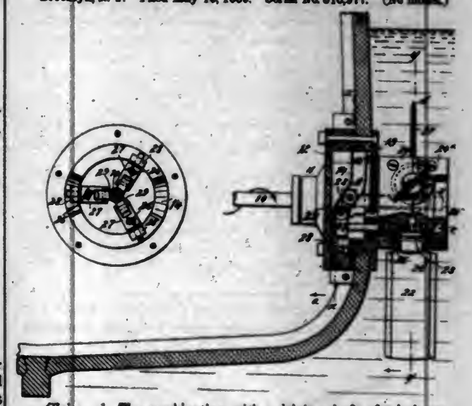
Claim.—1. In a shutter-fastener, the combination, with a shutter catch-plate 1, of the centrally-pivoted hook 4, having the apertured inner end, and the rod 10, extending through the wall having the nut 13 on its inner end, and having its inner end passing through the apertured end of the hook, substantially as set forth.

2. In a shutter-fastener, the combination, with a shutter catch-plate 1, of the centrally-pivoted spring-actuated hook 4, having the apertured inner end, and the rod 10, extending through the wall, having the nut 13 on its inner end, and having its inner end passing through the apertured end of the hook, substantially as set forth.

3. The combination, with the shutter catch-plate, of the slotted plate having an inwardly-projecting sleeve, the pivoted hook having the bent apertured inner end, the spiral spring, and cup-bearing, the plate formed with a central depression, and the operating-rod, substantially as set forth.

4. The combination, with the shutter catch-plate, of the slotted plate having the upwardly-inclined sleeve, the pivoted hook having the bent apertured inner end, the spiral spring and cup-bearing, the plate formed with the central depression, and the rod having the threaded ends, the knob, and the nuts, substantially as set forth.

409,439. COMBINED TABLE AND CHAIR. WILLIE O. WHITNEY, Glens Falls, N. Y. Filed Feb. 13, 1889. Serial No. 299,669. (No model.)

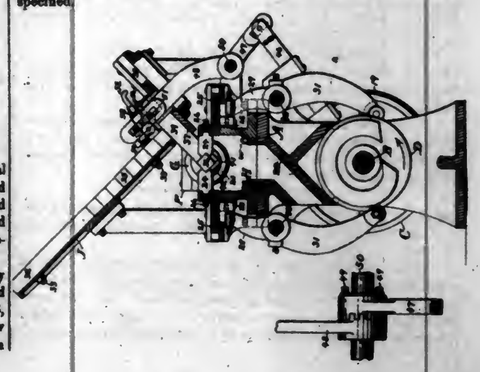


Claim.—1. The combination, with the chair-seat, the horizontal armed frame 11, the brackets 14, depending from the latter, and the screw 10, having a fixed collar that abuts the under side of said frame, of the legs 15 and nut 16, which are rigidly connected, and said nut sliding vertically in the guide-brackets 14, as shown and described.

2. The combination, with a frame 20, of a frame 21, pivotally connected thereto, a frame 23, also pivotally connected with said frame 20, side panels 24, pivotally connected to the frames 21 and 23, a table-top carried by the frame 21, upholstering *h* and *i*, a screw rigidly connected to the frame 20, brackets extending downward from said frame, a nut with which the screw engages, and legs carried by the nut, substantially as described.

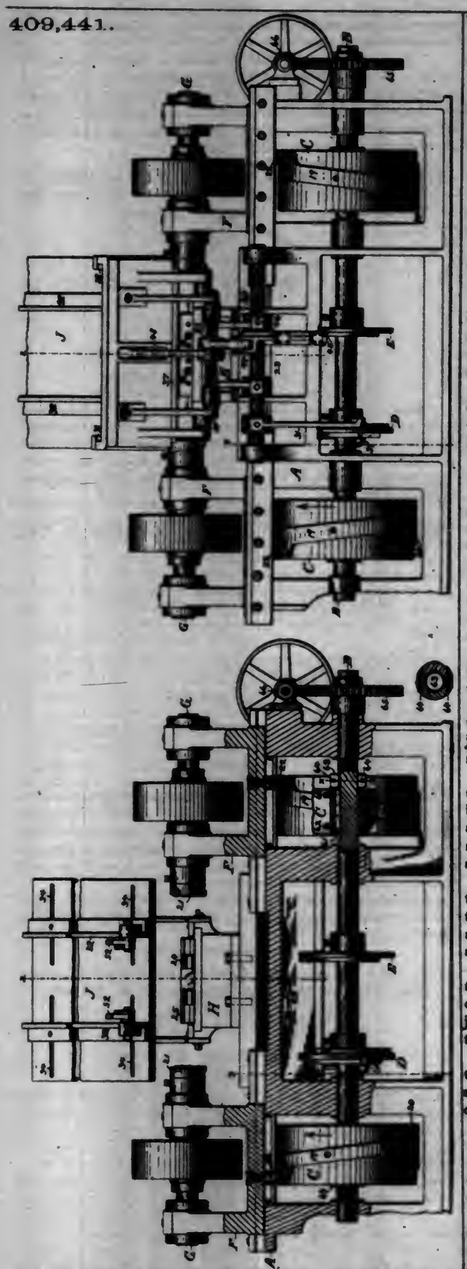
3. The combination, with a nut, of legs rigidly connected thereto, side flanges formed upon the nut, a spider to which the screw is connected, a frame through which the screw passes, brackets connected to the frame-arms and formed with grooves which the nut-flanges enter, a frame 20, supported by the spider, a frame 21, pivotally connected to the frame 20, a frame 23, also pivotally connected to the frame 20, side panels pivotally connected to the frames 21 and 23, a table-top carried by the frame 21, and upholstering *i* and *h*, substantially as described.

409,440. FEATHERING PADDLE-WHEEL. JOHN WILLIAMSON, Brooklyn, N. Y. Filed May 16, 1889. Serial No. 310,977. (No model.)



Claim.—1. The combination, with a driving-shaft, of a hub connected thereto, radially-extending blades held by the hub, gears connected to the blades, racks arranged to engage the gears, and a means for reciprocating the racks, substantially as described.

2. The combination, with a driving-shaft, of a hub connected thereto, radially-extending blades held by the hub, gears connected to the blades, racks arranged to engage the gears, brackets connected to the racks, anti-friction rolls or wheels carried by the brackets, and flanges forming a cam-groove within which the anti-friction rolls ride, substantially as described.



3. The combination, with a driving-shaft, of a hub connected thereto, radially-extending blades held by the hub, gears connected to the blades, racks arranged to engage the gears, brackets connected to the racks, anti-friction rolls carried by the brackets and arranged to bear upon the driving-shaft, other anti-friction rolls carried by the brackets, and flanges forming a cam-groove, within which groove the last-referred-to anti-friction rolls ride, substantially as described.

409,441. MACHINE FOR DRESSING THE ENDS OF SCREW-BLANKS. GEORGE E. WITHERELL, Hartford, Conn., assignor to the Hartford Machine Screw Company, same place. Filed Mar. 9, 1889. Serial No. 302,603. (No model.)

Claim.—1. The combination of a lathe-bed, two lathe-spindles, their sliding frames and operating-cams, with the holding-jaws sliding between said spindles, the levers 29, mounted on rock-shaft 30, the levers 31, and cam D, substantially as described, and for the purpose specified.

409,441.

2. In a machine for operating upon blanks, the combination of the holding-jaws arranged to slide to and from each other, the four levers 29, acting at four different points on said jaws, the rock-shafts on which said levers are mounted, the levers 31, and operating-cam, substantially as described, and for the purpose specified.

3. In a machine for operating upon blanks, the combination of the holding-jaws, levers 29, having adjusting-screws at their upper ends, rock-shafts on which said levers are mounted, the levers 31, and operating-cam, substantially as described, and for the purpose specified.

4. The combination of a lathe-bed, two lathe-spindles, their sliding frames, a pair of holding-jaws sliding between said spindles, operating mechanism for said sliding frames and jaws, and the rearwardly-inclined apron 23, formed in said bed immediately under the opening between said jaws, substantially as described, and for the purpose specified.

5. In a machine for operating upon blanks, the combination of the sliding lathe-frame, the cam-pulley having slotted hub, the cam-shaft having a longitudinal groove and threaded portion, the key 61, and adjustable clamp-nut 63, substantially as described, and for the purpose specified.

6. The combination of the longitudinally-moving spindles, the holding-jaws, mechanism for operating said jaws and spindles, the carrier 37, having holding-arms adjustable thereon, and mechanism for operating said carrier, substantially as described, and for the purpose specified.

7. In a machine for operating upon blanks, the carrier-arms having the sockets 40 and spring-pressed fingers 41, substantially as described, and for the purpose specified.

8. In a machine for operating upon blanks, the carrier having arms 39, provided with sockets, the spring-pressed hooked latch 57 projecting into one of said sockets, the cam 60, and mechanism for reciprocating said carrier, substantially as described, and for the purpose specified.

9. The combination of the longitudinally-moving spindle, the holding-jaws, mechanism for operating said jaws and spindles, the carrier arranged to slide to and from a point between said holding-jaws, the cam D, slide 46, and the carrier-operating lever, one end of which is connected with said slide and the other with said carrier, substantially as described, and for the purpose specified.

10. In a machine for operating upon blanks, the combination of the holding-jaws, the carrier, its operating-lever 47 and 48, made in two parts with adjustable hubs, and operating mechanism, substantially as described, and for the purpose specified.

11. In a machine for operating upon blanks, the combination of the hopper set upon an incline, a carrier arranged to slide on inclined ways at an angle to said inclined hopper, the holding-jaws, and operating mechanism for said carrier and jaws, substantially as described, and for the purpose specified.

12. In a machine for operating upon blanks, the hopper consisting of the inclined bottom J and side pieces 32, laterally adjustable thereon, substantially as described, and for the purpose specified.

13. In a machine for operating upon blanks, the combination of the hopper having adjustable side pieces and the carrier having adjustable arms with sockets for receiving the ends of the blanks, substantially as described, and for the purpose specified.

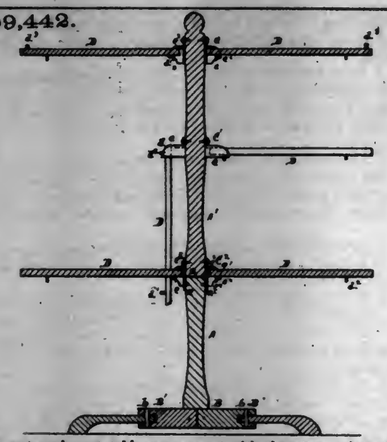
14. In a machine for operating upon blanks, the combination of the hopper, the carrier moving under the lower end thereof, the holding-clamp for pressing upon the bottom blank but one and holding it and the blanks above it from falling when the sockets of the carrier are under said hopper, and operating mechanism, substantially as described, and for the purpose specified.

15. In a machine for operating upon blanks, the combination of the hopper, the angle-lever having the adjustable clamp in one arm the carrier having the cam 56 for acting upon the other arm of said angle-lever, and mechanism for operating said carrier, substantially as described, and for the purpose specified.

16. The combination of the longitudinally-moving lathe-spindles, the holding-jaws, the hopper made adjustable to accommodate blanks of different lengths, the carrier having holding-arms, also made adjustable to and from each other, and operating mechanism, substantially as described, and for the purpose specified.

17. The combination of the longitudinally-moving lathe-spindle, the holding-jaws, the hopper, the holding-clamp for the blanks within said hopper, the carrier, and operating mechanism, substantially as described, and for the purpose specified.

18. In a machine for operating upon blanks, the combination of the hopper having adjustable side pieces, the holding-clamps mounted on and adjustable with said side pieces, the carrier, the adjustable carrier-arms 39, having cams 56 adjustable therewith, and operating mechanism, substantially as described, and for the purpose specified.



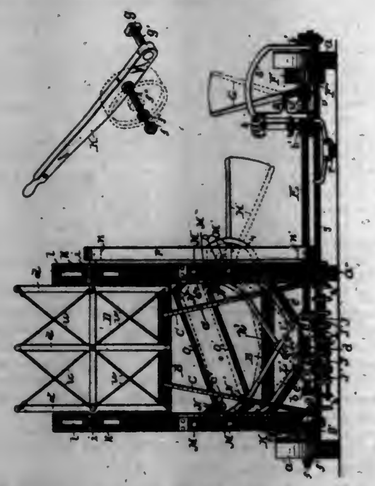
19. In a machine for operating upon blanks, the combination of the hopper, the holding-clamps, the carrier moving under said hopper and having arms 39, provided with sockets at their lower ends, and operating mechanism, whereby the solid body portions of said arms pass under the hopper and catch the blank when released by said clamping mechanism, substantially as specified.

20. In a machine for operating upon blanks, the combination of the holding-jaws, the carrier arms having the sockets 40 and spring-pressed fingers 41, and operating mechanism, substantially as described, and for the purpose specified.

409,442. REVOLVING CLOTHES-BAR. JOHN E. ARMON, Northville, Mich. Filed Mar. 23, 1889. Serial No. 305,140. (No model.)

Claim.—1. In clothes-bars, the combination, with a standard made in parts A A', of a collar C', having a fixed engagement with one of

409,442.



said parts and a rotatable engagement with the other, substantially as set forth.

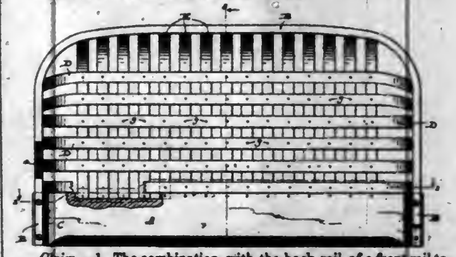
2. The combination, with a standard made in parts A A', having a revolving jointed engagement the one with the other, of a series of collars located thereupon provided with a series of ears, and movable arms engaged with said ears, the construction being such that said arms may be folded vertically and extended horizontally, substantially as set forth.

3. In combination, a standard consisting of two sections A A', and a collar having a fixed engagement with one of said sections and embracing the other section, the said sections being locked against vertical displacement, substantially as set forth.

4. In combination, a standard consisting of two sections A and A', one of said sections being provided with a circumferential groove, a collar fixed to the opposite section and embracing the section provided with the groove and having an interior groove registering with the said section, and a ring fitted in said grooves for locking the sections of the standard against vertical displacement, substantially as set forth.

409,443. CORN-HARVESTER. JOHN ARMSTRONG, Vine Creek, Kans. Filed Mar. 7, 1889. Serial No. 302,264. (No model.)

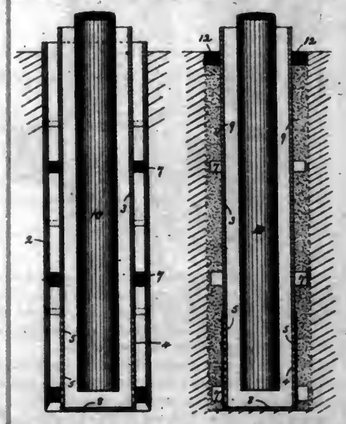
Claim.—1. In a corn-harvester, the combination, with the supporting-frame carrying the cutters, of the upper series of swinging arms affixed to rock-shafts M at opposite sides of the said frame and connected together for simultaneous operation, the lower series of swinging arms affixed to rock-shafts M', respectively, below the rock-shaft M, the operating-lever connected to said shafts to operate them simultaneously to alternately receive and deposit the stalks, and the centering and guiding arms arranged below the swinging arms to receive the stalks therefrom and deposit them in bundles, substantially as specified.



2. In a corn-harvester, the combination, with gathering-arms having upwardly and rearwardly inclined arms which converge toward their free ends, of the reel arranged above said gathering-arms and provided with inclined convergent rods to engage the upper ends of the stalks and draw them together between said arms, substantially as and for the purpose specified.

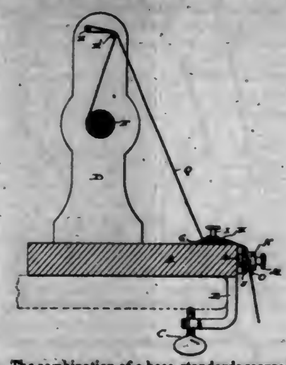
409,444. GUARD FOR ROCKING-CHAIRS OR ANALOGOUS ARTICLES OF FURNITURE. ALFRED F. RAGMANN, Watertown, Wis. Filed May 24, 1889. Serial No. 311,942. (No model.)

Claim.—The combination, with a furniture-rocker having a vertically-slotted end, a guard consisting of a shank fitting in and secured to said slotted end, and a transverse elastic buffer secured to or formed with said shank, and having transverse grooves on each side of said shank for the reception of the extreme tips of the rocker end, substantially as set forth.



409,445. VEHICLE-SEAT. CHARLES S. BEEBE, Moline, Ill. Filed July 1, 1889. Serial No. 316,221. (No model.)

Claim.—1. The combination, with the back rail, of a front rail to which the ends of the back rail are secured, and strips extended from the front to the back rail, and other strips extending from one side to the other of the back rail and crossing the first-named strips substantially at right angles, substantially as described.

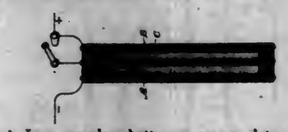


2. The combination, with the front and back rails, of the strips D and E, crossing each other at right angles and forming a seat, substantially as described.

409,446. METHOD OF SINKING WELLS. HIRAM W. BLAKESLEE, Yuma, Ariz. Filed May 22, 1889. Serial No. 311,698. (No model.)

Claim.—The method of constructing wells which consists in sinking an outer casing, inserting a perforated pipe of less diameter therein, filling the existing space entirely or in part with sand, withdrawing said outer casing, and finally placing a suction-pipe interiorly of the filter-pipe, substantially as herein specified.

409,447. DEVICE FOR WINDING BANDAGES, &c. HERMAN C. BLOCK, Milwaukee, Wis. Filed Jan. 26, 1889. Serial No. 297,705. (No model.)



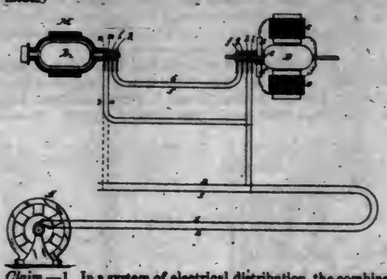
Claim.—1. The combination of a base, standards secured thereto, a spindle having its bearings in the standards, a spring-bar attached to the top of the base, edge-guides connected to said base adjacent to the spring-bar, and a spring-rod secured to said edge of the base to extend horizontally below said guides, substantially as set forth.

2. The combination of a base, standards secured thereto, a spindle having its bearings in the standards, a spring-bar attached to the top of the base, a set-screw for regulating the tension of the spring-bar, and guides attached to an edge of said base adjacent to the spring-bar, substantially as set forth.

3. The combination of a base, standards secured thereto, the guide-rods uniting the standards at their upper ends, a spindle having its bearings in said standards, a spring-bar attached to the top of the base, and edge-guides connected to said base adjacent to the spring-bar, substantially as set forth.

4. The combination of the base A, standards D, rods E E', connecting the standards, the spindle F, having its bearings in said standards, the plate G, attached to the top of said base, the spring-bar H, fastened to the plate, the set-screw I, for regulating the tension of the spring-bar, the slotted plate J, secured to an edge of the base, the guides N, set-bolts L, and nuts M, adjustably connecting the latter guides and slotted plate, the spring-rod O, and the latch P, substantially as and for the purpose set forth.

409,448. SECONDARY BATTERY. CHARLES S. BRADLEY, Yonkers, assignor to the Bradley Electric Power Company, New York, N. Y. Filed Aug. 11, 1884. Serial No. 140,234. (No model.)



Claim.—1. In a secondary battery, a porous plate, cell, or diaphragm composed of some suitable conducting material, which serves as a partition to separate the liquids while the battery is being charged, and means for connecting said plate or diaphragm to the working-circuit as an electrode in discharging, substantially as described.

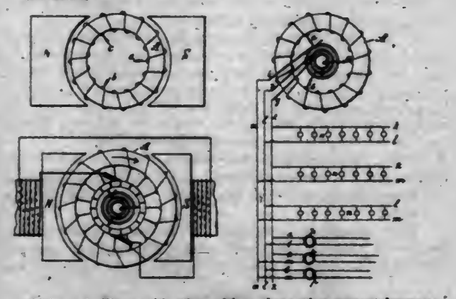
2. In a secondary battery, porous carbon plates or diaphragms which serve as partitions to separate the liquids in charging, and means for connecting said diaphragms to the working-circuit as electrodes in discharging, substantially as described.

3. A secondary battery provided with a series of plates or diaphragms of non-porous conducting material and of porous conducting material placed alternately, said non-porous plates constituting the partitions which separate the cells, and serving also as electrodes, and said porous plates serving in charging as partitions to separate the liquids, and means for connecting said porous plates as electrodes to the working-circuit in discharging, substantially as described.

4. In a secondary electric battery, the combination of porous plates, diaphragms, or cells composed of some suitable material which is a conductor of electricity, which act to keep apart the fluids of the battery, and a switch or switches whereby said plates, diaphragms, or cells may be electrically disconnected from the circuit while the battery is being charged and connected to the circuit while the battery is being discharged, substantially as described.

409,449. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES S. BRADLEY, Yonkers, N. Y. Filed Oct. 5, 1888. Serial No. 287,230. (No model.)

Claim.—1. In a system of electrical distribution, the combination of a generator of alternating currents, a pair of mains connected thereto, one or more multiple-circuit differential-phase electric motors having one circuit connected directly to said mains and the other circuit or circuits connected to said mains through an interposed electro-motive phase-changing device adapted to change the time-period of the currents passing through it.



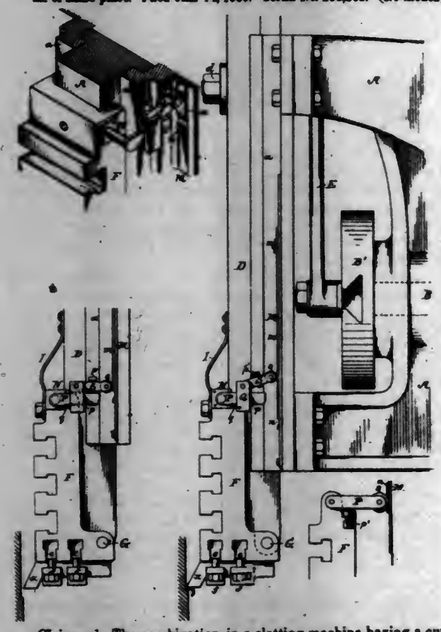
2. In a system of electrical distribution, the combination of a generator of alternating currents, a pair of mains connected thereto, one or more double-circuit quarter-phase electric motors having one circuit connected directly to said mains and the other circuit connected to the said mains through an interposed electro-motive device adapted to change currents passing through it at one-quarter of a phase or wave length.

3. The combination, with a quarter-phase double-circuit electric motor, of two transformers, each composed of a primary coil connected to the supply-circuit, and two or more graduated secondary coils connected to the motor-circuit, and means for switching said secondaries in matched pairs into the motor-circuits, substantially as described.

4. The combination, with an alternating-current double-circuit electric motor, of one or more transformers having primary coils connected to supply-circuits, and two or more graduated secondary coils adapted to be connected to the motor-circuits, and means for connecting said secondary coils into the motor-circuits as required, substantially as described.

5. The combination, with a multiple-circuit alternating-current electric motor, of two or more supply-circuits having their currents of respectively differing phase, two or more primary or inducing coils respectively included in the supply-circuits, two or more graduated sets of secondary coils in inductive relation to said primary coils, and a switch adapted to connect the respective motor-circuits to any pair of said secondary coils.

409,450. SYSTEM OF ELECTRICAL DISTRIBUTION. CHARLES S. BRADLEY, Yonkers, N. Y. Filed Oct. 20, 1888. Serial No. 288,601. (No model.)

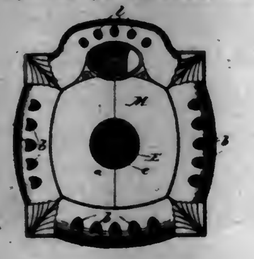


Claim.—1. The combination, with an alternating-current dynamo-electric machine adapted to generate and deliver three separate series of alternations differing in their time-periods by one-third of a phase, of three external circuits composed in all of three conductors permutated into said three circuits, and consumption devices located in said external circuits.

2. In an electro-motive device, the combination of a field-magnet and a rotating armature provided with a current-rectifying commutator and brushes therefor, through which current is received into the armature and rotation produced in the moving part of the machine, three current-leading devices on the one hand connected, respectively, into the armature-circuit at equidistant points [illegible] arranged rela-

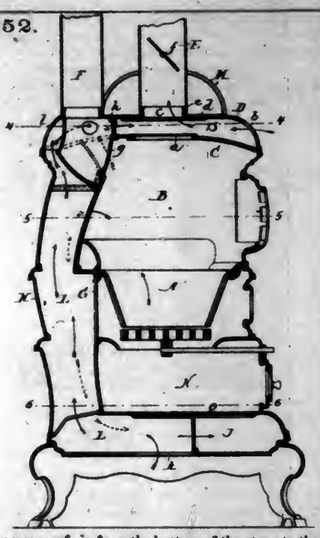
tively as to lead off three independent series of alternating currents substantially one-third of a phase apart in their relative time-periods, and on the other hand connected with three external circuits composed in all of three conductors permutated into the said three circuits, and consumption devices located in each of the three circuits.

409,451. **DEVICE FOR TILTING THE TOOL OF A SLOTTING-MACHINE.** JAMES C. CALDWELL, Philadelphia, Pa., assignor to Clarence S. Bement, Frederick B. Miles, William P. Bement, and Frank Bement, all of same place. Filed Jan. 14, 1889. Serial No. 296,263. (No model.)



Claim.—1. The combination, in a slotting-machine having a cutter-slide, of a pivoted tool-holder on said slide, and an arm pivoted to said tool-holder adapted to bear against a track-way and throw the tool away from its work on the return movement of the cutter-slide, substantially as described.

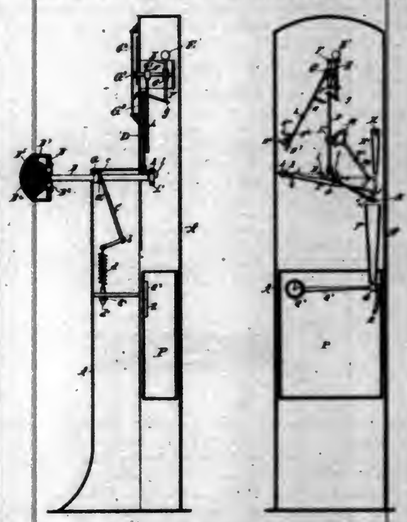
2. The combination of a reciprocating slide and a tool-holder pivoted thereto with an arm pivoted to said tool-holder and bearing against an adjustable bar beveled at its lower end, the whole acting to force the tool carried by said holder away from its work on its return movement, substantially as described.



3. The combination of the reciprocating slide, the tool-holder pivoted thereto and carrying a cutting-tool, an arm pivoted to the upper end of said tool-holder, and a sleeve adjustable on said arm and carrying a second arm, with a bar having at its lower end a recess or beveled end, into which the second arm will drop at the end of the stroke of the slide, the whole acting to force the tool away from its work on its return movement, substantially as set forth.

409,452. **HEATING-STOVE.** JAMES L. COLLINS and HENRY C. BURGER, Chicago, Ill. Filed May 7, 1889. Serial No. 309,856. (No model.)

Claim.—In a stove for heating, the combination of the plate C, the plate D, which is provided with a series of holes *b* and *l* and rests upon the plate C, a partition A, provided with holes *i*, and an air flue



409,452.

L, for the passage of air from the bottom of the stove to the chamber S through the holes *i* and to the room through holes *l*, substantially as and for the purpose specified.

409,453. **COIN-FREED STRIKING-MACHINE.** HENRY COOPER, Jersey City, N. J. Filed Apr. 12, 1889. Serial No. 307,042. (No model.)

Claim.—1. In combination with the movable rod, the striking head or buffer mounted thereon, said striking-head being packed with shreds of rubber, substantially as and for the purposes set forth.

2. In combination with the movable rod, the striking-head or buffer having a centrally-perforated back piece removably secured upon the extremity of the rod, substantially as and for the purposes set forth.

3. The herein-described striking-head or buffer, composed of the back piece, a receptacle of elastic material, a packing or filling of rubber shreds for such receptacle, and a cover, combined and arranged substantially as explained.

4. The combination, with the rod carrying a striking-head or buffer, of a collar on said shaft, a bell-crank lever, and a tension-spring connected with said lever, substantially as and for the purposes set forth.

5. The combination, with the rod, a lever connected thereto, a rack resting on said lever and carrying a weight, the index-shaft, and a pinion thereon for engagement with said rack, of a friction-pad for

preventing the backward movement of said shaft and a lever carrying such pad, substantially as described.

6. The index-shaft, the friction-pad bearing thereon, the pivoted lever carrying said pad and a cam for moving said lever and releasing said shaft, combined and arranged substantially as shown and described.

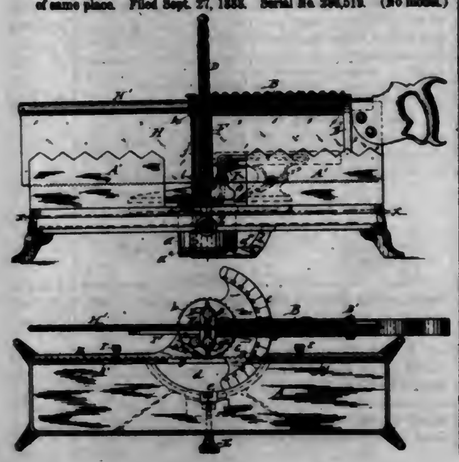
7. The combination, with the rod carrying the striking-head or buffer, of a hinged lever adapted to be moved by the weight of a coin and keepers or lugs for co-operation therewith, substantially as described.

8. The combination, with the coin-receptacle mounted upon the end of a hinged lever, a sliding bottom consisting of a perforate and imperforate part, and springs for holding the bottom, substantially as shown and described.

9. The combination, with the coin-receptacle and its sliding bottom mounted upon a hinged lever, of an opener-bar arranged to move said bottom, and the rod carrying the striking-head or buffer for operating said opener-rod, substantially in the manner shown and described.

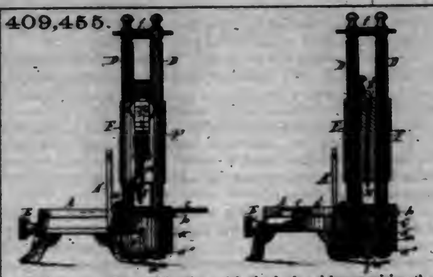
10. The combination, as before set forth, of the rod carrying the striking-head or buffer, the spring opener-bar bearing against an incline on said rod, a hinged lever, and the coin-receptacle with its movable bottom mounted thereon, said lever being arranged to carry the bottom into position to be moved by the opener-bar at the time and under the conditions essentially as explained.

11. The combination, as before set forth, of the rod carrying the striking-head or buffer, the index or pointer shaft connected with such rod and operated thereby, the hinged lever and the coin-receptacle mounted thereon and provided with the movable bottom, and the opener-bar arranged to be moved and to operate, substantially in the manner and for the purposes explained.



12. The combination, with the rod carrying the striking-head or buffer, the bell-crank lever connected thereto, the rack and weight resting upon said lever, and the pointer and pointer-shaft operated from said rack, of a second bell-crank engaging said rod, a resisting and returning spring connected to such last-mentioned bell-crank, a hinged lever carrying a coin-receptacle, keepers or lugs therefor, a sector and a sector-arm, and a warning-plate, substantially as described.

409,454. **SECTIONAL SCREW-CONVEYER.** WILLIAM H. CORNELL, Titusville, Pa. Filed May 23, 1887. Serial No. 239,086. (No model.)



Claim.—The within-described screw-conveyer, consisting of a number of sections confined together by longitudinal bolts, each section comprising a hub and a single projecting beveled blade, substantially as specified.

409,455. **MITER-MACHINE.** JULIUS J. COWELL, Westport, N. Y., assignor of two-thirds to Charles J. Brown and Charles D. Cleay, both of same place. Filed Sept. 27, 1888. Serial No. 286,519. (No model.)

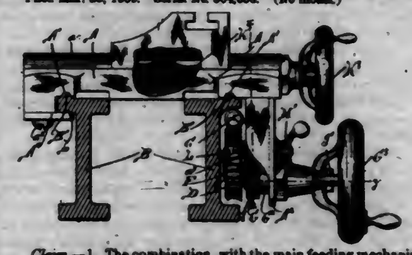
409,455.

Claim.—1. In combination with the bed and breast rising therefrom, a vertical socket projecting from the bed at the rear of the breast, a hub pivoted in said socket, posts secured to the said hub, sleeves sliding on the posts, and a saw-guide extended horizontally from said sleeves, consisting of an arm constructed to retain a saw in place during the operation, substantially as described and shown.

2. In combination with the two posts, two sleeves rigidly united and sliding, respectively, on the two posts, and the saw-guide extended horizontally from said sleeves, a right and left screw connecting the upper ends of the posts, substantially as and for the purpose set forth.

3. In combination with the bed, pivoted saw-guide support, and the saw-guide mounted movable vertically on said support, a rack on the under side of the bed, a dog connected to the aforesaid pivoted support and adapted to engage the rack, and a rod projecting vertically from the said dog and provided with a catch adapted to engage the saw-guide in its vertical movement, and thereby throw the dog out of engagement, substantially as set forth.

4. In combination with the bed and breast rising therefrom, a vertically-pivoted saw-guide support, a vernier concentric with the pivot of said support and turning synchronously therewith, and a clamp having a sliding engagement with the bed for engaging the vernier, as and for the purpose specified.



5. In combination with the bed and breast rising therefrom, a vertical socket projecting from the bed at the rear of the breast, a hub pivoted in said socket, posts secured to said hub, a vernier secured to the hub by the said posts, sleeves sliding on the posts, and a saw-guide extending horizontally from said sleeves, substantially as described and shown.

6. In combination with the bed, a breast rising therefrom and movable longitudinally thereon, a rack on said breast lengthwise thereof, a vertically-pivoted saw-guide support, and a pinion adapted to rotate with said support and engaging the aforesaid rack, substantially as and for the purpose set forth.

7. In combination with the bed, a breast rising therefrom and movable longitudinally thereon, a rack on said breast lengthwise thereof, a vertically-pivoted saw-guide support, a pinion pivoted concentric with the pivot of said support and engaging the aforesaid rack, and a dog adapted to lock the pinion to the pivoted saw-guide support, and thereby cause said parts to turn simultaneously, substantially as described.

8. In combination with the bed and breast rising therefrom, a vertical socket fixed to and projecting from the bed at the rear of the breast, a hub pivoted in said socket, posts rigidly secured to said hub, united sleeves sliding on said posts, and a saw-guide extending horizontally from said sleeves, consisting of an arm adapted to embrace the back of a saw and hold it in position during operation, substantially as described.

409,456. **FEEDING MECHANISM FOR LATHES.** HENRY M. DARLING, Seneca Falls, N. Y., assignor to Adelbert S. Davis, same place. Filed Mar. 25, 1889. Serial No. 304,653. (No model.)

Claim.—1. The combination, with the main feeding mechanism of a lathe and a lathe-carriage provided with a cross-feed, of an auxiliary feeding device, substantially as described, for transferring motion from the main feeding device, and a lock for transferring the motion

from the auxiliary feeding device to the cross-feed or to the lathe-carriage, substantially as and for the purpose specified.

2. The combination, with the main feeding mechanism of a lathe, the lathe-carriage, and a cross-feed provided thereon, of the wheel D, for transferring motion from the main feeding mechanism to the cross-feed, and a lock for preventing the rotation of said wheel to feed the carriage longitudinally, substantially as and for the purpose specified.

3. The combination of the main feeding mechanism C of a lathe, the wheel D, the hollow stud E, a lock for engaging the wheel D, and the rod M, connected to operate the lock, substantially as and for the purpose specified.

4. The combination, with the main feeding mechanism of a lathe, the hollow stud E, and the wheel D, journaled thereupon and provided with a beveled face, of the beveled lock N, for engaging said face of the wheel D to the rod M, substantially as and for the purpose specified.

5. The combination, with the main feeding mechanism of a lathe, of the hollow stud E, the wheel D, mounted thereupon and provided with serrations, the serrated lock N, for engaging the serrations of the wheel D, and the rod M, substantially as and for the purpose specified.

6. The combination of the main feeding mechanism of a lathe with the wheel D, connected to operate the lathe-carriage, the lock N, and means for engaging said lock with the wheel D, substantially as and for the purpose described.

7. The combination of the main feeding mechanism of a lathe with the wheel D, for conveying motion to the carriage thereof, the lock N, prevented from rotary movement, and means for engaging and disengaging said lock with said wheel, substantially as and for the purpose set forth.

8. The combination of the main feeding mechanism of a lathe, the lathe-carriage, the wheel D, for conveying motion to the carriage, the yoke L, provided with a projecting face N, and means for engaging said face with the wheel D, substantially as and for the purpose set forth.

9. The combination of the main feeding mechanism of a lathe, the carriage of a lathe, the wheel D, for conveying motion to the carriage, the yoke L, having the projecting face N for locking the wheel D, dog-pins *m*, for preventing movement of the yoke, and means for moving said yoke toward and away from the gear, substantially as set forth.

10. The combination of the main feeding mechanism of a lathe, the lathe-carriage, the wheel D, journaled on a spindle secured to the carriage, the yoke or bracket L, having the projecting face N for locking the wheel D, pins a^2, for guiding the yoke L, means for engaging said yoke with the gear D, and springs for disengaging the said parts, substantially as and for the purpose set forth.

11. The combination of the main feeding mechanism of a lathe, the lathe-carriage, the projecting hollow stud E, the wheel D, journaled thereupon, the yoke L, guided on pins a^2, secured to the lathe-carriage, the rod M, secured to the yoke, and means for operating said rod, substantially as and for the purpose set forth.

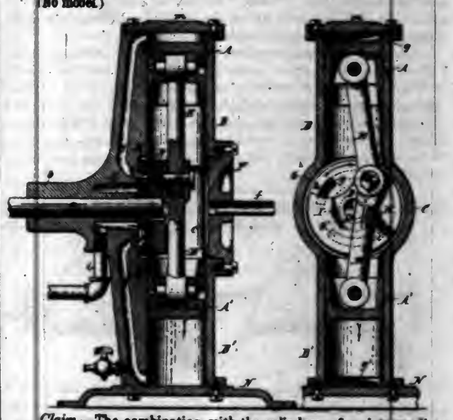
12. The combination of the main feeding mechanism of a lathe, of the lathe-carriage, the hollow stud secured thereto, the wheel D, mounted thereupon, the yoke L, having a projecting face N, a guide-pin *m* for the yoke, springs interposed between the yoke and the carriage, the rod M, and clamping device M', for engaging said projecting face of the yoke L with the wheel D, substantially as and for the purpose specified.

13. The combination, with the main feeding mechanism of a lathe and the carriage of a lathe, of the stud E, secured to the carriage, the wheel D, mounted upon said stud, the lock N, for preventing the rotation of the wheel D, the rod M, for operating the lock, and the pin *l*, secured to said rod for engaging a slot in the adjacent face of the stud E, substantially as and for the purpose specified.

14. The combination, with the main feeding mechanism of a lathe, of the lathe-carriage, the stud E, secured to said carriage, the wheel D, mounted thereupon, the wheel F, secured to the wheel D, the hand-wheel G^3, and gearing between said hand-wheel and the wheel F, substantially as and for the purpose specified.

15. The combination, with the main feeding mechanism of a lathe, the carriage of a lathe, and a cross-feed provided on the carriage, of the wheel D, mounted on a support secured to the carriage, the wheel F, secured to said wheel, and an intermediary between the cross-feed and said wheel D, substantially as and for the purpose described.

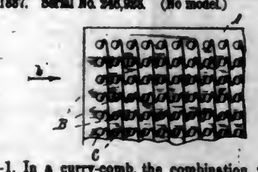
16. The combination, with the main feeding mechanism of a lathe, the carriage of the lathe, and the cross-feed, of the wheel D, mounted on a support secured to the carriage, a spur-gear F, secured to the wheel D, an intermediary between the cross-feed and the wheel F, and a lock N, for stopping the rotation of the wheel D and the movement of the cross-feed, substantially as and for the purpose specified.



17. The combination, with the main feeding mechanism of a lathe, the carriage of the lathe, and the cross-feed, of a wheel D, journaled on a support secured to the carriage, a spur-gear F, secured to the wheel D, and an oscillating intermediary between the cross-feed and the said wheel F, for transferring motion to the cross-feed, substantially as and for the purpose set forth.

18. The combination, with the main feeding mechanism of a lathe, the carriage of a lathe, and the cross-feed, of the stud E, projecting from the carriage, the wheel D, journaled upon the stud E, the bracket I, pivoted upon the stud, and intermediary gearing mounted upon the bracket I and oscillating to connect the motion of the wheel D to the cross-feed, substantially as and for the purpose specified.

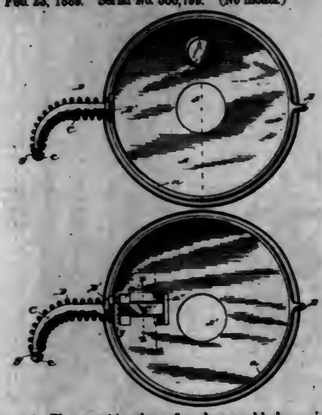
19. The combination, with the main feeding mechanism of a lathe, the carriage of a lathe, and the cross-feed, of a wheel D, for conveying motion from the feeding mechanism, the swinging bracket I, the intermediary J, interposed between the cross-feed and the wheel D, the stud provided upon said swinging bracket, and means for retaining said stud in its adjusted position, substantially as and for the purpose set forth.



20. The combination, with the main feeding mechanism of a lathe, the lathe-carriage, and the cross-feed, of the wheel D, journaled on a spindle secured to the carriage, the bracket I, pivoted to said spindle and provided with a stud guided in the apron of the lathe-carriage, a clamp for retaining the bracket in its adjusted position, intermediary gearing mounted upon said bracket for conveying motion from the wheel D to the cross-feed, and a lock for stopping the rotation of the wheel D and the feeding of the cross-feed, substantially as and for the purpose specified.

409,457. STEAM-ENGINE. JOSEPH W. DENNIS and FRANK A. SHOEMAKER, Buffalo, N. Y. Filed May 13, 1889. Serial No. 310,869. (No model.)

Claim.—The combination, with the cylinders, of an intermediate chamber which communicates with the inner ends of the cylinders, and which is at one side provided with an opening closed by a removable cover, and at the opposite side closed and provided with a central shaft-bearing, and an annular valve-seat containing an annular exhaust-port surrounding said bearing, and ports leading to the ends of the cylinders, a shaft arranged in said bearing, a crank secured to said shaft, a valve mounted on said shaft between the crank and the valve-seat, and pistons connected with said crank, substantially as set forth.

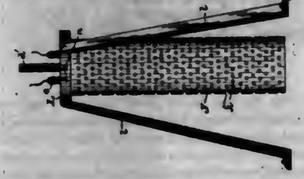


409,458. CURRY-COMB. LEVI M. DEVORE, Freeport, Ill. Filed Aug. 15, 1887. Serial No. 246,928. (No model.)

Claim.—1. In a curry-comb, the combination, with a back of leather or the like, of a working-face composed of wire coils, each having its spirals passed into and out of the back, inclosing small portions thereof within the coils, substantially as set forth.

2. In a curry-comb, the combination, with a flexible sheet of leather or the like, of the wire coils lying principally upon one face thereof, and having their end spirals passed through the sheet and bent bodily down upon the opposite surface without uncoiling, and a second flexible sheet stitched to the first to cover said end spirals and retain them in place, substantially as set forth.

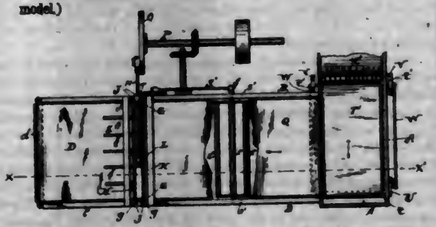
409,459. STOVE-PIPE DAMPER. LEVI M. DEVORE, Prescott, Ill. Filed Feb. 23, 1889. Serial No. 300,799. (No model.)



Claim.—1. The combination of a damper-blade, a rigid handle adapted to operate the same and formed with a spiral groove, and a spiral spring adapted to be passed over said handle by moving one or more of its coils spirally along said groove.

2. The combination, with a damper-blade and a curved handle rigid therewith and adapted to be passed through an opening in the pipe, of a spring encircling the handle and abutting against the pipe and against a projection or enlargement on the handle, the projection or enlargement being formed with a spiral groove adapted to permit the passage of the spring over it by a spiral movement.

3. The combination, with the blade A, having the gudgeon B, the boss B', and curved handle C, of the spiral spring D, adapted to abut at one end against a pipe in which the damper is placed and at the other against an enlargement c on the handle C, substantially as and for the purpose set forth.



409,460. ELECTRICAL CIRCUIT CLOSER FOR WATER-INDICATORS. FRANKLIN M. DUNN, ALPHONSA PRITCHARD, and JOSEPH H. KING, Baltimore, Md. Filed Mar. 22, 1889. Serial No. 304,249. (No model.)

Claim.—1. The combination of a tubular case A, provided with perforations *b*, binding-posts for the wires, and contact-points *g*, a float movable in the case and provided with contact-pieces, a supporting-ring L, and a gimbal-ring connecting the said case and supporting-ring.

2. The combination of a tubular case A, provided with perforations *b*, binding-posts for the wires, and contact-points *g*, a float movable in the case and provided with contact-pieces, a perforated jacket around the case, a support for the device, and a gimbal-ring connecting the said case and support.

409,461. BAND-CUTTER AND FEEDER. HARRY L. EARLE, Minneapolis, Minn., assignor to the Earle Manufacturing Company, same place. Filed Dec. 27, 1886. Renewed Apr. 1, 1889. Serial No. 305,630. (No model.)

Claim.—1. The combination, with a supporting-frame, of a bundle-carrier mounted in said frame, vertical guides secured to said frame and extending above said carrier, a band-cutter carriage movable upward in said guides by the pressure of the bundles, a band-cutter mounted on said carriage, and a bundle-guide secured to said carriage at an acute angle to the plane of said carrier, substantially as described

2. The combination, with a supporting-frame, of a bundle-carrier mounted in said frame, vertical guides secured to said frame and extending above said carrier, a band-cutter carriage movable upward in said guides by the pressure of the bundles, a band-cutter mounted on said carriage and reciprocating transversely to the path of the bundles, and a bundle-guide secured to the under side of said carriage at an acute angle to said carrier and provided with spring guards or fingers extending outward over the path of the uncut bundles, substantially as described.

3. The combination, with a supporting-frame, of a bundle-carrier mounted in said frame, vertical guides secured to the opposite sides of said frame and extending above said carrier, a band-cutter carriage movable upward in said vertical guides by the pressure of the grain, cross-head guides lengthwise of said carriage, a cross-head movable between said cross-head guides, a band-cutter or knife secured to said cross-head and projecting below said carriage, a crank-shaft coupled to a source of motion, and a connecting-rod pivotally attached to said cross-head and crank, substantially as described.

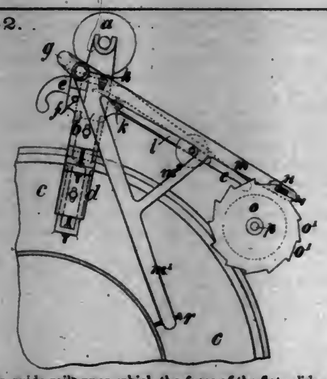
4. In a band-cutter, the combination, with the slotted cutter-head L, having at one end a lug-seat and at the other a spring-catch *l*, directly in line with said slot, of the knife M, fitting said slot and provided with the lug *m'*, adapted to fit said lug-seat, and with the lug *m''*, adapted to be engaged by said catch *l*, substantially as described.

5. The combination, with a suitable supporting-frame, of the vertical guiding-rods J, rigidly secured to said frame, the cutter-carriage F, having keepers *g*, sliding on said rods, the pairs of cross-head guides H H and H' H', arranged and shaped, as described, the cross-head L, the band-cutter M, attached to said cross-head, and the connecting-rod N, coupled to a source of motion, substantially as described.

6. The combination, with the frame B, of bundle-carrier D, guiding-rods J, carriage F, provided with keepers *g*, embracing said rods, cross-head guides H H and H' H', as described, guards K, attached to one of the guides H', facing the uncut bundle, cross-head L, detachable arc-shaped cutter M, attached to said cross-head, connecting-rod N, crank-disk Q, and driving-shaft P, substantially as described.

7. The combination, with a threshing-cylinder and a suitable supporting-frame arranged in front of said cylinder, of a feeding-belt mounted on driving-rollers and supported on said frame at an incline to said cylinder, fixed bearings in said frame for the lower of said driving-rollers, bell-crank levers pivoted at their elbows to said frame and having bearings in their outer arms for the upper of said driving-rollers, a crank-shaft coupled to a source of motion, and connecting-rods from said crank-shaft to the lower arms of said bell-crank levers, substantially as described.

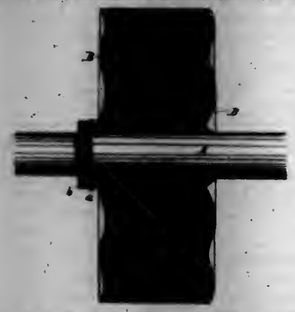
8. The combination, with a threshing-cylinder, of an inclined slotted casing in front of said cylinder, a feeding-belt mounted on driving-rollers supported on said frame at an incline to said cylinder, fixed bearings in said casing for the lower of said rollers, bell-crank levers pivoted at their elbows adjacent to the slots in said casing and having bearings in their outer arms for the upper of said rollers, a crank-shaft coupled to a source of motion, and connecting-rods from said crank-shaft to the lower arms of said bell-crank levers, substantially as described.



409,462. APPARATUS FOR CONTROLLING THE GRINDING OF CARDING-ENGINE FLATS. JOHN M. HETHERINGTON, Manchester, County of Lancaster, England. Filed May 28, 1888. Serial No. 275,277. (No model.) Patented in England Feb. 21, 1887. No. 2,642.

Claim.—1. In apparatus for grinding the traveling flats of carding-engines, the combination of a grinding-roll and movable guide-rails, against which the working-faces of the flats are pressed during the grinding, with a lever connected to and controlling the guide-rails, and a cam having faces to act on said lever to move each flat toward the grinding-roller while the flat is being ground and to quickly withdraw the flat when the grinding is finished, all substantially as set forth.

2. In apparatus for grinding the traveling flats of carding-engines, the combination of a grinding-roller and movable guide-rails, against which the flats are pressed at opposite sides of the engine, with a cross-bar connecting the guide-rails, a lever on said cross-bar, and a cam controlling the said lever, whereby the outer end of the latter is slowly lifted during the time the card is in contact with the grinder, and is dropped just before the next flat in the chain touches the grinder, all substantially as set forth.



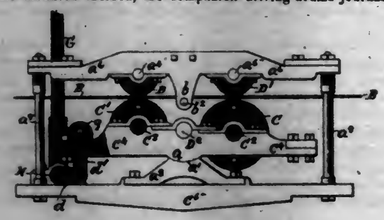
3. In apparatus adapted for application to a carding-engine for grinding the traveling flats, the combination of a grinding-roll, and

409,462.

the movable guide-rails upon which the faces of the flats slide during the grinding, with a lever connected to and controlling said guide-rails, and a cam to act upon the lever to slowly move it during the grinding to compensate for the inclination of the working-face of the flat, substantially as set forth.

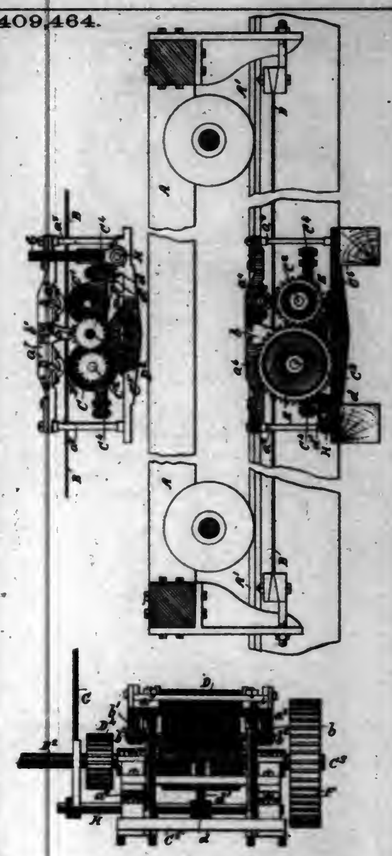
409,463. ARMATURE-CORE FOR DYNAMOS. DANIEL HIGHAM, Philadelphia, Pa., assignor to the Higham Patent Right Company, Rockland, Me. Filed May 10, 1889. Serial No. 310,368. (No model.)

Claim.—1. An armature-core for drum-winding, consisting of a shaft and a series of thin iron corrugated disks mounted thereon, with intervening air-spaces, but without other insulation than the air-spaces, substantially as described.



2. An armature-core for drum-winding, consisting of a shaft and a series of thin iron corrugated disks mounted thereon, with intermediate air-spaces, except near the shaft, where the disks are in contact with each other, substantially as set forth.

3. A core for the armature of a dynamo-electric machine or electric motor having its main body composed of spaced iron disks provided with annular corrugations, substantially as and for the purpose set forth.

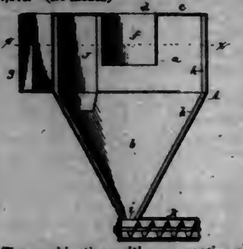


4. A core for the armature of a dynamo-electric machine or electric motor, comprising a shaft and corrugated thin iron disks mounted thereon and acute corrugations at the center, whereby the main portions of the disks are spaced from each other when strung upon the shaft, all substantially as set forth.

409,464. FEED MECHANISM FOR SAW-MILL CARRIAGES. ANDREW R. HOFFMAN, Fort Wayne, Ind. Filed Apr. 2, 1889. Serial No. 305,675. (No model.)

Claim.—1. In a friction device for transmitting motion to log-carriages, the combination, with a bed-plate, of a tilting or rocking frame mounted thereon, the companion driving-drums journaled in

409,464.



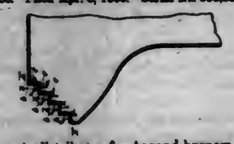
the tilting frame, the feed-ribbon placed just above and normally out of contact with said drums and having its ends secured to the respective ends of the log-carriage, the companion rollers journaled just above the ribbon and in line with the driving-drums, and means, substantially as described, for rocking said frame, whereby the friction-drums may be thrown up alternately against the ribbon and the same gripped between either drum and its corresponding roller, thereby imparting a reciprocating movement to the carriage, substantially as and for the purpose set forth.

2. In a friction-feed for log-carriages, the combination of the feed-ribbon, the driving-drums, the companion gripping-rollers, and the guide-roller located underneath said ribbon and supporting the same normally out of contact with the driving-drums, substantially as and for the purpose set forth.

3. In a friction-feed device of the character described, the combination of the bed-plate, the step-brackets bolted thereon and provided with a concave bearing-surface, the tilting or rocking frame provided with a convex bearing-surface and nesting in said brackets, the rock-shaft, the operating-lever mounted thereon, the rocker-arm, the link connecting the tilting frame and rocker-arm, the driving or feed drums, and their companion gripping-rollers, substantially as and for the purpose set forth.

4. In a friction-feed of the character described, the combination of the supporting-frame, the tilting frame having a rocking bearing therein, the friction driving-drums journaled in the tilting frame, the gear-wheels mounted upon the respective shafts of said drums and engaging with each other, the feed-ribbon, the log-carriage to which the respective ends of said ribbon are secured, the companion gripping-rollers located above said ribbon in line with the driving-drums, the driving-shaft journaled in the tilting frame, the gear-wheel mounted upon said driving-shaft, and the companion gear-wheel mounted upon one end of the shaft C^3, and with which the gear-wheel mounted on the driving-shaft engages, substantially as and for the purpose set forth.

409,465. DUST-COLLECTOR. ISAAC W. HOLT, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed July 6, 1888. Serial No. 307,173. (No model.)

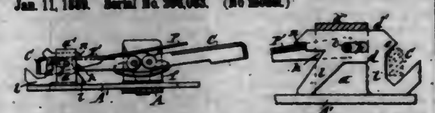


Claim.—1. The combination, with a separating-chamber having an imperforate peripheral wall and means whereby the dust-laden air is caused to assume a whirling motion in the same, of a recessed or depressed dust-discharge formed in the peripheral wall of the separating-chamber, substantially as set forth.

2. The combination, with a tapering separating-chamber, of an inlet-spout which delivers the dust-laden air to the large end of the separating-chamber, an air-exit at the large end of the separating-chamber, and a recessed or depressed dust-discharge formed in the side of the tapering chamber and provided with a discharge-opening at the small end thereof, substantially as set forth.

3. The combination, with the dust-separating chamber having an imperforate peripheral wall, a tangential inlet-spout, a central air-exit, and a dust-discharge opening, of a shield or skimmer arranged within the separating-chamber, open at its front end, where it receives the dust, and closed at its rear end, substantially as set forth.

4. The combination, with a dust-collecting chamber having an imperforate peripheral wall composed of a cylindrical and a conical or tapering portion, and having a central air-exit in the cylindrical portion and a dust-exit at the apex of the conical portion, of an inlet-spout opening tangentially into the side of the cylindrical portion, substantially as set forth.



409,466. AIR-DISTRIBUTER FOR ARGAND LAMPS. JOSEPH JARDS, Meriden, Conn., assignor to the Bradley & Hubbard Manufacturing Company, same place. Filed Apr. 8, 1889. Serial No. 306,836. (No model.)

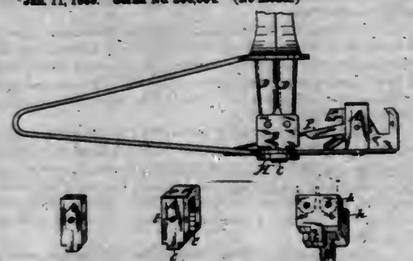
Claim.—1. An air-distributer for Argand burners, adapted to be concentrically arranged in the burner and having an exposed surface above the burner, the said exposed surface perforated with alternating series of vertical and horizontal perforations, substantially as described.

2. The herein-described distributer for Argand burners, constructed with one or more annular offsets forming substantially alternating horizontal and vertical surfaces, the said horizontal and vertical surfaces perforated to form alternating series of vertical and horizontal perforations, substantially as described.

409,467. ANIMAL-TRAP. HARRY R. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Jan. 11, 1889. Serial No. 296,063. (No model.)

Claim.—1. In combination with the frame, bait-pan, and jaws of an animal-trap, a sliding dog secured intermediate of its length to the frame and having one end provided with catches engaging the bait-pan, and the opposite end of said dog provided with wedging-bearings engaging one of the jaws, substantially as set forth.

2. In combination with the frame, bait-pan, and jaws of an animal-trap, a duplex post on the frame, a dog sliding in said post and adapted to engage at opposite ends simultaneously the bait-pan and one of the jaws, and provided with a longitudinal slot, and a pin passing through the post and aforesaid slot, substantially as described and shown.

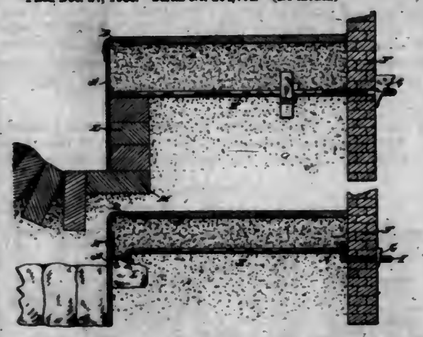


3. In combination with the frame, bait-pan, and jaws, the duplex post *a*, formed with the cap *a'*, the dog *d*, stamped out of sheet metal and sliding in the aforesaid post and formed with the horizontal top bearing *d'*, legs *l l*, longitudinal slot *b*, nose *n* at one end and wedging tail-piece *e* at the opposite end, and the pin *c*, passing transversely through the post and slot *b*, substantially as described and shown.

4. In combination with the frame, bait-pan, and jaws, the sliding dog *d*, formed at one end with a wedging catch engaging one of the jaws and at the opposite end with the nose *n* and guard *o* above said nose, substantially as and for the purpose set forth.

5. In combination with the duplex post *a*, the bait-pan and its sustaining catch or dog connected in common to said post, as set forth.

6. In combination with the duplex post *a*, the sliding dog *d*, provided with the slot *b*, the bait-pan P, provided with perforated ears, and the pin *c*, passing transversely through the post and through the ears of the bait-pan and slot of the aforesaid dog, substantially as described and shown.

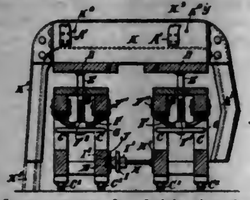


409,468. ANIMAL-TRAP. HARRY R. KELLEY, Niagara Falls, assignor to the Oneida Community, (Limited,) Community, N. Y. Filed Jan. 11, 1889. Serial No. 296,064. (No model.)

Claim.—1. In an animal-trap, the pan-post A and its rivets *c c*, formed in one piece of a blank stamped out of sheet metal and consisting of the elongated plate A', terminating with the prongs C C, bent at right angles and in one and the same direction on the lines *b b*, and perforated outside of and equidistant from said lines, substantially as described and shown.

2. In an animal-trap, the jaw-post B and its rivets *c c*, formed in one piece of a blank stamped out of sheet metal and consisting of the elongated plate B', provided with the notch *a* in the center of one of its longitudinal edges, and with the prongs C C on the opposite edge, and bent at right angles and in one and the same direction on the lines *d d*, substantially as described and shown.

409,469. PAVEMENT-CURB. ISRAEL L. LANDIS, Lancaster, Pa. Filed Dec. 27, 1888. Serial No. 294,771. (No model.)



Claim.—1. The combination, with the curb-plate, of the angle-iron bolted thereto and provided with a series of apertures in its projecting ledge for the engagement of the hooked ends of the binding-rods, substantially as specified.

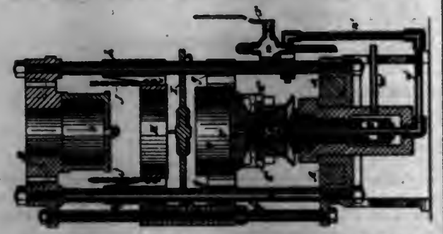
2. The combination, with the binding-rod, of the angle-iron having openings or perforations for a binding-wedge and secured to said rod in such manner as to clamp it in position to the foundation-walls of a building, substantially as set forth.

3. The combination, with the curb-plate and its perforated angle-iron, of the hooked rod engaging said plate and the perforated angle-iron and wedge, whereby the rod is clamped to the walls of a building, substantially as specified.

409,470. APPARATUS FOR TREATING ANIMALS BY ELECTRICITY. GEORGINA M. LAWRANCE, London, England. Filed Apr. 11, 1888. Serial No. 306,875. (No model.)

Claim.—1. In an apparatus for administering electricity to animals, the combination, with a vertically-adjustable bed, of supports therefor arranged beneath said bed, a boss swiveled on the frame of one support and engaging with a screw-shaft on the frame of the other, and threaded shafts for separately adjusting said supports, substantially as described.

2. In an apparatus for treating animals, the combination, with a bed concaved to support the animal underneath and having a metallic conducting-lining serving as one electrode, of means for raising said bed, and a generator of electricity connected to the lining and to a movable electrode adapted to be applied to different parts of the body, substantially as described.



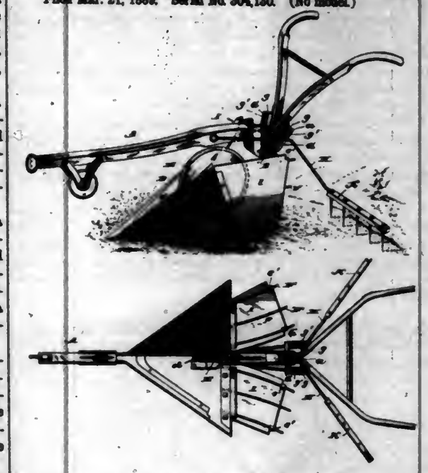
3. In apparatus for treating animals, the combination, with a vertically-adjustable bed provided with extensions at its ends to support the legs and having a concave surface to receive the body, said surface lined with a conducting metal, of means for raising and lowering said bed, and supplemental extensions or filling-pieces forming continuations of the extensions attached to the ends of the bed, substantially as described.

4. In apparatus for treating animals, the combination, with a vertically-adjustable bed having a conducting metal-lined concave surface and provided with extensions attached thereto at its ends and lined with metal to support the limbs, of supports raising and lowering said table, filling-pieces or supplemental extensions, also metal-lined and forming continuations of the extensions on the bed, and a generator of electricity connected to the metal lining and to a movable body-electrode, substantially as described.

5. In apparatus for treating animals, the combination, with a vertically-adjustable bed having a concave metal-lined surface and provided with extensions depending from its ends and metal-lined to support the limbs, of independent horizontally and vertically adjustable supports arranged beneath said bed, a generator of electricity connected to the metal lining of the bed and extensions, and a movable body-electrode, substantially as described.

6. In apparatus for treating animals, the combination, with a vertically-adjustable bed having a concave metal-lined surface and provided with end extensions having continuations of said metal lining, of a generator of electricity consisting of a casing containing separate compartments for the electrolyte, for an intensity-coil, and for the battery-plates and chemicals, said plates being composed of zincs Q and platinum P, adapted to be raised and handled by a handle R, having clips R', substantially as described.

409,471. SAND-MOLDING MACHINE. FREDERICK G. LEEDER, Dalmuir, County of Dumbarton, Scotland. Filed Apr. 19, 1889. Serial No. 307,949. (No model.) Patented in England Aug. 7, 1888, No. 11,268.



Claim.—1. A sand-molding machine composed of the following elements arranged and operating in combination, as follows: the framing A, carrying hydraulic rams B C, one placed within the other, a head on the ram C, to which is attached a lower mold-box G, and a platen on the ram B, adapted to enter said mold-box, a pattern-plate I, fitted to swing horizontally out or into position between the mold-box G and an upper mold-box H and to slide vertically in guides with said boxes, and a resisting plate or entablature E, adapted to resist the pressure of the rams upon sand compressed within the mold-boxes on both sides of the pattern-plate, substantially as described.

2. In a sand-molding machine, the framing A, carrying hydraulic rams B C, and a pressure-resisting plate E, in conjunction with the flasks or mold-boxes G H, fitted to slide on guides D D, the box G being carried by the ram C, a pattern-plate I, adapted to be placed between said boxes, and a platen carried by the ram B, substantially as described.

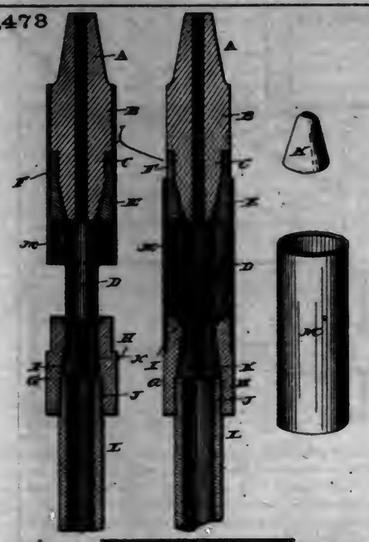
3. In a sand-molding machine, the combination of a pressure-resisting plate, the vertically-guided mold-boxes G H, a pattern-plate free to be swung horizontally out or into position between said boxes and to slide vertically with the mold-boxes, and rams carrying one of said mold-boxes and a compressing-platen, substantially as described.

4. In a sand-molding machine, the arrangement, in combination, of a pressure-resisting plate, the hydraulic rams B C, fitted one within the other, one ram being provided with a platen fitted within a mold-box carried by the other ram and being adapted to eject from the box the sand-mold produced in the machine by the exertion of pressure of both rams, substantially as described.

409,472. POTATO-DIGGER. DANIEL LEVARI, New Haven, Vt. Filed Mar. 21, 1888. Serial No. 304,130. (No model.)

Claim.—1. In a potato-digger, the combination of a double-shovel plow, provided centrally at its upper portion with a slot, and a colter journaled beneath the mold-board, so that its upper portion will pass through the slot, the lower portion of said colter being on a line or beneath the point of the plow, substantially as shown and for the purpose set forth.

2. In a potato-digger, the combination of a centrally-slotted double-shovel plow, separating-boards B B, attached to the double-shovel plow on each side of the slot, said boards being also secured to the handle-bars and plow-beam, and a wheel or colter E, journaled beneath the mold-board, so that its upper portion will extend through the slot in the plow and its lower portion be on a line with or below the plow-point, substantially as shown, and for the purpose set forth.



3. The combination, with a double-shovel plow, of the bars F, secured to the rear portion thereof, and plates I, mounted on said bars, said plates having the lower under guides and the upper rear corners bent under to form eyes *d'*, so as to embrace and slide on the bars, substantially as shown.

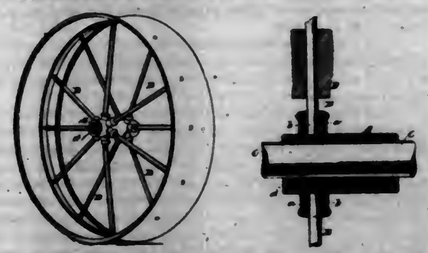
4. In a potato-digger, the combination of the beam A, plates B B, secured to said beam and to the lower ends of the handle-bar, said plates extending forwardly parallel with each other, the ends thereof being bent for attachment to the under side of the shovel-plow, a shovel-plow provided centrally with a slot *d*, through which slot passes the forward and upper portion of the colter, said colter being journaled to the plates B B and extending above and below the plow, and removable handles, substantially as shown, and for the purpose set forth.

409,473. PIPE-COUPLING. DAVID LEFFT, Mansfield, Ohio. Filed Sept. 28, 1888. Serial No. 286,682. (No model.)

Claim.—The combination of the nozzle, the flexible tubing connected thereto, the connecting pipe or joint, and the lower connecting pipe or joint provided with an annular collar or shoulder, and the exterior cylindrical casing or sleeve, substantially as set forth.

409,473

409,474. METHOD OF MANUFACTURING METAL WHEELS. JAMES R. LITTLE, Quincy, Ill., assignor to the Quincy Metal Wheel Company, same place. Filed Apr. 24, 1888. Serial No. 308,377. (No model.)

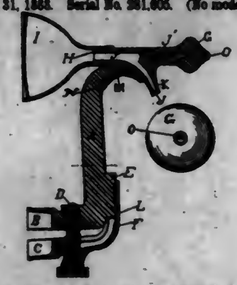


Claim.—1. The method of uniting the hub and spokes of a metal wheel, which consists in casting the hub upon the inner ends of the spokes and afterward enlarging each of the latter within the former, substantially as and for the purpose specified.

2. The method of uniting the hub and spokes of a metal wheel, which consists in casting the hub upon and around the inner ends or tenons of the spokes, and then by longitudinal compression enlarging such tenons within their mortises, substantially as and for the purpose shown.

3. The method of uniting the hub and spokes of a metal wheel, which consists in casting the hub upon and around the inner ends of the spokes, and then by the longitudinal compression of the inner portion of said spoke expanding the same within and immediately outside of said hub, substantially as and for the purpose set forth.

409,475. METAL WHEEL. JAMES R. LITTLE, Quincy, Ill., assignor to the Quincy Metal Wheel Company, same place. Filed Apr 24, 1888. Serial No. 308,378. (No model.)



Claim.—1. A metal wheel in which the hub is cast upon the spokes and said spokes expanded within their mortises, substantially as and for the purpose specified.

2. A metal wheel in which the hub and spokes are united by casting and the portions of the spokes within and immediately outside of the hub are expanded laterally, substantially as and for the purpose shown.

3. A metal wheel in which the spokes and hub are united by casting and each spoke within and immediately outside of the hub is compressed longitudinally, substantially as and for the purpose set forth.

409,476. COMBINED WRENCH AND OIL-CAN. JOHN H. LOSS, Los Angeles, Cal., assignor of one-half to Walter S. Maxwell, same place. Filed July 31, 1888. Serial No. 281,605. (No model.)

Claim.—In a combined wrench and oiler, the handle G, provided with a longitudinal oil-passage J' and a lateral oil-passage J, in combination with the oil-receptacle secured to the handle.

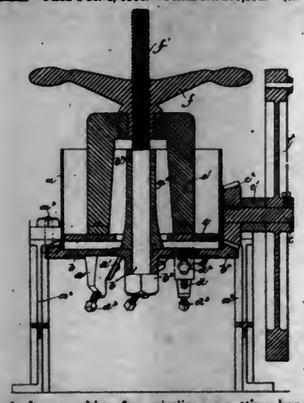
409,477. WIRE-FENCE MACHINE. LEONIDAS C. LOWDEN, Indianapolis, Ind. Filed June 6, 1889. Serial No. 313,279. (No model.)

Claim.—1. In a wire-fence machine, a frame-work, a series of twisters revolving therein, socket-clamps *sc*, bolted to such frame, for holding the upper and lower twisters in position, and a central socket-clamping bar *sc*, also bolted to such frame, having one or more extra socket-openings, allowing for the adjustment as to space of the twisters, in combination with means for revolving the twisting mechanism, substantially as shown and described.

2. In a wire-fence machine, a socket-clamping bar *sc*, having socket-openings 4 and 3 at its ends and a socket-opening 1 at its center, and an intermediate socket-opening 2 between the central and lower openings, substantially as shown and described.

3. The lever *l*, provided with a slot *sl* at its upper end, and the chain *ch*, connected to such lever and also to the machine-frame, substantially as shown and described.

409,478. HAY-FORK. SIMON K. LOUKY, Lang Bottom, Ohio. Filed May 2, 1889. Serial No. 310,170. (No model.)



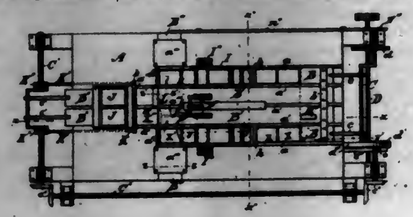
Claim.—The combination, in a hay-fork, of the tines A and A', having members B and B' and D and D' formed integral therewith, pulleys E and E', located on opposite sides at the junction of the tines and the members B and B', pulleys F and F', located between the pivotal point of connection and ends of the members D and D', flexible connection G, attached to the loops or eyes *d* and *d'*, and a flexible connection H, also connected to said loops or eyes and passed over the pulleys, and operating-cord I, the parts being organized substantially as shown, and for the purpose set forth.

409,479. WATERPROOFING COMPOUND. THOMAS MANAHAN, New York, N. Y., assignor to Margaret E. Manahan, same place. Filed May 18, 1889. Serial No. 311,008. (No specimens.)

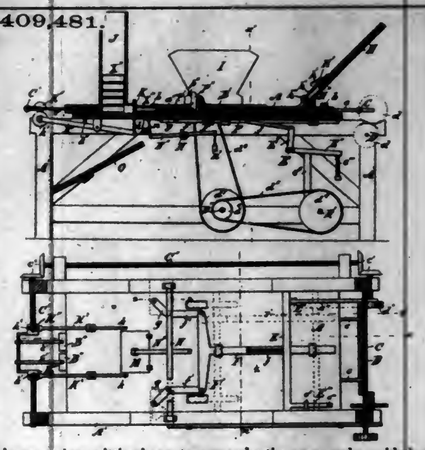
Claim.—The herein-described composition of matter, serviceable for waterproofing paper, consisting of resin-oil, resin, pine-tar, spirits of turpentine, and a drier, such as alcohol, substantially in the proportions specified.

409,480. **MACHINE FOR GRINDING BONE.** FRANKLIN W. MANN and CLARENCE H. FARRINGTON, Milford, Mass.; said Farrington assignor to said Mann. Filed Feb. 8, 1888. Serial No. 263,152. (No model.)

Claim.—1. In a machine for grinding or cutting bone, the cylinder *a*, rotatable bottom plate and knives carried by it, and means, substantially as described, for rotating said bottom plate, combined with the platen or follower *c*, yoke *d*, and cross-bar or handle *f*, and the fixed support or rod *b'*, having the screw-threaded end *f'*, whereby the platen may be moved vertically, substantially as described.



2. In a machine for grinding or cutting bone, the fixed cylinder *a*, having the fixed division-wall extended from the top to near the bottom of said cylinder, combined with the rotatable bottom plate and knives carried by it, and means, substantially as described, for rotating the bottom plate, the split platen or follower, slotted to receive the division-wall, and means, substantially as described, for moving it independently of the bottom plate, substantially as described.



3. In a machine for grinding or cutting bone, the fixed cylinder *a* and partition-wall a^4, combined with the rotatable bottom plate, knives carried by it and inclined with relation thereto, and means, substantially as described, to rotate said plate, the split platen or follower, its yoke, and the cross-bar *f* and fixed support *b'*, having the screw-threaded end *f'*, as and for the purposes set forth.

4. In a machine for grinding or cutting bone, the fixed cylinder *a* and division-wall a^4, combined with the rotatable bottom plate *b*, having a series of holes therein at different distances from its center, lugs *d'* adjacent to said holes, adjustable slotted knives carried by said lugs, inclined with relation to the bottom plate, set-screws d^3 d^3 to adjust said knives, and means, substantially as described, for rotating said plate, and the slotted platen or follower, its yoke and cross-bar, and the fixed support *b'*, having the screw-threaded end *f'*, substantially as described.

409,481. **SLIDE MATCH-BOX-FILLING MACHINE.** JOHN D. MARTIN, GEORGE H. MILLER, and ALFRED DROUIN, Hull, Quebec, Canada. Filed Apr. 24, 1889. Serial No. 308,473. (No model.)

Claim.—1. A match-box-filling machine comprising a frame and table, parallel longitudinal races for the match-boxes thereon, parallel longitudinal races in continuation of the central races for the match-box covers, transverse races for the transfer of the boxes from one race to another, pushers in said races having a reciprocating motion working in opposite and transverse directions, an inclined feed-slide provided with races to receive boxes and with means of holding and releasing them, a match-hopper placed over each race holding empty

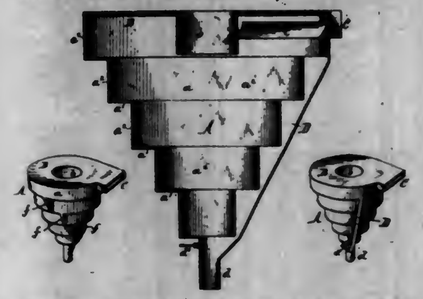
boxes and permitting boxes to pass under the same, and provided with a spring at the entrance and a rotary roller at its exit, a vertical cover-hopper placed over each cover-race, a stop placed across the cover-race between the cover-hopper and match-hopper, said stop having an intermittent lifting action, a set of fine plate-springs in the cover-race projecting toward and into the cover, and a downwardly-hinged trap-door having an intermittent downward swinging movement and provided at its upper surface at the hinged end with a forwardly-projecting plate with upward shoulder, substantially as set forth.

2. In a match-box-filling machine, the combination of the table A, supported on a frame, guides *a a' a''*, forming races on said table, longitudinal pushers B, B', and B'', working in said races, crank-shafts C and C' at the ends of said frame and connected by the shaft C'', and miter-gear with pitmen *c c'*, giving alternate reciprocating motion to said pushers, cam *e* on shaft C, rod *e''*, operated by said cam and pivoted to the arm E', rocking shaft E, having arm E, balanced arm E'', and arm E''', pivoted to a pitman, pitman *f*, pivoted to said arm E''' and to a slide-rod, slide-rod F, connected to said pitman and having a cross-head F', double vertical crank G, journaled in the table and having crank-arms *g g'* connected to the cross-heads by links, links *f'*, connecting cranks and cross-head, and the transverse pushers B'', each having a triangular cavity adapted to receive the upper crank-arm *g'*, set at a right angle to the lower arm *g*, to be operated thereby, substantially as set forth.

3. In a match-box-filling machine, the combination of the table A, provided with guides forming races thereon, reciprocating pushers in said races, an inclined feed-slide H, near the end of the table, having races thereon corresponding to the outer races on the table, a transverse shaft H', journaled over said races, fingers *h'* on said shaft over said races, an arm *h''* on said shaft over one of the central slides, and an incline or wedge H'' on said central slide adapted to lift said arm, substantially as set forth.

4. In a match-box-filling machine, the combination of a table A, guides thereon forming races, reciprocating pushers in said races, a match-hopper I over each outside race, a fine spring *i'* at the lower inside front edge of said hopper, and a shaft I', near the lower inside rear edge thereof and carrying a fluted roller I'', having hooks *i''*, said roller flush with the inner rear end of said hopper and partly covered thereby, and its lowest point level with the top of the race, substantially as set forth.

5. In a match-box-filling machine, the combination of a table A, guides thereon forming races, reciprocating pushers in said races, and a vertical cover-hopper J, near the rear end of the table set over the central races, substantially as set forth.



6. In a match-box filling-machine, the combination of a table A, guides thereon forming races, reciprocating pushers in said races, a crank-shaft C at the rear end of said table, a stop K, intersecting the central races transversely, a sliding pin *k*, secured at each end of said stop and passing vertically through said table and pivoted below the table to the end of a double lever, a double lever K', pivoted to each pin fulcrumed to the under side of said table and held up by a spring, the other end reaching under the crank-shaft C', and a cam K'' on said crank-shaft, adapted to depress said end of the lever, substantially as set forth.

7. In a match-box-filling machine, the combination of a table A, having guides thereon forming races, reciprocating pushers in said races, a crank-shaft C at the front end of said table, a trap-door M, hinged in said table and having a shouldered forwardly-projecting

plate M' at the upper surface of the hinged end, a link *n*, pivoted to the under side of said trap and the arm of a rocking shaft, a rocking shaft N, having a double arm N'', pivoted to the link *n* and counterbalanced at the other end, and a rocking arm N', pivoted to a rod, the rod *n''*, pivoted to the said rocking arm and having upward projection *n'''*, bearing against a cam, and the cam N''' upon the crank-shaft C, substantially as set forth.

8. In a match-box-filling machine, the combination of the table A, having guides *a'* to form races, a pusher B', provided at its operating end with a cavity, a rod P', carrying a slide P in said cavity, an upright lever P'', pivoted at its lower end to said rod and fulcramed to said pusher, a bracket *p*, secured to the central guide *a'*, and a cross-bar *p'*, secured to said bracket and adapted to be struck by the upper end of the lever P'' when the pusher B' is near the end of its stroke, substantially as set forth.

409,482. **DUST-COLLECTOR.** ORVILLE M. MORSE, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Apr. 12, 1888. Serial No. 270,414. (No model.)

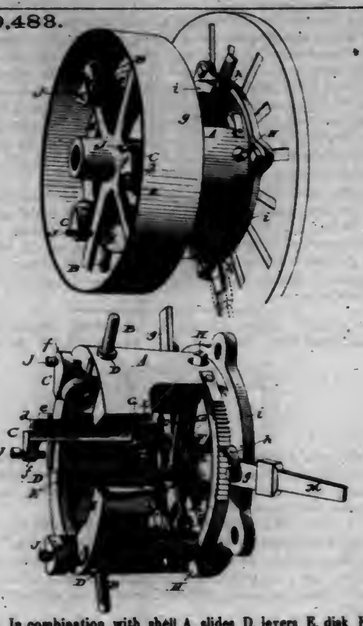
Claim.—1. A dust-collector having the peripheral wall of its separating-chamber composed of inwardly-projecting shelving portions alternating in the longitudinal direction of the separating-chamber, with connecting portions arranged parallel with the axis of the chamber, substantially as set forth.

2. A dust-collector having the peripheral wall of its separating-chamber composed of a series of shelves of gradually-decreasing diameter, and cylindrical bands connecting said shelves, substantially as set forth.

3. A dust-collector consisting of a separating-chamber having its peripheral wall composed of a series of annular shelves of gradually-decreasing diameter connected by cylindrical bands, an inlet-spout for the dust-laden air entering the large end of the separating-chamber, a dust-discharge, and a discharge for the purified air, substantially as set forth.

4. The combination, with the separating-chamber having its peripheral wall composed of a series of annular shelves of gradually-decreasing diameter and connecting cylindrical bands, of a recessed dust-conduit arranged on the side of the separating-chamber, substantially as set forth.

5. The combination, with the separating-chamber having its peripheral wall composed of a series of annular shelves of gradually-decreasing diameter and connecting cylindrical bands, an inlet-spout for the dust-laden air entering the large end of the separating-chamber, and a dust-discharge at the small end of the separating-chamber, of a recessed dust-conduit extending on the side of the separating-chamber from the large end thereof to the dust-discharge and communicating with the interior of the separating-chamber, substantially as set forth.



409,488. **PULLEY-CHUCK.** WALTER J. MUSGRAVE, Cumberland, Md., assignor of one-half to Merwin McKaig, same place. Filed June 6, 1889. Serial No. 313,206. (No model.)

Claim.—1. The herein-described pulley chuck or holder, consisting of shell or body A, centering pins or stems B, carriers D for said pins, clamping-levers C, disks F K, and rods connecting the carriers D and the levers C with the disks F K, respectively.

2. In combination with the shell of a pulley chuck or holder, a centering device consisting of a series of radially-movable slides or stems, levers connected at one end with said slides, a disk mounted and arranged to turn about a pivot equidistant from the outer ends of the several slides or stems, and rods connecting the levers with the disk.

3. In combination with shell A, radial slides or carriers D, pins B, carried by said slides, levers E, for moving said slides, disk F, and rods G, connecting the levers E and the disk F, substantially as described and shown.

409,488.

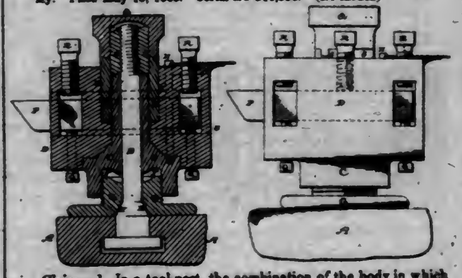
4. In combination with shell A, slides D, levers E, disk F, and connecting-rods G, removable pins B.

5. In a pulley chuck or holder, a series of radially-movable slides or carriers and removable pins applied to said carriers and serving to center a pulley or wheel applied to the holder.

6. In combination with shell A, having rack *i*, slides D, levers E, rods G, and disk F, provided with pawl *h* to engage with rack *i*.

7. In combination with shell A, a series of levers C, pivoted thereto and provided with jaws overhanging the face of the shell, substantially as described and shown, whereby they are adapted to clamp the spokes of a pulley or wheel between them and the face of the shell.

8. In combination with shell A, carriers D, levers E, disk F, and rods G, connecting the levers and the disk, said rods being adjustable as to length, substantially as set forth.



9. In combination with shell A, levers E, blocks or carriers D, disk F, rods G, connecting the disk and the levers, and the adjustable connection H I between the levers and the rod, whereby the carriers may be brought to proper position.

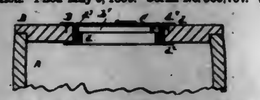
10. In combination with shell A, levers C, pivoted thereto and formed with jaws *f*, disk K, and connecting rods or bars L, extending from the levers to the disk.

11. In combination with shell A, levers C, pivoted thereto and provided with jaws *f*, screws J, passing through said jaws, and mechanism, substantially such as described, for moving the levers toward or from a common center.

12. In combination with shell A, provided with rack *i*, levers C, rods L, and disk K, provided with dog *h*, and serving, through the medium of the rods L, to actuate the levers C.

409,484. **TOOL-POST FOR LATHES.** JOHN A. MYERS, Louisville, Ky. Filed May 13, 1889. Serial No. 310,560. (No model.)

Claim.—1. In a tool-post, the combination of the body in which



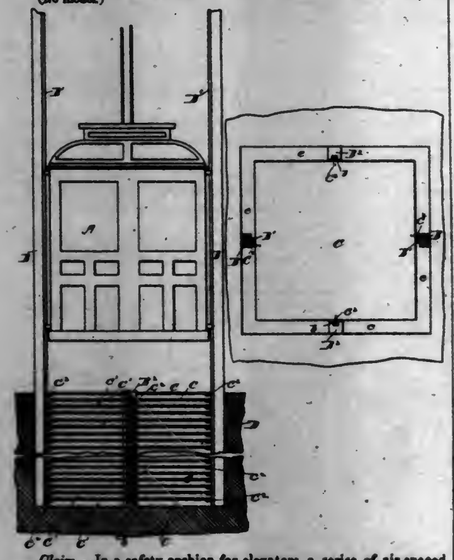
the tools are held, the sleeve which is screw-threaded at its inner end, and a nut for adjusting the post vertically, substantially as shown.

2. The combination of the body, the sleeve provided with a collar and recess, with a locking rod or device whereby the body is prevented from being revolved upon the sleeve, substantially as described.

3. The combination of the screw-rod provided with a head at one end and a nut at the other, and the sleeve through which the rod passes, with the body provided with slots through which the tools are passed, and the locking-rod by which the body is prevented from being revolved, substantially as set forth.

4. The combination of the headed screw-rod, the sleeve through which the head passes, the nut by which the post is raised and lowered, the body placed upon and adapted to revolve upon the sleeve, the locking-rod which passes through the body and engages with the sleeve, the nuts upon the rod and the sleeve, the slots for tools which are passed through the body, and the set-screws for adjusting them, substantially as specified.

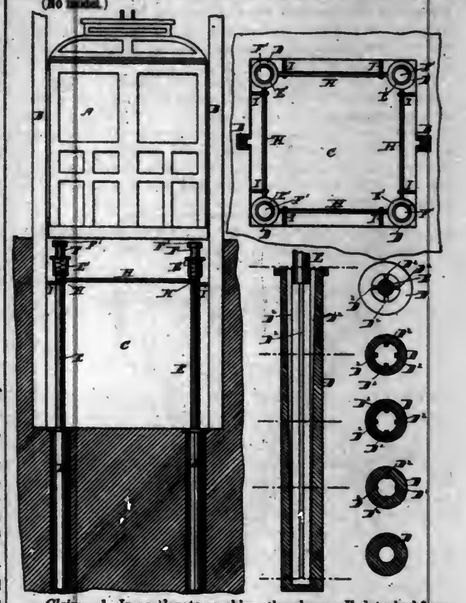
409,485. RECEPTACLE FOR MERCHANDISE. PETER E. MCDONALD, Detroit, Mich. Filed May 6, 1889. Serial No. 309,707. (No model.)



Claim.—1. A receptacle for articles of merchandise, consisting of a body A, having in combination therewith a cover B, provided with an opening therein, a rim engaged with said cover, and a cover C, seated upon said rim, substantially as set forth.

2. A receptacle for articles of merchandise, consisting of a body A, having in combination therewith an external cover B, a rim D, provided with an upturned flange engaged upon said cover within an opening therein, and a cover C, constructed with a flange *c*, seated upon said rim to close the opening in the external cover, substantially as set forth.

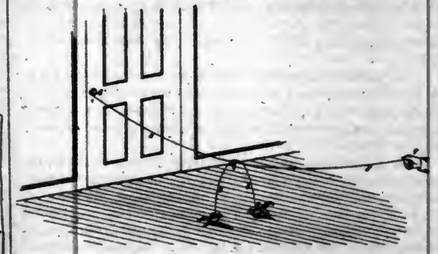
3. A receptacle for articles of merchandise, consisting of a body A, having in combination therewith an external cover B, provided with an opening therein, a cover C, to close said opening, and a fabric F, underlying the covers B and C, substantially as set forth.



4. A receptacle for articles of merchandise, consisting of a body A, having in combination therewith an exterior cover B, hinged upon said cover and provided with an opening therein, a rim surrounding said opening, and a cover seated upon said rim to close said opening, substantially as set forth.

409,486. SAFETY-CUSHION FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed May 15, 1889. Serial No. 310,881. (No model.)

Claim.—In a safety-cushion for elevators, a series of air-spaced platforms supported normally on pins, said pins being adapted to yield to increased pressure, substantially as and for the purpose set forth.



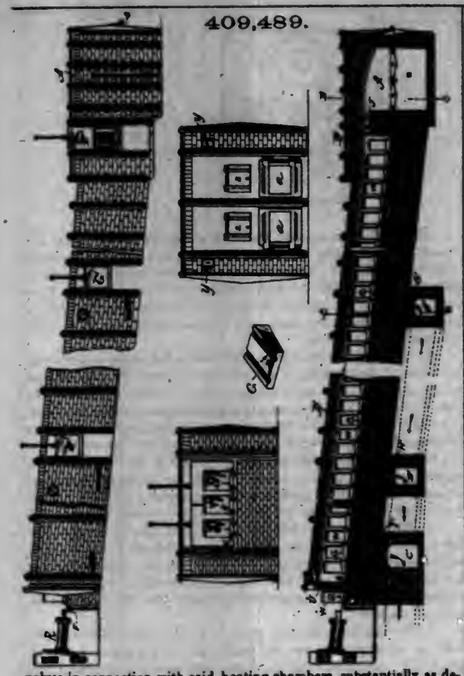
409,487. SAFETY-CUSHION FOR ELEVATORS. WILLIAM E. NICKERSON, Cambridge, Mass. Filed May 15, 1889. Serial No. 310,882. (No model.)

Claim.—1. In an elevator-cushion, the plunger E, detached from the carriage and supported normally in its withdrawn position, and the cylinder D, having a taper bore, substantially as and for the purpose set forth.

2. In an elevator-cushion, the cylinder D, having a taper bore, the plunger E, having upon its upper end the cylinder E', and the plunger F, substantially as and for the purpose set forth.

409,488. AUTOMATIC TOY. FRANK NOECKER, St. Louis, Mo. Filed May 16, 1889. Serial No. 310,948. (No model.)

Claim.—1. The described toy, consisting of two figures 1, the wire bow-spring 3, to which said figures are attached, and a cord 5, from which said wire bow-spring hangs pendent, substantially as described, and for the purpose set forth.



2. The described toy, consisting of two figures 1, the wire bow-spring 3, to which said figures are attached, the said bow-spring being provided with a spiral bend at its mid-length, and a cord 5, which may be secured at one end and held in the hand of the operator at the other end, substantially as described, and for the purpose set forth.

3. In a toy, the combination of an operating-cord adapted to be secured at one end and held in the hand of the operator at the other end, a bow-spring pendent from said cord, and figures attached to the ends of said spring, said spring and figures being free to move bodily the length of the cord, substantially as and for the purpose set forth.

409,489. KILN FOR THE MANUFACTURE OF CARBONS. PHILIP P. NEWBERRY, Cleveland, Ohio. Filed Dec. 27, 1888. Serial No. 294,790. (No model.)

Claim.—1. In the manufacture of carbons, a furnace having a fire-chamber at one end, an elongated heating-chamber in connection with the said fire-chamber, and a series of flues controlled by suitable

409,489.

409,490.

valves in connection with said heating-chambers, substantially as described.

2. In the manufacture of carbons, a furnace having a fire-chamber at one end, a stationary elongated heating-chamber in connection with said fire-chamber, a charging-opening, and a discharge-opening in the side wall of the heating-chamber between the charging end and the fire-chamber, substantially as described.

3. In combination with a furnace having a fire-chamber, a heating-chamber having tubular tracks laid in the bottom thereof, conveyers adapted to said track, a suitable water-supply, in connection with said tubular track, and a pipe-connection between the lower end of the track and the ash-pit of the fire-chamber, substantially as described.

4. In combination with a fire-chamber and a heating-chamber, a series of independent sliding conveyers composed of refractory material and receptacles for the carbons mounted upon said conveyers and moving therewith, substantially as described.

5. In combination, in the described furnace, with the tubular water-tracks, of independent sliding conveyers having grooves in their bottom adapted to said track and composed of refractory material, substantially as described.

6. In combination with the heating-chamber inclined from front to rear, of independent sliding conveyers composed of refractory material having inclined bottoms and tops in horizontal plabe, with receptacles carried thereby, substantially as described.

7. In combination with the fire-chamber, the elongated heating-chamber, the-water-tracks in said chamber, the grooved conveyers adapted thereto having inclined bottoms, and the receptacles supported on said conveyers and of less width, whereby spaces are provided between each receptacle, substantially as described.

409,490. METHOD OF MANUFACTURING CARBONS. PHILIP P. NEWBERRY, Cleveland, Ohio. Filed Jan. 31, 1889. Serial No. 298,305. (No model.)

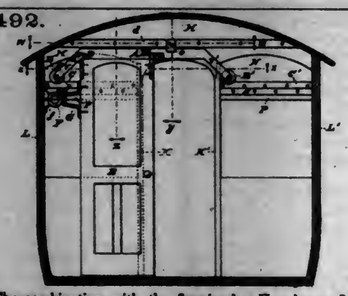
Claim.—1. The hereinbefore-described method of treating carbons, consisting in packing them in saggers of greater depth than the length of the carbons, covering the ends of the carbons with sand, and passing the saggers thus packed through a heating-chamber in which the highest degree of heat is at the discharge end and the lowest degree at the charging end, substantially as described.

2. The described method of baking carbons, consisting in placing the carbons in saggers, passing the saggers successively through a chamber from a lower to a higher heat, and finally removing the saggers while hot from the discharge end of the chamber, substantially as described.

3. The described method of treating carbons, consisting in placing them in saggers with the ends resting on the bottom of the saggers, placing the saggers with their open mouths upward in a chamber heated gradually from the charging to the discharging end, and in passing the saggers thus filled from the lower to the higher heat, with the flames passing over the upper ends of the saggers, whereby they are heated gradually and from the top downward, substantially as described.

409,491. FLOUR-SIFTER. ROBERT OLP, Manitowoc, Wis. Filed Apr. 24, 1889. Serial No. 308,455. (No model.)

Claim.—The flour-sifter comprising the scoop, having upon its rear side, at the top edge, an eye, and the combined handle and agitator consisting of the continuous wire bent in rectangular form for a portion of its length and terminating within the scoop in a series of coils, one vertical portion of its rectangle having a hand-hold, the other vertical portion of the rectangle engaging the eye upon the scoop, and having at its lower end an eye, through which the horizontal portion of said wire passes, substantially as set forth.



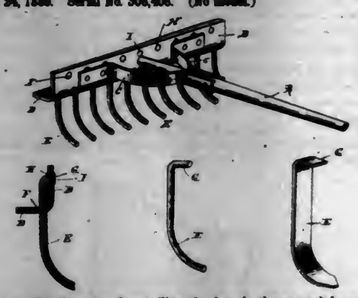
409,492. STREET-CAR DOOR. SILAS R. OWEN, St. Joseph, Mo. Filed Dec. 3, 1888. Serial No. 292,493. (No model.)

Claim.—1. The door-carrying bar A, having the downwardly-inclined ends V, projecting beyond each side of the door, in combination with and engaging the tracks C C, arranged below the top of the doorway on each side of the doorway, substantially as specified.

2. The combination, with the tracks C C, arranged on both sides of and below the top of the doorway, the door-carrying bar A, having the downwardly-inclined ends, and the grooved rollers B B', applied to said ends, substantially as specified.

3. The combination, with the door-carrying bar A, having downwardly-inclined ends, its rollers, and the tracks arranged below the top and on each side of the doorway, of the door, and the hanger-brackets D D', connected to said bar and door and channeled to receive the bar A, substantially as specified.

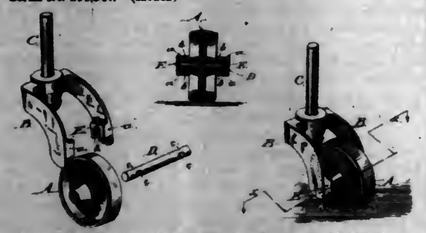
409,492.



4. The combination, with the framing-bar H and posts L L', of the rabbeted bars S, panels N, secured to posts L L' and to the rabbeted bars S, the bars P, let into the bars S, and the tracks C C', secured in rabbets of said bars S, substantially as specified.

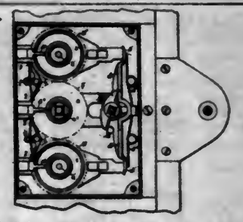
5. The combination, with the door-carrying bar A and its grooved rollers, of the frame-bar H, its strip *d*, and guide *c*, secured to said strip *d*, the panels N, secured to posts L L' of the car-framing, and transverse supports P S, secured together, and tracks C C', secured in rabbets of the supports S, substantially as specified.

409,493. BITUMINOUS SAND-ROCK FOR PAVING, ROOFING, AND BUILDING PURPOSES. WILLIAM PATTERSON and ELIAS GROAT, San Francisco, Cal., assignors to the California Bituminous Rock Manufacturing Company, of California. Filed June 21, 1888. Serial No. 277,322. (No specimens.)



Claim.—The process of treating bituminous sand-rock, which consists in disintegrating or separating the particles thereof by crushing or grinding and reuniting them by pressure, without the aid of heat other than the latent heat developed by crushing and pressure, substantially as and for the purpose set forth.

409,494. HAND-RAKE. JONATHAN PARSON, Pottsville, Pa. Filed Apr. 24, 1888. Serial No. 308,408. (No model.)



Claim.—The improved metallic rake herein shown and described, the same consisting of the flat head B, bent at its lower end to form a right-angled flange D and having slots or apertures F and H, in combination with the teeth inserted through said apertures and clinched at the back part of the rake-head.

409,495. CASTER. OLE PEDERSON, Joliet, Ill. Filed Nov. 20, 1888. Serial No. 291,247. (Model.)

Claim.—In a furniture-caster, the combination, with fork having the boxes E, the inner walls of which are formed with inwardly-turned lugs or projections, of an axle having its opposite sides grooved at points near the ends and adapted to be engaged by said lugs, and a wheel or roller mounted on the axle, substantially as herein described.

409,496. PERMUTATION-LOCK. JOHN M. PFLAUM, Cleveland, Ohio. Filed Aug. 22, 1888. Serial No. 283,488. (Model.)

Claim.—1. The combination, with outside hand-knobs, dial, and internal disk mounted on a spindle in common, of spring-actuated dogs connected with such disk, toothed wheels mounted loosely on either side of the disk, the dogs having beveled ends arranged in reverse order, and the toothed wheels having corresponding notches for engaging the respective dogs with reverse movements of the disk, substantially as set forth.

2. The combination, with internal disk, mechanism, substantially as indicated, for actuating the same, said disk having annular flanges on either side thereof, such flanges having respectively radial openings, of toothed wheels journaled on the respective hubs of such disk, the rim of the respective toothed wheels overlapping the respective flanges of the disk, spring-actuated dogs located between the disk and the respective toothed wheels, beveled points of the dog, and corresponding notches of the toothed wheels for mutual engagement, whereby the respective toothed wheels are rotated with the respective reverse movements of the disk, substantially as set forth.

3. The combination, with hand-knob, dial, spindle, and disk, the latter having a hollow hub, substantially as indicated, of a tumbler mounted on the said spindle, the hub of the tumbler entering the hollow hub of the disk, a nut mounted on such spindle for tightening the engaging-hub to cause the tumbler to revolve with the disk, substantially as set forth.

4. The combination, with gears F F' and mechanism, substantially as indicated, for operating these gears in opposite directions, of gears H H', the latter being connected with tumblers arranged substantially as described, and for the purposes set forth.

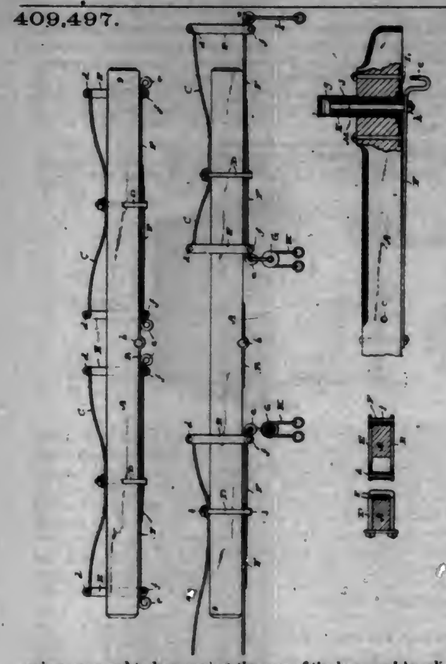
5. The combination, with hand-knob, dial, and spindle, a central tumbler mounted on the said spindle and adjustably secured thereto, of tumblers arranged on either side of the central tumbler, mechanism, substantially as indicated, for connecting the side tumblers with the central spindle, whereby the side tumblers are actuated in opposite directions by reverse movement of the central spindle, substantially as set forth.

6. The combination, with three tumblers and mechanism for actuating the different tumblers, substantially as indicated, of slot and hole in each tumbler, corresponding holes in the face-plate of the lock, arranged substantially as indicated, whereby the opposing holes of plate and tumbler register when the slot of such tumbler is in position to receive the opposing bolt, substantially as set forth.

7. The combination, with lever and spindle for withdrawing the bolts, a lateral arm connected with such spindle, said arm having a V-shaped notch at the free end thereof, of signal-bell and spring-actuated bell-lever for the same, said bell-lever having a V-shaped projection for engaging such notch of the spindle-lever, substantially as set forth.

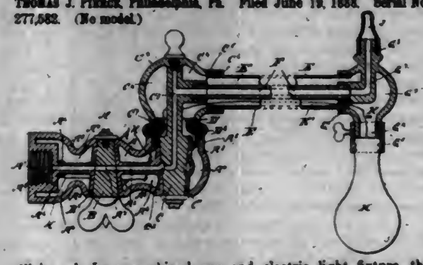
409,497. DRAFT-EQUALIZER. CHARLES W. PHELPS, Mygatts Corners, Wis. Filed May 23, 1889. Serial No. 311,816. (No model.)

Claim.—1. A draft-equalizer comprising a beam, a spring-plate secured in front of the beam and provided with trace-connections, and a spring device connected to the ends of the spring-plate to exert resistance to draft thereon, substantially as set forth.



2. A draft-equalizer comprising a beam, sectional spring-plates secured in front of the beam on opposite sides of the center and provided with trace-connections, and a spring device connected to the ends of each spring-plate to exert resistance to draft thereon, substantially as set forth.

3. A draft-equalizer comprising a beam, spring-plates arranged in front of the beam and provided with trace-connections, leaf-springs arranged to bear against the rear of the beam and connected to the ends of the spring-plates, and clips for uniting said beam, plates, and springs, substantially as set forth.



4. A draft-equalizer comprising a beam, spring-plates secured in front of the beam on opposite sides of the center and provided with trace-connections, leaf-springs arranged to bear against the rear of the beam, straps united to the leaf-springs and arranged above and below said beam, and bolts or rivets uniting the straps in front of the spring-plates, substantially as set forth.

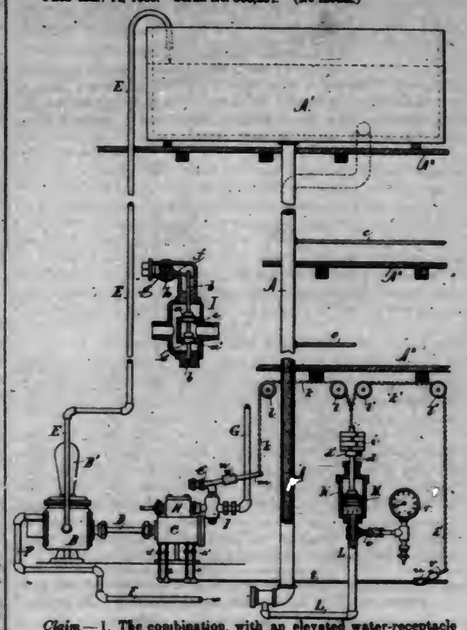
5. A draft-equalizer comprising a beam, spring-plates adjustably secured in front of the beam on opposite sides of the center, leaf-springs arranged to bear against the rear of the beam and be adjustable with the spring-plates, straps united to said leaf-springs and arranged above and below said beam, bolts or rivets uniting the straps in front of the spring-plates, sheave-blocks connected to the inner ends of the spring-plates, tugs run through the blocks, and other tugs connected to the outer ends of the said spring-plates, substantially as set forth.

409,497.

409,498. COMBINED GAS AND ELECTRIC LIGHT FIXTURE. THOMAS J. PIERCE, Philadelphia, Pa. Filed June 19, 1888. Serial No. 277,582. (No model.)

Claim.—1. In a combined gas and electric light fixture, the combination of the shells C^2 and A^2, and the insulating-collar D, located in and between the said shells, with the plug C and gas-tube C^2, substantially as shown and described, and for the purpose set forth.

2. In a combined gas and electric light fixture, the combination of the shell C^2, having a central gas-channel surrounded by an electric-wire channel, with the insulating-collar D, provided with the bead D^2, adapted to support the said shell, substantially as shown and described, and for the purpose set forth.



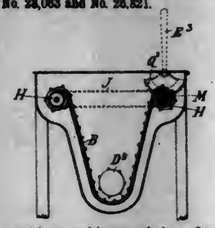
409,499. STRAP FOR PACKING-BOXES. WALLACE J. PIERPONT, Galesburg, Ill. Filed June 22, 1889. Serial No. 315,276. (No model.)

Claim.—1. A binding-strap for boxes or other angular wooden packages, which is composed of wood, and which is provided at intervals upon its exterior surface with metallic protecting and strengthening stripe.

2. A binding-strap for boxes, which is composed of wood, and which is provided at intervals upon its outer surface with metallic protecting and strengthening strips, and with a protecting-plate of sheet metal, which is embraced between the protecting-strips and the body of the strap, substantially as and for the purposes set forth.

409,500. PUMP-GOVERNOR. JOHN Y. PIKE, New York, N. Y. Filed Mar. 14, 1888. Serial No. 306,831. (No model.)

Claim.—1. The combination, with an elevated water-receptacle in the upper part of a building and a steam-pump and pipe therefrom to the tank, of a vertical supply stand-pipe connected with the tank and passing down through the building, a branch pipe connected to the stand-pipe, and a vertical cylinder upon the branch pipe, a piston and rod moving within said cylinder, and variable weights upon the rod to counterpoise the weight of water in the stand-pipe and tank to the desired level, and pulleys and a connection from the weighted piston to the valve of the steam-pump, whereby the weighted piston is raised and the valve is moved by the increase of pressure due to the rise of the water in the tank and the reverse, substantially as specified.

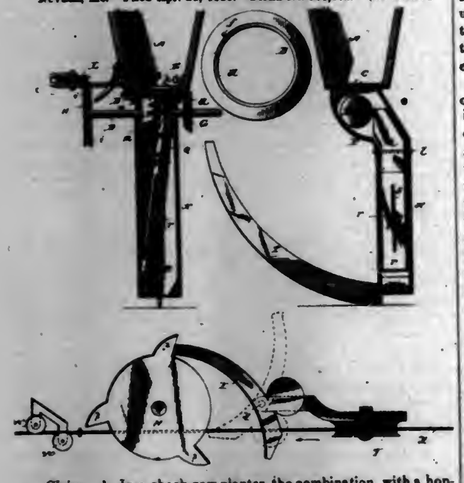


2. The combination, with an elevated water-receptacle in the upper part of a building and a steam-pump and pipe therefrom to the tank, of a vertical supply stand-pipe connected with the tank and passing down through the building, a branch pipe connected to the stand-pipe, and a vertical cylinder upon the branch pipe, a piston and rod moving within said cylinder, and variable weights upon the rod to counterpoise the weight of water in the stand-pipe and tank to the desired level, and the steam-valve chamber I and valve, and the weighted lever *m* connected therewith, and pulleys, and a chain over the pulleys connecting the weighted piston and weighted lever, whereby the weighted piston is raised and the valve is moved by the increase of pressure, due to the rise of the water in the tank and the reverse, substantially as specified.

3. The combination, with a water tank or receptacle in the upper part of a building, a vertical stand-pipe connected therewith and passing down through the building, and a steam-pump and pipe therefrom to the tank, of a branch pipe connected to the stand-pipe and a cylinder upon the branch pipe, a weighted piston within said cylinder, the steam-valve chamber I and valve, and the weighted lever *m* connected therewith, and a chain *k*, and pulleys around which said chain passes, the ends of the chain being connected, respectively, to the weighted piston N and weighted lever *m*, and a branch pipe *o*, connected to the pipe L, and a pressure-gage *r* to indicate the pressure of the weight of water in the stand-pipe and the variations thereof, substantially as set forth.

4. The combination, with a water tank or receptacle in the upper part of a building, a vertical stand-pipe connected therewith and passing down through the building, and a steam-pump and pipe therefrom to the tank, of a branch pipe connected to the stand-pipe and a cylinder upon the branch pipe, a weighted piston within said cylinder,

the steam-valve chamber I and valves, and the weighted lever *m* connected therewith, and a chain *k*, and pulleys around which said chain passes, the ends of the chain being connected, respectively, to the weighted piston N and weighted lever *m*, the drip-pipes *s* and *t*, connected to the steam-cylinder of the pump, and a valve *u*, lever *v*, chain *k'*, and pulleys *i'* for the same, one end of the chain *k'* being connected to the weighted lever *v* and the other end to the weighted piston-N, substantially as and for the purposes set forth.

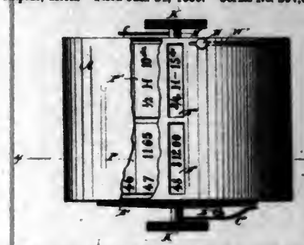


409,501. WASHING-MACHINE. ALBERT RAMMOSER, Berlin, Germany. Filed Aug. 1, 1888. Serial No. 281,697. (No model.) Patented in Germany July 26, 1887, No. 42,550; in England May 23, 1888, No. 7,564; in France June 2, 1888, No. 185,152, and in Austria-Hungary Sept. 22, 1888, No. 28,063 and No. 26,821.

Claim.—1. A washing-machine consisting of a tub and a flexible slatted or ribbed apron having its ends secured within the tub and forming a sag, and a weighted automatically-rotating ribbed roller working in the said sag of the apron, substantially as set forth.

2. A washing-machine provided with a flexible slatted or ribbed apron having its ends fastened to two rollers journaled at two opposite sides of the tub and provided with means for reciprocally rotating them, and with a weighted automatically-rotating ribbed roller working in the sag of the apron in the tub, whereby provision is made for washing the clothes between said apron and roller by the reciprocating curvilinear motion of the apron and the reciprocating rotary motion of the weighted roller, substantially as herein described.

409,502. CHECK-ROW CORN-PLANTER. STEPHEN D. REYNOLDS, Nevada, Mo. Filed Apr. 26, 1889. Serial No. 308,662. (No model.)



Claim.—1. In a check-row planter, the combination, with a hopper, of a valve-box arranged beneath the same and a vertically-adjustable oscillating valve arranged in said box, substantially as specified.

2. In a check-row planter, the combination, with a hopper, of a valve-box or seed-tube, an intermittently-rotating shaft passing through said box and having a cam-cylinder secured thereto, and a valve pivoted in the box and having an adjustable extension at its lower end and its upper end adapted to engage the groove of the cylinder, substantially as specified.

3. In a check-row planter, the combination, with a hopper, of a valve-box or seed-tube arranged beneath the same, a cylinder having a cam-groove and journaled in the seed-tubes, and the vertically-adjustable oscillating valve, also arranged in the tube and having a lug at its upper end to engage the groove of the cylinder, substantially as specified.

4. In a check-row planter, the combination, with a seed-tube, of a shaft journaled therein, a grooved cylinder fixed to the shaft, a vertically-adjustable oscillating valve arranged in the tube, a forked wheel fixed to the shaft, and the lock or catch I, pivoted and weighted, the said catch being arranged so as to have one end engaged by the check-line and its opposite end adapted to engage the forks of the wheel, so as to limit the movement of the latter, substantially as specified.

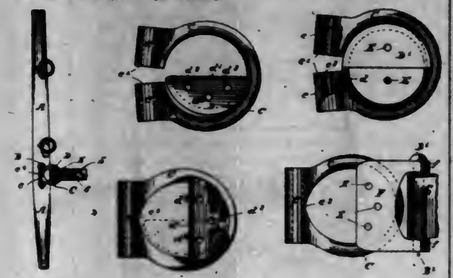
409,503. TIME AND WAGE INDICATOR. JESSE T. RICE, Grand Rapids, Mich. Filed Jan. 21, 1889. Serial No. 297,026. (No model.)

Claim.—1. A time and wage indicator comprising a slotted casing having on its front a stationary dial, a rotating shaft extending through the casing and having a knob or handle for turning it at will, a pointer rigidly attached to the shaft and moving therewith in front of the stationary dial, and an internal cylinder rigidly attached to the shaft and rotating in unison with the shaft, the pointer and the knob or handle, said stationary dial divided into parts having characters to indicate the days of the week, and provided with a circle subdivided to indicate hours, and the cylinder having figures showing the amount earned for the time indicated by the pointer on the stationary dial, substantially as described.

2. A time and wage indicator comprising a slotted casing having on its front a stationary dial divided into spaces having characters to indicate days and hours, a rotating shaft extending through the casing and dial, and having a knob or handle for turning it at will, a pointer rigidly attached to and turning with the shaft in front of the dial, and an internal cylinder rigidly attached to the shaft and turning in unison with the shaft, the knob, and the pointer, said cylinder having two sets of figures to indicate, respectively, through the slotted casing the time of the workman and the amount earned for the time indicated by the pointer on the stationary dial, substantially as described.

3. A time and wage indicator comprising a slotted casing having on its front a stationary dial divided into spaces having characters to indicate the days and hours, a rotating shaft extending through the casing and dial and having a knob or handle for turning said shaft at will, a pointer rigidly attached to the shaft and turning therewith in front of the stationary dial, an internal cylinder rigidly attached to the shaft and turning in unison therewith and with the pointer, and having two sets of characters to indicate, respectively, through the slotted casing the full hours and the amount earned, an internal secondary cylinder rotating independent of the shaft, and having two sets of characters to indicate through the slotted casing the fractions of the hours and the amount earned for such fractions, and a knob or handle for independently rotating the secondary cylinder at will, substantially as described.

4. In a combined time and wage indicator, the combination of the cylindrical case provided with a slot, an inner cylinder provided with two series of figures—one series indicating time and the other wages—a front dial divided to indicate the six working days of the week and again subdivided to indicate hours, a pointer adapted to be moved to any required position, a stationary rear dial subdivided into two unequal portions, the larger portion having figures representing dollars, and the smaller portion, called the "fractional register," having the ten Arabic numerals, and the smaller movable dial upon the face of said stationary dial having numerals adapted to register with such Arabic numerals on the fractional register to indicate cents, substantially as described.



409,504. PAVING COMPOSITION. CLIFFORD RICHARDSON, Washington, D. C., assignor of one-half to Henry L. Cranford, same place. Filed Apr. 5, 1889. Serial No. 306,066. (No specimens.)

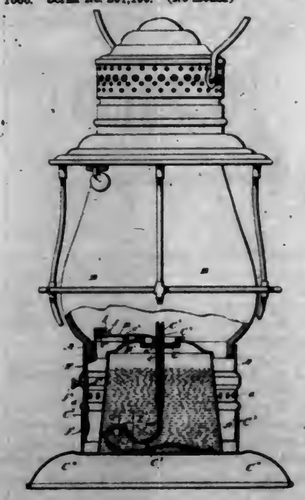
Claim.—1. A wearing-surface mixture suitable to be laid upon any proper base or made into paving blocks or tiles, composed of the refined Rabe acid tar of the proper consistency and mineral matter, as above described.

2. A wearing surface, as above, the cement of which is a mixture of asphalt and refined Rabe tar, substantially as and for the purpose hereinbefore set forth.

3. A wearing-surface mixture, as above, in which the cement is Trinidad or other asphalt, mixed with the Rabe acid tar refined to a consistency corresponding to petroleum-residuum oil, and used in the same manner as the petroleum-residuum oil for imparting the proper tenacity, toughness, and consistency to the asphalt.

409,505. HAME ATTACHMENT. ALBON B. ROWELL, Sunapee, N. H., assignor to Bartlett & Rowell, same place. Filed May 6, 1889. Serial No. 309,827. (No model.)

Claim.—1. In a hame attachment, a tug-connection comprising a circular ring, a portion of its interior being conoidal and provided with a perforated projection adapted to receive a start-bolt or staple, and a swivel-piece formed in a segment of a circle, having its arc portion grooved to fit the interior of said circular ring and provided with one or more perforations for receiving rivets by which the tug may be attached.



2. In a hame attachment, a tug-connection comprising a circular ring, a portion of its interior being conoidal and provided with a perforated projection adapted to receive a start-bolt or staple, and a swivel-piece to which a tug is attached, consisting of a segmental circle having its arc portion grooved to fit the interior of said circular ring and having its chord or plane convexed or rounded, all substantially for the purpose set forth.

3. In a hame attachment, a tug-connection comprising a circular ring provided with a perforated slotted projection adapted to receive a start-bolt or staple, and an interior perforated swivel-piece formed in a segmental circle, having its arc portion grooved to fit the interior of said circular ring and its chord or plane convexed or rounded, all substantially for the purpose specified.

4. In a hame attachment, a tug connection comprising a circular ring provided with a perforated slotted projection adapted to receive a start-bolt or staple, and a circular swivel-piece formed in two parts, having its periphery grooved to fit the interior of said circular ring and having one or more perforations for attaching a tug.

5. In a hame attachment, a tug-connection consisting of a circular ring having a perforated projection for connection with a start-bolt or staple, a swivel-piece fitting the interior of said ring, and a tug attachment rigidly secured to said swivel-piece by rivets or their equivalents, all substantially for the purpose set forth.

409,506. LANTERN. AUGUST M. SCHILLING, Chicago, Ill. Filed Nov. 19, 1888. Serial No. 291,199. (No model.)

Claim.—1. In combination with the burner of a lamp, a lever engaging the lamp-wick, a slide connected with the lever so as to operate the same, and means for moving the slide and holding it as moved, substantially as and for the purposes shown.

2. In combination with the burner of a lamp, a lever engaging the lamp-wick, a slide held and guided in a guideway on a suitable support and connected with the lever, and means for holding such slide from accidental movement, substantially as and for the purpose set forth.

3. In combination with the burner of a lamp, a lever engaging the wick, the slide guided in a way on a suitable support and connected with the lever, a handle to move the slide, and a spring engaging the slide to hold it from accidental movement, substantially as and for the purpose described.

4. In combination with the burner of a lamp, a lever engaging the wick and having an arm, the vertically-moving slide having an arm with a slot in it to engage the lever-arm, and means for holding the slide against accidental movement from shock or jar, substantially as and for the purpose specified.

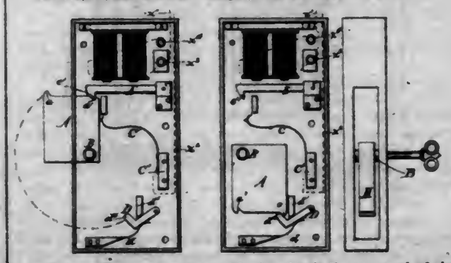
5. In combination with a lamp body and burner having a slotted wick-tube, the pivoted lever having one end extending in through the slot or slots in the tube and adapted to engage a wick therein, and a removable pivot for such lever, substantially as and for the purpose shown.

6. In combination with a lamp body and burner having a flat wick-tube provided with two slots in one side, the lever having the forked end with arms of its fork entering the slots in the wick-tube and on their ends provided with wick-engaging teeth or points, substantially as and for the purpose described.

7. In a lantern, in combination with the lamp body and burner, the lever pivotally supported on the lamp-body, adapted at its inner end to engage the wick of the lamp, and a movable piece carried by the lantern-frame connected with the lever and adapted to be moved from the outside of the frame, substantially as and for the purpose specified.

8. In a lantern, in combination with the lamp body and burner, the lever for engaging and operating the wick, the slide supported on the lantern-frame and connected with the wick-lever, and means whereby such slide can be moved from the outside of the lantern, substantially as and for the purpose shown.

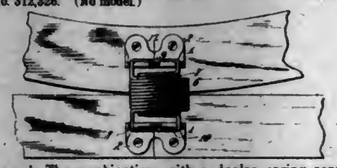
9. In a lantern, in combination with the slide supported upon the lantern-frame having a knob or handle in position to be moved from the outside of the frame, and within the frame having an arm with a slot therein, the lamp body and burner, and the wick-operating lever pivotally supported from the lamp-body having an arm to engage the slot in the arm on the slide, substantially as and for the purpose set forth.



409,507. STRIPPED NEGATIVE. FRANÇOIS SCHMALZ, New York, N. Y., assignor to the American Waltham Watch Company, Waltham, Mass. Filed Apr. 2, 1888. Renewed May 13, 1889. Serial No. 310,686. (No model.)

Claim.—1. A negative film having a facing of oiled silk, as set forth.

2. A stripped negative film having a lifting coat or back applied to one side and a facing of oiled silk secured to its opposite side, as set forth.

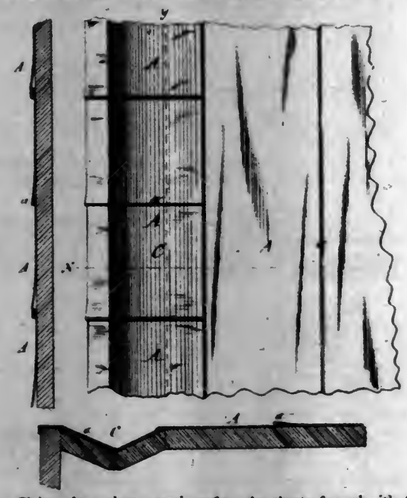


409,508. ELECTRICAL LOCK. PAUL SCHWEMER, Zerbst, Anhalt, Germany. Filed Nov. 16, 1888. Serial No. 291,072. (No model.) Patented in Germany Aug. 18, 1887, No. 43,050; in France Oct. 3, 1887, No. 186,184, and in Austria-Hungary Feb. 26, 1888, No. 38,543.

Claim.—The combination, with the circuit X, composed of the wires $x' x^6$, having a suitable circuit-closer at a proper point, and the electro-magnets F in said circuit, the wires $x' x^6$ extending from the

circuit-closer to the top of the lock, passing therein and connecting with the opposite magnets F, in the manner substantially as described, of the lock, comprising the shaft B, journaled in the front and rear plates of the back casing and having an angular bore for the purpose of being turned up by a key fitting in said bore, the rectangular gravity-bolt A, mounted on said shaft and provided with the projection *a* and notch *a'*, the armature E, pivoted within the casing at *e*, below the magnets F, and provided with the point *e'* to engage the notch *a'*, the springs C *d*, and the pivoted detent D, all constructed and arranged substantially as and for purpose specified.

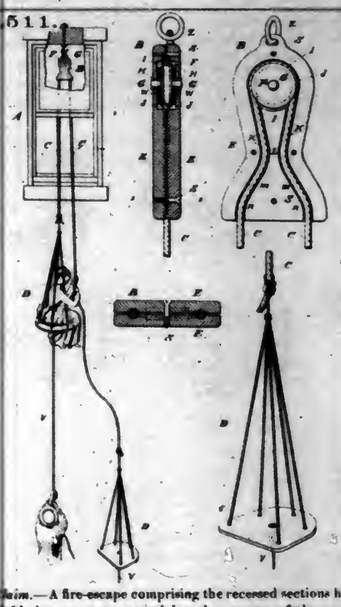
409,509. SPRING AND BRACKET CONNECTION FOR PLATFORM-ROCKERS. GEORGE J. SHULTS, Avoca, N. Y. Filed May 27, 1889. Serial No. 312,326. (No model.)



Claim.—1. The combination, with a duplex-spring connection consisting of outer and inner concentric coils formed of a single continuous spring-wire having loops, of brackets adapted to be mounted upon the rocker-frame and base-frame of a chair, respectively, substantially as described.

2. In a rocking-chair, the combination, with duplex springs composed of inner and outer concentric coils formed of a single integral wire, of brackets adapted to be mounted upon the rocker-frame and base-frame, and provided with grooves for said loops, and shoulders at the ends of said grooves, having notches which receive the parallel arms of the loops, substantially as described.

3. In a rocking-chair, the combination, with a stationary base-frame, of a rocker-frame, and duplex elastic connections, each consisting of an inner and an outer concentric coil of one and the same continuous wire having loops which form part of each coil and lie in the channels of bracket-plates mounted on the rocker-frame and base-frame, said brackets being provided with shoulders at the ends of said channels, said shoulders having notches receiving the parallel arms of the loops, substantially as described.

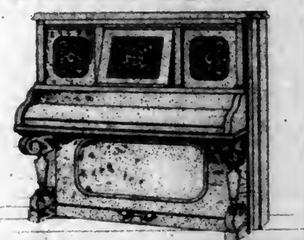


4. The combination, with the supporting-brackets adapted to be attached to the rocker-frame and base-frame of a chair, of a duplex-spring connection consisting of an outer and inner coil formed of a single piece of spring-wire, said coils being wound in opposite directions, substantially as described.

409,510. SHEET-METAL ROOFING. SIDNEY SLOCOMBE, Marcellus, N. Y. Filed Apr. 13, 1889. Serial No. 307,162. (No model.)

Claim.—In a sheet-metal roofing, the sheets formed with the double fold *a* across their central portions and remote from the seams joining said sheets, substantially as described and shown.

409,511. FIRE-ESCAPE. LOUIS SLOSSE, Wellsville, N. Y. Filed Apr. 13, 1889. Serial No. 307,073. (No model.)



Claim.—A fire-escape comprising the recessed sections having the curved friction-grooves tangential to the recesses of the sections, the intermediate sheave in the recesses, and the screws securing the sections together to form the friction-block, having the inwardly-convex passages terminating in reversely-curved open end portions, the escape-rope having at each end a basket or car, and the extension-ropes or steady-cords attached to the baskets or cars, substantially as shown and described.

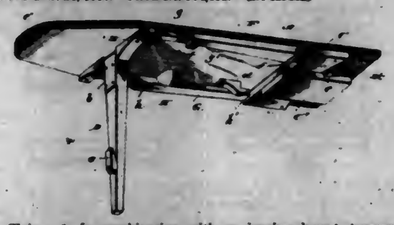
409,512. HOSE-COUPLING. CHARLES L. SMITH, Cleveland, Ohio. Filed Apr. 15, 1889. Serial No. 307,221. (No model.)

Claim.—In combination, the sections A B, the ring D, interposed between their adjacent ends, the nut C, bearing upon the ring D, said nut having a flange *d*, and the hooks on the section B, adapted to fit beneath said flange, substantially as described.

409,513. PIANO-CASE. HENRY W. SMITH, Boston, Mass. Filed Oct. 20, 1888. Serial No. 288,667. (No model.)

Claim.—A piano with a wooden case having its outer surface insulated from the surrounding air by an inelastic coating of cloth or other similar material, substantially as described.

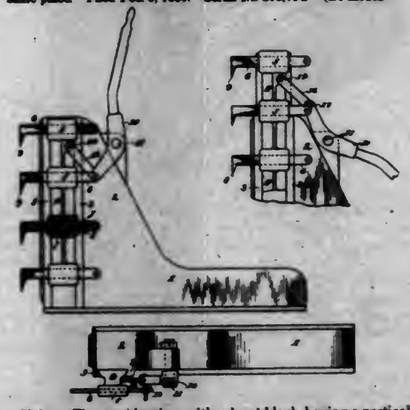
409,514. WATER-MOTOR. JESPER SMITH, Washington, N. J. Filed Feb. 23, 1889. Serial No. 300,860. (No model.)



Claim.—In a water-wheel, the combination, with a casing, of a water-wheel provided with buckets having one of their faces perpendicular and the opposite face inclined, an axle or shaft provided on one end with a pulley-wheel, a horizontal lower pipe having its bore gradually tapering from each end toward the center, the diameter of

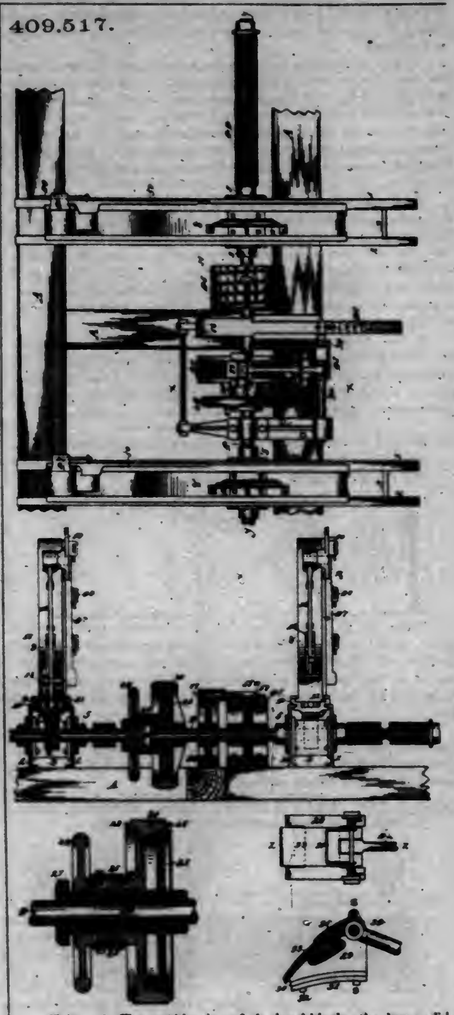
409,514.

the outlet end being larger than the diameter of the inlet, and an upper horizontal pipe constructed in a similar manner to the lower pipe, but arranged inversely thereto with reference to the inlet and outlet openings, substantially as set forth.



409,515. IRONING-BOARD. JOSEPH D. SMITH, Rising City, Nebr. Filed Mar. 21, 1889. Serial No. 304,132. (No model.)

Claim.—1. In combination with an ironing-board, transverse battens B and C, secured to the under side of the board, one of said battens serving as a means for connecting to the board a pivoted leg, the block C, attached parallel with the board beneath the batten C and provided with an inclined recess or notch, and a lever horizontally pivoted to swing laterally over said inclined notch for securing the wide end of the board to the overlapping edge of a table, substantially as shown, and for the purpose set forth.



2. The combination, in an ironing-board, of a block C, secured beneath the under side of the board and parallel therewith, one end of said block being provided with an inclined recess, a bar E, wedge-shaped in cross-section and pivoted at one end so as to be capable of being moved above said recess, to swing to a horizontal position in either direction, substantially as shown, and for the purpose set forth.

409,516. DOGGING DEVICE FOR SAW-MILL HEAD-BLOCKS. SAMUEL R. SMITH, Cincinnati, Ohio, assignor to Smith, Myers & Schaier, same place. Filed Feb. 9, 1889. Serial No. 299,764. (No model.)

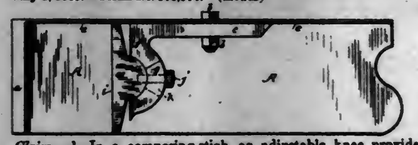
Claim.—The combination, with a head-block having a vertically-arranged guideway, and a vertically-movable slide having a housing containing the dog and adapted to said guideway, of a lock-lever pivoted intermediate its ends directly to the head-block, and a link pivoted at its lower extremity to the inner end of the lever at one side the pivot thereof, and rising therefrom and having its upper extremity pivoted directly to the slide to lock the same in its elevated position when the lever is depressed to raise its inner end above its pivot-point, substantially as described.

409,517. SAW-MILL HEAD-BLOCK. SAMUEL R. SMITH and EDWARD MYERS, Cincinnati, Ohio, assignors to Smith, Myers & Schaier, same place. Filed Mar. 13, 1888. Renewed Feb. 5, 1889. Serial No. 299,771. (No model.)

Claim.—1. The combination of the head-blocks, the knees slidable thereon, the rack-bars slidable independent of the knees, the drive-shaft having pinions engaging the rack-bars, setting-levers pivoted to the knees and loosely connected at their lower ends with the rack-bars, means for holding the levers stationary to lock the knees and rack-bars together, a sleeve keyed on the drive-shaft, a ratchet-wheel loosely mounted on the sleeve and having a friction-rim, pawl mechanism for rotating the ratchet-wheel, a friction clutch-wheel connected to the sleeve and having its periphery adapted to engage and disengage the friction-rim of the ratchet-wheel, and means to slide the sleeve for engaging and disengaging the friction-wheel and ratchet-wheel, substantially as described.

2. The combination, with the head-blocks, of the sliding knees, the rack-bars connected with the knees, the driving-shaft having pinions engaging the rack-bars, a sleeve keyed to the drive-shaft, a ratchet-wheel loose on the sleeve having a friction-rim, pawl mechanism for rotating the ratchet-wheel, a friction clutch-wheel fixed to the sleeve and adapted to engage and disengage the friction-rim of the ratchet-wheel, and means to slide the sleeve for engaging and disengaging the friction-wheel and ratchet-wheel, substantially as described.

3. The combination, with the head-blocks, of the sliding knees, the rack-bars connected with the knees, the driving-shaft having pinions engaging the rack-bars, a threaded sleeve keyed to the drive-shaft, a ratchet-wheel loose on the sleeve and having a friction-rim, pawl mechanism for rotating the ratchet-wheel, a friction clutch-wheel fixed on the sleeve to engage and disengage the friction-rim, and a

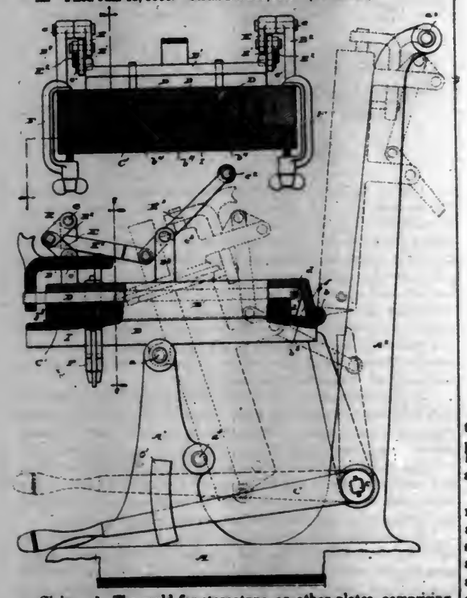


rotating screw-nut loosely connected with the ratchet-wheel and engaging the threaded part of the sleeve to slide the latter, substantially as described.

4. The combination, with the head-blocks, of the sliding knees, the rack-bars connected with the knees, the driving-shaft having pinions engaging the rack-bars, a sliding sleeve keyed to the drive-shaft and provided with a friction clutch-wheel, a ratchet-wheel loosely mounted on the sleeve, pawl mechanism for rotating the ratchet-wheel, and means for sliding the sleeve on the shaft to move the friction clutch-wheel to and from the ratchet-wheel, substantially as described.

5. The combination, with the head-blocks, of the sliding knees, the rack-bars connected with the knees, the driving-shaft having pinions engaging the rack-bars, a sliding sleeve keyed to the drive-shaft and provided with a friction clutch-wheel, a ratchet-wheel loosely mounted on the sleeve, pawl mechanism for rotating the ratchet-wheel, and a rotating screw-nut on the sleeve having keepers loosely engaging the ratchet-wheel to slide the sleeve, substantially as described.

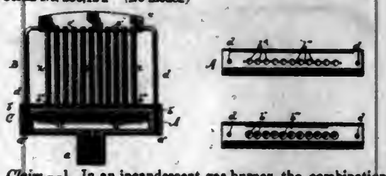
6. The combination, with the knees, the drive-shaft, mechanism for rotating the shaft, and connections for adjusting the knees by the rotation of the shaft, of a drum fixed on the shaft and having a spiral groove, a sliding index-finger having a tooth engaging the spiral groove, and a support for the finger, substantially as described.



409,518. COMPOSING-STICK. VALENTINE SPERLE, Pittsburg, Pa., assignor to James B. Pearson and Fred R. Youngs, same place. Filed July 1, 1886. Serial No. 170,396. (Model.)

Claim.—1. In a composing-stick, an adjustable knee provided with a curved recess in its head and a flaring slot through it, in combination with the adjustable piece provided with a rounding projection on its inner side and a clamping-bolt, which passes through the flaring slot and locks the adjustable piece in position, substantially as shown.

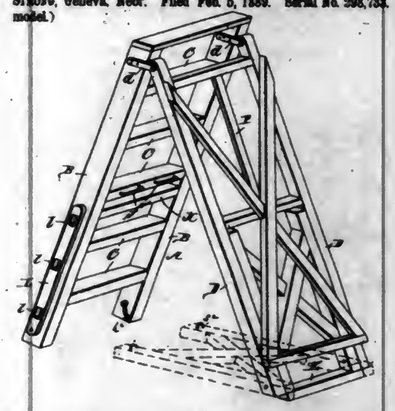
2. In a composing-stick, the combination of a slotted and recessed knee with the adjustable piece, which is fastened to the knee at its center only, whereby the two ends of the adjustable piece can be moved alike, substantially as described.



409,519. MOLD FOR CASTING. ERNEST C. STANDIFORD, Chicago, Ill. Filed Jan. 13, 1888. Serial No. 260,618. (No model.)

Claim.—1. The mold for stereotype or other plates, comprising a substantially flat part and a grooved or longitudinally-recessed part, the latter part being provided with a plurality of movable bars located in the groove or recesses and forming parts of the inner surface of the mold, said bars being hinged to the said grooved or recessed part, a movable plate attached to all of said bars, and actuating devices for operating said movable plate, connected with said movable plate and the recessed part of the mold and acting to thrust the said bars inwardly to free the casting from the mold, substantially as described.

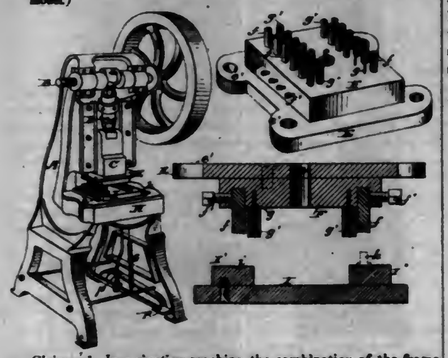
2. The combination, with a mold comprising a substantially flat part and a recessed or grooved part with a movable part acting upon the rear face of the casting, of an operating-lever pivoted to the recessed part of the mold and toggle-links pivoted to said recessed part and to said movable part, said operating-lever being connected with said toggle-links, substantially as described.



409,520. INCANDESCENT GAS-BURNER. JOHN L. STEWART, Philadelphia, Pa., assignor, by mesne assignments, to the Weisbach Incandescent Gas Light Company, of New Jersey. Filed Dec. 16, 1887. Serial No. 258,124. (No model.)

Claim.—1. In an incandescent gas-burner, the combination of a burner-head having a series of fine perforations or gas-exits, a saddle supported on the burner-head above said gas-exits and forming an intermediate gas and air mixing chamber, the saddle being provided with a series of perforations for the exit of the gas and air mixture and a series of sockets for the lower ends of a series of incandescing cylinders, a cage or frame supported above the saddle, and a series of incandescing cylinders supported by said cage and saddle, substantially as described.

2. In an incandescent gas-burner, the combination of a burner-head having a series of fine perforations or gas-exits, a saddle supported on the burner-head above said gas-exits and forming an intermediate gas and air mixing chamber, said saddle provided with a series of concentric sockets and perforations or flame-passages, a cage or frame supported above the saddle, and a series of incandescing tubes supported by said cage and saddle with their lower ends in the saddle-sockets, substantially as described.

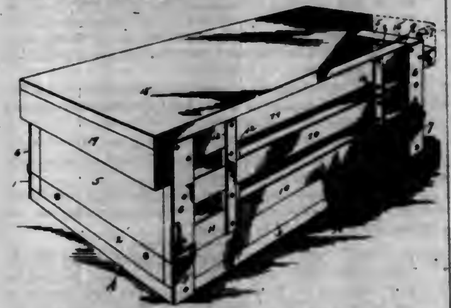


409,521. IRONING-TABLE AND STEP-LADDER. SYLVESTER L. SIMMS, Geneva, Nebr. Filed Feb. 5, 1889. Serial No. 298,733. (No model.)

Claim.—1. The combination of the ladder having staples *f'* attached to the rear side of one of its steps, and having a hinged brace provided with a pivoted support at its lower end, with an ironing-board having a transverse groove on its under side, and provided with hooks at one end to engage the staples *f'*, substantially as set forth.

2. The combination of the ladder having staples attached to the rear side of one of its steps and provided with a cross-bar adjacent and parallel to said step, the hinged ladder-brace having a pivoted support at its lower end, the ironing-board having hooks at one end and provided with a transverse groove in its under side, and a detachable bosom-board having a swinging frame and an arm or extension adapted to be inserted between the ladder-step, to which the ironing board is connected, and the parallel cross-bar, substantially as set forth.

409,522. MACHINE FOR RIVETING CURRY-COMBS. MILES SWEET, Troy, N. Y. Filed Sept. 13, 1883. Serial No. 106,338. (No model.)



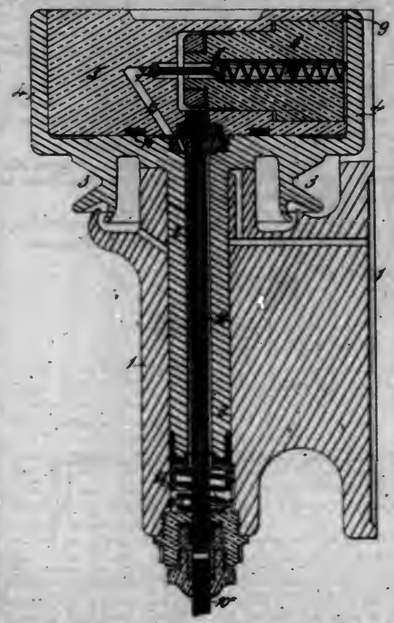
Claim.—1. In a riveting-machine, the combination of the frame of a press, its bed-plate H, and plate I, provided with means for holding a series of rivets, with the press-plates and plate F, provided with a corresponding series of upsetting-dies, substantially as described.

2. The combination of the frame of a press, its bed-plate, and plate I, provided with means for holding a series of oval-headed rivets, with the press-plates and a corresponding series of upsetting-dies provided with corrugated faces, substantially as and for the purpose set forth.

3. The combination, with the bed-plate and movable platen of a press, of a series of rivet-upsetting dies *f*, and a series of springs *g'*, pendent from said platen, substantially as and for the purpose described.

409,523. FOLDING BOX OR CRATE. JAMES C. THOMPSON and WILLIAM L. THOMPSON, Ormanville, Iowa. Filed May 20, 1889. Serial No. 312,508. (No model.)

Claim.—1. In a folding or knockdown box or crate, the combination, with a bottom and end and side sections, of a locking-block removably connected with the body and a removable cover adapted to engage and be held in position by the locking-block, substantially as set forth.



2. In a folding or knockdown box or crate, the combination, with a body, end and side sections, and a locking-block removably secured to one end section, of a removable cover adapted to engage one end of the box and be engaged by the locking-block, substantially as set forth.

3. In a folding or knockdown box or crate, the combination, with a bottom and end and side sections, of a locking-block removably secured to one end of the box, a removable cover adapted to engage the locking-block, and a locking device on the locking-block for securing the cover in position, substantially as set forth.

4. The combination, with a bottom having a rim around its edge, end sections hinged by intermediate connections to the bottom, and removable side sections adapted to enter grooves in the end sections, of a removable cover having dowel-pins at one end adapted to enter dowel-sockets in one of the end sections, and a removable locking-block having dowel-pins by which it is held to one of the end sections, and also pins which enter the cover, and a spring-catch on the block adapted to lock the cover, substantially as set forth.

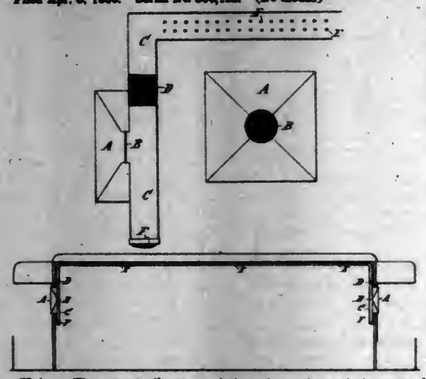
5. The combination, with a bottom having a rim on its edges, end sections hinged to the rim, said sections having grooves therein, and removable side sections adapted to slide in the grooves and provided with pivoted hooks to engage pins on the end sections, of a removable cover having depending ledges at the ends, dowel-pins in one ledge to enter sockets in the ends of the box, and a removable locking-block having dowel-pins adapted to be inserted in one end of the box and in one of the ledges of the cover, said block having a spring-actuated hook for locking the cover in place, substantially as set forth.

409,524. SPEED-MEASURER. JOHN I. THORNYCROFT, Chiswick, County of Middlesex, England. Filed Jan. 3, 1888. Serial No. 259,736. (No model.) Patented in England Mar. 18, 1887, No. 4,122; in Sweden Dec. 21, 1887, No. 1,813; in France Dec. 24, 1887, No. 187,806; in Germany Dec. 24, 1887, No. 43,967; in Italy Feb. 28, 1888, No. 22,843; in Spain Apr. 30, 1888, No. 7,751, and in Austria-Hungary May 7, 1888, No. 49,953.

Claim.—1. In apparatus for indicating the speed of rotating shafts, a rotating valve-case or cylinder connected at one part to an apparatus for increasing or reducing fluid-pressure—such as an exhauster—at another part to the pipe in which pressure is to be varied, and at a third part to a source of constant pressure—such as the atmosphere—in combination with a body—such as a piston—arranged to rotate with said valve-case or cylinder and itself subjected to the direct action of centrifugal force, and a valve or valves controlling two of the connections to the said valve-case or cylinder, substantially as described.

2. In apparatus for indicating the speed of rotating shafts, a rotating valve-case or cylinder connected at one part to an apparatus for increasing or reducing fluid-pressure—such as an exhauster—at another part to the pipe in which pressure is to be varied, and at a third part to a source of constant pressure—such as the atmosphere—a piston arranged to be rotated with said valve-case or cylinder and to be subjected to the direct action of centrifugal force, and two valves, of which one is seated in the said piston, substantially as described, for the purpose specified.

3. In apparatus for indicating the speed of rotating shafts, a rotating valve-case or cylinder connected at one part to an apparatus for increasing or reducing fluid-pressure—such as an exhauster—at another part to the pipe in which pressure is to be varied, and at a third part to a source of constant pressure—such as the atmosphere—a piston arranged to be rotated with said valve-case or cylinder and to be subjected to the direct action of centrifugal force, and two valves, of which one is seated in the said piston, while the other commands a connection between the apparatus for increasing or reducing fluid-pressure and the space in which the pressure is to be varied, substantially as described.



4. In apparatus for indicating the speed of rotating shafts, a rotating body in which is a piston that rotates with and can slide radi-

ally within said body, is directly acted upon by centrifugal force, and is subject on one side to the pressure of the atmosphere and on the other side to the pressure to be varied, and a valve or valves controlled by the said piston, substantially as described, for the purpose specified.

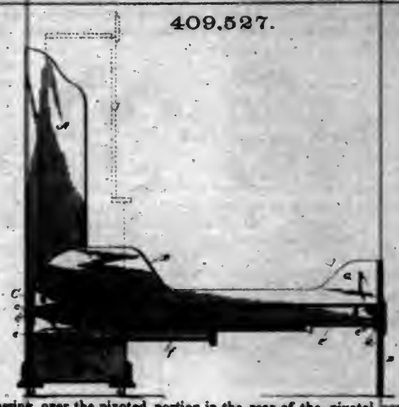
5. In apparatus for indicating the speed of rotating shafts, the combination, with a rotating body 5, formed with a passage 13, in communication with an apparatus for increasing or reducing pressure, of the piston 6, arranged to move radially in said body and provided with a passage therethrough, air-inlet opening 9, in communication with the passage through said piston, the connected valves 7 and 8, said valve 7 being arranged to control said passage 13 and said valve 8 being arranged to control the passage through said piston, and a passage 10, in communication with the pipe in which pressure is to be controlled, all substantially as described.

6. In apparatus for indicating the speed of rotating shafts, the combination, with a rotary valve-case or cylinder connected at one part to an apparatus for increasing or reducing fluid-pressure, at another part to the pipe in which pressure is to be varied, and at a third part to a source of constant pressure—such as the atmosphere—a piston which is in rotation and is subject to centrifugal force, and a valve or valves controlling two of the connections to the said valve-case or cylinder, of indicating-dials, substantially as described, for the purpose specified.

409,525. VENTILATOR. BERNARD M. TORRIBLL, Scranton, Miss., assignor of one-third to Brownlee Wickliffe Taylor, New Orleans, La. Filed Apr. 5, 1889. Serial No. 306,132. (No model.)

Claim.—The car-ventilator consisting of a perforated pipe extending from end to end of the car and having a downward imperforated extension at each end thereof, said extensions being each provided with a brush therein, a removable cap at the open end thereof, and a flaring air-collector located between the brush and the cap and provided with a screw, substantially as specified.

409,526. CALENDAR. FRANCIS M. UNDERHILL, Brooklyn, assignor to Whitall, Tatum & Co., New York, N. Y. Filed Apr. 25, 1889. Serial No. 308,576. (No model.)



Claim.—The combination of the frame A, having transparent front *a* and notches *c*, with the follower D, and the spring *b*, that engages the notches *c*, said follower being adapted to press against and hold a larger and also a smaller number of papers in the frame while permitting of their ready removal, substantially as described.

409,527. FOLDING BED. GUSTAVUS VAN HOORNBEKE and THOMAS B. FOAN, Carlyle, Ill. Filed Dec. 19, 1887. Serial No. 258,402. (No model.)

Claim.—1. In a folding bed, the combination, with the upright stationary portion, of the folding portion pivoted thereto, having legs hinged to its end, the cords having the interposed spring and attached to the legs above the hinge and to the stationary portion and

409,527.

passing over the pivoted portion in the rear of the pivotal connection between the stationary and movable portions, substantially as described.

2. In a folding bed, the combination, with the upright stationary portion, of the folding portion pivoted thereto having legs hinged to its end and the weight attached in the rear of the pivot, the cord having the interposed spring attached to the legs above the hinge and to the stationary portion and passing over the pivoted portion in the rear of the pivotal connection between the stationary and movable portions, substantially as described.

409,528. GAS-INCANDESCENT. CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 31, 1888. Serial No. 269,196. (No specimens.) Patented in France Nov. 4, 1885, No. 172,084; in Belgium Nov. 4, 1885, No. 70,739, and Sept. 9, 1886, No. 74,503; in Italy Feb. 23, 1886, XXXVIII, 310, and Oct. 13, 1886, XL, 415; in England Mar. 13, 1886, No. 3,592; in Austria-Hungary Apr. 9, 1886, No. 44,960 and No. 5,176; in Sweden Apr. 14, 1886, No. 687; in Germany Apr. 29, 1886, No. 41,945; in Finland July 10, 1886, No. 261; in Norway Aug. 25, 1886, No. 83; in Portugal Apr. 6, 1887, No. 1,127, and in Russia Dec. 31, 1887, No. 12,505.

Claim.—1. An incandescent burner for gas, consisting of a skeleton hood or frame composed of a compound containing thorium and zirconium, substantially as described.

2. An incandescent burner for gas, consisting of a skeleton hood or frame composed of a compound containing thorium, zirconium, and lanthanum, substantially as described.

3. An incandescent burner for gas, consisting of a skeleton hood or frame composed of a compound of thorium, zirconium, and an yttrite earth, substantially as described.

409,529. METHOD OF REGENERATING MANTLES FOR INCANDESCENT USES. CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 31, 1888. Serial No. 269,202. (No specimens.) Patented in Germany Jan. 26, 1887, No. 44,016; in England Apr. 28, 1887, No. 6,239, and in Austria-Hungary May 15, 1887, No. 1,663 and No. 16,176.

Claim.—1. The method of regenerating exhausted mantles composed of earthy materials for incandescent purposes, which consists in impregnating the mantle with a restorative or revivifying solution of a salt of lanthanum or other refractory earth, and heating the mantle to convert the salt into an oxide, substantially as described.

2. The method of regenerating exhausted mantles composed of earthy materials for incandescent purposes, which consists in impregnating the mantle with a restorative or revivifying solution of a salt of lanthanum, and subsequently heating the mantle to convert the salt into an oxide, substantially as described.

409,530. INCANDESCENT GAS-LAMP. CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 31, 1888. Serial No. 269,203. (No model.) Patented in England July 28, 1886, No. 9,755.

409,530.

Claim.—1. The combination of a burner-tube provided with a cap having a vertically-projecting cone 13, surrounded by an inner annular series of perforations 14 and an outer annular series of radiating slots 15, a hood of refractory incandescent material suspended above said burner-cap, and a chimney surrounding said hood, substantially as described.

2. The combination, with the burner-tube 5 and gallery 8, having lugs 23 and set-screws 24, located on a laterally-extended portion of the gallery-body, of the chimney 19, the hood 20, and the vertically-adjustable rods 21 and 22, substantially as described.

3. The combination of a vertically-perforated thimble having a gas-inlet, a perforated disk supported by said thimble, a Bunsen burner having lateral air-inlets, and a shield located around the burner air-inlets, substantially as described.

4. The combination of a Bunsen burner having lateral air-inlets, a ring shrunk onto the burner-tube above the air-inlets, and a shield suspended from said ring and surrounding the air-inlets of the burner, substantially as described.

5. The combination, with a gas-burner and a chimney-gallery, of a vertically-adjustable rod supported by the gallery and an incandescing hood suspended from said rod above the burner, substantially as described.

6. The combination, with a gas-burner, a chimney, and an incandescing hood suspended in said chimney, of a gallery having converging ribs 8^a, arranged at intervals, substantially as described.

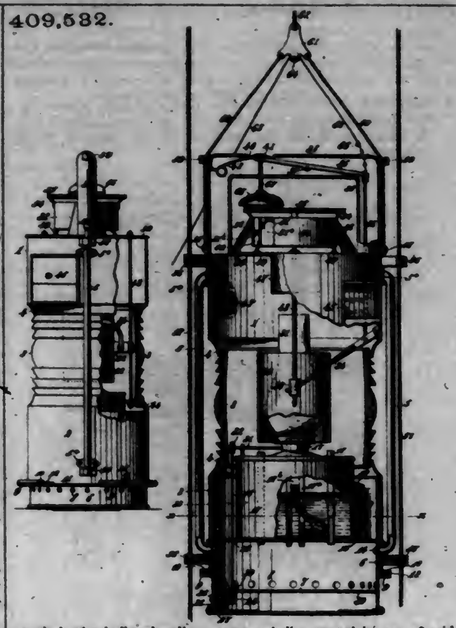
409,531. MANUFACTURE OF GAS-INCANDESCENTS. CARL A. VON WELSBACH, Vienna, Austria-Hungary, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Mar. 31, 1888. Serial No. 269,204. (No model.)

Claim.—The herein-described method of manufacturing mantles or frames for incandescent illumination, which consists in impregnating a textile fabric with a solution of the salts of the rarer metals that produce earthy oxides, then drying the fabric and afterward applying to its upper end a fixing-fluid of a metallic salt in solution, then again drying and attaching a platinum wire to the upper end of the mantle, then exposing the mantle to heat for the purpose of consuming the textile fabric and decomposing the salts of the solutions with which it was impregnated, thereby leaving the mantle composed entirely of incombustible and infusible earthy oxides, and finally annealing said mantle, substantially as described.

409,532. SIGNAL-LANTERN. JOSEPH WALL, Seaforth, Liverpool, County of Lancaster, England. Filed Feb. 27, 1889. Serial No. 301,360. (No model.) Patented in England May 6, 1887, No. 6,644, and Nov. 27, 1888, No. 17,217.

Claim.—1. In a signal-lantern, the combination of a casing having a hollow handle, a lens, a lamp, an opaque cylindrical screen surrounding the lamp-chimney, and screen-operating levers located in the lantern-casing and in its hollow handle for raising and lowering said screen to expose and conceal the light, substantially as described.

2. In a signal-lantern, the combination of a casing having a hollow handle, a globular lens, a lamp, an opaque vertically-movable screen surrounding the lamp-chimney, levers inclosed in the lantern-casing and in its hollow handle for operating said screen, and a gong or bell located in position to be actuated by one of said levers in raising the screen to expose the light, substantially as described.



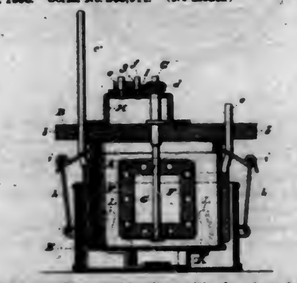
3. In a signal-lantern, the combination of a globular lens, an opaque shield detachably and adjustably secured around a portion of the lens, a lamp, and an opaque vertically-movable screen surrounding the lamp-chimney, substantially as described.

4. In a signal-lantern, the combination of a casing comprising upper and lower outer shells connected by detachable tubular stays, the upper shell being provided with a hollow handle, a globular lens supported between said shells, an inner lower shell detachably supported in the outer lower shell and carrying an oil-reservoir and lamp, an opaque vertically-movable screen surrounding the lamp-chimney, and screen-operating levers inclosed in the lantern-casing and its hollow handle, substantially as described.

5. In a signal-lantern, the combination of a casing having a hollow handle and a transparent direction-plate, a globular lens, a lamp, an opaque screen surrounding the lamp-chimney, and levers for operating said screen located partly in the lantern-casing and partly in its hollow handle, substantially as described.

6. In a signal-lantern, the combination of a casing having a hollow handle and a globular lens, a lamp, an opaque vertically-movable screen surrounding the lamp-chimney, screen-operating levers located

409,532.



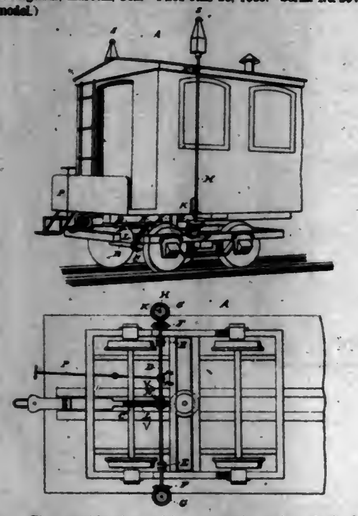
partly in the hollow handle, a gong or bell actuated by one of said levers, means for hoisting the lantern to an elevated position, and an operating-line connected with the levers for actuating the screen and bell, substantially as described.

7. In a signal-lantern, the combination, with a lantern-casing comprising upper and lower shells connected by tubular stays adapted to conduct heated air from the upper part of the lantern to the lower part, of a lamp, an oil-reservoir, and air-tubes extended through said reservoir, two of said tubes being flattened to serve as guides for the lamp-wick, substantially as described.

8. In a signal-lantern, the combination of the shell 1, having a top 39 and a hollow handle 38, the chimney 50, the non-conducting plate 55, supported above the chimney, the non-conducting tube 52, surrounding the chimney, and the heat-guards 53, located near the upright portions of the handle, substantially as described.

9. In a signal-lantern, the combination of the shell 2, having exterior segmental flanges 12, the detachable shell 6, having an exterior annular flange 9, provided with segmental lips 10, and the set-screw 13, substantially as described.

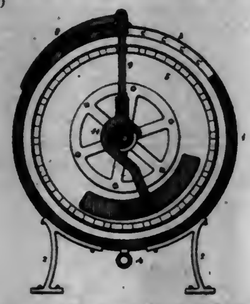
409,533. CHURN. WILLIAM WALTER, Saltsburg, Pa. Filed Sept. 20, 1888. Serial No. 285,911. (No model.)



Claim.—1. The combination, with the churn-body having the long rod *d* and the short rod *e*, of the cover having the projection and the perforated lugs, said long rod being adapted to permit of the movement thereon of said cover with the dasher while the dasher is being removed, and to permit the dasher to remain connected to the churn-body after such removal, substantially as set forth.

2. In a churn, the combination, with the churn-body having the long rod *d* and short rod *e*, and the cover having the projection and the perforated lugs, of the crank-shaft having bearings extending from the cover projection, the rack-plate, the overlapping guide-plate, the

pitman, and the dasher-shaft having the pinion, substantially as specified.

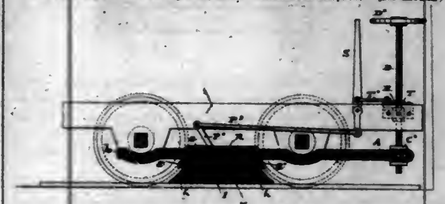


3. In a churn, the combination, with the churn having the eyes and the tub having the hooks, of the brackets secured to the bottom of said tub, provided with the spring-arms, substantially as specified.

409,534. REVOLVING SIGNAL. JOHN W. WARREN, Mineola, Tex., and SAMUEL H. RADFORD, Hartsville, Ala.; said Radford assignor to A. C. Cunningham, Mineola, Tex. Filed Jan. 28, 1889. Serial No. 297,788. (No model.)

Claim.—The combination, with a car-axle and a shaft driven thereby, of the lateral supporting-stems carrying signaling-lanterns glazed in alternating colors, a shifting-lever acting alternately upon studs or stops of the said shaft, said shaft having a sliding movement and gearing alternately with said signal-carrying stems, substantially as set forth.

409,535. WASHING AND STARCHING MACHINE. FRANK M. WATKINS, Cincinnati, Ohio. Filed July 20, 1888. Serial No. 280,457. (No model.)



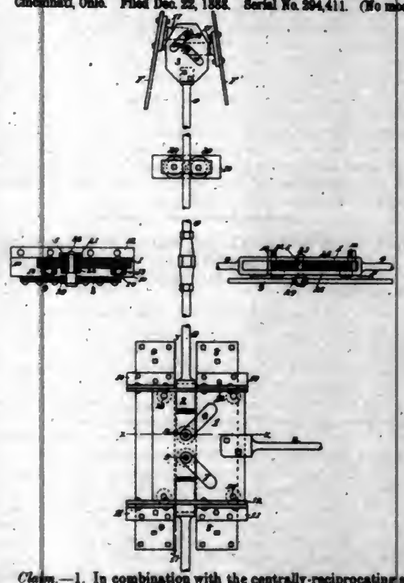
Claim.—1. The combination, with a horizontal cylindrical shell or tank having an opening near its top and containing a rotary cage, of an oscillating cover 8, curved interiorly to fit the margin of said opening and pivoted eccentrically to said margin by means of a frame which occupies the interior of the shell outside of the cage, as and for the purposes set forth.

2. The concavo-convex lid or cover 8, whose arms 9 are journaled on bosses 6, eccentric to and within the shell 1, as and for the purpose set forth.

3. The combination, with cylindrical shell 1, having opening 3, of cover 8, guided to a path nearly concentric with the shell by arms 9, journaled on eccentric bosses 6, and equipped with counterpoises 13, which ease the cover to either the closed or the open position, as set forth.

4. The combination, with cylindrical shell 1 of a washing or starching machine and with opening 3 of the same, of concavo-convex lid or cover 8, whose arms 9 extend inwardly between said shell and rotatable cage 5, are journaled upon eccentric bosses 6, and extend beyond the same to form counterpoises 13, as and for the object explained.

409,536. BRAKE FOR RAILWAYS. ALEXANDER WATSON, San Francisco, Cal. Filed Apr. 10, 1889. Serial No. 306,727. (No model.)



Claim.—1. The herein-described car-brake, consisting of the frame A A C, the brake-blocks G G, with faces *g g* to engage the rims of the wheels, the blocks H H, attached to said brake-blocks in such manner that they are capable of sliding independently in a longitudinal direction, a locking mechanism by which these two blocks are secured together, having connection with an operating-lever on the car, and mechanism whereby the said frame is raised and lowered to operate said sets of brake-blocks, as set forth.

2. In a car-brake, a wheel brake-block G, adapted for operation between two wheels on the same side of a truck to engage the rims of the wheels when moved upward, a track-brake shoe or block H, connected to said wheel-brake by a groove and dovetail rib, and locking mechanism adapted to hold said block H, substantially as described, and to be operated from the car to release it for action, as set forth.

3. In combination with the wheel brake-blocks G G, the pivoted frame A A C, the screw-shaft D, supported on bearings on the car-track, and the holding-plate E, arranged for operation as set forth.

409,537. COMBINED CROSSING AND SWITCH. FREDRIC C. WEIR, Cincinnati, Ohio. Filed Dec. 22, 1888. Serial No. 294,411. (No model.)

Claim.—1. In combination with the centrally-reciprocating shaft 4, the plate 1, provided with a slot engaging with a stud on said central shaft, reciprocating said shaft 4, substantially as herein specified.

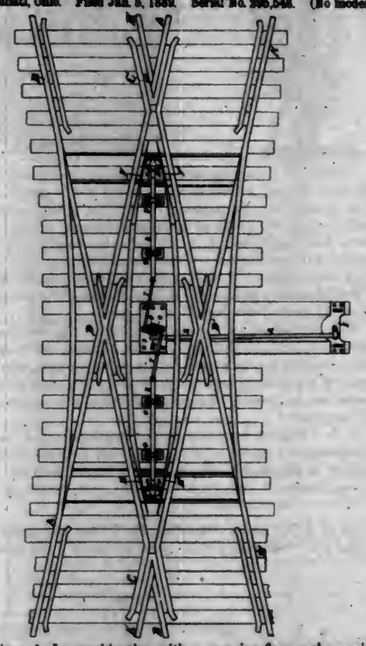
2. In combination with the central cam-plate 1, the central shaft 4, connected at the outer ends with the two sets of switch-rails, and a mechanism for simultaneously opening and closing said switches as said central shaft is reciprocated, substantially as herein specified.

3. In combination with a central cam-plate 1, the central shaft 4, with the supporting-plates 8 and 9, forming guides for the central shaft 4 and a support for reciprocating the shaft upon plate 1, substantially as specified.

4. In combination with the supporting-plates 8 and 9, guides 10 and 11, the central cam-plate 1, supported laterally, and the friction-rollers 5, traveling against said guides, substantially as herein set forth.

5. A support for the central plate 1 and central shaft 4, consisting of the plates 8 and 9, rigidly united together by yoke-plates bolted to said plates 8 and 9 at either end of the cam-plate 1, substantially as herein specified.

6. A double switch-moving device consisting, substantially, of the shaft 4, located centrally between two sets of switches, the mechanism for moving said shaft longitudinally, and the cam-plates 3 at either end of the shafts, connected with the rail-bars 17, provided with studs engaging with the slots 15 and 16, whereby the two sets of switch-rails are simultaneously opened or closed by the reciprocation of the said shaft 4, substantially as described.



7. The combination, with the plate 3, operated by the reciprocating shaft 4 and provided with slots 15 and 16, of the rail-bars 17, connected to the inside of the switch-rails and provided with studs engaging in the slots 15 and 16, whereby said switch-bars are moved in unison to or from each other as the said plates are reciprocated, substantially as herein specified.

8. The combination of the plate 3, provided with slots 15 and 16, and the rail-bars 17, engaging said slots 15 and 16 from opposite sides of said plate 3, substantially as specified.

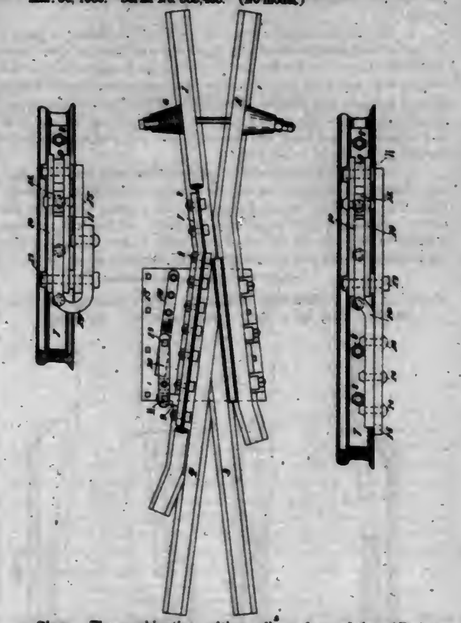
9. The combination, with a crossing, of a switch-moving mechanism consisting of the cam-plate 1, connected to the switch-bar, the reciprocating shaft 4, the cam-plates 3, connected at either end of said bar, and the rail-bars 17, provided with studs engaging with the slots of plate 3 and attached to the switch-rails on either side of said plates, substantially as specified.

10. In combination with two sets of switches, the central shaft 4, supported in anti-frictional guides and connected at each end to the cam-plates 3, which operate the rail-bars and switch-rails as they are reciprocated by said shaft 4, substantially as specified.

409,538. COMBINED CROSSING AND SWITCH. FREDRIC C. WEIR, Cincinnati, Ohio. Filed Jan. 5, 1889. Serial No. 295,546. (No model.)

Claim.—1. In combination with a crossing-frog and a switch-stand, the switch-bar 2, hinged to the arm 3, and the cross-head lever, the connecting-rod 7, and reciprocating shaft 8, hinged to bell-crank levers 10, and the bracket-arms 15 of the switch-rails, substantially as specified.

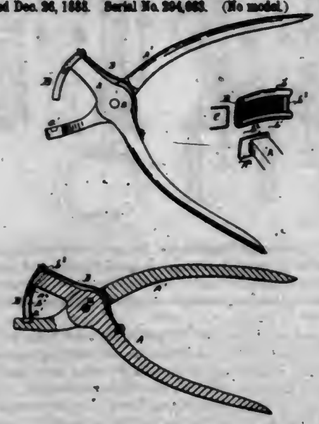
2. In combination with a crossing-frog, the switching mechanism consisting, substantially, of the switch-bar 2, the crank-levers 3 and 6, the connecting-rods 7, and reciprocating shafts 8, for simultaneously moving the switch-rails at both ends of the crossing, substantially as described.



3. In combination with the centrally-reciprocating shafts 8, the bell-crank levers 10, loosely hinged at their inner ends to the shafts 8 and at their outer ends pivoted to the bracket-arms 15 of the switch-rails, substantially as specified.

4. In combination with switch-rails F F', the crank-levers 10, hinged to the bracket-arms 15 and loosely hinged at their inner ends to the reciprocating shaft 8, with a fixed bed-plate 12, attached to the rails, serving as a base for the fulcrums of the levers, substantially as specified.

5. In combination with two sets of switch-rails F F and E E', located at the two ends of the crossing, the centrally-reciprocating shafts 8, hinged at their outer ends to mechanism for moving the switch-rails and operated by the cross-head levers 3 and 6, hinged to connecting-rods and the switch-bar 2 of the switch-stand, whereby the two sets of switches are simultaneously moved by the reciprocation of the said switch-bar, substantially as specified.



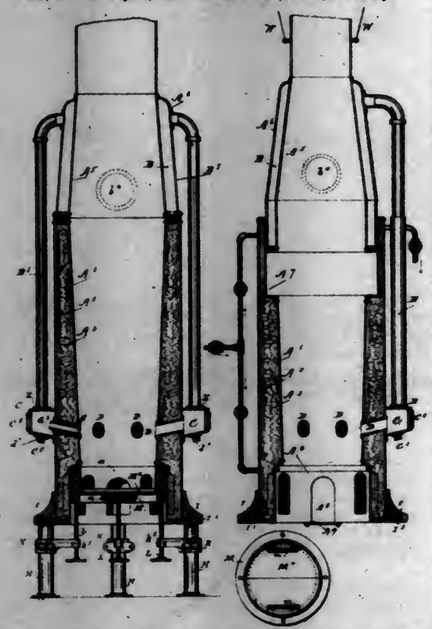
6. The combination of longitudinal reciprocating shafts 8, located centrally between the inner rails of the crossing-frog and connected at their inner ends to the T-shaped bell-crank lever, the arm 3 of which is hinged to the switch-bar, substantially as herein specified.

409,539. SPRING-FROG. FREDRIC C. WEIR, Cincinnati, Ohio. Filed Mar. 30, 1889. Serial No. 305,465. (No model.)

Claim.—The combination, with a railway-frog, of the stiffening-bar 7, rigidly secured to the web of the moving rail and provided with an arm 9 hinged to the link 10 and to the bar 14, secured to the base-plate, substantially as specified.

409,540. STAPLING IMPLEMENT. HENRY P. WHITE, Detroit, Mich. Filed Dec. 26, 1888. Serial No. 294,063. (No model.)

Claim.—1. The stapling implement herein described, consisting of jaws A A', one of said jaws provided with a driving-arm A^3 and the other jaw with a clinching-die, a sliding head supported upon said driving-arm, and a single spring bearing on said head and operating said jaws, the movement of said head toward said die limited at a point above the said arms, substantially as set forth.



2. The stapling implement herein described, consisting of jaws A A', one of said jaws provided with a driving-arm, and a sliding head supported upon said arm, said head provided with a flange b^3 and the other jaw provided with a clinching-die, substantially as and for the purpose described.

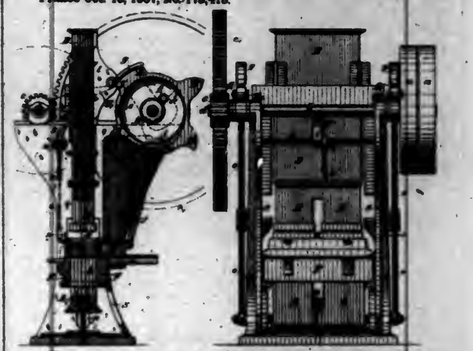
3. The stapling implement herein described, consisting of jaws A A', one of said jaws provided with a driving-arm made integral therewith, a sliding head supported upon the driving-arm, said head flanged at the sides to embrace the lateral edges of the said arm and also flanged at its upper end to limit the movement of the head in one direction, and a single spring bearing on said head and operating said jaw and the other jaw provided with a clinching-die, substantially as set forth.

4. The stapling implement herein described, consisting of jaws A A', one of said jaws provided with a driving-arm made integral therewith and having side flanges, as b^3, a sliding head supported upon the driving-arm, said head flanged at the sides to embrace the side flanges of said arm and also flanged at the upper end to limit the movement of the head in one direction, a spring connected to one of said jaws and bearing on said head, and the other jaw provided with a clinching-die, substantially as set forth.

5. In a stapling implement, the combination, with jaws A A', having a jointed connection, one of said jaws provided with a driving-arm, of a sliding head engaged upon said arm, a spring bearing on the end of said head, a part of said head cut away and bent over to form a flange to limit the movement of said head in one direction, and a guide-notch for the end of said spring, substantially as set forth.

409,541. SMELTING-FURNACE. JOHN J. WILLIAMS, San Francisco, Cal. Filed Apr. 7, 1887. Serial No. 234,061. (No model.)

Claim.—1. In a smelting-furnace, the combination, with a stack, of an adjustable air-heating chamber located therein, and means for vertically adjusting said chamber, tuyere-boxes, and air-conductors connecting the air-heating chamber with the tuyeres, said conductors being extensible in length, as set forth.



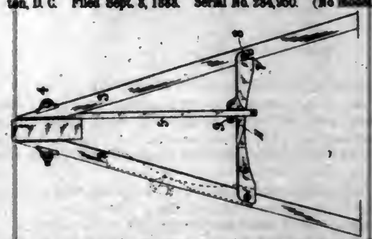
2. In a smelting-furnace, an air-heating chamber and independent tuyere-box to each tuyere and an independent connecting-passage from the air-chamber to each box, said passage being provided near its connection with the tuyere with an annular liquid-channel g^3, having an orifice g^3, and an oil-pipe connecting the channel, all combined and arranged substantially as and for the purpose set forth.

3. In a smelting-furnace, a stack having a water-space between its inner and outer shells and provided with an offset-space in its upper portion, in combination with an air-heating chamber arranged to slide in said offset-space, and connections from said chamber to the tuyeres of the furnace, as set forth.

4. In a smelting-furnace, the combination, with a double-walled stack having vertical openings in its walls near the base thereof, of spouts extending through the two walls, and provided with back plates resting against the outer wall, said back plates having vertical slots therein and screws extending through the slots for holding the spouts at any elevation in the openings, as set forth.

5. In a smelting-furnace, a stack having vertical openings in its walls, and spouts extending through said walls and having vertically-slotted back plates resting against the outside thereof, with screws therein for holding the spouts at any adjustment in combination with an adjustable metal-chamber in the base of the stack, as set forth.

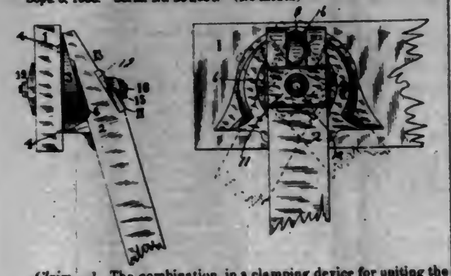
409,542. STAMPING-MACHINE FOR MOLDING ARTIFICIAL STONE. JOSEPH WIENLER, Kissenbach, near Waldshut, Germany. Filed July 24, 1888. Serial No. 280,951. (No model.) Patented in Germany July 1, 1887, No. 42,780; in England Sept. 23, 1887, No. 13,133, and in France Oct. 10, 1887, No. 173,413.



Claim.—1. A machine for manufacturing bricks, tiles, briquettes, and other objects, consisting substantially of the drop-hammer B, which is raised by the tappets I II III IV, of a disk *e*, the anvil A, which is raised by means of the connecting-rods *o*, levers *g*, g^3, and arms *g*, the charging-box K, which feeds the material into the form, pushes the formed articles out of the machine, and is operated by the lever *j* with its claws j' j^3, and has its fulcrum at *i*, which said lever *j* preferably receives its movement from the roller *f*, arranged crank-like on the shaft *d*, substantially as set forth.

2. In a machine for manufacturing bricks, tiles, and the like, the combination, with the charging-box, the hammer, and means for retaining the hammer temporarily in the raised position, of a series of tappets of gradually-increasing size, whereby the blows of the drop-hammer are successively increased, substantially as and for the purposes set forth.

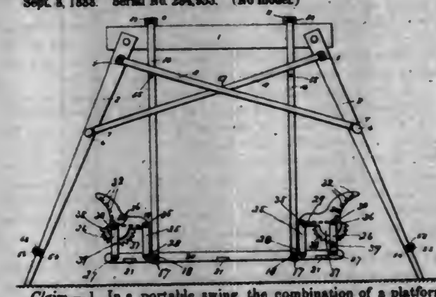
3. In a machine for manufacturing bricks, tiles, and the like, the arrangement of a pawl *t* on an eccentric *u* on the shaft *r*, which said pawl can be operated by the handle *v* or hand-lever *s* for retaining the drop-hammer B in its highest position, substantially as set forth and shown on the drawings.



409,543. BRACE FOR TRESTLES. GEORGE W. ZIEGLER, Washington, D. C. Filed Sept. 8, 1888. Serial No. 284,950. (No model.)

Claim.—1. In a trestle, the brace 5 and a brace having flattened ends, a beveled central portion, and a set-off projection formed thereon above the said beveled portion, substantially as shown and described, and for the purpose set forth.

2. In a trestle, a brace therefor having a flattened perforated end, a beveled central portion, and also a flattened notched end, a set-off projection located above the beveled central portion 11 with the diagonal brace 5 and legs 2 and 3, substantially as and for the purpose set forth.



409,544. TRESTLE. GEORGE W. ZIEGLER, Washington, D. C. Filed Sept. 8, 1888. Serial No. 284,951. (No model.)

Claim.—1. The combination, in a clamping device for uniting the parts of trestles, the washer 3, provided on its inner surface with the projections 4 and having an opposite outer surface inclined to the said inner surface with a plate having oppositely-situated flanges, the washer 11, provided with the projection 16, washers 15 and 19, and bolt 10, substantially as shown and described.

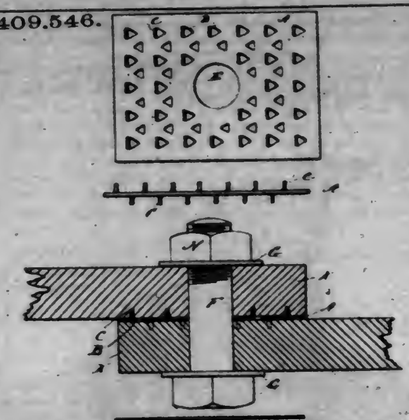
2. In a clamping device for uniting the parts of trestles, the combination of a washer having its outer surface inclined to its inner surface with a plate having oppositely situated flanges and a loop located between the said flanges adapted to engage a projection of the washer 11, washers 15 and 17, nut 19, and bolt 10, substantially as shown, and for the purpose set forth.

409,545. SWING. GEORGE W. ZIEGLER, Philadelphia, Pa. Filed Sept. 8, 1888. Serial No. 284,953. (No model.)

Claim.—1. In a portable swing, the combination of a platform suspended from the beam 1 by links 16, having their bearings in sockets secured to the said platform, with the seats 24, provided with toothed sectors and pivoted links adapted to support the said seat upon the said platform, two of the said links having projections formed thereon and adapted to lock the said sectors in different positions, substantially as shown, and for the purpose set forth.

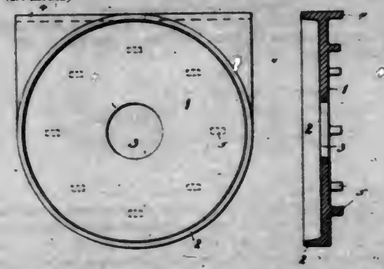
2. The saddle 11, having a central concave bearing, the convex fulcrum 10, provided with downwardly-extending ends 13, having hooks 14 and pins 15, and the suspending-links 16, all arranged substantially as set forth.

3. In a portable swing, the platform 19 and means for supporting the same, consisting of the fulcrum-saddle 11, the links 16, hooked thereon, and the beam 1, adapted to support the said saddle, in combination with the seats 24, links 25 and 26, pivoted to the said seats and to the said platform, stops secured to the links 26, and sectors secured to the said seats, having radial teeth engaging the said stops, substantially as and for the purpose set forth.



4. In a portable swing, the perforated suspending-links 16, the saddle 11, and its hooks and pins, the said links adapted to fit upon said hooks and pins, in combination with the platform 19, the fulcrum 10, and the beam 1, substantially as and for the purpose set forth.

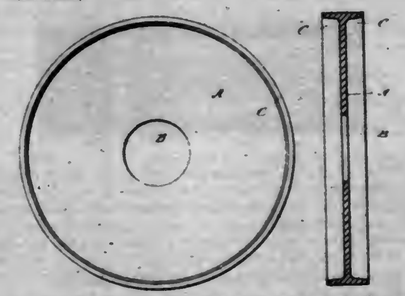
5. In a portable swing, the beam 1, links 16, platform 19, links 25 and 26, and stops 39, secured to the links 26, in combination with the seats 24 and the perforated sectors having radial teeth adapted to engage with the said stops, substantially as shown, and for the purpose set forth.



409,546. CLAMPING-PLATE FOR TIMBER STRUCTURES. GEORGE W. ZIEGLER, Philadelphia, Pa. Filed May 13, 1889. Serial No. 310,606. (No model.)

Claim.—As a new article of hardware manufacture, the plate A, having teeth C upon both sides thereof, and an aperture adapted to receive a screw-bolt, constructed substantially as and for the purpose set forth.

409,546.

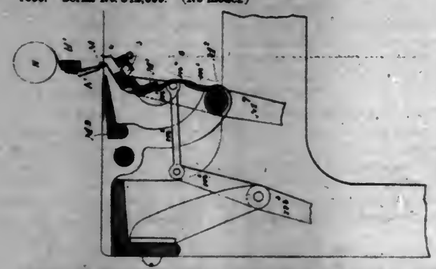


409,547. CLAMPING-PLATE FOR TIMBER STRUCTURES. GEORGE W. ZIEGLER, Philadelphia, Pa. Filed May 13, 1889. Serial No. 310,607. (No model.)

Claim.—1. A new and useful article of hardware manufacture adapted to be used in uniting timber frame-works, consisting of washer having a central aperture and a concentric rim formed upon one side thereof, and a projecting right-line flange upon the other side, both framed integrally with the washer, substantially as set forth.

2. A new and useful article of hardware manufacture, consisting of a washer having a central aperture and a concentric annular rim upon one side and a right-line flange and projecting spurs and points upon the opposite side, and adapted to unite pivotally-adjustable parts of timber frame-works, substantially as set forth.

409,548. CLAMPING-PLATE FOR TIMBER-STRUCTURES. GEORGE W. ZIEGLER, Philadelphia, Pa. Filed May 13, 1889. Serial No. 310,608. (No model.)



Claim.—A new article of manufacture, consisting of a flat washer provided with annular rims adapted to be fitted between pieces of timber to avoid side strain upon bolts, clamping together, and permitting pivotal motion without lengthwise or lateral movement, substantially as set forth.

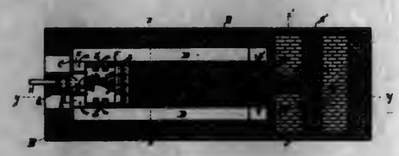
409,549. NITRO-GELATINE EXPLOSIVE. FREDERICK A. ABEL, London, and JAMES DEWAR, Cambridge, County of Cambridge, England. Filed June 20, 1888. Serial No. 314,907. (No specimens.)

Claim.—An explosive for ammunition manufactured by pressing blasting-gelatine or compounds thereof through holes to form wires,

cutting these wires into suitable lengths, and packing them in cartridge-cases, substantially as described.

409,550. LOOM FOR WEAVING TUFTED FABRICS, &c. WILLIAM ADAM, Kidderminster, County of Worcester, England. Filed May 31, 1889. Serial No. 312,699. (No model.)

Claim.—In looms for weaving tufted fabrics, the combination, with the comb for lifting or pushing the tufts through the spaces in the warp, of a bar, plate, or supplemental comb preceding the before-mentioned comb and acting to straighten the tufts to insure their being lifted or pushed through their proper spaces in the warp, substantially as herein shown and described.

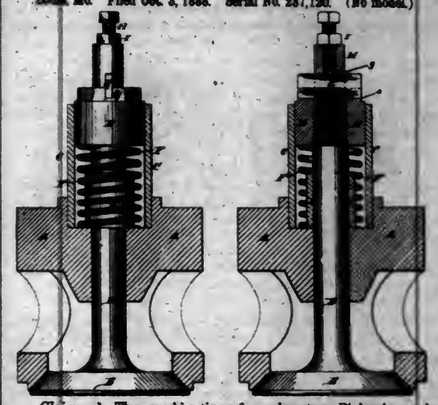


409,551. LAST. ELIPHAS W. ARNOLD, Weymouth, Mass., assignor of one-half to George W. Osgood, same place. Filed Feb. 14, 1889. Serial No. 299,850. (No model.)

Claim.—1. The last-body *a*, having a pin-receiving hole, combined with the last-block *b*, having a projection, shoulder, or lip at the top, provided with a pin-receiving hole registering with the pin-receiving hole in the last-body, the pin for said hole having a hook-engaging end or head, and a hole formed in the top of the last-block in the path of movement of the pin to receive the end of the hook, substantially as and for the purpose set forth.

2. The last-body *a*, having a pin-receiving hole, combined with the last-block *b*, having a lip *c*, provided with a pin-receiving hole registering with the pin-receiving hole in the last-body *a*, the pin for said hole and the hole formed in the top of the last-block in the path of movement of said pin to receive the hook, and the limiting-stop for the pin, substantially as described.

409,552. BOILER-SETTING. JOHN BALMORE and WALTER S. ROCKWELL, New York, N. Y. Filed Apr. 26, 1889. Serial No. 308,720. (No model.)

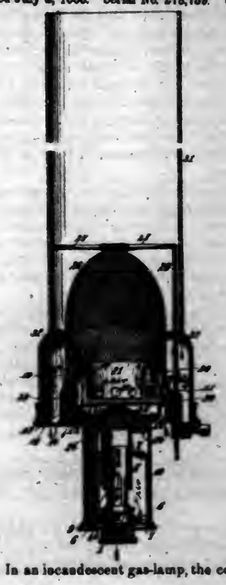


Claim.—1. In a boiler-setting, the combination, with a primary combustion-chamber, a secondary combustion-chamber, and air-ducts located under the secondary combustion-chamber and leading rearwardly and then forwardly to the primary combustion-chamber, of a cross-wall located at or near the rear end of the boiler and provided near its lower end with openings, and diving-flues leading from the secondary combustion-chamber to the openings in the cross-wall, substantially as set forth.

2. In a boiler-setting, air-ducts connecting with the ash-pit chamber and leading from thence rearward and connecting with lateral ducts, the latter opening upward into ducts located along the side walls of the setting, the latter ducts connecting with air-pipes leading to the burner, substantially as set forth.

3. The combination of oil-burner with ducts *c c'*, and D, substantially as indicated, and hollow-bridge wall, the chamber thereof connecting with ducts D, such chamber having a discharge presenting upward, ducts D having lateral openings discharging into the combustion-chamber between the line of the bridge-wall and burner, substantially as set forth.

409,553. SAFETY-NUT FOR VALVES. JACOB H. BINKHARD, St. Louis, Mo. Filed Oct. 3, 1888. Serial No. 287,190. (No model.)

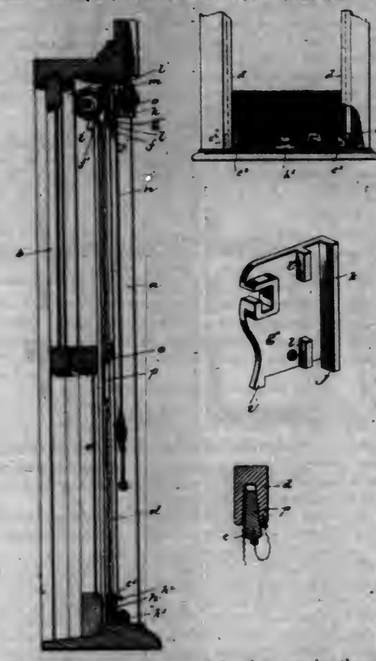


Claim.—1. The combination of a valve-stem B', having a key-slot *b'*, a nut E, having key-seat *e* and screw-threaded on the valve-stem, a key G, occupying the said slot and seat and having a notch *g*, and a set-screw H, threaded in the valve-stem and engaging in the notch of the key, for the purpose set forth.

2. The combination of the valve-stem B', with key-slot *b* through it, and screw-hole leading from the top of the stem into the slot, set-screw occupying the screw-hole and carrying a jam-nut, a nut screwing upon the stem and having a key-seat in its top, a key fitting the key-seat and slot and having a notch to receive the end of the set-screw, a cylinder surrounding the nut and forming a guide therefor, a sleeve D, surrounding the valve-stem and forming a stop for the nut, and a spring surrounding the sleeve and bearing against the bottom of the nut, substantially as and for the purpose set forth.

3. The combination, with the body A, valve-seat, and valve B, having stem B', of a cylinder secured to the body around the valve-stem, a removable sleeve D, surrounding the valve-stem within the cylinder, a nut secured to the valve-stem and fitting snugly in the cylinder, forming a guide for said stem and adapted to come against the sleeve D to limit the opening of the valve, and a spiral spring located between said sleeve and cylinder and bearing between said nut and the body A, said sleeve being of sufficient length to project above the spring when the latter is compressed, substantially as set forth.

409,554. INCANDESCENT GAS-LAMP. HAROLD J. BELL, Gloucester City, assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed July 2, 1888. Serial No. 278,739. (No model.)



Claim.—1. In an incandescent gas-lamp, the combination, with a mantle, and an Argand burner having horizontal lateral air-inlets leading into a central air-chamber, of an air-crown surrounding and supporting said burner, and comprising an annular air-chamber open at the bottom and having its inner wall provided with air-openings that register with the horizontal lateral air-inlets of said burner, substantially as described.

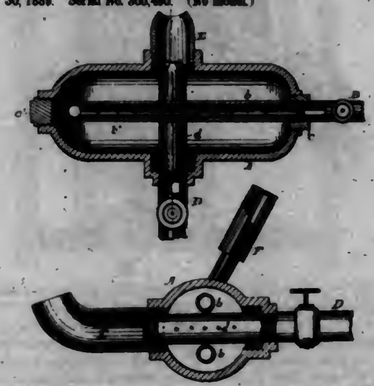
2. In a gas-lamp, the combination, with the air-crown 11, having an annular air-chamber 12, provided with an annular series of openings 15, of the circular burner 17, having annular flame-slot 20, central air-chamber 21, horizontal air-passages 22, and vertical gas-passages 23, substantially as described.

3. In a gas-lamp, the combination of the Argand burner 17, the air-crown 11, supporting said burner and formed with double walls inclosing an annular air-chamber 12, that communicates with the central air-chamber of the burner through horizontal air-passages, the gallery 13, having air-inlets 14, and a chimney supported on said gallery, substantially as described.

409,555. WINDOW-SCREEN. ARTHUR L. BENEDICT, New Canaan, Conn. Filed Apr. 7, 1887. Serial No. 234,052. (No model.)

Claim.—1. A window-screen of the class covering the whole of the opening in the window-casing, comprising a netting of just sufficient length from its supporting-roller to the sill that when drawn down its full length and locked at its lower end it will be held taut, irrespective of the tension of its spring-roller or supporting device, combined with such supporting device, such as an ordinary spring curtain-roller, guides to receive the longitudinal edges of the netting, and a locking device to secure the lower end of the extended netting to the window-sill, substantially as described.

2. The combination, with the netting and its roller or support, of an extension e^{x} of such netting integral therewith, turned back and up over the roller, substantially as and for the purpose set forth.



3. The combination of the netting, its support or roller, vertical guides for the longitudinal edges of the netting, and brackets to receive and sustain the netting support or roller, constructed wholly independent of the guides, and having the downwardly-projecting lugs *i* and *j* to engage the vertical guides, substantially as described.

4. As an article of manufacture, the herein-described window-screen-roller bracket, consisting of bearings for the roller, the lugs *i j*, depending from the lower edge, and the flanges *k l l'*, projecting laterally from the inside face of the bracket, substantially as and for the purpose set forth.

5. A window-screen of the class covering the whole of the opening in the window-casing, comprising a netting of just sufficient length from its supporting-roller to the sill that when drawn down its full length and locked at its lower end it will be held taut, combined with an ordinary spring curtain-roller, about which such netting is looped, as shown, and having an ordinary pawl-and-ratchet detent, guides to receive the longitudinal edges of the netting, and a locking device for its lower end, all arranged as set forth, that when the netting is extended and unlocked the roller is free to raise automatically the netting a short distance before its pawl and ratchet act, and thus the netting is put in condition to be further raised by manual interposition, substantially as described.

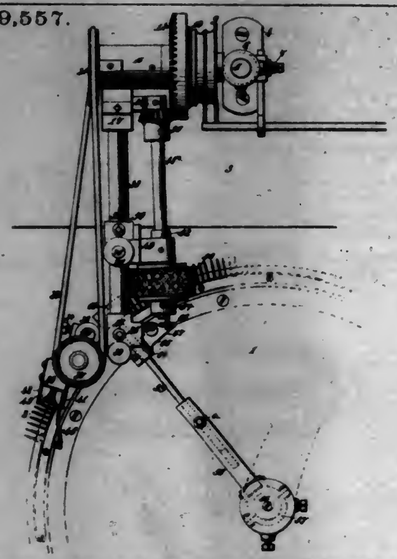
6. In a window-screen, the combination, with the grooved guides and the netting having its edges arranged in said guides, of independent detachable wedges *p*, adapted to be inserted between the netting and the guides within said guides, substantially as and for the purpose set forth.

409,556. OIL-BURNER. JOHN BRAGG, Cleveland, Ohio. Filed Mar. 30, 1889. Serial No. 305,493. (No model.)

Claim.—1. In an oil-burner, the combination of the shell having lateral arms and air-inlets, a perforated oil-inlet pipe extending within said shell lengthwise thereof, a nozzle secured to one of said lateral arms of the shell and a steam-injector pipe entering said shell through the other lateral arm thereof and extending across the shell and into said nozzle, said injector-pipe being perforated opposite the long arms or body of the shell, substantially as described.

2. In an oil-burner, the combination of a shell having lateral arms and having air-inlets at the top of said shell, a perforated oil-inlet pipe extending within said shell lengthwise thereof and bent in a return-bend, a nozzle secured to one lateral arm of the shell and adapted to be turned to change the direction of the flame, and a steam-injector pipe entering the other lateral arm of the shell and passing across the same into said nozzle, being perforated within the shell, substantially as described.

3. The combination of the shell A, having air-inlets F and lateral arms, to one of which is affixed the nozzle, the steam-injector pipe *d*, entering the other lateral arm, perforated within the shell and extending across the same and into the nozzle, and the perforated oil-inlet pipe *b*, bent in a return-bend and extending through the long arms of the shell, and the curved nozzle E, adapted to be turned so as to direct the flame in any desired direction, substantially as described.



409,557. TRIMMING AND BRUSHING ATTACHMENT FOR TURNING-OFF MACHINES. NORMAN H. BROCK, Waterford, N. Y. Filed June 3, 1888. Serial No. 276,476. (No model.)

Claim.—1. An attachment for a turning-off machine, consisting of a bed-plate, an arm connected therewith and provided at one end with a support carrying two depending yielding plates having jaws at their lower ends projecting toward each other, a cutter carried by the arm and operating below the jaws, a movable brush arranged near the cutter, a support for holding said brush, and means, substantially as described, for operating the cutter and brush.

2. An attachment for a turning-off machine, consisting of a bed-plate, an arm connected therewith and provided at one end with a support carrying two depending plates having jaws at their lower ends projecting toward each other, a cutter carried by the arm and operating below the jaws, a rotary main brush arranged near the cutter, a support for said brush, a support carrying an auxiliary brush which is situate between the cutter and main brush, and means, substantially as described, for operating the cutter and both brushes.

3. The combination, with the cylinder of a turning-off machine, of two depending plates having guide-jaws at their lower ends which project toward each other, a movable brush arranged over the cylinder-points, a cutter located between the brush and the jaws, supports

409,557.

for holding the plates, brush, and cutter above the cylinder, and means for operating said brush and cutter, substantially as described.

4. The combination, with a cylinder of a turning-off machine, of two depending yielding plates having guide-jaws at their lower ends which project toward each other, a movable main brush arranged over the cylinder-points, a cutter located adjacent to the jaws, a movable auxiliary brush between the cutter and main brush, supports for holding the plates, cutter, and brushes above the cylinder-points, and means for operating the cutter and brushes, substantially as described.

5. The combination, with the cylinder of a turning-off machine, of a pair of guiding-jaws, a revolving cutter adjacent to the jaws, a rotating main brush, a movable auxiliary brush located between the cutter and main brush, supports for holding the jaws, cutter, and brushes above the cylinder-point, and means for rotating the cutter and main brush and moving the auxiliary brush, substantially as described.

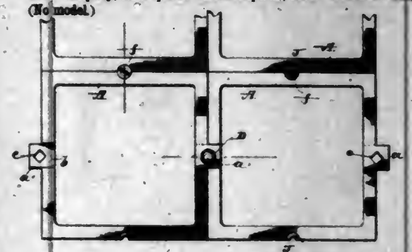
6. The combination, with the cylinder of a turning-off machine, of a bed-plate having an arm carrying guiding-jaws at its outer end, a vertically and laterally adjustable cutter supported by the arm, means for adjusting said cutter, a movable brush at the side of the cutter opposite the jaws, a support for the brush, and means for operating the cutter and brush, substantially as described.

7. The combination, with the cylinder of a turning-off machine, of an arm supported outside the cylinder and carrying two guiding-jaws located above the cylinder-points, a vertically and laterally adjustable revolving cutter carried by the arm, means for adjusting said cutter, a revolving brush adjacent to the cutter, a support for the brush, and means for revolving the cutter and brush, substantially as described.

8. The combination, with the cylinder of a turning-off machine, of a pair of guide-jaws, a cutter operating below the jaws, a rotary main brush, a reciprocating brush arranged between the cutter and main brush, supports for holding the jaws, cutter, and brushes above the cylinder-points, and means for operating the cutter, rotating the main brush, and reciprocating the auxiliary brush, substantially as described.

9. The combination, with the cylinder of a turning-off machine, of depending laterally-yielding elastic plates having their lower extremities extending toward each other to form a pair of guiding-jaws having a converging entrance, a movable brush, a cutter movable beneath the jaws between the latter and the brush, supports for holding the plates, cutter, and brush above the cylinder-points, and means for operating the cutter and brush, substantially as described.

10. The combination, with the cylinder of a turning-off machine, of an arm 23, supported at one end and having at the other end a head 25, an arm 26, adjustable axially and lengthwise in said head, a cutter-shaft supported by the said adjustable arm and carrying a cutter-disk 38 a pair of guiding-jaws 45, supported adjacent to the cutter, a movable brush, a support for the latter, means for axially and lengthwise adjusting the arm carrying the cutter-shaft, and means for rotating the cutter-shaft and moving the brush, substantially as described.



409,558. STIRRUP. JOHN BULL, Cincinnati, assignor to Edward E. Johnson, Painesville, Ohio. Filed May 8, 1889. Serial No. 309,978. (No model.)

Claim.—1. The combination of the stirrup A, hood B, having parallel top slots D D, and side slots C C registering with slots in the stirrup, and provided with the depending rods E, coiled springs F, and movable socketed block or bearing H, having reduced ends projecting through the slots in the sides of the stirrup and hood, and provided with the downwardly-projecting shoulders K K, substantially as and for the purpose set forth.

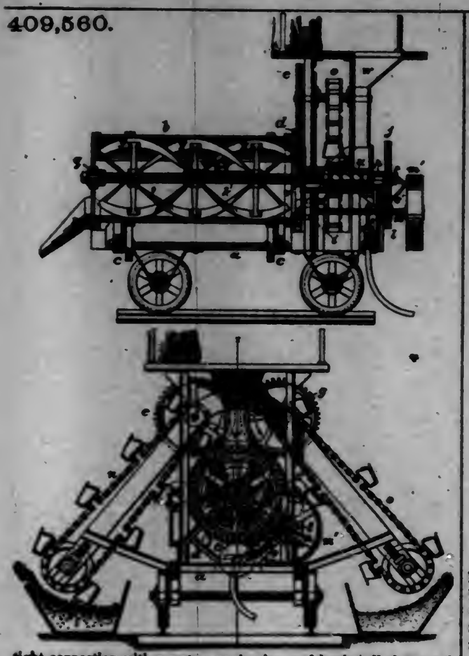
2. The combination of the stirrup A, hood B, having parallel top slots D D, and side slots C C registering with slots in the stirrup, and provided with the depending rods E, coiled springs F, movable socketed block or bearing H, having reduced ends projecting through the slots in the sides of the stirrup and hood, and provided with downwardly-projecting shoulders K K, and stirrup-strap J, doubled around the movable block or bearing and having its ends inserted loosely through the parallel slots D D in the hood, substantially as and for the purpose shown and set forth.

409,559. FRAME FOR DOORS OF POST-OFFICE LOCK-BOXES. BUNNOD H. CAMP, New Britain, Conn., assignor to the Corbin Cabinet Lock Company, same place. Filed Sept. 27, 1883. Serial No. 240,459. (No model.)

Claim.—1. A lock-frame having its sides provided with laterally-projecting perforated ears or projections, the said ears or projections adapted to overlap corresponding ears or projections on the next adjacent frame, substantially as set forth.

2. A lock-box frame having its sides constructed with outwardly-projecting perforated ears, the frame being provided with recesses on its side opposite the ears, substantially as set forth.

3. The combination, with a series of lock-box frames, each provided with outwardly-projecting perforated ears and constructed with recesses opposite the ears, whereby the ear on one frame overlaps the ear on the opposite frame and fits within the recess formed in the latter, of fastening-bolts, each constructed with an angular shank in cross-section that fits within the angular perforations in the overlapping ears, substantially as set forth.



4. The combination, with a series of door-frames, the adjacent edges of which are provided with countersunk screw-holes, one-half of the countersunk and opening being formed in each edge, the bottom of each countersunk constituting a conical projection, of fastening-screws, each having a conical recess formed on the under side of its head, substantially as set forth.

5. In a post-office lock-box, the combination, with a series of frames having perforated overlapping ears and holes that are formed in the edges of adjacent frames, the countersinks of which holes have cone-shaped bottoms, of screw-bolts that are formed to fit squared holes in the ears of the frames, and screws that are capped on the lower faces of their heads to mate the cone-shaped recesses of the countersunk holes in the edges of the frames, substantially as set forth.

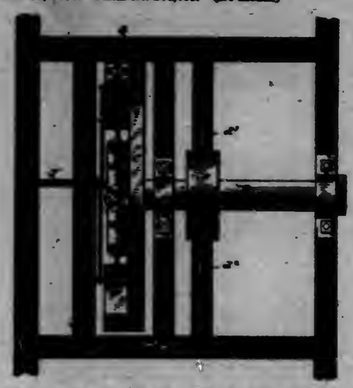
409,560. MACHINE FOR MAKING CONCRETE, &c. ALFRED E. CAREY, Westminster, and ERNEST LATHAM, London, County of Middlesex, England. Filed June 26, 1888. Serial No. 315,864. (No model.) Patented in England Oct. 25, 1884, No. 14,115.

Claim.—In a machine for the automatic manufacture of concrete or mortar, the combination, with suitable separate hoppers or receptacles for the several ingredients, (such as sand, stones, or broken rock and dry cement or lime,) of the several coacting conveying and measuring devices, a revolving cylinder which receives said ingredients, and independently revolved mixing and forwarding blades within said cylinder, said blades being mounted on a hollow shaft having water-

409,560.

tight connection with a water-supply pipe, and having discharge-orifices midway of said cylinder, whereby the ingredients, having been first intimately mingled in the dry condition, are then at one continuous operation mixed and tempered into a wet or pasty mass in condition for use.

409,561. PERCH-BEARING FOR FIFTH-WHEELS. WILLIAM H. COOPER, New Haven, Conn., assignor to M. Seward & Son, same place. Filed Jan. 21, 1889. Serial No. 297,001. (No model.)



Claim.—The herein-described perch-bearing for fifth-wheels, consisting of the body A, constructed for attachment directly to the perch, the body also constructed with a transverse recess C, with a vertical chamber E opening from the perch side of the body into the body each side the said recess C, combined with a bar D on the side of the body opposite the perch and extending across the recess C, a spring F in each of said chambers of the body, screw G, extending through said springs and through the bar, the said screws constructed with a head of non-cylindrical shape, larger in area than the said spring-chambers, the spring-chambers constructed with a recess at their open end corresponding to the shape of the said heads, and in which the said heads will rest, with a nut on said screw adapted to bear upon said bar, substantially as described.

409,562. BUCKET FOR CHAIN-PUMPS. ADAM D. CROSBY, Cuba, N. Y. Filed Mar. 21, 1888. Serial No. 304,126. (No model.)

Claim.—In a bucket for chain-pumps, the rubber A, having the concave recess *a* in its upper side, a concave recess *a'*, of substantially the same diameter formed in its bottom, the sides of said bucket being of egg-shape form to present the lower depending wall, as described, said bucket having a vertical central perforation, an upper eye carrying a stem within said perforation and of the same diameter throughout the length of the latter, the lower projecting end of the stem being reduced to form a shoulder *c'*, the swivel D, having a plate *d*, permanently located within said lower recess and having its upper surface convex, said plate having a central opening in which the reduced end of the stem is riveted, so that said plate can bear pivotally against the shoulder *c'*, the construction being such that the upward draft on the eye will cause the plate *d* to expand the bucket while the lower depending walls are free to take up wear, substantially as set forth.

409,563. STEAM-ENGINE. JOHN COLTON, North Dorset, Vt. Filed June 12, 1888. Serial No. 276,765. (No model.)

Claim.—1. The combination, with the shaft provided with independent steam-ports, of a disk secured on the end of this shaft, independent radiating steam-cylinders secured on this disk and connected, respectively, to the said independent steam-ports, pistons and piston-rods working in these cylinders, radiating ways, also secured on the face of the disk in line with the cylinders, cross-heads in these ways connected to the piston-rods, and the rods H, connecting the said cross-heads with a stationary pivot-pin set eccentrically to the said shaft, substantially as described.

2. The combination of the steam-box provided with two recesses, the shaft having independent ports corresponding to the number of cylinders, the disk provided with two or more cylinders having piston connected in the ordinary manner with cross-heads, the slides secured to the disk in a manner to balance each other, and the rods connecting the cross-heads with the pivot set eccentric to the shaft, substantially as and for the purposes set forth.

3. The combination of a frame, a shaft journaled in the same and provided with two or more independent steam-ports, a balance disk or wheel on the shaft, independent radiating steam-cylinders on this disk, the said independent ports communicating with these independent steam-cylinders, pistons and piston-rods, cross-heads, and radiating slides secured on the disk, substantially as and for the purpose herein described.

4. As an improvement upon my patent numbered 333,060, granted the 22d day of December, 1885, a steam-engine consisting of the following instrumentalities: a suitable frame, a shaft journaled in bearings upon this frame and provided with two or more independent steam-ports, a steam-box surrounding the shaft, a rotating disk secured on one end of this shaft, independent radiating steam-cylinders secured on the face of the said disk, the inner ends of these cylinders being closed and connected, respectively, to the independent steam-ports in the shaft, pistons working in these cylinders, piston rods and slides, and radiating guides secured on the face of the said disk and connecting the said slides with a stationary eccentric-point on the said frame, substantially as and for the purpose herein set forth.

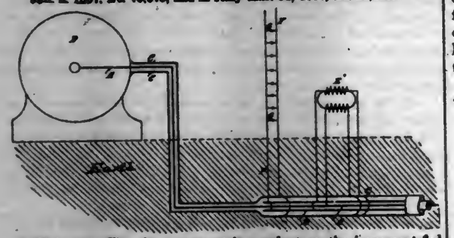
5. The combination of a shaft provided with independent ports, a disk rigidly secured to one end of the shaft, independent radiating cylinders secured to the face of the said disk, the inner ends of the said cylinders being closed and connected, respectively, with the independent steam-ports in the shaft, radiating guides, pistons and piston-rods, cross-heads working in the said guides, radiating independent rods connecting the said cross-heads with a pin J on a stationary beam, said pin, and beam, the said pin being secured in a slot J' in the said beam, substantially as described.

6. The combination, with a frame, of a drive-shaft journaled upon this frame and provided at one end with a rotating disk, a steam-box embracing this shaft and provided with inlet and exhaust chambers, this steam-box being mounted upon the frame to the rear of the disk on the shaft, radiating steam-cylinders closed at their inner ends and secured on the face of the said disk, radiating guides upon the face of the disk, pistons in the cylinders, piston-rods connected with slides working in the guides, and independent radiating rods connecting the said slides with a stationary eccentric-pin upon the frame, the said

shaft being provided with independent steam-ports connecting the inner closed ends of the cylinders with the steam-box, substantially as herein set forth.

7. The combination, with a frame, of a drive-shaft journaled in the frame, a disk secured on one end of the shaft, radiating independent cylinders and slides upon this disk, pistons and slides, the said shaft being provided with independent ports leading to the cylinders, a stationary adjustable eccentric pin or shaft J upon the frame, and independent radiating rods connecting this adjustable eccentric-pin with the slides working in the guides on the disk, as and for the purposes set forth.

409,564. ADJUSTABLE ROLLING-PIN. LIDDIE CURTIS, Callicoon Depot, N. Y. Filed May 16, 1889. Serial No. 310,980. (No model.)

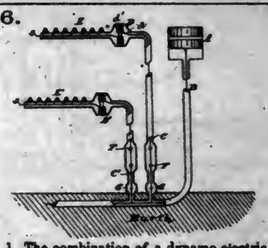


Claim.—1. The combination, with the roller and its shaft, of the gage-blocks at the ends of the roller, with their bearing-edges at varying distances from the acting surface of the roller, substantially as shown and described, and for the purpose specified.

2. The combination, with the roller and the shaft passed through the same, of the handles on the ends of the shaft and the gage-blocks upon the handles, having bearing-edges at varying distances from the bearing-face of the roller, substantially as shown and described.

3. The rolling-pin described, consisting of the shaft, the hollow roller rotatable thereon, the handles on the shaft provided with rectangular portions, and the gage-blocks having apertures to receive the rectangular portions of the handles and having their outer edges at varying distances from the apertures, substantially as shown and described, and for the purpose specified.

409,565. DISTRIBUTION OF ELECTRICAL ENERGY. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Feb. 19, 1889. Serial No. 300,457. (No model.) Patented in England Dec. 11, 1885, No. 15,251; in France Dec. 9, 1886, No. 180,176; in Belgium Jan. 8, 1887, No. 75,875, and in Italy Mar. 31, 1887, No. 21,119.



Claim.—1. The three concentric conductors, the innermost fed with high-tension current, the converter supplied with current from the high-tension conductor feeding the intermediate conductor with low-tension current, and the outer conductor serving as a return-conductor to both the high and low tension mains.

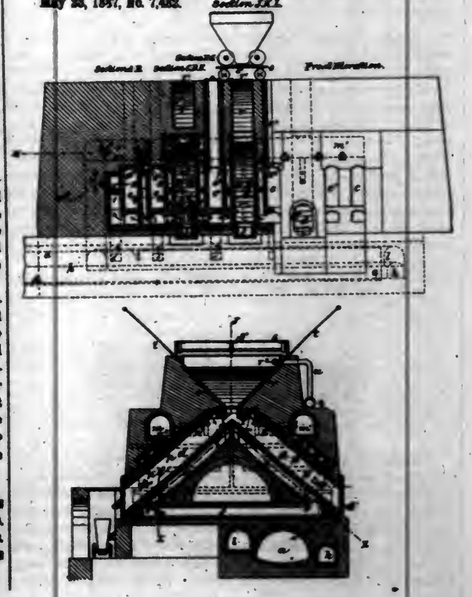
2. The combination of a dynamo-electric machine producing current of high tension, three concentric conductors, the inner one coupled to one pole of the dynamo, the outer one to the other pole of the dynamo and to earth, a converter with its primary coupled to the innermost and outer conductors and its secondary to the outer and intermediate conductors, and branch circuits from the intermediate conductor to the outer conductor.

3. The combination of a dynamo-electric machine producing current of high tension, three concentric conductors, the inner one coupled to one pole of the dynamo, the outer one to the other pole and to earth, a converter with its primary coupled to the innermost and outer conductors and its secondary to the outer and intermediate conductors, a branch conductor led off from the intermediate conductor and passing away through two other conductors concentric with but insulated from it, a second converter with its primary coupled to the innermost and outer conductors of this branch and its secondary to the outer and intermediate conductors, and branch circuits from the intermediate to the outer conductor.

409,566. DISTRIBUTION OF ELECTRICAL ENERGY. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Feb. 19, 1889. Serial No. 300,458. (No model.) Patented in England Dec. 11, 1885, No. 15,251; in France Dec. 9, 1886, No. 180,176; in Belgium Jan. 8, 1887, No. 75,875, and in Italy Mar. 31, 1887, No. 21,119.

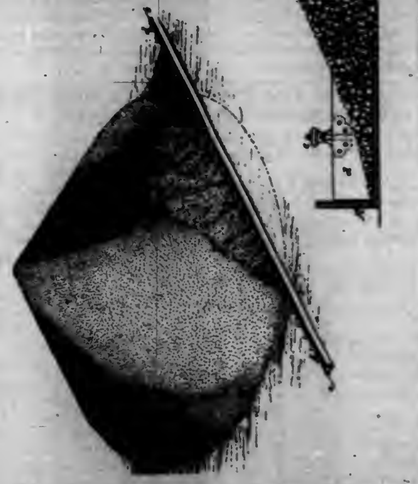
Claim.—1. The combination of a dynamo-electric machine, concentric conductors insulated from one another leading therefrom, the inner conductor coupled to one terminal of the dynamo, the outer conductor to the other terminal and to earth.

2. The combination of a dynamo-electric machine, concentric conductors insulated from one another leading therefrom, the inner conductor coupled to one terminal of the dynamo, the outer conductor coupled to earth and to the frame of the dynamo, which forms the other terminal.



3. The combination of a dynamo-electric machine, concentric conductors insulated from one another leading therefrom, the inner conductor coupled to one terminal of the dynamo, the outer conductor to the other terminal and to earth, and a converter with one pole of its primary coupled to the inner conductor and the other pole to the outer conductor and to earth.

4. The combination of a dynamo-electric machine, concentric conductors insulated from one another leading therefrom, and an electrical appliance—such, for instance, as a fuse, switch, or converter—inclosed within the outer return-conductor.



5. The combination of a dynamo-electric machine, concentric conductors insulated from one another leading therefrom, the outer conductor being connected with the earth and kept approximately at the same potential as the earth, and an electrical appliance—such, for instance, as a fuse, switch, or converter—used in connection with the inner conductor inclosed within the outer one.

6. The combination of a dynamo-electric machine, concentric conductors insulated from one another leading therefrom, branch concentric conductors leading from the first conductors, switches and fuses on the inner high-tension conductor of the branches inclosed in casings which form part of the outer conductor, and converters similarly inclosed and with their primary coupled at one end to the high-tension conductor and at the other to the casing.

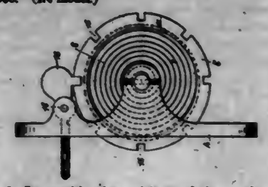
409,567. APPARATUS FOR THE MANUFACTURE OF COKE. RICHARD DE SOLDENHOFF, Cardiff, County of Glamorgan, England. Filed Oct. 21, 1887. Serial No. 253,085. (No model.) Patented in England May 23, 1887, No. 7,462.

409,568. PROCESS OF REMOVING PILES OF COAL. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Naugatuck, Conn. Filed Feb. 8, 1888. Serial No. 263,222. (No model.)

Claim.—The mode herein described of effecting the removal or distribution of storage-piles of coal or like gravitating granular material, which consists in continuously attacking the pile along one side of its base, thus causing the material to flow by gravity on that side of the pile which is attacked, catching said flowing material and removing it laterally in contact with and past the pile to a predetermined point of delivery, all substantially as specified.

Claim.—1. The combination, with two or more coke-ovens and flues under said ovens, of an incinerating-furnace situated between said ovens and consisting of two inclined chambers communicating at their upper ends, flues connecting the upper portions of said ovens with the lower ends of said inclined chambers, and flues under said inclined chambers connected with the upper ends thereof and with the flues under the ovens, substantially as set forth.

2. The combination, with two or more coke-ovens, flues under said ovens, the main flue *a* connected with said flues under the ovens, and a hopper, of an incinerating-furnace, having its floor inclined downwardly from its mid-length, interposed between said coke-ovens under said hopper, flues leading from said ovens to the furnace at the lower ends of said inclined floors, and flues under said furnace connected therewith and with the flues under the ovens, substantially as set forth.



3. The combination, with two or more coke-ovens, of an incinerating-furnace interposed between said ovens and connected therewith, and having its floor inclined downwardly from its mid-length, a hopper arranged above the upper ends of such inclines, the doors *d'*, and the rabbles *t*, projecting in the direction of the inclines of the floor and forming a valve for said hopper, as set forth.

4. The combination, with the coke-ovens *a d'*, of the incinerating-furnace interposed between said ovens and having an inclined floor, flues *h h'*, arranged under said incinerating-furnace, said furnace having communication with said oven at the lower end of its incline and with said flues at the upper end of its incline, and the flue *j* and flues under said ovens connected with the flues *h h'*, substantially as set forth.

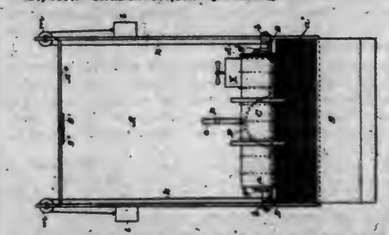
5. The combination, with the coke-ovens and the main flue *a*, of the horizontal flues *m m'*, air-flues *k l*, arranged in juxtaposition to flue *a* and communicating with flues *m m'*, and an incinerating-furnace arranged between said ovens and communicating therewith and with the flues *m m'*, substantially as set forth.

6. The combination, with the coke-ovens and the main flue *a*, of an incinerating-furnace *d*, having its floor inclined downwardly from the center on each side, interposed between and connected at its lower ends with said ovens, a hopper arranged above the center of said floor, flues extending under said ovens and connecting with flue *a*, the flue *h* under the furnace *d*, connected with the upper end thereof and with the said oven-flues, the flue *h'* under the furnace *d*, connected with the upper end thereof, the flue *j*, connected with the flue *h'* and with said oven-flues, and the horizontal flues *m m'*, communicating with the atmospheric air and leading to furnace *d*, as set forth.

409,569. SASH-BALANCE. LEWIS W. DOREN, St. Louis, Mo., assignor to Henry Schmeeze, same place. Filed Apr. 10, 1888. Serial No. 306,840. (No model.)

Claim.—1. In combination with a window-sash, a spring-drum provided with notches, a cable attached to the drum and to the sash, and a pivoted lever engaging the notches in the drum and having an end projecting inward beyond the pivot for engaging the drum and an end projecting outward beyond the pivot for engagement by the hand, substantially as and for the purpose set forth.

2. The combination, with a window-sash and frame, of a bracket secured to the frame, a spring-drum having a notched flange and journaled in the bracket, a cable secured to the drum and extending in both directions therefrom and secured by its opposite ends to the sash, and a pivoted lever engaging the notches of the drum-flange, substantially as and for the purpose set forth.



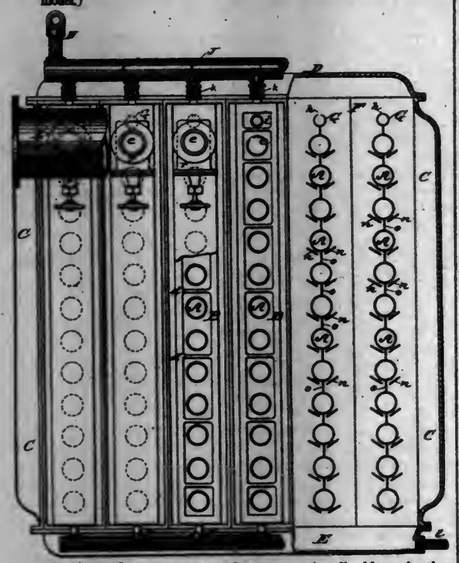
409,570. CARBURETOR. JOSEPH ELDER, Peoria, Ill. Filed Apr. 12, 1889. Serial No. 307,065. (No model.)

Claim.—1. In a carburetor, the body divided by horizontal partitions into distinct chambers, in combination with the pipe leading into the top of the bottom chamber, the pipe leading from the top of the bottom chamber to the top of the one above and the outlet-pipe *h*, each of said pipes terminating in a cross-pipe with a narrow horizontal slit therein, substantially as described and shown.

2. In a carburetor, a chamber *d* nearly filled with a hydrocarbon, in combination with an inlet-pipe presenting a narrow slit across one end of the chamber above the liquid, and a similar slitted outlet-pipe at the opposite end of the chamber, whereby air or gas is directed in a thin sheet across the top of the chamber.

409,571. AUTOMATIC DISTRIBUTER FOR CARDS OR OTHER ARTICLES. WILHELM FISCHER, Vienna, Austria-Hungary. Filed Oct. 26, 1888. Serial No. 289,467. (No model.)

Claim.—1. In an automatic distributer for cards and other articles, the combination, with a receptacle or casing, of a frame or follower loosely mounted therein and adapted to travel from one end of said casing toward the other, and feeding projections or rollers mounted in said frame and adapted to bear upon the sheets to be distributed and to follow up the diminishing pile by virtue of the movement of said frame, substantially as set forth.



2. In an automatic distributer for cards and other articles, the combination, with a receptacle or casing, of a frame or follower loosely mounted therein and adapted to travel from one end of the casing toward the other, feeding projections or rollers mounted in said frame and adapted to bear upon the sheets to be distributed, and to follow up the diminishing pile by virtue of the movement of said frame, and pressure-rollers independent of said feeding projections or rollers and mounted on said frame, substantially as set forth.

3. The combination, with the follower or frame having the feeding projections or rollers, of the counterbalance-weights *l*, cords *k*, and pulleys *m*, substantially as and for the purposes shown and described.

4. In combination with the inclosing-casing and the rotary feeding projections or rollers, the curved bars or straps *f*, carried by the follower B or bar E, as shown and described, for the purpose specified.

5. The combination, with the working parts of the apparatus, comprising the frame or follower, the motor or clock-work carried thereby, and the feeding projections or rollers connected with and rotated by said motor, of the casing A, constructed substantially as shown and described, to contain and permit the automatic delivery of cards or sheets.

409,572. APPARATUS FOR EVAPORATING LIQUIDS. THOMAS GAUNT, Brooklyn, N. Y. Filed Dec. 22, 1887. Serial No. 258,655. (No model.)

Claim.—1. In an apparatus for evaporating liquids and other substances, an undulatory evaporating-surface and a feed or delivery for the liquid to be treated, combined with a series of returning-surfaces co-operating with the said evaporating-surface to receive and return the liquid thereto, substantially as described.

2. In an apparatus for evaporating liquids and other substances, an undulatory evaporating-surface consisting of a series of tubes or pipes A and intervening bridges *o*, and a feed or supply for the liquid to be treated, combined with a series of returning-surfaces co-operating with the said surfaces to receive and return the liquid thereto, substantially as described.

3. In an apparatus for evaporating liquids and other substances, an undulatory evaporating-surface consisting of a series of tubes or pipes A and intervening bridges *o*, and a feed or supply for the liquid to be treated, combined with a series of returning-surfaces co-operating with the said tubes on opposite sides thereof, substantially as described.

4. In an evaporating apparatus, a plurality of independent detachable sections, each consisting of an evaporating-surface and a liquid feeder or delivery for each evaporating-surface, combined with a supply-pipe for the said sections and with a cock or valve for each section, whereby a section of the apparatus may be cut off and rendered inoperative, substantially as described.

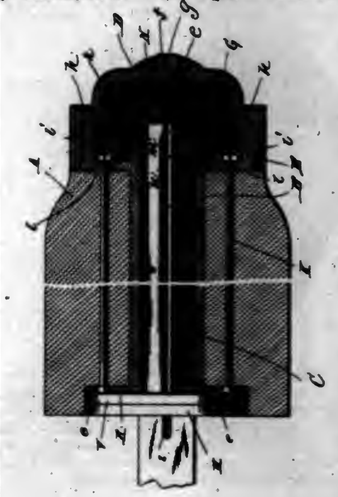
5. The combination, with the horizontal evaporating tubes or pipes vertically ranged, as shown, of the parallel removable inclined returning-surfaces proximate to the under surface thereof, adapted to return separated portions of the gravitating liquid to the surfaces of each succeeding tube, as set forth.

6. In an evaporating apparatus, the combination, with a feeder and an undulatory evaporating-surface located below it, of the intermediate disconnected returning-surfaces, upon which the liquid from the feeder is discharged to be conducted to the evaporating-surface, substantially as described.

7. In an evaporating apparatus, a heated non-spherical evaporating-surface, combined with the herein-described liquid-feeder connected to form a continuous surface therewith and having a delivery-slot, from which the substance to be evaporated flows by a force due to gravity to spread over and so as to envelop or cover the said evaporating-surface with a liquid sheet, the said evaporating-surface and connected feeder being formed to maintain the said liquid sheet continuous or unbroken in its passage from the delivery-slot and being acted directly upon by the heating medium, whereby a maximum evaporating effect is produced, substantially as described.

8. In an evaporating apparatus, a heated non-spherical evaporating-surface, combined with the herein-described liquid-feeder connected to form a continuous surface therewith, and having a delivery-slot, from which the substance to be evaporated flows by a force due to gravity to spread over and so as to envelop or cover the said evaporating-surface with a liquid sheet, the said evaporating-surface and liquid-feeder having an undulatory outline formed to maintain the said liquid sheet continuous or unbroken in its passage and being acted directly upon by the heating medium, whereby a maximum evaporating effect is produced, substantially as described.

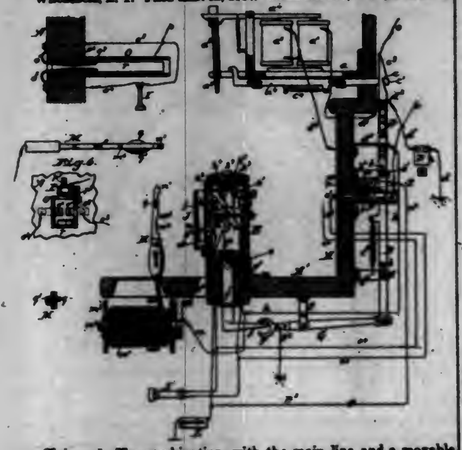
9. In an evaporating apparatus, a heated evaporating-surface consisting of a series of connected tubes or pipes A, arranged in substantially a vertical plane to form an evaporating-surface having an undulatory outline, and through which the heating medium is circulated, combined with the herein-described liquid-feeder connected to said evaporating-surface by an intermediate bridge and constructed to overflow the liquid upon and so as to cover the said evaporating-surface with a continuous liquid sheet, which flows over the evaporating-surface substantially at right angles to the length of the said tubes, substantially as described.



10. In an apparatus for evaporating or distilling liquids, the evaporating-surface composed of horizontal parallel tubes ranged in vertical series and successively connected with each other for a continuous flow of the liquid, and by chambers or headers for a continuous passage of the heating agent therein, in combination with an elevated feed or supply pipe parallel to and connected to said series by an intermediate bridge to form a continuous-flowing surface and adapted by a slotted opening to overflow and spread the liquid solution in a continuous sheet upon the exterior of the evaporating-surface, and with an enveloping chamber or shell for receiving and separating the vapor and liquid constituents, substantially as described.

11. In an apparatus for evaporating liquids, an evaporating-surface composed of horizontal tubes or chambers through which a heating-medium is circulated, in combination with a parallel supply or feed trough located above said tubes or chambers and feed-trough being, respectively, connected by an intermediate bridge to form a continuous face, whereby the liquid to be evaporated is spread upon said surface by the overflow of said feed-trough, and gravitates over the same in an unbroken sheet.

12. In an evaporating apparatus, a plurality of independent detachable sections, each consisting of an evaporating-surface and a surface-connected liquid feeder or delivery, as described, for each evaporating-surface, each section being constructed to be used alone or in conjunction with the remaining sections, substantially as described.



13. In an evaporating apparatus, the combination, with a series of evaporating-surfaces and a liquid feeder or delivery for each evaporating-surface, of an independently-controlled liquid-supply connected to the liquid-feeder of each evaporating-surface, whereby each evaporating-surface may be rendered inoperative independently of the others, substantially as described.

409,573. AXLE-LUBRICATOR. HENRY M. GOODMAN, Louisville, Ky. Filed May 20, 1889. Serial No. 311,369. (No model.)

Claim.—The combination, with a grooved axle-spindle, of a hub having a boxing surrounding the inner bore of the hub and formed with a vertical extension inward a short distance from its outer end extension, which outer end extension has a lubricant-aperture, while said vertical extension has a horizontal peripheral extension fitted with a chambered cap, and the said outer end extension has fitting against it a cap screwed upon the axle-spindle, substantially as set forth.

409,574. TELEPHONE SWITCH SYSTEM. CLAUDE C. GOULD, Batavia, assignor to the Eastern Electrical Manufacturing Company, Wheatfield, N. Y. Filed Mar. 12, 1887. Serial No. 230,616. (No model.)

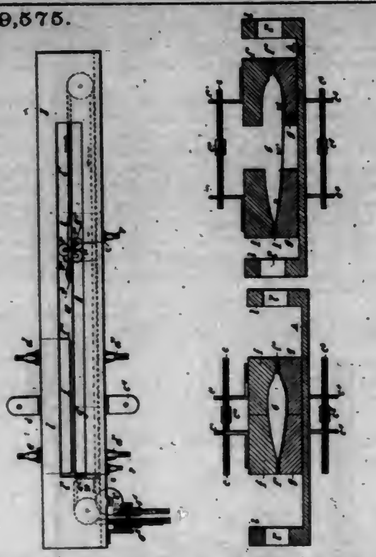
Claim.—1. The combination, with the main line and a movable plug M, connected therewith, of a socket O, also connected with the main line, a contact-lever P, connected with the generator and provided with a conducting-arm *p'* and a non-conducting arm *p*, and a spring, whereby one of said arms is projected into the socket upon inserting the plug into the socket and a connection made between the main line and the generator, substantially as set forth.

2. The combination, with the main line and the frame E, of a socket J, attached to the frame E, a contact-lever K, projecting into the socket and connected with a generator L, and a plug M, connected with the main line, substantially as set forth.

3. The combination, with the frame E and contact-lever K, of the socket J, provided with a clamping-spring *n*, and a plug M, connected with the main line, substantially as set forth.

4. The combination, with the frame E, the socket J, and the contact-lever K, of the contact-springs $k' k^3$, connected contact-points $k^2 k^4$, push-button k^5, contact-points $i' i^2$, and a listening-telephone I, connected with the contact-points $i i^2$, substantially as set forth.

5. The combination, with the frame E, of a contact-lever K, having a conducting-arm *k'*, connecting with the generator, and a non-conducting arm *k*, of a socket J and a plug M, provided with a shoulder m^2, substantially as set forth.



6. The combination, with the plug M and its socket O, each connected with the main line, of a pivoted contact-lever P, connected with the generator and provided with contact-arms *p p'*, and a spring p^4, whereby the contact-lever is held with one of said arms in contact with the plug, substantially as set forth.

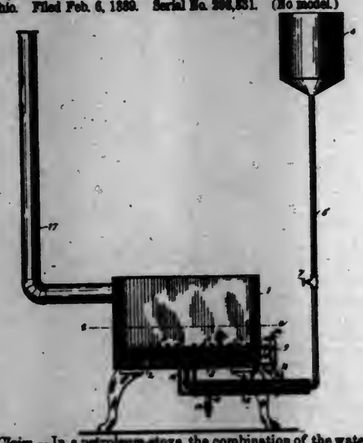
7. The combination, with the ground-lever G, having a contact-bow *g'*, of the pivoted frame E, provided with a contact-point *g*, projecting between the prongs of the contact-bow *g'*, substantially as set forth.

8. The combination, with an out-socket O, connected with the main line, of two contact-springs $o' o^2$, connected with the listening-telephone, one of said springs being insulated from the socket, and a plug M, adapted to be inserted between said springs and provided with a non-conducting portion *q'*, substantially as set forth.

9. The combination, with an out-socket O, connected with the main line, of two contact-springs $o' o^2$, connected with the listening-telephone and arranged in the front portion of the socket, and a contact-lever P, connected with the generator and projecting into the rear portion of the socket, substantially as set forth.

409,575. CIGAR-BUNCHING MACHINE. FREDERICK A. GRAF, New York, N. Y. Filed Aug. 16, 1883. Serial No. 303,130. (No model.)

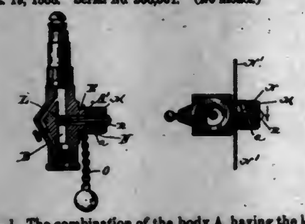
Claim.—1. In a cigar-bunching machine, the combination, with a supporting-table and side pieces fastened on either side of said table, of rails extending from one of said side pieces to the other, a yielding connection attaching said rails to said side pieces, a separable upper cigar-mold section adjustably attached to said rails, substantially as specified, a separable lower cigar-mold section adjustably fastened, substantially as described, to said supporting-table directly below said upper mold-section, a separable rolling-table also adjustably attached to said supporting-table, each part of said rolling-table being integral with a corresponding part of said lower mold-section, adjustable therewith, and said rolling-table arranged for a cigar-bunch to be rolled thereon before passing through said mold, all substantially as and for the purpose set forth.



2. In a cigar-bunching machine, the combination, with a supporting-table, side pieces fastened upon either side of said table, rails extending from one of said side pieces to the other, a yielding connection attaching said rails to said side pieces, a separable upper cigar-mold section adjustably attached to said rails, substantially as specified, a separable lower mold-section adjustably fastened, substantially as described, to said supporting-table directly under but apart from said upper mold-section, and a separable rolling-table also adjustably attached to said supporting-table, each part of said rolling-table being integral with a corresponding part of said lower mold-section and adjustable therewith, and said rolling-table arranged for a cigar-bunch to be rolled thereon before passing through said mold, of a reciprocating carriage mounted on wheels running in guides formed in said side pieces and adapted to pass through the space between said upper and lower mold-sections, a bunching-roller carried by said carriage and cords attached to said carriage, and pulleys on which said cords run to actuate said carriage, all substantially as and for the purpose set forth.

3. In a cigar-bunching machine, the combination, with a supporting-table, side pieces fastened to either side of said table, rails extending from one of said side pieces to the other, a yielding connection attaching said rails to said side pieces, a separable upper cigar-mold section adjustably attached to said rails, substantially as specified, a separable lower mold-section adjustably fastened, substantially as described, to said supporting-table directly under but apart from said upper mold-section, and a separable rolling-table having a cavity, substantially as described, formed in the outer end thereof and adjustably attached to said supporting-table, each part of said rolling-table being integral with a corresponding part of said lower mold-section and adjustable therewith, and said rolling-table arranged for a cigar-bunch to be rolled thereon before passing through said mold, of a reciprocating carriage mounted on wheels running in guides formed in said side pieces and adapted to pass through the space between said upper and lower mold-sections, a bunching-roller carried by said carriage, cords attached to said carriage to impart motion thereto, substantially as specified, a flexible forming-apron extending over said cavity in said rolling-table, over said bunching-roller, over said rolling-table, over said lower mold-section, between said upper and lower mold-sections, through slots in said supporting-table, and adjustably fastened by its two ends below said supporting-table, substantially as specified, and said carriage, bunching-roller, and apron being so con-

structed and arranged that facility is afforded whereby a cigar-bunch may be first rolled upon said rolling-table in the bight of said apron, and then in the bight of said apron rolled through and between said molds to give it proper form, all substantially as and for the purpose set forth.

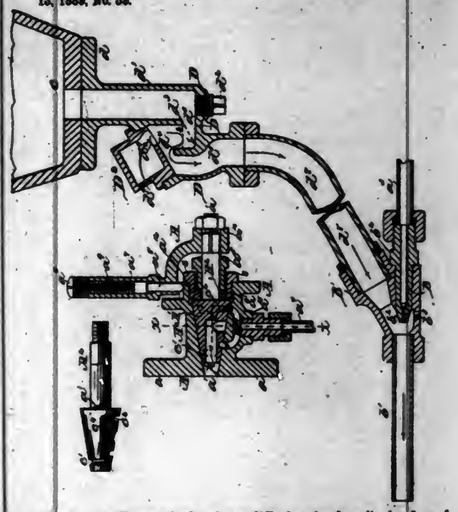


4. In a cigar-bunching machine, the combination, with a separable mold-section, substantially as herein described, and a separable rolling-table, the parts whereof are integral with corresponding parts of said mold-section, substantially as specified, of a lining extending through the inside of said mold-section and said rolling-table, consisting of three pieces, and constructed and arranged so that when the parts of said mold-section and said rolling-table are separated to form cigars of different lengths a part of said lining is retained within each half of said mold-section and of said rolling-table integral therewith, and the third part of said lining fills the gap between the parts of said mold-section and of said rolling-table, all substantially as and for the purpose set forth.

409,576. PETROLEUM-FURNACE. JAMES A. S. GRAY, Cincinnati, Ohio. Filed Feb. 6, 1889. Serial No. 298,831. (No model.)

Claim.—In a petroleum-stove, the combination of the water-tight hearth, the communicating tuyeres, the oil-supply pipe, the steam-jacket which surrounds the oil-supply pipe, and the steam-ducts that lead from said steam-jacket to said hearth, as and for the purposes explained.

409,577. GAS-FITTING. GEORGE H. GREGORY, New York, N. Y. Filed Oct. 19, 1888. Serial No. 288,561. (No model.)



Claim.—1. The combination of the body A, having the longitudinal passage B and the side passage E, communicating therewith, the outer portion of the side passage being enlarged, as shown, the cap H, having the cavity K, the packing K' in said cavity and filling the space between the cap H and the shoulder formed by the enlargement of passage E, and the piston-valve, said valve being provided with a rod or shaft which extends through the packing and cap by which the valve is operated, substantially as shown and described.

2. The combination, with the body A of a gas-fitting provided with the projection or shoulder A' and having a main passage B, and a side passage E, extending through the shoulder A', of the valve L, provided with the rod L', the cap H, packing K', cap M, provided with the slot N, and the lug *a* on the projection A', substantially as shown and described.

3. The combination, with the body A of a gas-fitting provided with the projection or shoulder A' and having a main gas-passage B, and a side passage E, extending through the shoulder A', of a valve L, the cap H, packing K', cap M, provided with the slot N and arms N', and lug *a* on the projection A', substantially as shown and described.

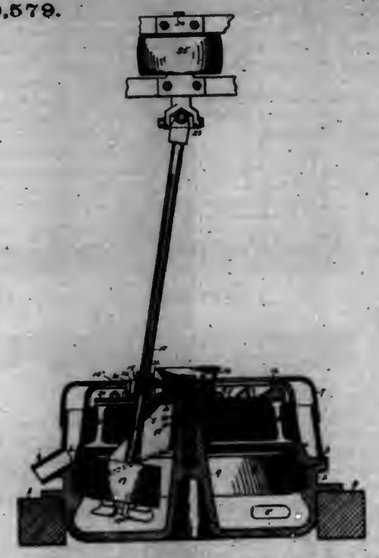
409,578. METHOD OF APPLYING SAND TO RAILS OF RAILWAYS. JAMES GRESHAM, Stretford, near Manchester, County of Lancaster, England. Filed Mar. 30, 1888. Serial No. 269,020. (No model.) Patented in England Apr. 26, 1887, No. 6,073; in France July 25, 1887, No. 184,974; in Germany July 26, 1887, No. 42,954; in Belgium Nov. 2, 1887, No. 79,201; in Italy Nov. 7, 1887, XLIV, 442; in Canada Feb. 7, 1888, No. 26,496; in Austria-Hungary Mar. 5, 1888, and in India Mar. 13, 1889, No. 39.

Claim.—1. The method, substantially herein described, of sanding railroad-rails, which consists in inducing an air-current within a closure open to the outer air and over and in contact with the surface of a non-moving body of sand contained within said closure by means of the sucking action of a steam-jet, and inducing the sand-laden current so produced into the path of the steam-jet by means of the same force.

2. The method herein described, which consists in utilizing the inducing force of a jet of steam as the means of causing a current of air to be drawn within a closure over and in contact with the surface of a non-moving body of sand and to take up and carry by such inducing action into the path of the steam-jet a portion of the sand from its surface and varying the volume of the sand so taken up by the induced air-current by varying the velocity of the latter.

3. The method, substantially herein described, of sanding railroad-rails, which consists in supplying the sand-blast by means of a current of air induced by means of a jet of steam, and caused to impinge upon the surface of the sand and to take up by such impingement and carry a portion therefrom into the path of the said jet through a conduit having perpetual communication with the said sand surface and the said steam-jet.

409,579. PULVERIZING-MILL. JAMES K. GRIFFIN, Brooklyn, N. Y. Filed Feb. 13, 1888. Serial No. 300,304. (No model.)



Claim.—1. In a pulverizing-mill, the combination, with an annular die, of a radially-movable roll-shaft and roll and mechanism for positively revolving the same upon their own axis and for gyrating them around the central axis of the mill, substantially as described.

2. In a pulverizing-mill, the combination, with a pan or pulverizing-chamber and an annular die arranged above the bottom thereof, of a suspended radially-movable roll-shaft and roll, which are also arranged above the bottom of said pan or chamber, and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill, substantially as described.

3. In a pulverizing-mill, the combination, with the pan or chamber and the annular die or ring, of the radially-movable shaft having a fixed roll at its lower end rotating against the inner surface of said die, mechanism for positively revolving said shaft and roll upon their own axis, and a universal joint for permitting of their gyration and connecting them to said revolving mechanism, substantially as described.

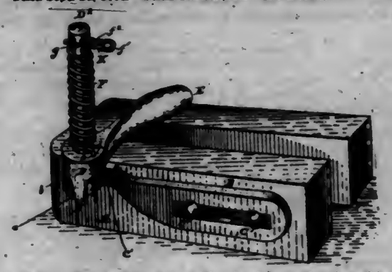
4. In a pulverizing-mill, the combination, with the pan or chamber and the annular die or ring, of the radially-movable shaft having a fixed roll at its lower end rotating against the inner surface of said die, and mechanism for positively revolving and gyrating said shaft and roll upon their own axis and around the central axis of the mill,

409,579.

said mechanism consisting of the drive-shaft, the pulley, and the universal joint, substantially as described.

5. In a pulverizing-mill, the combination, with a pan or chamber provided with an annular die and a revolvable top or cover, of a radially-movable roll-shaft passing through said cover and having a roll at its lower end, and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill and revolving said top or cover, substantially as described.

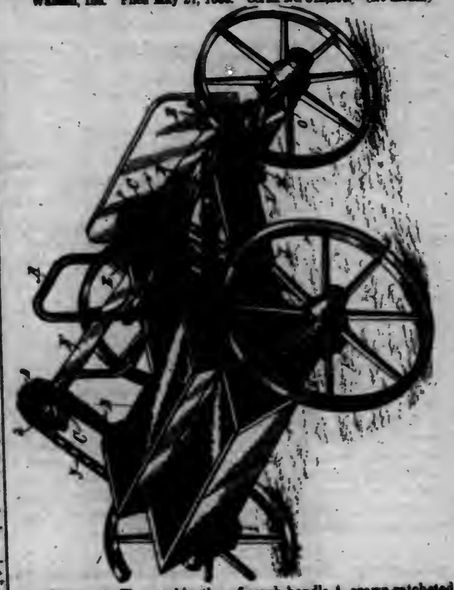
6. In a pulverizing-mill, the combination, with the pan or chamber 1, provided with the annular die 8, and the revolvable top or cover 12, formed with the radial slot 12', and provided with the plate 22, having anti-friction-lined flanges 21, of the radially-movable shaft passing through the slot in said cover and provided with the sleeve 19 and the roll 17, and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill and revolving said top or cover, substantially as described.



7. In a pulverizing-mill, the combination, with a pan or chamber provided with an annular die, and a revolvable top or cover having a feed-spout, of a stationary receiving-hopper communicating with said feed-spout, a radially-movable roll-shaft passing through said cover and having a roll at its lower end, and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill and revolving said top or cover, substantially as described.

8. In a pulverizing-mill, the combination, with a pan or pulverizing-chamber and an annular die arranged above the bottom thereof, of a suspended radially-movable roll-shaft, a roll secured to the lower end thereof and provided with stirrers on its lower end, which are also arranged above the bottom of said pan or chamber, and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill, substantially as described.

9. In a pulverizing-mill, the combination, with the pan or pulverizing-chamber 1, formed with the opening 8' and provided with the annular die 8, the screens 5, and the screen-frame 3, of the suspended radially-movable roll-shaft 18, the roll 17, secured to the lower end thereof and provided with the stirrers 17', and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill, substantially as described.



10. In a pulverizing-mill, the combination, with the pan or pulverizing-chamber 1, formed with the opening 8' and provided with the annular die 8, the screens 5, and the screen-frame 3, formed with the trough 4 and spout 6, of the suspended radially-movable roll-shaft 18, the roll 17, secured to the lower end thereof and provided with the stirrers 17', and mechanism for positively revolving said shaft and roll upon their own axis and for gyrating them around the central axis of the mill, said mechanism consisting of the drive-shaft 24, the pulley 25, and the universal joint 23, substantially as described.

409,580. PICKER-STAFF CHECK FOR LOOMS. THOMAS HALL and DAVID YOUNG, Lawrence, Mass.; said YOUNG assignor to said HALL. Filed Sept. 26, 1888. Serial No. 286,301. (No model.)

Claim.—The combination, with a lay-beam, of a slotted bracket and means for adjusting the same longitudinally, said bracket being provided with shoulders *c c'* and a pintle D^2, having perforations *g*, the arm E, having an eye *e* and stop-leg D', the helical spring F, engaging with the eye in said arm and having an eye f^2 and thumb-piece *f'*, and the removable key-pin K; as set forth.

409,581. HAND-MOTOR FOR VEHICLES. ABRAHAM R. HARRELL, Wabash, Ind. Filed May 27, 1889. Serial No. 312,296. (No model.)

Claim.—1. The combination of crank-handle A, crown-ratcheted sprocket-wheels C, pawls *d*, spiral springs *c*, braces B' B G, adjusting-screws F, screw-clamps E, clips H, sprocket-wheels I, sprocket-chains J, steering-levers K, screw-clamps L, connecting-rods N, and screw-clamps O, substantially as and for the purposes specified.

2. The combination, with the crank-handle A, pawls *d*, crown-ratcheted sprocket-wheels C, sprocket-chains J, and sprocket-wheels I, of the braces B', pivoted to screw-clamps E, braces B, and braces G, pivoted to clips H, as and for the purposes specified.

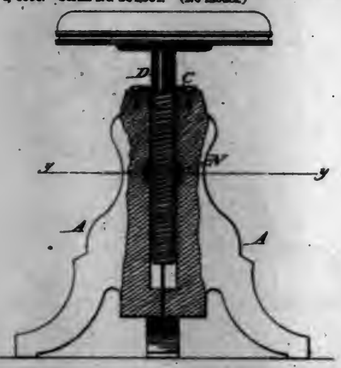
3. The combination of steering-levers K, screw-clamps L, connecting-rods N, and screw-clamps O, as and for the purposes specified.

4. The combination of crank-handle A, pawls *d*, crown-ratcheted sprocket-wheels C, spiral springs *c*, sprocket-wheels I, and sprocket-chains J, as and for the purposes specified.

409,582. SASH-LIFT. GEORGE HASSENFLUG, Cleveland, Ohio. Filed Feb. 7, 1889. Serial No. 298,961. (No model.)

Claim.—In a sash-lift consisting of two distinct parts, a base having a depending portion the bearing-surface of which is at an angle

to the upper surface of said base, and an opening through its center, in combination with a finger-piece adapted to fit the upper surface of the base, and provided with a screw which passes through the opening in the base to secure the parts to the sash, substantially as set forth.



409,583. REFRACTORY COMPOUND. JAMES L. HASTINGS, Philadelphia, Pa., assignor, by mesne assignments, to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Dec. 30, 1887. Serial No. 259,409. (No specimens.)

Claim.—A refractory compound containing a number of metallic salts—such as acetates of magnesium, calcium, and strontium—a mineral acid—such as sulphuric or nitric acid—and an adhesive material, substantially as described.

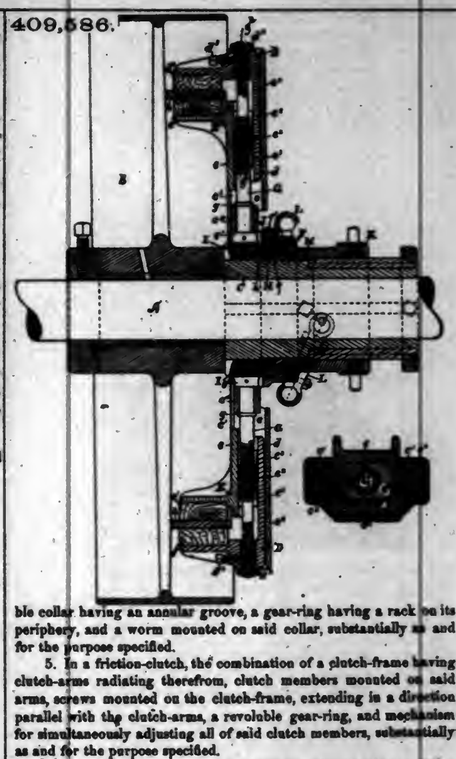
409,584. PLASTIC MINERAL COMPOSITION. JAMES L. HASTINGS, Philadelphia, Pa., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Sept. 27, 1888. Serial No. 286,581. (No specimens.)

Claim.—A composition for forming a refractory compound, containing two or more metallic compound substances—such as oxides, carbonates, or sulphates of metals—a flux, a moistening-fluid, and one or more flame or light coloring substances, such as oxide of uranium, strontium, and lead chromate or chromium oxide, permanganic acid, cadmium sulphide, sodium salts, or indium oxide, and calcite.

409,585. PIANO-STOOL. WILLIAM HEAP, Muskegon, Mich. Filed Sept. 4, 1888. Serial No. 284,581. (No model.)

Claim.—The herein-described piano-stool, comprising a suitable seat, the supporting-screw D therefor, the sections forming the legs and standard and having an axial recess for the screw, the cap C, screwed to the top of the standard and having an internally-threaded boss to engage the screw D, the angular nut N, seated in a recess of corresponding shape in the facing edges of the legs, and the key-plates B, that connect the standard-sections in the manner described and form parts of the wall of the recess that holds the nut N, and thereby aids in the support of said nut, as specified.

409,586. FRICTION-CLUTCH. HARRY W. HILL and LOUIS J. HIRT, Cleveland, Ohio. Filed Apr. 29, 1889. Serial No. 309,036. (No model.)



Claim.—1. In a friction-clutch, the combination of a clutch-arm and a clutch member supported thereby, with a screw mounted on the clutch-frame and engaging with said clutch member, a gear on said screw, a gear-ring revolnble apon the shaft, a sliding sleeve, and a mechanism connecting said ring and sleeve, whereby the former is revolved by the longitudinal sliding movement of the latter, substantially as and for the purpose specified.

2. In a friction-clutch, the combination of a clutch-arm and a clutch member supported thereby, with a screw mounted on the clutch-frame and engaging with said member, a gear upon said screw, a gear-ring, a sliding sleeve, and a link connected at its ends with said sleeve and ring, respectively, in different radial planes, and by ball-and-socket joints, substantially as and for the purpose specified.

3. In a friction-clutch, the combination of a clutch-frame having arms radiating therefrom, movable clutch members supported on said arms, screws mounted on the clutch-frame, extending parallel to said arms and engaging with said clutch members, and gears secured to said screws, with a revoluble collar surrounding the shaft, a gear-ring, and mechanism for adjustably securing said gear-ring to said collar, substantially as and for the purpose specified.

4. In a friction-clutch, the combination of a clutch-arm and a clutch member supported thereby, with a screw mounted on the clutch-frame and engaging with said member, a gear on said screw, a revolvable collar having an annular groove, a gear-ring having a rack on its periphery, and a worm mounted on said collar, substantially as and for the purpose specified.

409,586.

5. In a friction-clutch, the combination of a clutch-frame having clutch-arms radiating therefrom, clutch members mounted on said arms, screws mounted on the clutch-frame, extending in a direction parallel with the clutch-arms, a revolnble gear-ring, and mechanism for simultaneously adjusting all of said clutch members, substantially as and for the purpose specified.

6. In a friction-clutch, the combination of a clutch-arm and a clutch member supported thereby, having a longitudinal curved shank upon which are the lugs c^3 c^3, with a screw-block c^3, a screw mounted on the clutch-frame and engaging with said block, a gear on said screw, a gear-ring on the shaft, a sliding sleeve, and a mechanism connecting said sleeve and ring, whereby the latter is revolved by a longitudinal sliding movement of the former, substantially as and for the purpose specified.

7. In a friction-clutch, the combination of a clutch-arm having two parallel grooved bars and the yoke connecting them, and a clutch member having a longitudinal curved shank seated in said grooves, with a screw having the collars g g', the yoke c^4, the beveled gear I, the collar F, having annular groove f, the gear-ring H, having a rack on its periphery, the worm J, mounted on the collar, sleeve K, having sliding movement on the shaft, and link L, connecting said sleeve and collar, substantially as and for the purpose specified.

409,587. DOOR-SPRING. FREDERICK W. HOEFER, Freeport, Ill., assignor to the Warner Manufacturing Company, same place. Filed May 7, 1889. Serial No. 309,876. (No model.)

Claim.—1. In a door-spring, the combination, with two rigidly-connected parallel spring-cores lying side by side, of oppositely-coiled springs mounted thereon and provided with opposing arms adapted to engage, respectively, suitable fastenings upon a door and its jamb, substantially as set forth.

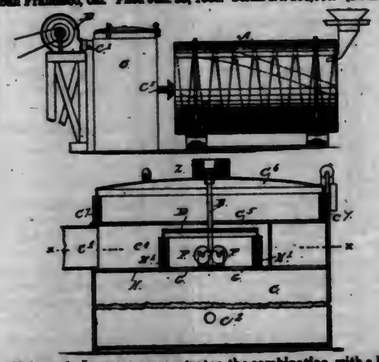
2. In a door-spring, the combination, with two parallel spring-cores rigidly united at the middle, of oppositely-coiled springs mounted thereon, each with one end in engagement with its core and each having its opposite end carried outward to form an arm and returned apon itself and engaged with one of said cores, substantially as and for the purpose set forth.

3. The combination, with the cores E E, united by a web F, of springs I I', mounted thereon, the looped spring-arm M', carried by the springs I', and the looped spring-arm M, carried by the springs I, and having the inwardly-bent branches passing between the branches of the arm M', substantially as set forth.

4. The combination, with the laterally-slotted cores rigidly connected by the web F, of the oppositely-wound springs I I', mounted upon the core E, with their adjacent ends in engagement with said core and with their outer ends extended to form a single arm-loop, the similar springs I', mounted in like manner upon the core E', and having their outer ends extended to form a second opposing arm-loop M', substantially as and for the purpose set forth.

409,588. TWO-WHEELED VEHICLE. HENRY G. M. HOWARD and BYRON J. HEALY, Kalamazoo, Mich. Filed June 13, 1888. Serial No. 314,168. (No model.)

Claim.—1. In a two-wheeled vehicle, the thills attached to the axle at their rear ends and having the cross-bars one above the other at the center and separated by the thills at the ends, with the whiffle-tree located between and held to its place by the pipe and bolt, as shown, and for the purpose specified.

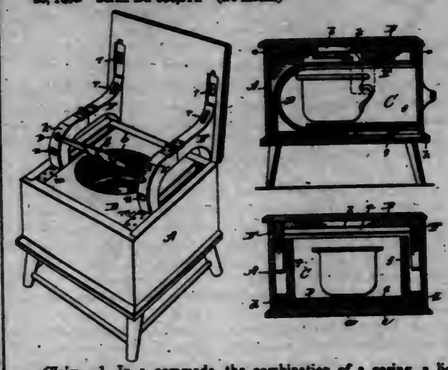


2. In combination with the thills and axle and body fulcrumed at the forward ends, the braces C C, located one above the other, their ends attached at the same point under seat on each side and running at different angles to the springs in rear of axle, as shown, and for the purpose specified.

3. In combination with the thills and axle of a two-wheeled vehicle, the connecting-rods E, the notched plate v, and step S, as shown, and for the purpose specified.

4. In a two-wheeled vehicle, the thills having the cross-bars with whiffletree, located as shown, the body having the hooked forward ends and turned-up rear portion, with the end rail K, the thill-attaching rods E, connecting the thills with axle J, plate v, steps S, and brace, the semi-elliptic spring in rear of axle supported by steps S, and the angled braces C C, supporting the body from the spring, all as shown and described.

5. In a two-wheeled vehicle, the frame D for the body and seat with back combined, made in one continuous piece of T-steel or other material, bent in the shape and manner shown, having the forward ends terminate in hooks for fastening to thill or cross-bars, and the rear portion bent up for back of seat and perforated to receive end of seat-rail K, and bolts to plate, constructed, combined, and used substantially in the manner shown and described, and for the purpose specified.



409,589. DRY-ORE CONCENTRATOR. CHRISTIAN F. JACOBSEN, San Francisco, Cal. Filed Jan. 26, 1888. Serial No. 261,900. (No model.)

Claim.—1. In an ore-concentrator, the combination, with a blower and concentrator connected to the inlet of a pressure-regulator, of said pressure-regulator consisting of two chambers having a double perforated partition between them, a sealing-trough on the upper chamber, and a hood with its edges immersed in the sealing-trough, said hood having a stem, guide-rollers for said stem, and a sealed valve connected thereto and exposed to the pressure of the lower chamber, substantially as set forth.

2. In an ore-concentrator, the combination of a support and a cylindrical rotatable concentrating-chamber placed in a horizontal position on said support and having a continuous spiral flange extending from end to end of the chamber, and a series of oblique shelves extending from end to end of the chamber, as set forth.

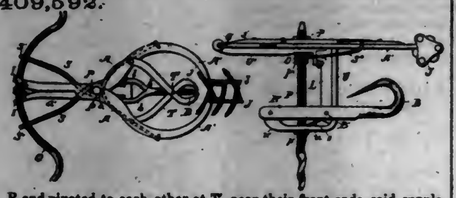
409,590. COMMODE. THOMAS C. JOYCE, Berlin, Wis. Filed Apr. 26, 1888. Serial No. 306,514. (No model.)

Claim.—1. In a commode, the combination of a casing, a lid hinged to the casing and provided with arms F, curved sections k, hinged to the ends of these arms, spring-catches upon the lower ends of these sections k, and a seat B, fitted within the casing and provided with notched plates m, substantially as and for the purpose herein set forth.

2. In a commode, the combination of a casing, a removable draw inserted in this casing, a sliding flexible cover mounted in grooves upon this draw, a lug attached to this folding cover, and a spring-catch secured upon the said casing and adapted to engage the said lug, as and for the purpose set forth.

409,591. ROTARY ENGINE. THOMAS R. KEAVY, Medina, Ohio, assignor to the Medina Engine Company, same place. Filed Mar. 23, 1889. Serial No. 304,417. (No model.)

Claim.—1. In a rotary engine, the combination, with piston-wheel and shaft, the latter being journaled in stationary boxes, substantially as indicated, of a base, a steam-cylinder inclosing such piston-wheel, the cylinder being hinged or pivoted to the base in position to render the cylinder adjustable toward and from the contact-line between piston-wheel and cylinder, and devices for locking the cylinder against movement, substantially as set forth.



2. In a rotary engine, the combination, with piston-wheel and cylinder eccentric with each other and having a contact-line, the said cylinder being hinged or pivoted to the base in position to render it adjustable toward and away from the contact-line, and devices for locking the cylinder against movement, of induction and eduction ports, substantially as indicated, and a back-pressure vent or port, the same entering cylinder near the contact-line, substantially as set forth.

409,592. ANIMAL-TRAP. ZEBAS R. KIDDER, Hays City, Kans. Filed Apr. 17, 1889. Serial No. 307,604. (No model.)

Claim.—1. In a trap, the main arms A, carrying jaws J, and the supplemental arms T, connected to said main arms and carrying jaws j, in combination with springs for forcing said arms into normally-closed position, the bait-hook B, and a latch connected to said bait-hook and adapted to hold said arms open, substantially as described.

2. In a trap, the picket-pin P, the outwardly-curved main arms A, pivoted thereon and carrying jaws J at their free ends, and the supplemental arms T, pivoted to said main arms forward of said pin

409,592.

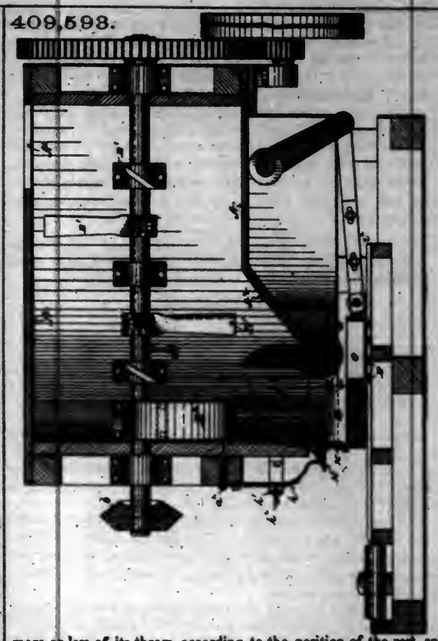
P and pivoted to each other at T, near their front ends, said supplemental arms carrying inwardly-curved jaws *j* at their free ends, in combination with springs for forcing said arms into normally-closed position, a bait-hook, and a latch connected to said bait-hook and adapted to hold said arms open, substantially as described.

3. In a trap, the picket-pin P, a frame carried thereby, and a curved guide G, supported at the rear end of said frame, in combination with a pair of main arms A, centrally pivoted at *a* upon said pin, curved outwardly at A' forward of said pin and carrying jaws J at their front ends, said arms extending rearwardly from said pin and carrying eyes I at their ends loosely engaging said guide, springs for forcing said arms into normally-closed position, a bait-hook, and a latch connected to said bait-hook and adapted to hold said arms open, substantially as specified.

4. In a trap, the picket-pin P, having a shoulder *p'* thereon, a frame mounted on said pin above said shoulder, and a curved guide G, supported at the rear end of said frame, in combination with a pair of main arms A, centrally pivoted at *a* upon said pin, curved outwardly at A' forward of said pin and carrying jaws J at their front ends, extending rearwardly in straight arms *a'* from said pin, and carrying eyes I at their rear ends loosely engaging said guide, springs S, having central coils O engaging said pin between said shoulder and frame, secured at their front ends to said curved arms A' and having loops S' at their rear ends loosely embracing said guide-rods G outside said eyes I, a bait-hook, and a latch connected to said bait-hook and adapted to hold said arms open, substantially as described.

5. In a trap, the picket-pin P, having the shoulder *p'*, the U-shaped frame U, journaled on said pin, with its lower arm *u* resting upon said shoulder and turned up at *u'* at its rear end, the bait-hook B, pivoted at its rear end to said turned-up end *u'* and extending forwardly therefrom, the latch L, pivoted to the center of said bait-hook, and the spring *s*, for pressing said latch into operative position, in combination with spring-operated arms carrying jaws and pivoted on said pin P, said latch being adapted to engage said arms to hold them in open position, substantially as described.

6. In a trap, the picket-pin P, having the shoulder *p'*, the U-shaped frame U, journaled on said pin, with its lower arm *u* resting upon said shoulder and turned up at *u'* at its rear end, the bait-hook B, pivoted at its rear end to said turned-up end *u'*, the latch L, pivoted to the center of said bait-hook, and the spring *s*, for pressing said latch into operative position, in combination with the spring-operated main arms A, pivoted upon said pin, curved outwardly at A' and carrying main jaws J at their front ends, and the tongs T, pivoted to said curved arms A' at their rear ends and to each other at T, and carrying supplemental jaws *j* at their front ends, said tongs occupying an approximately-transverse line across the trap when it is open and adapted to be engaged by said latch to hold it set, substantially as and for the purpose hereinbefore described.

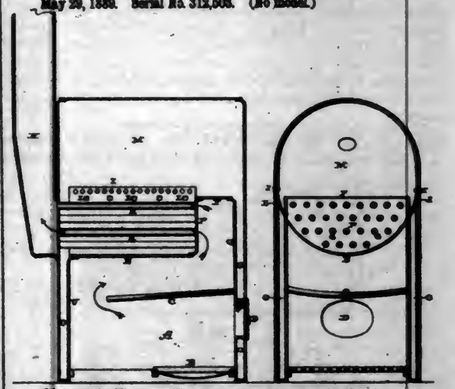


409,593. BRICK-MACHINE. THOMAS KIRK and CHARLES H. HORTON, Wellington, Ohio, assignors to Bennett Brothers & Company, same place. Filed Feb. 26, 1889. Serial No. 301,456. (No model.)

Claim.—1. In a brick-machine, the combination, with compression-box and oscillating head operating in the compression-box, substantially as indicated, of toothed sector mounted on the trunnion or axial shaft of the oscillating head, a dog for operating the sector, a vibrating lever for operating the dog, and a movable rest or trip adapted to disengage the dog from the sector during a part or the whole of the throw, according to the position of the rest, substantially as set forth.

2. In a brick-machine, the combination, with compression-box and oscillating head operating therein, and toothed sector for operating the heads, substantially as indicated, of a vibrating lever bearing a dog for engaging such sector in advancing the latter, such vibrating lever having a lug or projecting member for engaging the sector in reversing the latter, substantially as set forth.

3. In a brick-machine, the combination, with oscillating head, toothed sector rigidly mounted on the axial shaft of the oscillating head, and a vibrating lever and oscillating rest or trip journaled on such shaft, the lever having a dog for engaging the sector, the rest having an incline for disengaging the dog from the sector, of a hand-lever for shifting the rest, whereby the dog is held disengaged from the sector

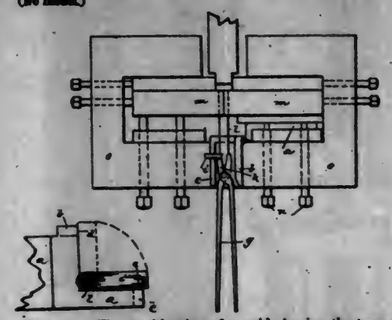


409,593.

more or less of its throw, according to the position of the rest, substantially as set forth.

4. In a brick-machine, the combination, with compression-box, oscillating head, toothed sector, vibrating lever, and dog, substantially as indicated, of toggle for operating the vibrating lever, and a pitman for operating the toggle, such pitman having lost motion, whereby the oscillating head is operated intermittently, substantially as set forth.

409,594. STEAM-BOILER. FLORENS KITTEL, Ferdinand, Ind. Filed May 29, 1888. Serial No. 312,603. (No model.)



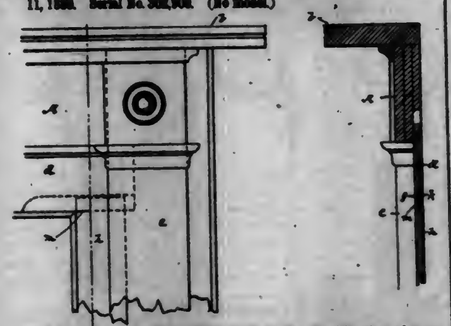
Claim.—1. The combination of the fire-box with a fire-shield formed of a plate or water-bars, and which is placed in the box above the door, so as to cause the products of combustion to first move toward the front end of the boiler, then backward under the crown-sheet, and then through the flues to the front of the boiler, substantially as shown.

2. In a boiler, the combination of the crown-sheet having its ends secured directly to the shell of the boiler and provided with a series of holes for the passage of the water to and from the water-leg, substantially as shown.

3. In a boiler, the combination of the crown-sheet having its ends secured directly to the shell of the boiler, the front wall U, having its upper edge secured to the front edge of the crown-sheet, the flue-head F, the flues, and the crown-sheet F, substantially as described.

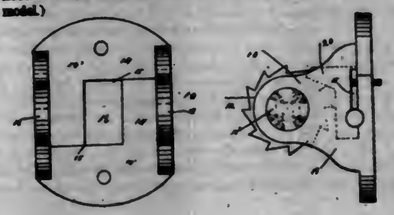
4. In a boiler, the combination of the fire-box, the crown-sheet E, having its ends secured directly to the shell of the boiler and provided with perforations I, the front and side sheets of the water-leg secured at their upper edges to the crown-sheet, the flue-head, the flues, the crown-sheet F, and the fire-shield C, substantially as specified.

409,595. TONGS AND GUIDE FOR BOLT-HEADING MACHINES. JOHN H. ALLEN, Pittsburg, Pa. Filed Apr. 6, 1889. Serial No. 306,332. (No model.)



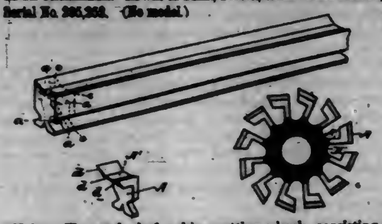
Claim.—1. The combination of a guide having the two arms or prongs arranged in a position relatively at right angles to each other, and a bolt-gripping tool having a device which is adapted to alternately strike the arms or prongs when the gripping-tool is turned axially in the guide, and thus limit the play or movement of said tool, substantially as and for the purpose described.

2. The combination of a fixed guide having the angularly-arranged arms, and a bolt-gripping tool provided with a projection, which is adapted to limit the axial movement of the tool in the guide by alternately striking the arms thereof, substantially as and for the purpose described.



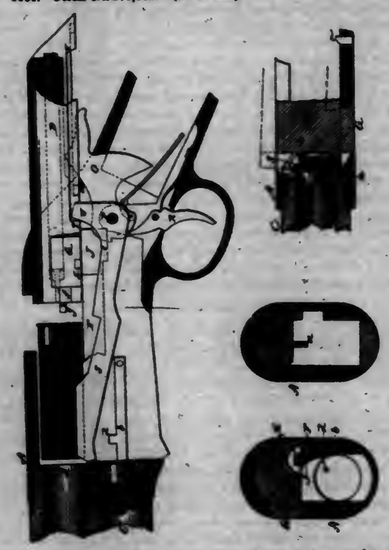
3. The combination of a fixed guide-strip *a*, having the two projecting arms or tangs, which are arranged in different vertical planes at right angles to each other, and a bolt-gripping tool provided with a right-angled projection *i*, combined and adapted for service substantially as described, for the purpose set forth.

409,596. MANTEL. WILLIAM ANDERSON, Bolton, Pa. Filed Mar. 11, 1889. Serial No. 302,908. (No model.)



Claim.—In a mantel or chimney piece, the combination of a vertically-movable top portion *d*, provided with a rabbet *g*, extending inwardly from each end at the lower edge thereof, and the side pieces *h*, having projections *h'*, which overlap the rabbet *g*, and means for securing the side pieces *h* to the top portion *d*, for the purpose described.

409,597. WIRE-STRETCHER. VERDEN ARNOLD and WILLIAM L. YERDEN, Marshall, Mich., assignors of one-half to ANDREW ENDICOTT and ARTHUR CASE, same place. Filed June 3, 1889. Serial No. 313,543. (No model.)

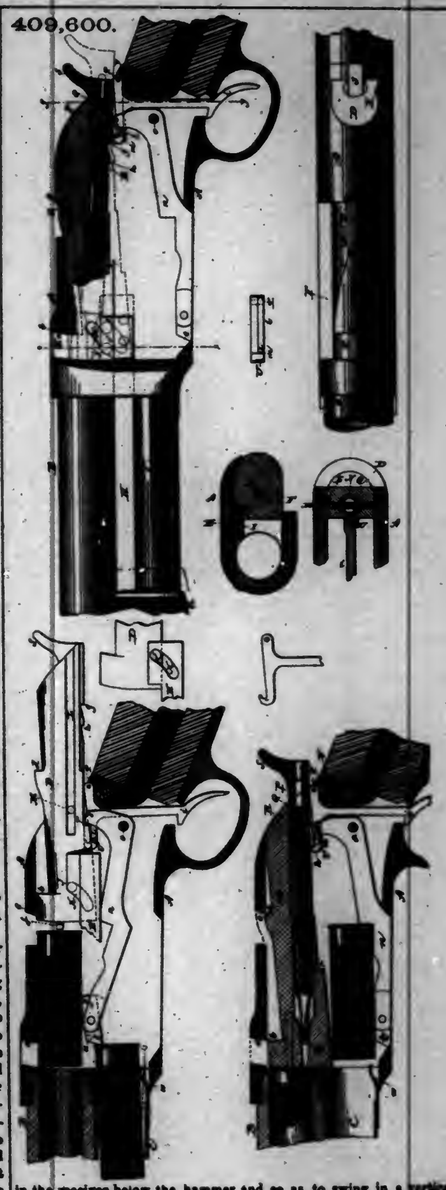


Claim.—A wire-stretcher consisting of a supporting-bracket having a vertical slot 18, and made of two parts or members, formed with the lawardly-extending bases which lap each other on irregular lines, for the purpose described, a winding-drum journaled in aligned bearings on said members or sections of the bracket, and provided with a ratchet and a sliding pawl, having a lateral guide-pin which operates in the slot of the bracket, substantially as and for the purpose described.

409,598. MANUFACTURE OF CUTTING-WHEELS FOR SOLID-RIDGE TRIMMERS. EDWIN R. BEAN, Boston, Mass. Filed Dec. 31, 1888. Serial No. 295,262. (No model.)

Claim.—The method of making cutting-wheels, consisting of the following steps: first, forming a steel bar, as shown in Fig. 2; second, milling and cutting it into cutters A A'; third, embodying the cutters in a molded hub H, and, fourth, compressing the molded hub, all substantially as described, and for the purpose set forth.

409,599. MAGAZINE FIRE-ARM. JOHN M. BROWNING and MATTHEW S. BROWNING, Ogden, Utah. Filed May 21, 1888. Renewed Jan. 8, 1889. Serial No. 295,806. (No model.)



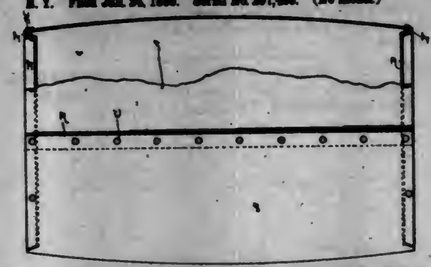
Claim.—1. In a fire-arm in which the barrel opens into the receiver at the rear, the combination of a breech-piece arranged in the receiver in longitudinal line with the barrel and so as to move longitudinally backward and forward in opening and closing, a handle beneath the barrel, forward of the receiver, with a bar extending therefrom into the receiver beneath the breech-piece, the said breech-piece upon its under side at the forward end constructed with a diagonal groove, and the said bar provided with a corresponding stud entering said groove, the said breech-piece supported upon a pivot stationary in the receiver at its rear, the breech-piece constructed with a lateral projection at its forward end upon one side, and the receiver with a corresponding shoulder with which said projection is adapted to engage when the breech-piece is closed, the said receiver constructed with its side opposite said shoulder open, substantially as described, and whereby under the first part of the rear movement of said handle the breech-piece receives a lateral movement to disengage it from said shoulder, then by the continued rear movement of said handle receives its opening movement, and on the forward movement of the said handle the breech-piece receives its closing movement, and under the last part of the forward movement of said handle the breech-piece

is returned laterally to engage the breech-piece with the said shoulder in the receiver, substantially as described.

2. In a fire-arm having the barrel open into the receiver at the rear the breech-piece D, arranged in the receiver and so as to move backward and forward in longitudinal line with the barrel, the breech-piece constructed with a lateral projection G upon one side at its forward end, a stationary stud L in the receiver below the breech-piece at the rear, the breech-piece constructed with a groove M upon its under side corresponding to said stud L, the said stud L forming a pivot upon which the breech-piece may swing laterally when in its closed position, the receiver constructed with the shoulder H, corresponding to the said projection G on the breech-piece when the breech-piece is in the closed position, a handle E, beneath the barrel and movable longitudinally toward and from the receiver, a bar F, extending from said handle into the receiver below the breech-piece, the breech-piece constructed with a diagonal groove I upon its under side at its forward end, the said bar provided with an upwardly-projecting stud K working in said groove I, the receiver open upon its side opposite the said projection G, a block *f*, arranged in a transverse groove in the forward end of the breech-piece, but the said block held against transverse movement, an extractor-hook on said block adapted to engage the head of the cartridge when the breech-piece is closed, substantially as described.

3. In a fire-arm having the barrel open into the receiver at the rear, with a magazine below it opening also into the receiver at the rear, the combination therewith of the breech-piece D, arranged to move longitudinally toward and from the rear end of the barrel, a stationary pivot in the receiver below the breech-piece at the rear, the breech-piece constructed with a longitudinal groove corresponding to said stud, said stud serving as a pivot upon which said breech-piece may swing laterally when in its closed position, the breech-piece constructed with a lateral projection upon one side and the receiver with a corresponding shoulder on the same side with which said projection on the breech-piece is adapted to engage when the breech-piece is in its closed position, the receiver open upon the side opposite the said projection on the breech-piece, the handle beneath the barrel and arranged to move longitudinally toward and from the receiver, a bar F, extending from the said handle into the receiver beneath the breech-piece, the breech-piece constructed with a diagonal groove I, and the bar provided with a corresponding stud K, adapted to work in said diagonal groove I and so as to impart a lateral movement to said breech-piece before the opening movement of the breech-piece commences, and also a return of said lateral movement after the breech-piece closes to correspondingly disengage and engage the projection of the breech-piece with the shoulder in the receiver, a spring-stop *b* in the receiver below the said bar F, and a cam-like projection *c* on the said bar adapted to engage a corresponding projection *d* on the said spring-stop when the breech-piece is in the closed position, substantially as and for the purpose described.

409,600.

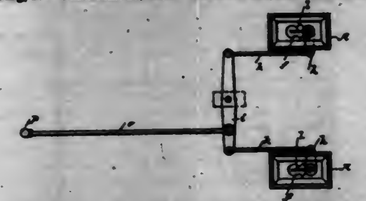


409,600. MAGAZINE FIRE-ARM. JOHN M. BROWNING and MATTHEW S. BROWNING, Ogden, Utah. Filed May 21, 1883. Renewed Jan. 8, 1889. Serial No. 296,807. (No model.)

Claim.—1. In a fire-arm having the barrel open into the receiver at the rear, the combination therewith of a longitudinally-reciprocating breech-piece constructed with one or more upwardly-projecting shoulders and the receiver with one or more corresponding shoulders, with which said shoulder on the breech-piece will engage when the breech-piece is in the fully-closed position, the said breech-piece also hung at its rear end, whereby a vertical swinging movement may be imparted to said breech-piece, a handle beneath the barrel forward of the receiver, with a bar extending therefrom into the receiver, the rear end of the bar within the receiver, and the breech-piece constructed the one with a cam-shaped groove and the other with corresponding stud, substantially as described, and whereby under the first part of the rear movement of said handle and bar the forward end of the said breech-piece will be dropped, and then under the last part of the forward movement of said bar the forward end of the breech-piece will be raised to respectively engage and disengage the shoulder of the breech-piece and receiver.

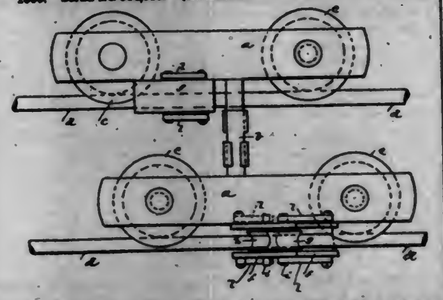
2. In a fire-arm having a barrel open into the receiver at the rear, the combination therewith of a longitudinally-reciprocating breech-piece constructed with one or more upwardly-projecting shoulders, and the receiver with one or more corresponding shoulders, with which the said shoulder on the breech-piece will engage when the breech-piece is in the fully-closed position, the said breech-piece also hung at its rear end, whereby a vertical swinging movement may be imparted to said breech-piece, a handle beneath the barrel forward of the receiver, with a bar extending therefrom into the receiver, the rear end of the bar within the receiver, and the breech-piece constructed the one with a cam-shaped groove and the other with a corresponding stud, a hammer extending longitudinally through the breech-piece provided with one or more engaging-notches, a sear hung in the receiver below the hammer and so as to swing in a vertical plane, the nose of the said sear adapted to engage a corresponding notch on the hammer as the breech-piece approaches its closed position, and a trigger, substantially as described.

3. In a fire-arm having the barrel open into the receiver at the rear, the combination therewith of a longitudinally-reciprocating breech-piece constructed with one or more upwardly-projecting shoulders, and the receiver with one or more corresponding shoulders, with which said shoulder on the breech-piece will engage when the breech-piece is in the fully-closed position, the said breech-piece also hung at its rear end, whereby a vertically-swinging movement may be imparted to said breech-piece, a handle beneath the barrel forward of the receiver, with a bar extending therefrom into the receiver, the rear end of the bar within the receiver, and the breech-piece constructed the one with a cam-shaped groove and the other with corresponding stud, a hammer extending longitudinally through the breech-piece provided with one or more engaging-notches, a sear U, hung in the receiver and so as to swing in a vertical plane, and adapted to engage a corresponding notch on the hammer as the breech-piece is moved forward, a trigger hung to swing in a plane parallel with the sear, the said trigger and sear constructed with corresponding shoulders *l m*, adapted to engage each other but leave the sear free for downward movement independent of the trigger, substantially as and for the purpose described.



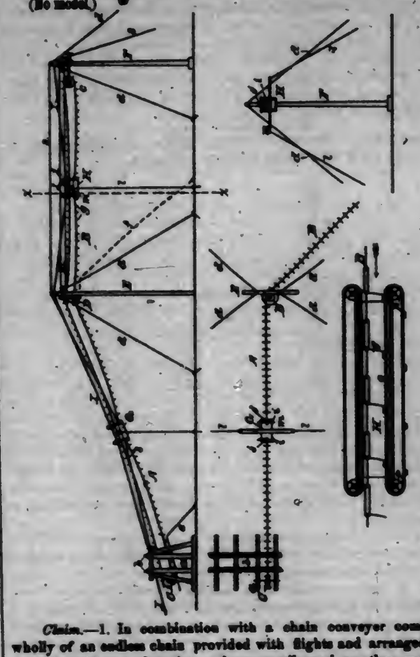
409,601. METALLIC BARREL. CORNELIUS J. CURTIS, High Falls, N. Y. Filed Jan. 24, 1889. Serial No. 297,689. (No model.)

Claim.—1. As a new article of manufacture, the metallic barrel having its side formed of a single sheet of metal with its edges overlapped and riveted together, and the metallic heads having the outturned flanges riveted within the ends of the barrel, the rivets employed to secure one of said heads being split and provided with ears adapted to be spread apart or closed together, whereby said head is rendered detachable from the barrel, substantially as described.



2. As a new article of manufacture, the metallic barrel having the heads provided with the outturned outwardly-flared flanges F, fitting in the ends of the barrel and secured thereto, whereby internal pressure, by forcing out the centers of the heads, will expand the flanges and compress the same more tightly in the ends of the barrel, substantially as described.

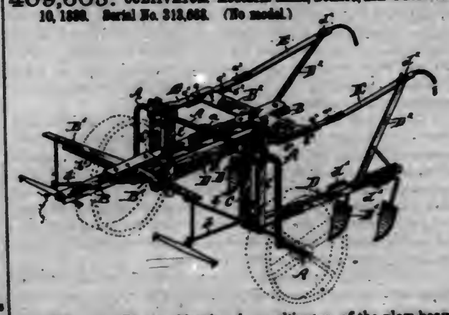
409,602. SAND-BOX FOR RAILWAY-CARS. ELI W. DAVIS, Pittsburg, Pa. Filed Mar. 11, 1889. Serial No. 302,868. (No model.)



Claim.—In an apparatus for the purpose described, the combination consisting of the two bins A, each provided with a pipe leading from its base, the valves *f*, for covering the openings *e*, the cranks k, attached to the said valves *f*, the lever i and connecting-rods *k*, and the hand-lever *p* and connecting-rod *o*, and the upwardly-extending flange *l*, attached to the valves *f*, for the purpose of agitating the sand in the bins A, substantially as and for the purpose described.

409,608. TROLLEY FOR ELECTRIC RAILWAYS. JOHN G. DENISON, ROBERT DENISON, and PETER SNYDER, Pittsburg, Pa. Filed Mar. 28, 1889. Serial No. 304,983. (No model.)

Claim.—The herein-described trolley, consisting of the two frames *a*, loosely connected together by the sliding brace *b*, the grooved sheaves *c*, mounted on the said frames *a*, and each frame *a* provided with two small rollers *g h*, operating on each side of the wire, each roller *g h* capable of a limited movement toward or away from the conductors *d*, and a spring *l*, operating on each of the bearings *i* of the said rollers *g h* to keep the same in contact with the conductors, substantially as and for the purpose described.

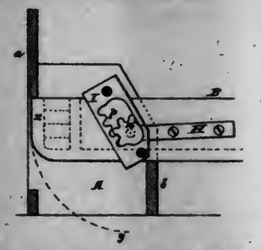


409,604. CONVEYER FOR FILING COAL. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Kensington, Conn. Filed Dec. 17, 1887. Renewed Mar. 30, 1889. Serial No. 304,951. (No model.)

Claim.—1. In combination with a chain conveyer composed wholly of an endless chain provided with flights and arranged and operating either to form into a heap or pile coal or other material supplied to the lower end or portion of said chain conveyer or to remove the pile of material, an adjustable chain-supporting device arranged in connection with the lower run of the flighted chain and adapted, as specified, to support the gravity of the chain and its flights at various points intermediate of the points at which the end portions of the conveyer-chain are permanently supported by the usual sprocket-wheels, all in substantially the manner and for the purpose hereinbefore set forth.

2. The combination, with a chain and its flights, of a tubular or centrally-open adjustable supporting or sustaining device arranged in connection with the lower run or portion of said flighted chain, and provided, as specified, with suitable means for facilitating the travel through it and along over the upper surface of its bottom or lower side of the attached flights of the chain without undue friction, all as hereinbefore fully set forth.

409,605. CULTIVATOR. AUGUSTUS HILLS, Bedford, Ind. Filed June 10, 1889. Serial No. 313,663. (No model.)



Claim.—1. The combination, in a cultivator, of the plow-beams, hangers and arms for said plow-beams, and jointed levers connected

thereto at the front and rear, whereby by moving said levers both ends of said plow-beams are moved simultaneously, substantially as set forth.

2. The combination, in a cultivator, of the plow-beams, arms extending upwardly from said plow-beams, hangers whereby said plow-beams are connected to the axle or shaft, and jointed levers pivoted to the frame-work and connected at the forward and rear ends, respectively, with said hangers and said upwardly-projecting arms, substantially as described, and for the purpose as specified.

3. The combination, in a cultivator, of the hanger C, suspended to the axle or a shaft, a plow-beam D, connected to said hanger and having an upwardly-projecting arm at its other end, and a jointed lever E, pivoted to the frame-work and attached to said hanger and said upwardly-projecting arm, said lever being formed in two parts, which engage with each other by means of a projection and a slot, substantially as and for the purpose set forth.

409,606. FOLDING BEDSTEAD. HENRY S. HALE, Philadelphia, Pa. Filed Feb. 6, 1880. Serial No. 2,210. (No model.)

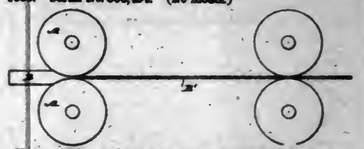
Claim.—1. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon each side with a series of independent fulcra and the other is provided upon each side with a series of stationary fulcra-seats, the fulcra and fulcra-seats being adapted to engage successively with each other, substantially as set forth.

2. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon each side with a series of independent fulcra and the other is provided upon each side with a series of stationary fulcra-seats, the fulcra and fulcra-seats being adapted to engage successively with each other, and being arranged at different heights from the lower side of the bed, substantially as set forth.

3. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon each side with a series of independent fulcra and the other is provided upon each side with a series of stationary fulcra-seats, the fulcra and fulcra-seats being adapted to engage successively with each other, the rearmost fulcra and fulcra-seats being higher than those at the front, whereby, when the bed is folded up, the swinging frame is lifted bodily, substantially as set forth.

4. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon each side with a series of independent fulcra and the other is provided upon each side with a series of stationary fulcra-seats, the fulcra and fulcra-seats being adapted to engage successively with each other, said fulcra and fulcra-seats being arranged at different distances from the rear of the bed, substantially as set forth.

5. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon each side with a series of independent fulcra and the other is provided upon each side with a series of stationary fulcra-seats, the fulcra and fulcra-seats being adapted to engage successively with each other, said fulcra and fulcra-seats being so arranged as to support the folding frame upon those nearest the rear when the folded part is vertical, whereby, when the bed is folded up, the folding frame is moved rearwardly relatively to the supporting-frame, substantially as set forth.



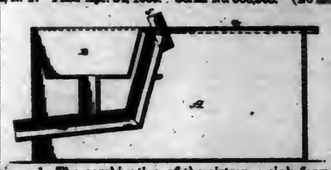
6. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon each side with a series of independent fulcra and the other is provided upon each side with a series of stationary fulcra-seats, the fulcra and fulcra-seats being adapted to engage successively with each other, the rearmost fulcra and fulcra-seats being higher than those at the front, the arrangement of parts being substantially as described, whereby, when the bed is folded up, the folding frame is moved bodily rearward and upward relatively to the supporting-frame, substantially as set forth.

7. In a bed, the combination of a supporting-frame and a folding frame, of which one is provided upon either side with a series of fulcra and the other is provided with a series of stationarily-attached fulcra-seats arranged on lines extending upward and backward, the folding frame, when horizontal, being supported upon the lower and forward fulcra and fulcra-seats, and being successively supported upon those above and in rear as it is folded up, substantially as set forth.

8. In a bed, the combination of a supporting-frame and a folding frame, the counterbalancing-weight attached to the inner end of the folding frame, and the fulcra upon opposite sides of the bed interposed between the folding frame and the supporting-frame and arranged substantially as described, whereby, when the folding frame is swung into a vertical position, the counterbalancing-weight lies below the fulcra and partly in front thereof, substantially as described.

9. In a bed, shifting fulcra consisting of two cogged racks, in combination with the upright frame and folding frame, substantially as set forth.

409,607. METHOD OF MAKING INCANDESCING ELEMENTS FOR GAS-BURNERS. CHARLES B. HARRIS, New York, N. Y. Filed Apr. 24, 1889. Serial No. 308,454. (No model.)



Claim.—The method of making incandescing elements for gas-burners, which consists in preparing a composed of the refractory earth or material and some vehicle—such, for instance, as glue—then rolling it into a thin sheet, then cutting or punching from the sheet an element of the desired design, and then burning the element to burn out the material mixed with the refractory earth or material, substantially as set forth.

409,608. PINE FIBER. WILLIAM LATHER, Wilmington, N. C. Filed May 3, 1889. Serial No. 309,453. (No specimens.)

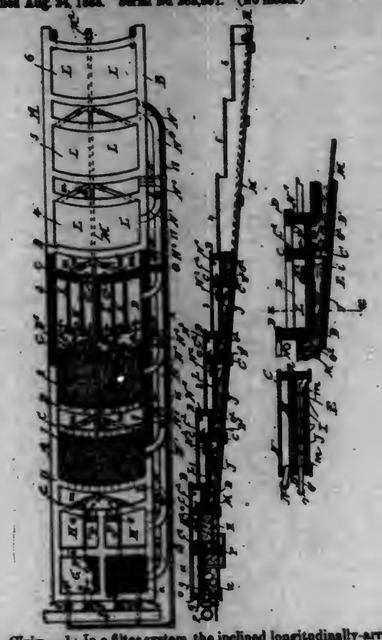
Claim.—As a new manufacture, the herein-described product, termed by me "pine fiber," composed of long fine-twisted filaments having serrated or rough edges or surfaces intertwined and clinging each other, dry and practically devoid of moisture, and sufficiently strong, soft, and pliable to withstand the unavoidable and necessary strain incident to its manipulation in spinning and weaving, as hereinbefore set forth.

409,609. WATER TANK OR CISTERN. ROBERT H. MASON, Woodhull, N. Y. Filed Apr. 24, 1889. Serial No. 308,365. (No model.)

Claim.—1. The combination of the cistern, a sink formed in one end thereof, an outlet-pipe for the tank, and an outlet-pipe for the sink, the two pipes being connected together, substantially as described.

2. The combination of the tank or cistern, the movable cover provided with a door, the sink placed in one end of the tank, an overflow-pipe leading from the tank, and an outlet-pipe extending from the sink, the two pipes being connected together, substantially as specified.

409,610. VEHICLE-WHEEL. ASA R. MILLER, Atlanta, Ga. Filed Dec. 26, 1886. Serial No. 204,870. (No model.)

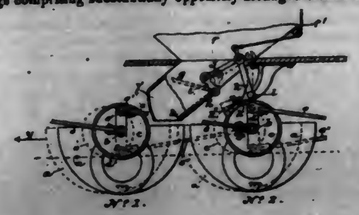


Claim.—1. In a vehicle-wheel hub, the combination of spokes dovetailed in cross-section and having notches *b* with sloping inner sides, caps G and H, adapted to enter said notches and press with a corresponding sloping face against the inner side of the notches *b*, and

means, as shown and described, for clamping said caps against the spokes.

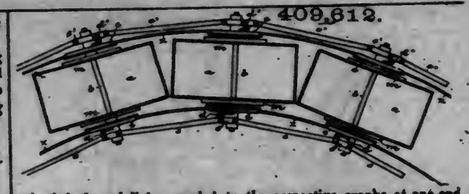
2. In a vehicle-wheel, the combination of the spokes B, having notches *b* placed alternately on each side of the wheel, the caps G and H, having lugs *g* and *h* arranged to enter each alternate spoke on the opposite side, the axle-box C, and nut D, all arranged and operating as shown and described.

409,611. FILTER SYSTEM. JOHN J. MURPHY, New York, N. Y. Filed Aug. 24, 1888. Serial No. 283,691. (No model.)



Claim.—1. In a filter system, the inclined longitudinally-arranged tanks having filter-beds above their floors, and the forward wall of each tank provided with discharge-openings above the filter-beds, in combination with an outer longitudinal pipe N, a series of branch pipes N', connecting said pipe with the respective tanks below the discharge-openings in said forward walls, the discharge-pipe and the drain, the drain-pipe O, and the branch pipes O', connecting said pipes O with the respective tanks below the filter-beds, substantially as described.

2. The combination, with the inclined tanks, the longitudinally-arranged outer pipes N and O and their branch pipes connecting with the tanks, of the pipe M, extending longitudinally below the tanks, and the branch pipes *m*, connecting with said tanks, the whole arranged to operate substantially as specified.



409,612. CONVEYER. GEORGE W. MCCASLIN, New York, assignor to the McCaslin Machine Company, West New Brighton, N. Y. Filed July 27, 1888. Renewed July 26, 1889. Serial No. 318,727. (No model.)

Claim.—1. A conveyer comprising a series of buckets mounted on track-wheels and connected together by rigid-link compensating couplings—that is, couplings which expand at the outside of the curve when the conveyer is moving about a lateral curve and contract proportionately at the inside of the curve—as set forth.

2. A conveyer comprising buckets mounted on track-wheels and connected together in endless series by compensating couplings, said couplings comprising substantially oppositely-arranged cranks on the

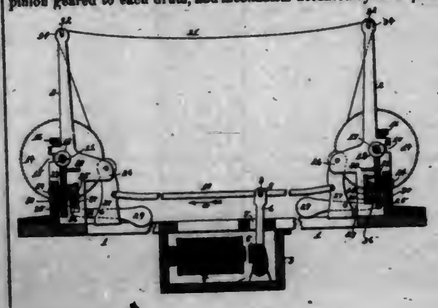
409,612.

wheel-shaft, and links coupled to the respective cranks at one end and to the adjacent axle at their other ends, substantially as set forth.

3. A conveyer comprising gravity-buckets, as *a a*, arranged in endless series, the shafts *b b*, on which said buckets are hung, the wheels *c c* on said shafts, the cranks *d* and $d^{\times}$ on the opposite ends of said shafts, the link *e*, coupled at one end to crank *d* and at the other end to the adjacent axle, and the link $e^{\times}$, coupled at one end to crank $d^{\times}$ and at the other end to the axle next adjacent, whereby, when the conveyer is moved around a curve in the track, the shafts or axles will assume their proper radial positions, as set forth.

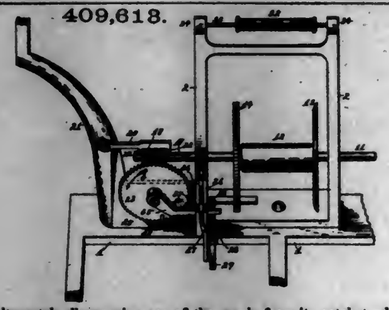
4. The combination, with an elevated magazine having an outlet at its lower part for discharging its contents and a positively-closing cut-off controlling said outlet, of a conveyer consisting of an endless series of conveyer elements moving under said cut-off continuously in one direction, a part of said cut-off being in the path of a part of each conveyer element, and said cut-off being closed thereby as each element passes, whereby the material from the magazine is prevented from falling between the conveyer elements.

5. The combination, with a conveyer consisting of an endless series of conveyer elements, each consisting of a bucket, its supporting-wheels, and wheel-shaft, of a magazine arranged above said conveyer, a chute for the material, a cut-off to check the flow from said chute, and an operating-arm connected with said cut-off and arranged in the path of some part of the conveyer elements and adapted to be actuated by each element in succession, whereby the flow from the chute is checked intermittently and the charge measured, as set forth.



6. A conveyer comprising a series of buckets mounted on track-wheels and connected together by couplings formed of rigid links arranged in pairs at the sides of the buckets and connected dependently by a cross-shaft, and cranks, whereby, when the conveyer moves about a lateral curve the contraction at one side is compensated by expansion on the other side, as set forth.

7. The combination, with the conveyer comprising an endless series of coupled elements, as described, of the hopper or magazine and its chute, the valve *h*, hinged in the chute, the arm *i* on the hinging-shaft of said valve, the bell-crank *k*, and the link *j*, coupling the arm *i* with the upper arm of said bell-crank, the lower arm *k'* of said crank being arranged in the path of the wheels of the conveyer elements, substantially as set forth.

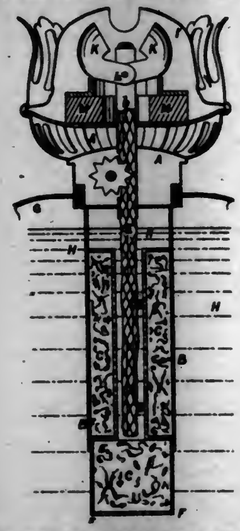


409,618. INK-RIBBON MECHANISM FOR TYPE-WRITING MACHINES. JAMES F. MCLAUGHLIN, Philadelphia, Pa. Filed Jan. 26, 1889. Serial No. 297,641. (No model.)

Claim.—1. An ink-ribbon-feed mechanism for type-writers, consisting, essentially, of two ribbon-drums, pawls and ratchets for actuating the same by the letter-spacing mechanism of the machine, a pinion geared to each drum having an arm hung to its shaft adapted to bear upon the pawl to disengage the same from its ratchet, and a pin carried by each pinion for actuating one of the arms to release the pawl into engagement with its ratchet while the other is being locked out of engagement, substantially as described.

2. In an ink-ribbon-feed mechanism, the combination of two ribbon-drums each provided with a ratchet and a pawl for actuating the same by the letter-spacing mechanism of the machine, with a pinion geared to each drum, and mechanism actuated by each pinion

409,618.

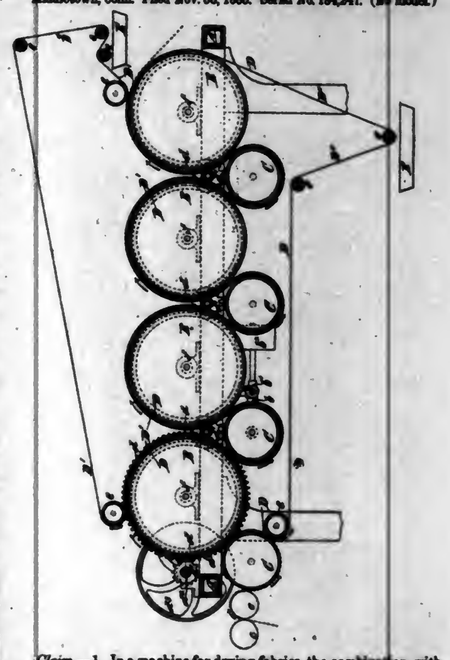


for alternately disengaging one of the pawls from its ratchet while the other is being engaged, substantially as described.

3. In an ink-ribbon-feed mechanism, the combination of two ribbon-drums between which the ribbon extends, and two pawls and ratchets for rotating the drums by the letter-spacing mechanism of the machine, with a pivoted arm for each pawl held by friction in any position and adapted to establish and break operative connection between the pawl and ratchet, and a pinion moved by each drum for alternately actuating one of these arms to move in one position while the other is being moved to the other position, substantially as described.

4. In an ink-ribbon mechanism for type-writers, the combination of two ribbon-drums and a pawl and ratchet for each drum for actuating the same step by step by the letter-spacing mechanism of the machine, with a pivoted arm extending over each pawl, adapted to lock the latter out of engagement with its ratchet and to release the same into operative relation to said ratchet, a spring for holding the arm in either of its two positions, and mechanism actuated by each ribbon-drum for shifting the pivoted arms alternately, substantially as described.

5. In an ink-ribbon mechanism for type-writers, the combination of two rotary ribbon-drums adapted to move longitudinally in their bearings, and automatic mechanism for feeding the ribbon from one drum to the other, with mechanism for reversing the feed automatically, and a worm locked against lateral movement and connected by tongue and groove with the shaft of each drum for actuating the reversing mechanism, whereby the ink-ribbon is shifted laterally at will without disturbing its automatic feed and reversal, substantially as described.



409,614. LAMP-BURNER. WILLIAM HOYLEY, Peckham, County of Surrey, England. Filed Feb. 20, 1888. Serial No. 264,692. (No model.) Patented in England June 16, 1887, No. 8,696; in Germany Jan. 15, 1888, No. 44,443; in Belgium Jan. 16, 1888, No. 80,266, and in India July 4, 1888, No. 56.

Claim.—1. The combination, with the burner of an oil-lamp, of a vertically-extended wick-tube of porous refractory material, provided with an extended axial passage adapted to receive a wick and laterally feed oil thereto throughout the length of the passage, and an outer incasing metal tube, substantially as described.

2. The combination, with the burner of an oil-lamp, of a vertically-extended wick-tube of porous refractory material, provided centrally with an extended axial passage adapted to receive a wick and laterally feed oil thereto throughout the length of the passage, and an outer incasing metal tube having a plug of porous material in its lower end, substantially as described.

409,615. MACHINE FOR DRYING FABRICS. ISAAC R. PALMER, Middletown, Conn. Filed Nov. 30, 1885. Serial No. 184,247. (No model.)

Claim.—1. In a machine for drying fabrics, the combination, with two series of drying-cylinders, arranged one series in advance of the other, of gearing whereby the cylinders of the second series may be driven at a different speed from those of the first series, and the said difference of speed may be varied at pleasure, substantially as herein described.

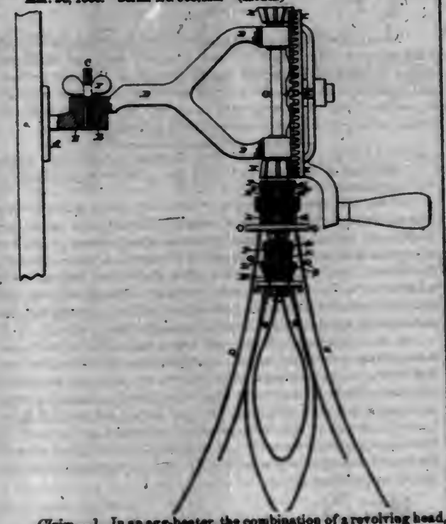
2. The combination, with two series of drying-cylinders, arranged one series in front of the other, and pinions and shafts through which motion is transmitted to the cylinders of the two series, of cone-pulleys reversely set on said shafts, and a belt connecting them, whereby the two series of cylinders may be driven at different velocities, and the difference of their velocities may be varied at pleasure, substantially as herein described.

3. The combination, with a drying-cylinder, of an endless apron, of wire-gauze or non-absorbent reticulated or foraminated material, to pass with the fabric around the cylinder, and supports whereby the apron is caused to pass between the fabric and the surface of the drying-cylinder, substantially as herein described.

4. The combination, with a drying-cylinder, of an endless apron to pass with the fabric around the cylinder, supports whereby the apron will have an upward and downward movement in its return, and brushes on opposite sides of the returning portion of the apron for cleaning it, substantially as herein described.

5. The combination, with drying-cylinders, of two endless aprons, of wire-gauze or non-absorbent reticulated material, to pass with the fabric around the cylinders, and supports whereby the aprons are caused to pass, one of them between the fabric and cylinders and the other outside the fabric, and whereby said aprons are guided in the return, one above the cylinders and the other below the cylinders, substantially as herein described.

6. The combination, with drying-cylinders, of transferring-cylinders arranged between the drying-cylinders, and means, substantially as herein described, of holding the said transferring-cylinders against the drying-cylinders, whereby the fabric is prevented from drawing in laterally in passing from one to another of the drying-cylinders, substantially as herein described.



7. The combination, with drying-cylinders, of transferring-cylinders arranged between the drying-cylinders, and balancing devices applied to the transferring-cylinders, whereby they are held toward the drying-cylinders, to prevent the fabric from drawing in laterally in passing from one to another of the cylinders, substantially as herein described.

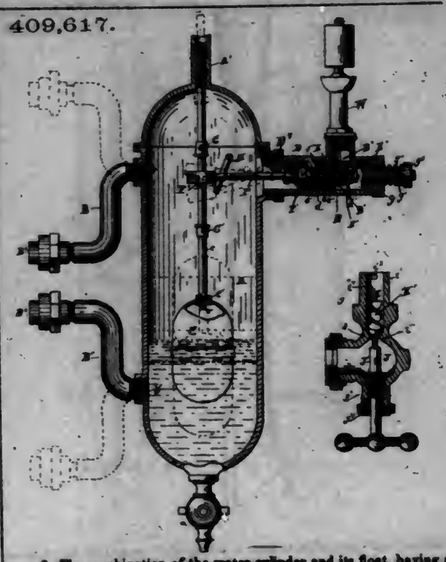
8. The combination, with main drying-cylinders, of a hollow steam-heated transferring-cylinder arranged between the drying-cylinders, and means, substantially as herein described, of holding the said transferring-cylinders toward the drying-cylinders, to prevent the fabric from drawing in laterally as it passes from one to another of the cylinders, substantially as herein described.

9. The combination, with drying-cylinders, of a transferring-cylinder consisting of a cylindric spreader, and pressure devices for holding the transferring-cylinder against the drying-cylinders, said transferring-cylinder being arranged between the drying-cylinders, whereby the fabric will have a spreading action exerted upon it, and it is prevented from drawing in laterally in passing from one to another of the cylinders, substantially as specified.

10. The combination, with main drying-cylinders, of transferring-cylinders arranged between them, pressure devices for holding the transferring-cylinders against the drying-cylinders, and webs or jackets, whereby the cylinders when pressed one against the other are prevented from having a calendering action on the fabric, substantially as specified.

409,616. EGG-BEATER. JOHN RICHARDSON, New York, N. Y. Filed Mar. 23, 1888. Serial No. 268,122. (Model.)

Claim.—1. In an egg-beater, the combination of a revolving head, provided with a slotted flange at its lower end, with the beater-wires which are attached to the head and passed through the slots, substantially as shown.



2. The combination of the revolving head provided with a slotted flange and longitudinal grooves, the beater-wires located in the grooves and passed through the slots and having their upper ends secured to the head, and an endwise-moving collar placed upon the head outside of the wires for limiting the outer movement of the wires, substantially as described.

3. In an egg-beater, the combination of the frame A, rigidly secured to a support having a socket in its outer end and provided with a screw-threaded rod C, a thumb-nut thereon, and the arm D, having a tenon E at its inner end and journals at its outer end, with the revolving head carrying wires, whereby the beater can be moved around at any desired angle, substantially as specified.

409,617. STEAM-BOILER ATTACHMENT. LEVI F. SMITH, Philadelphia, Pa. Filed Nov. 5, 1888. Serial No. 289,908. (No model.)

Claim.—1. The combination of the water-cylinder and the float and its rod therein, with the valve-casing attached to said column, having a conical valve-seat, a conical spring-controlled valve and its stem therein, and the rocking stem in said casing and connected to said valve and actuated by stops on the float-rod, substantially as and for the purpose described.

409,617.

2. The combination of the water-cylinder and its float, having a rod provided with adjustable stops, with the valve-casing having an annular partition, a cone-shaped valve-seat, and a spring surrounding the same, the conical valve controlled by said spring, and the rocking valve fitted against the annular partition and connected to said conical valve and having a rearwardly-extending stem engaging the float-rod stops, substantially as described.

3. The combination of the casing D, having an interior conical valve-seat and cone d', a spring-controlled valve E within cone d', with the screw-cap g, having a spring-controlled stem g', adapted to unseat valve E when pushed inward, substantially as described.

4. The combination of the casing D, having an annular partition d and the cone d', with the conical spring-controlled valve E, engaging a seat in cone d', and the rocking valve-stem F and its valve F', seated against partition d and engaging and operating valve E, and the float and its rod for operating stem F, all substantially as described.

5. The combination of the float and its rod provided with stops, with the valve-casing D, having an annular partition d and cone d', and the alarm-whistle on said casing, the cone-valve E, spring e', rock-valve F', and its stem, all substantially as described.

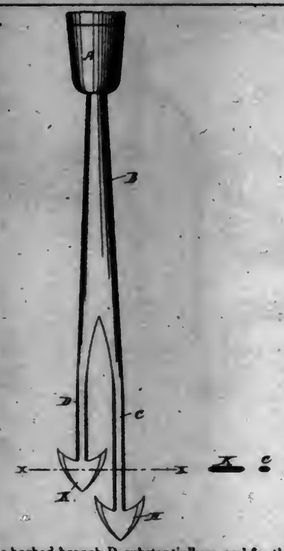
6. The combination of the water-cylinder and its S-joint connections, the float therein, the rod c, detachably secured to said float, and the adjustable stops thereon, with the valve-casing D, having the cone-valve E, rock-valve F', engaging valve E, rock-valve stem F, engaging rod c, and the alarm-whistle, all substantially as described.

7. The combination of the water-cylinder, the float and the vertical rod therein, and the rocking valve engaging said stem, with a rod adapted to engage the stem and prevent its rising when the boiler is to be pumped full of water, substantially as described.

8. The combination of the water-cylinder, the float and rod therein, and the stops on said rod, with the valve-casing D, having an annular partition d and cone d', the conical valve E, spring e' therefor, rocking valve F' and its stem, the whistle and the screw-cap g, and its push-stem g', all substantially as described.

409,618. PHOTOGRAPHIC DEVELOPING-BATH. CHARLES SPIRO, New York, N. Y. Filed Feb. 13, 1889. Serial No. 300,008. (No specimens.)

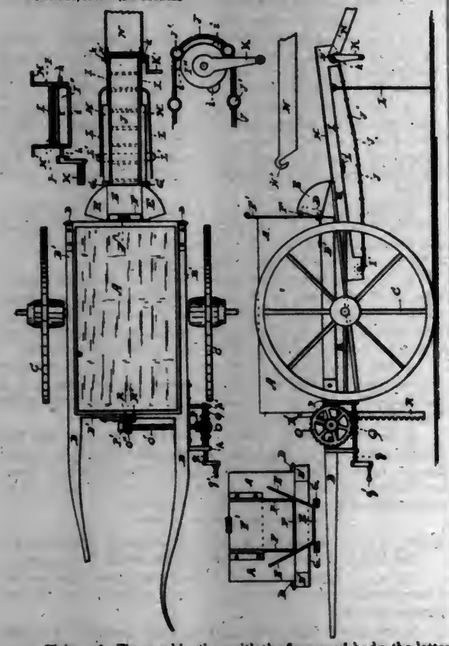
Claim.—1. The combination, with a photographic developer, of a non-actinic inorganic coloring-matter, substantially as and for the purpose specified.



2. The combination, with a photographic developer, of a non-actinic aniline solution, substantially as and for the purpose specified.

3. The combination, with a photographic developer, of orange aniline, substantially as and for the purpose specified.

409,619. LAWN-WEEDER. MARY A. STEBBINS, Chelsea, Mass. Filed May 22, 1889. Serial No. 311,757. (No model.)



Claim.—In a lawn-weeder, the combination of the shank B, having a barbed branch C extending below the barbed branch D and adapted to act as an axle for turning the instrument about, as de-

409,619.

scribed, and the barbed branch D, substantially as and for the purpose set forth.

409,620. COAL-CART. MORTON TOULSON, Baltimore, Md., assignor of two-thirds to Frank C. Fenhagen, same place, and Peter G. Zouck, Glen Morris, Md. Filed Oct. 30, 1888. Renewed July 24, 1889. Serial No. 318,497. (No model.)

Claim.—1. The combination, with the frame and body, the latter being hinged to the former, of a hopper secured to the rear of the frame and a hopper secured to the rear of the body, the sliding door F in the tail-board, the parallel grooved guides rigidly secured to the frame below the body, the conveyer I, having flanges or slides H on its upper edge working in the grooves of the guides, and the endless belt J in the conveyer, substantially as described.

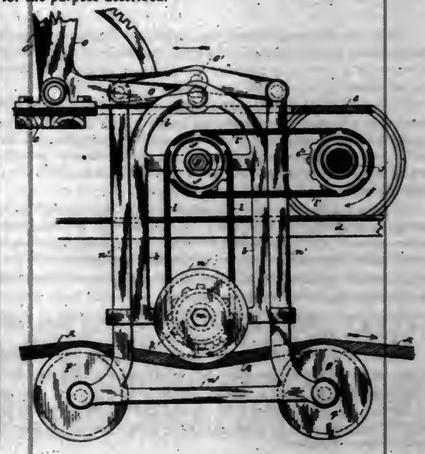
2. The combination, with the frame and body, of the grooved guides G below the body, inclining downwardly toward the front, the conveyer I, having flanges or slides H on its upper edge, which work in grooves formed in the guides, and the endless conveyer-belt J, substantially as described.

3. The combination, with the frame and body of a cart, of forwardly and downwardly inclined guides secured to the frame beneath the body, the semicircular piece, as H'', formed on the rear end of the guides, the conveyer-trough I, having a ring H' on its inner end working in said guides and semicircular piece, and the endless belt J, substantially as described.

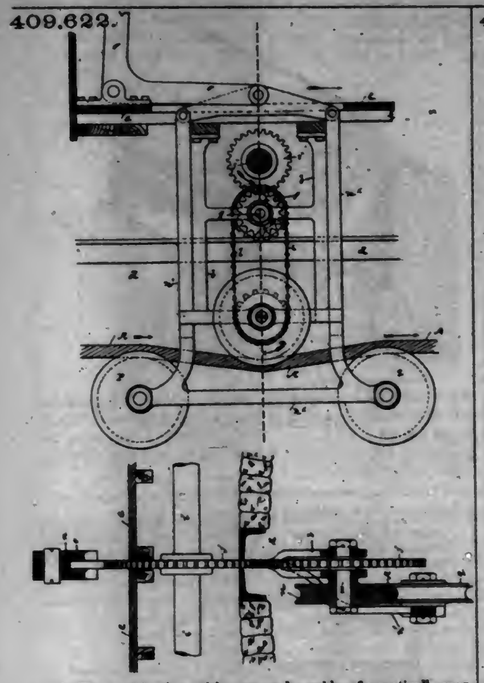
4. The combination, with the frame, of the body hinged thereto, a vertically-arranged rack-bar pivotally secured to the front of the body, a pinion meshing with the rack-bar, a shaft on which said pinion is mounted extending to the outside of the frame, a gear on the outer end of the shaft, a screw meshing with said gear, and a frame supporting the screw, substantially as described.

5. The combination, with the frame and body of a cart, of a conveyer-trough, having rollers, as I' and I'', located, respectively, in the ends thereof, said rollers having a series of ribs, as i, thereon, the conveyer-belt J, having transverse pieces secured thereto, and a handle for moving the outer roller, substantially as described.

409,621. SHAFT-SUPPORTER FOR VEHICLES. HOWARD F. WELCH, Richfield Springs, assignor to Margaret Howard Chase, New York, N. Y. Filed Feb. 9, 1889. Serial No. 299,336. (No model.)



Claim.—The combination, with the upper or smaller dash-board hook-section and the larger or lower cross-bar hook-section, of the sliding clamp C, embracing the lapped portions of the said sections and provided with the thumb-screw intermediate of its ends, whereby the sections may be securely held in contact after having been adjusted to the length required, substantially as specified.



409,622. APPARATUS FOR OPERATING CABLE CARS. JOSEPH WILLIAMS, Jr., Pittsburg, Pa. Filed Apr. 1, 1889. Serial No. 305,614. (No model.)

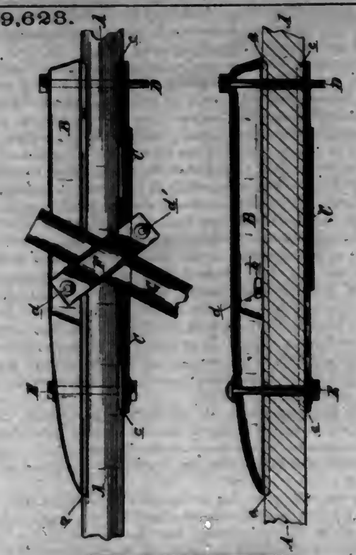
Claim.—1. The combination, with a car and a cable, of two frames carried by the car, one of which is adapted to be moved vertically with relation to the other, friction-rollers carried by the vertically-movable frame and arranged to contact with the cable to lift the latter, a shaft carried by the other frame and having means adapted to be driven by the cable when the latter is elevated, and gearing intermediate of said shaft and one of the axles of the car, substantially as described, for the purpose described.

2. The combination, with a car and a cable, of a normally-stationary frame carried by the car, a vertically-movable frame also carried by the car and having rolls at its lower end arranged to contact with the cable to lift the latter when said frame is elevated, a shaft journaled in the other frame and having a friction-roll adapted to be positively driven by the cable when it is elevated by the movable frame, and gearing intermediate of said shaft and one of the axles of the car, all arranged and combined for service, substantially as and for the purpose described.

409,622.

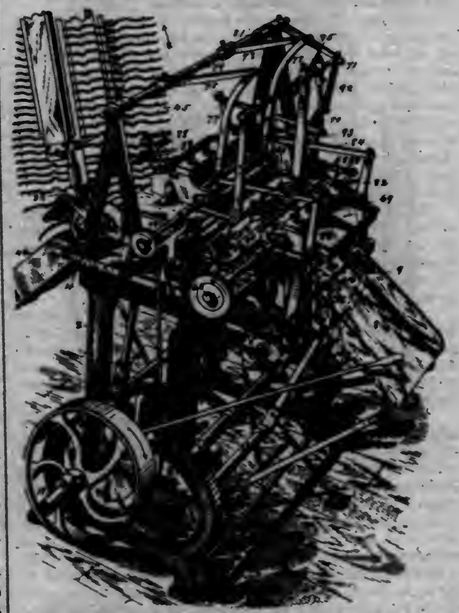
3. The combination, with a car and a cable, of a vertically-movable frame carried by said car and having at its lower extremity the spaced friction-rolls which are arranged to contact with the lower side of the cable, a normally-stationary frame arranged within said vertically-movable frame and suitably mounted on the car, a shaft journaled in said stationary frame at a point between and above the rollers of the movable frame, and having a friction-roll adapted to engage and be positively rotated by the cable when it is elevated by said movable frame, and gearing intermediate of said shaft and one of the axles of the car, substantially as and for the purpose described.

4. The combination, with a car and a cable, of a vertically-movable frame, as *a'*, carried by said car and having friction-rolls adapted to engage the cable to lift the same when the frame is elevated, another frame, as *b*, arranged within the first-mentioned frame *a'*, which remains normally at rest and is capable of vertical play within the vertically-movable frame *a'*, a shaft carried by the frame *b* and having a friction-roll adapted to be positively driven by the cable when it is lifted by the rolls of said frame *a'*, and gearing intermediate of the shaft and one of the axles of the car, substantially as and for the purpose described.



5. The combination, with a car and a cable, of an outer vertically-movable frame suspended from the car and having friction-rolls adapted to engage the cable to lift the same when said frame is elevated, an inner movable frame arranged within the outer frame and carrying a shaft which is adapted to engage and be rotated by the cable when said inner frame is at its lowest position and which is withdrawn from the cable when said frame is elevated, and gearing intermediate of said shaft and an axle of the car, arranged and combined for service, substantially as herein shown and described.

6. The combination, with a car and a cable, of two frames carried by the car, one having friction-rollers arranged to engage the lower side of the cable and the other having a shaft provided with a friction-roll which is adapted to be rotated by the cable when the latter is lifted, another shaft journaled in the last-mentioned frame, and suitable belt-gearing intermediate of the two shafts and an axle of the car, all arranged and combined for service, substantially as and for the purpose described.



409,623. FLOW-BEAM. NORMAN W. WILLIAMS, Detroit, Mich., assignor of one-half to Charles H. Gale, same place. Filed Oct. 24, 1887. Serial No. 253,202. (No model.)

Claim.—The metallic girder-box B, having the transverse slot *b*, adapted to receive the bolt *d* of the grip-strap F, in combination with the channel-plate C and straight wooden bar A, substantially as set forth.

409,623.

409,624. ENVELOPE-MACHINE. JAMES BALL, Holyoke, Mass., assignor to the Holyoke Envelope Company, same place. Filed Mar. 8, 1886. Serial No. 194,377. (No model.)

Claim.—1. In a machine for gumming and folding envelopes, the blank-carriage 36, having a reciprocating horizontal motion; a blank-supporting arm attached to one end of said carriage and extending between the sides thereof, combined with the yoke 42, having a divided folding box plunger attached thereto, whereby the movements of the latter are not interrupted while the blank-supporting arm extends over the folding-box, substantially as set forth.

2. In combination, the blank-carriage 36, the arm 39, attached to the latter and extending between the sides thereof, the yoke 42, the divided plunger 41, and the shaft 48, provided with two blank-guiding pinions, substantially as set forth.

3. The trough 8, having slots therein, the vibrating feed-arms 9, projecting through said slots, the arms 10, pivoted between said feed-

arms and having their free ends moving in said slots in advance of said arms 9, and the curved guide-strip 15, attached under said trough, combined and operating substantially as set forth.

4. The envelope-lifter 11 and means, substantially as described, for giving it a vertically-reciprocating motion, the vibrating crank-shaft 56, the stop-arms 52, secured on said shaft, and the vibrating arms 49, co-operating with the arms 52 to hold the envelope while it is gummed, combined and operating substantially as set forth.

5. As means for gumming the lap-spots on the outside of the seal-flap of the envelope, a crank-shaft 65, having thereon the picker-gummers 66, and means, substantially as described, for imparting a rocking motion to said shaft, combined with the gumming-roller 67 and means, substantially as described, for swinging said roll from the gum-box against said picker-gummers, substantially as set forth.

6. As means for opening out and gumming the inside of the seal-flap of the envelope, the crank-shaft 65, having the picker-gummers 66 thereon, and means, substantially as described, for imparting a rocking motion to said shaft, the vibrating gumming-roller 67, to apply gum to said picker-gummers, the flap-table 60, the gumming-roller 75, and means, substantially as described, for imparting thereto a horizontal and vertical reciprocating motion, whereby it is moved from the gum-box 76 to the seal-flap on said table 60, combined and operating substantially as set forth.

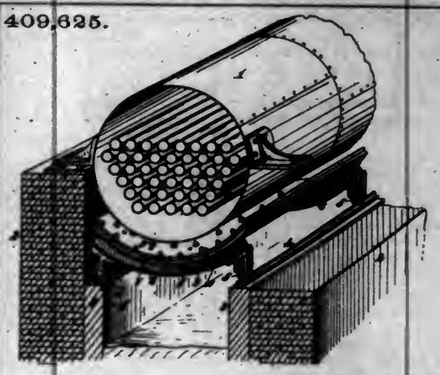
7. The pivoted flap-table 60, gravitating against table 4 and having curved recesses in its edge to receive the picker-gummers, and the picker-gummers 66, combined with the swinging lever 61, engaging under said table 60 and lifting its recessed edge, substantially as set forth.

8. As means for conveying the envelope from the gumming devices to the drying-chain, the vibrating arms 86, each carrying a gripper consisting of a bar 101, having a fixed jaw thereon, a pivoted jaw opening and closing opposite the latter and having a projection 103 thereon, a latch 104, pivoted on said bar and engaging with said projection, and a spring to open jaw 102 and to swing said latch, combined with the sleeves 55, to close said grippers, and the gripper-trips 89, to swing said latch, substantially as set forth.

9. As means for arresting the action of the gumming-roll 75 and preventing the application of gum to the flap-table 60 when no envelope is present, the pin 91, projecting horizontally from a disk on the end of the rocking crank-shaft 65, the curved-edged hook-bar 92, having a hook thereon to engage with the upper side of said pin and suspended on an arm on the rock-shaft 79, to which said gumming-roll is attached, the slotted guide 93, the pivoted hook 97, to engage with the under side of said pin, the shaft 110, having thereon an arm connected with said hook 97, and the finger 111, and means, substantially as described, for imparting a rocking motion to shaft 110, combined and operating substantially as set forth.

10. In combination, the envelope-lifter 11, having a slot in its edge, the rock-shaft 110, the finger 111, having a vibrating motion within said slot, the hook 97, pivoted on the table of the machine, the arm 99, secured on said shaft and connected with said hook by the rod 108, and the rocking shaft 65, having connected therewith the pin 91 for engagement with said hook, substantially as set forth.

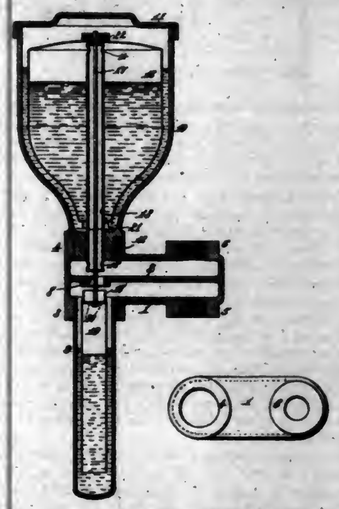
11. The rock-shaft 79, having the gumming-roll 75 connected thereto, the hook-bar 92, pivoted on an arm on said shaft and having a curved projection and a hook on one edge, the slotted guide 93, through which said bar passes, and the pin 91, attached to the shaft 65, with which said hook-bar engages, all the elements combined substantially as set forth.



12. In a machine for gumming and folding envelopes, the blank-carriage 36, having a reciprocating horizontal motion, the arm 39, attached to said carriage, the yoke 42, the divided folding plunger attached to said yoke, the pickers 26 and 27, and suitable gumming devices therefor, the chute 7, to receive the envelope from said gumming and folding devices, the trough 8, to receive envelopes from said chute, and the vibrating arms 9 and 10, to move said envelopes upward in the latter, the vertically-reciprocating envelope-lifter 11, receiving the envelope from said arms, the vibrating arms 49 and 52, to hold the envelope while it is gummed, the rocking crank-shaft 65, having the picker-gummers 66 thereon, the vibrating gumming-roll 67, the flap-table 60, and the horizontally-vibrating gumming-roller 75, and the necessary co-operating adjuncts, all in combination substantially as described.

409,625. BURNER-CARRIAGE FOR GAS-FURNACES. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Apr. 11, 1889. Serial No. 306,786. (No model.)

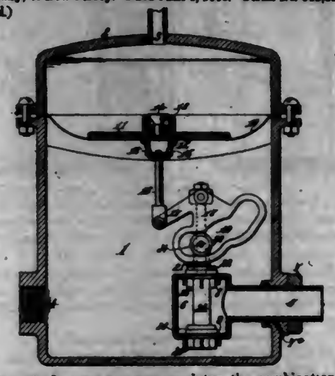
Claim.—1. The combination, with a gas burner carriage, of separate gas and air chambers supported on said carriage, and comprising horizontal plates connected by bolts, and blow-pipe gas-burners supported by and communicating with said chambers, substantially as described.



2. The combination, with the combustion-chamber of a furnace,

409,625.

of a movable gas-burner carriage, gas and air chamber supported on said carriage and comprising plates 10, connected by tubular bolts 12, for the passage of air to carry off the products of combustion, and gas-burners supported by and communicating with said chambers, substantially as described.



409,626. GAS-PRESSURE REGULATOR. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed June 6, 1889. Serial No. 313,224. (No model.)

Claim.—1. In a gas-pressure regulator, the combination of a valve-casing having a depending tubular extension and a partition provided with a gas-passage and a valve-seat, a regulator-casing attached to the upper part of said valve-casing in line with said tubular extension, a stationary perforated tube vertically and centrally supported in the regulator-casing and communicating with the valve-casing, a liquid-sealed float inclosed in the regulator-casing and having a stem that is passed through said tube, and a tubular liquid-sealed balanced valve attached to the float-stem and inclosed in the tubular extension of the valve-casing, substantially as described.

2. In a gas-pressure regulator, the combination of a valve-casing having an inlet and outlet and a horizontal partition provided with a gas-passage and valve-seat, a tubular extension depending from one end of the valve-casing, a regulator-casing above and in line with said extension, a vertical stationary tube supported in the regulator-casing and communicating with the valve-casing, a hollow liquid-sealed float inclosed in the regulator-casing and having a stem that is passed through and guided in said tube, and a tubular liquid-sealed valve inclosed in the tubular extension of the valve-casing and having a perforated cup-shaped portion attached to the float-stem, substantially as described.

409,627. GAS-PRESSURE REGULATOR. HAROLD J. BELL, Gloucester City, N. J., assignor to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed June 6, 1889. Serial No. 313,227. (No model.)

Claim.—1. In a gas-pressure regulator, the combination, with a casing or chamber having a flexible diaphragm, an inner chamber having gas-passages communicating with the said casing or outer chamber, and automatic safety cut-off and pressure-regulating valves for controlling said gas-passages, of cam-lever connections between said diaphragm and valves, substantially as described.

2. In a gas-pressure regulator, the combination of an outer chamber or casing, an inner chamber having gas-passages communicating with the outer chamber, automatic safety cut-off and regulating valves, an anti-friction roller connected with said valves, a cam having a slot engaged with said roller, a flexible diaphragm, and a rod or lever connecting the said diaphragm and cam, substantially as described.

3. In a gas-pressure regulator, the combination of the casing 1, the flexible diaphragm 10, having a depending rod 16, the chamber 6, having gas-passages 8 and 9 and by-pass 27, the safety cut-off and regulating valves 22 and 23, roller 20, cam 18, and starting-valve 28, substantially as described.

4. In a gas-pressure regulator, the combination of the flanged valve-stem 24, the annular elastic valves 22 and 23, and the flanged blocks 30 and 31, for securing the valves to said stem, substantially as described.

5. In a gas-pressure regulator, the combination of the flanged stem 24, having guides at one end, the annular elastic valves 22 and 23, the flanged block 30, provided with guides and having a central boss that engages the lower valve, the flanged block 31, having a central boss engaged with the upper valve, and means for securing said blocks to the ends of the valve-stem, substantially as described.

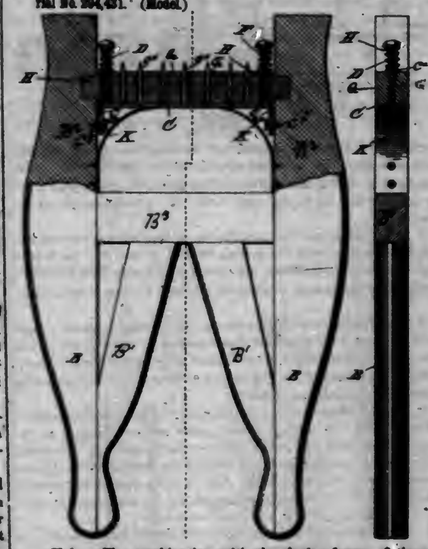
6. In a gas-pressure regulator, the combination, with the diaphragm 10, the elastic valves 22 and 23, and the stem 24, to which said valves are secured, of cam-lever connections between the diaphragm and valves, substantially as described.

7. In a gas-pressure regulator, the combination of the standard 26, the adjustable two-part cross-bar 36, the lever 18, centered on said cross-bar and provided with a cam-slot 19, the anti-friction roller 20, engaged in said slot, and the valves 22 and 23, having a stem that carries bearings for said roller, substantially as described.

409,628. SAFETY-FUSE FOR ELECTRIC CONDUCTORS. WALTER S. BISHOP, New Haven, Conn., assignor to himself and Frank B. Parker, same place. Filed Nov. 23, 1883. Serial No. 291,634. (No model.)

Claim.—1. In a safety-fuse for electric circuits, the combination, with the binding-posts B B', formed of the part *c b*, and screw *a*, of the fusible strip C, provided with the apertured ends *g* and the protecting-plate D, the said fusible strip and protecting-plate being arranged to be clamped by the binding-posts, substantially as specified.

2. In a safety-fuse for electric circuits, the combination, with the binding-posts B B', provided with the shoulders *d*, of the strip C, having the apertured ends *g*, the mica protecting-plate D, and the plate *f*, substantially as specified.



409,629. GAGE-KNIFE. WILLIAM H. BROCK, Plainfield, N. J., assignor to the New York Glass Enameling Company, New York, N. Y. Filed Dec. 19, 1888. Serial No. 294,194. (No model.)

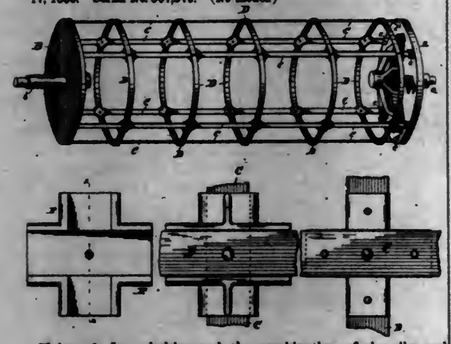
Claim.—1. A vegetable-parer composed of a blade of metal curved on opposite edges in opposite directions, having in the bight of either of its curved edges a slot, one edge of which forms a knife, substantially as shown and described, for the purpose set forth.

2. A vegetable-parer composed of a blade of metal curved on opposite edges in opposite directions, having in the bight of either of its curved edges a slot, one end of which forms a knife, said having one end of either of said edges projected in a curved line to form a scoop or corer, substantially as shown and described, for the purpose set forth.

409,630. DRYING-FRAME FOR KNITTED DRAWERS. MIKE CLEMENS and CHARLES A. TICE, Herkimer, N. Y. Filed Dec. 22, 1883. Serial No. 294,431. (Model.)

Claim.—The combination, with the drying-frame of the usual construction, provided at its upper portion with a perforated cross-piece, of a sliding plate arranged beneath said cross-piece and provided with pins which project through the perforations of said cross-piece, means for depressing said sliding plate, and means for returning it to its normal position, substantially as set forth.

409,631. PIPE ELBOW OR SECTION. CHARLES R. COOPER, New York, N. Y. Filed Mar. 11, 1889. Serial No. 302,770. (No model.)



Claim.—1. A curved pipe-elbow consisting of a series of transverse sections, each convex on the back and concave at the throat and composed of a single blank narrowed toward the ends, which ends

overlap and are secured together, one end or edge of each section being depressed inwardly the thickness of the metal, or formed with an annular corrugation, said corrugation and the opposite end of the section being provided with transverse indentations, whereby, when the sections are secured together, the straight edge of one section fits on the corrugation of the next and the indentations intermesh, substantially as described.

2. A curved pipe-elbow consisting of transverse sections concave at the throat and convex at the back, each formed of a single blank having its ends secured together, said sections being secured together at their ends, and the two end sections of the elbow at about half their length departed from a curved form and made straight or tapering at the outer ends, for the purpose set forth.

409,632. ROTARY BOLT. JOHN R. CORNWALL, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed Apr. 17, 1888. Serial No. 307,579. (No model.)

Claim.—1. In a bolting-reel, the combination of the ribs and braces, with the castings secured to said ribs and braces at their point of intersection on the inside of the reel, so as not to interfere with the cloth or protrude above the outer brace or rib, substantially as described.

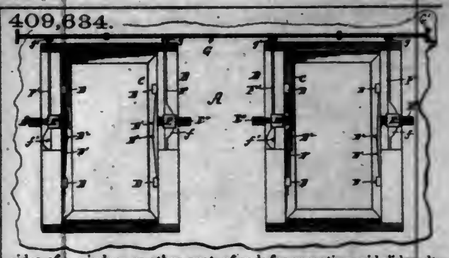
2. In a bolting-reel, the combination of longitudinal ribs and circumferential braces, with the casting secured to said ribs and braces at their points of intersection and bracing the same, and curved to accommodate the braces, substantially as and for the purpose specified.

3. In combination with the ribs and intersecting braces of a bolting-reel, castings having flanged arms attached to said ribs and braces at the points of intersection thereof, the flanges of the arms preventing lateral movement of the ribs or braces thereon and strengthening the same, substantially as described.

4. The combination of the longitudinal ribs and the circumferential braces, with the castings having pairs of arms flanged, as described, and centrally perforated and placed upon said ribs and braces at their points of intersection to the inside of the circumferential braces to prevent contact thereof with the cloth, and the rivet or bolt passing centrally through the casting and through the rib and brace, substantially in the manner and for the purpose set forth.

5. In a bolting-reel, the combination of longitudinal ribs and circumferential braces, with castings having arms arranged in pairs at right angles to each other and flanged on opposite sides and interposed between and secured to the ribs and braces, substantially as described.

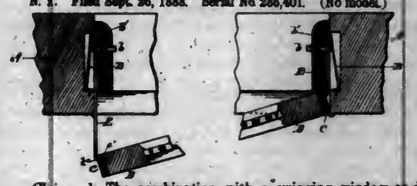
409,633. POULTICE OR SPONGE HOLDER FOR HORSES' FEET. CORNELIUS P. DACEY, Cincinnati, Ohio, assignor of one-half to Eugene L. Firnkoess, same place. Filed Apr. 2, 1888. Serial No. 269,357. (No model.)



Claim.—A poultice or sponge holding appliance for horses' hoofs, composed, substantially, of the imperforate plate C, having a straight or squared fore end, and an upturned tongue or projection *c* at its rear end, a pliable concave transverse clamp-bar D, a rectangular plate or washer D', a vertical rivet *d*, a longitudinal upwardly-turned and forwardly-projecting bar E, and rivets *e e'*, whereby said poultice or sponge is detachably held in position against the bottom of the hoof, as herein set forth.

409,634. SWINGING WINDOW. ENOCH R. DE KALB, Syracuse, N. Y. Filed Aug. 30, 1888. Serial No. 284,118. (No model.)

Claim.—1. The combination, with locking-slides on the opposite

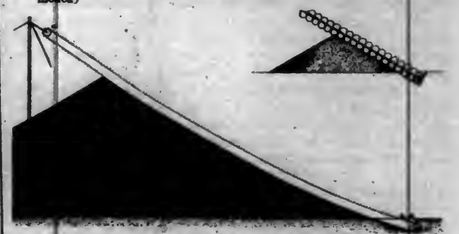


409,634.

sides of a window or other part, of rods for operating said slides alternately, and a horizontal rocking rod, to which the first-named rods are connected, above the window or other part, substantially as set forth.

2. The combination, with locking-slides having projections on opposite sides of a window or other part, of rods having cams arranged to operate alternately upon the projections of the slides, and a rod for operating the cams, as set forth.

409,635. HOLDER FOR WINDOWS. ENOCH R. DE KALB, Syracuse, N. Y. Filed Sept. 26, 1888. Serial No. 286,401. (No model.)



Claim.—1. The combination, with a swinging window or door or other part, of a slotted segmental arm loosely jointed to the sash or analogous part at one end, and a spring-plate and pin over which it rides secured to the frame, as set forth.

2. The combination, with a swinging window or door or other part, of a slotted segmental arm loosely jointed at one end, and a spring-plate having an angle-piece on its free end and a pin over which the slotted arm moves, as set forth.

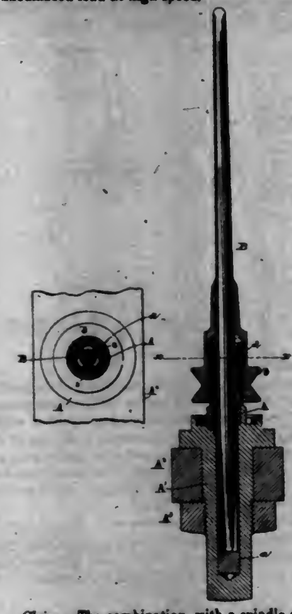
3. The combination, with a swinging window or door, of a slotted segmental arm having notches in it, as described, and a spring-plate having an angle-piece at one end and provided with a push pin or button, substantially as and for the purpose described.

409,636. PROCESS OF PILING COAL OR ANALOGOUS MATERIAL. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, of Connecticut. Filed Apr. 12, 1889. Serial No. 306,980. (No model.)

Claim.—The process herein described of progressively and continuously forming a pile of coal or analogous material, said process consisting in, first, delivering the material to be piled to a conveyer at a fixed point at or near the ground; secondly, in carrying the said material upward at an inclination not exceeding the natural angle of repose until the material discharges itself to form an initial conical pile, and, thirdly, progressively carrying fresh material along the surface of such previously-formed pile and at the same constant angle of inclination, and leaving such material at the top of the already-formed pile to distribute itself by gravity and form a new, a higher, and a constantly-receding apex for a conical pile or mass.

409,637. HEEL-NAILING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Apr. 23, 1889. Serial No. 308,303. (No model.)

Claim.—1. A nail-box, drivers and driver-plate, and a convexed tipping support combined with a block having co-operating concaved surface, whereby the support, together with the nail-box and drivers, may tip to conform to variations in thickness or shape of a heel, substantially as described.



409,637.

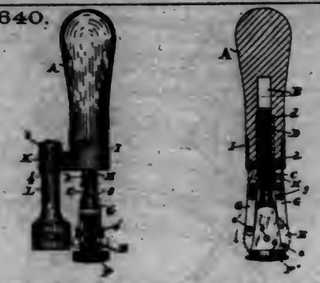
2. The block having a convexed seat and a nail-box and convexed tipping support, combined with a locking device to fix the support in adjusted position, substantially as described.

409,638. SUPPORT FOR SPINNING-SPINDLES. BENJAMIN H. GOODALE, Saco, Me., assignor to the Sawyer Spindle Company, Boston, Mass. Filed May 24, 1888. Serial No. 311,968. (No model.)

Brief.—The object of the invention is to provide an improved bearing in which the spindle may have sufficient looseness to run with an unbalanced load at high speed.

Claim.—The combination, with a spindle and step, of a faceted bolster-bearing, substantially as described.

409,639. WICK-ADJUSTING MECHANISM. CHARLES P. GOODRICH, Brooklyn, assignor of two-fifths to Rowland A. Robbins, New York, and James S. Barrow, Brooklyn, N. Y. Filed Mar. 1, 1886. Serial No. 193,686. (No model.)



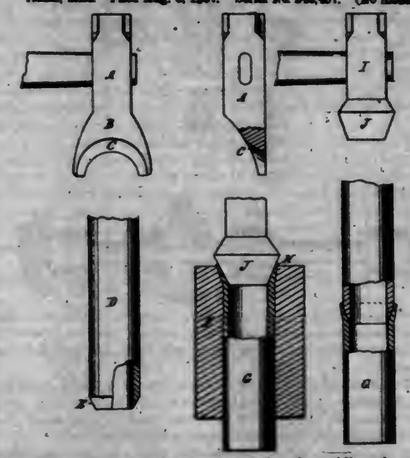
Claim.—1. The combination, with a wick-tube, of a pair of rollers arranged at opposite sides and provided with spiral collars extending circumferentially about them in the same direction, having rows of short blunt teeth extending at right angles to the axes of the rollers, substantially as specified.

2. The combination of the wick tube or casing, the equally-geared adjacent parallel rollers, and the ribs wound spirally around the rollers and formed with teeth on lines parallel to the axes of the rollers, substantially as specified.

409,640. STAMP-CANCELING DEVICE. FERDINAND HORN, Columbus, Ohio, assignor of one-half to Philip A. Hiller and George Long, same place. Filed Mar. 22, 1889. Serial No. 304,205. (No model.)

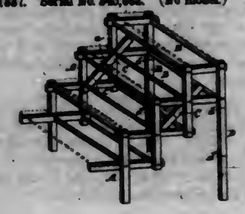
Claim.—1. In a stamp-canceler, a vertically-movable hollow handle, a coil-spring therein, and a bifurcated rod, the upper end of which

409,640.



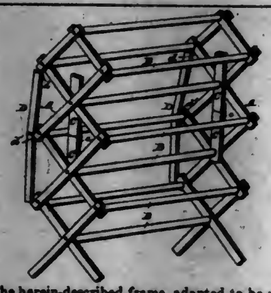
projects into said handle and is encircled by said spring, in combination with rasping-wheels mounted on a suitable shaft within said bifurcated rod, and pitmen secured to said rasping-wheels and connecting them with said handle.

2. In a stamp-canceler, a vertically-movable hollow handle and a bifurcated rod, the upper end of which projects into the cavity of said handle, in combination with rasping-wheels mounted on a suitable shaft within said bifurcated rod, and pitmen secured to the outer surfaces of said wheels on opposite sides of the shaft thereof and connecting said wheels with said handle, all substantially as and for the purposes specified.



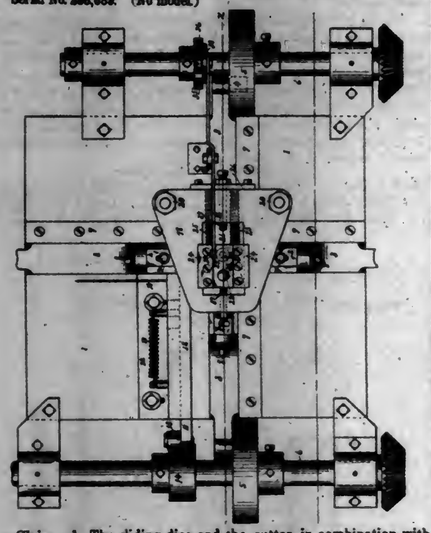
3. In a stamp-canceler, the combination of a handle having a recess, a rod having one end projecting loosely into said handle-recess and the other end provided with bifurcations, a ring-plate having an opening *f* and secured to the extremity of said bifurcations, two rasping-wheels between the said bifurcations and mounted on a shaft with the rasping-rims projecting through the ring-plate opening, and each wheel provided with a series of perforations *e*, and two pitman-rods G, pivoted to the handle, and each secured to a different wheel by a screw *e'*, entered in one of said perforations.

409,641. DEVICE FOR PREPARING TUBES FOR WELDING. HARRY JEFFREY, Ludlow, Ky., assignor of one-half to Fred Hoeffle, Meridian, Miss. Filed Aug. 3, 1887. Serial No. 246,457. (No model.)



Claim.—In devices for preparing tubes for welding, the tool A, having the beveled and crescent shape C, jointly with the tool J, and the former-tool F, having the bell-mouth H, substantially as set forth.

409,642. CLOTHES-DRIER. WILLIAM H. LITTLE, Picture Rocks, Pa., assignor of one-half to George R. Little, Washington, D. C. Filed July 20, 1887. Serial No. 245,092. (No model.)



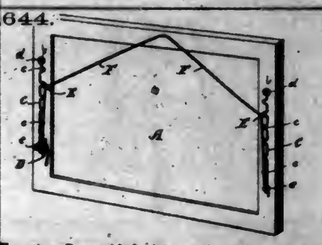
409,642.

Claim.—The herein-described frame adapted to be used for the described purposes and consisting of the side bars A, pivoted together in pairs, the transverse rungs connecting the ends and centers of opposite pairs of side bars, the stops C, each consisting of two bars and hinge *c*, and the legs D, each composed of two sections connected by the hinge *d'* and connected to the top side bar A on one side of the frame by the hinge *d*, substantially as specified.

409,643. WIRE-FORMING MACHINE. FRANK B. MANVILLE, Waterbury, Conn., assignor to Blake & Johnson, same place. Filed Dec. 15, 1888. Serial No. 293,689. (No model.)

Claim.—1. The sliding dies and the cutter, in combination with a raised table having a central opening, a block adapted to slide in said opening, and a former carried by said block toward which the dies act.

2. The sliding dies and the cutter, in combination with table 18, block 23, sliding in said table, a former carried by said block, stop-bolts to limit the movement thereof, and springs 25, to return the block to its normal position after the dies have acted.

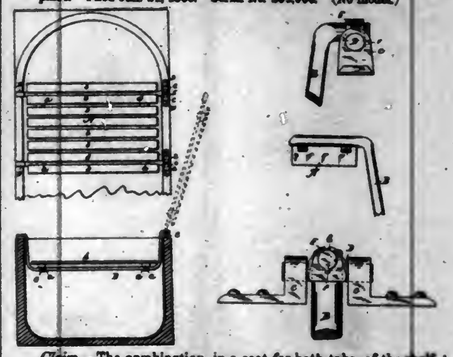


3. In a machine of the class described, the former, a sliding block by which it is carried, and a stripper having a shank 28 extending through said block, in combination with a disk having a lug 36 and a pivoted lever, one end of which engages said shank, and a link pivoted to the other end of said lever and carrying a roller engaging said disk, as and for the purpose set forth.

4. Block 23, the former carried thereby, and the stripper whose shank extends through said block and is provided with a roller 30, in combination with a lever against which said roller bears, mechanism, as a spring, acting to hold the roller in contact with the lever, and mechanism, substantially as described and shown, for tilting said lever to actuate the stripper.

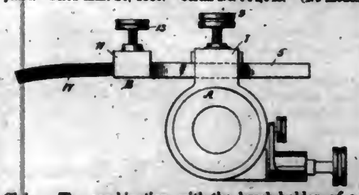
409,644. ADJUSTABLE PICTURE-HANGER. LEVERETT MESSER, Haverhill, Mass., assignor of one-half to Gerry C. Messer, Brattleborough, Vt. Filed Aug. 29, 1888. Serial No. 284,069. (No model.)

Claim.—1. The wires C, provided with a series of loops *c* and eyes *b*, in combination with the screw-eyes *e*, cord F, and adjusting-rings E, substantially as and for the purpose set forth.



409,644.

2. The wires C, provided with a series of loops *c*, in combination with the adjusting-rings E and cord F, substantially as and for the purpose set forth.



3. The wire C, provided with a series of loops *c* and eyes *b*, in combination with the rings E, screw-eyes *e*, and cleat D, substantially as and for the purposes set forth.

409,645. ATTACHMENT-SEAT FOR BATH-TUBS. GEORGE W. MYERS, Philadelphia, Pa., assignor of one-half to Abraham Overholt, same place. Filed Jan. 21, 1889. Serial No. 296,968. (No model.)

Claim.—The combination, in a seat for bath-tubs, of the shelf A, supports B, the ends of which turn up, as shown, one end being adapted to rest on the side of the tub and the other being furnished with a downwardly-projecting leg F, bearings C, secured to the top of the tub, shafts D, supported by and free to revolve in bearings C, and bearing E in shaft D, slotted out at G, in order to allow the introduction of leg F on the end of support B, all arranged and operating substantially as and for the purposes set forth.

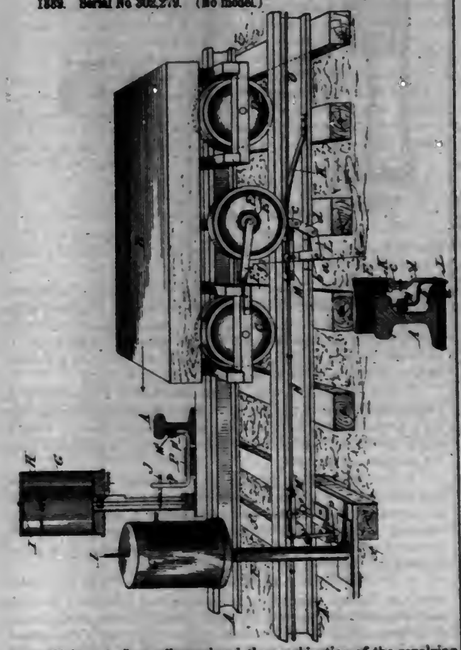
409,646. BRUSH-HOLDER FOR DYNAMOS. JAMES M. MCLELLAN, St. Paul, Minn., assignor to George H. Finn and John R. Munson, same place. Filed Mar. 20, 1889. Serial No. 304,043. (No model.)

Claim.—The combination, with the brush-holder, of a dynamo-electric machine having the sleeve 7 and set-screw 9, of an auxiliary brush-holder B, having the shank 5 slidably adjustable in said sleeve, and the head 11, suitably recessed to receive the brush 17 and provided with the set-screw 13 and the plate 15, by means of which the brush is secured in said head, combined and operating substantially as described.

409,647. CARPET-STRETCHER. HERBERT MCCORMACK, McLeansboro, Ill. Filed May 26, 1888. Serial No. 275,210. (No model.)

Claim.—1. In a carpet-stretcher, the combination of a block A, having a roughened surface and provided with a catch n on its opposite surface, a lever D, and a rack E, connected with the lever and movable by operating the lever backward across the catch when applied thereto, substantially as and for the purpose set forth.

2. In a carpet-stretcher, the combination of a block A, provided with a roughened surface and pointed toward one end, a beard n on the opposite surface of the block, beveled along the under side of its

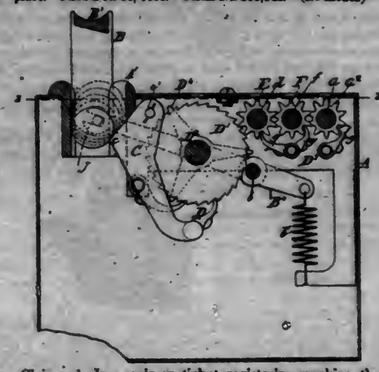


409,647.

inner edge and affording a catch, a rack E, and a lever D, substantially as described.

3. In a carpet-stretcher, the combination of a block A, having a beveled end *e*, and provided on one side with soft rubber B, having projections *r* on its exposed surface, a catch comprising a head *n* on the opposite side of the block, beveled on the under side of its inner edge, and a lever D, having a rack E pivotally connected with it, substantially as and for the purpose set forth.

409,648. RAILWAY-SIGNAL. RICHARD W. NORWOOD, Courtland, Ala., assignor of one-half to James C. Grant, same place. Filed Mar. 7, 1889. Serial No. 302,279. (No model.)

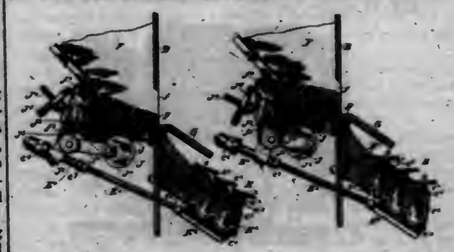


Claim.—1. In a railway-signal, the combination of the revolving cylinder and its spindle, having a slotted arm, the spring located alongside of the track and adapted to be depressed by the moving car, a bell-crank having a journal supported in a bearing beneath the rail, the link connecting the spring and the bell-crank, the horizontal rods to which the bell-crank is pivotally connected, and the crank connecting the horizontal rod with the slotted arm of the signal-cylinder, all substantially as described.

2. In a railway-signal, the combination of the signal-operating truck running outside of the track, the spring adapted to be depressed by said truck, the bell-crank, the link connecting the bell-crank and the spring, the horizontal rods to which the bell-crank is pivotally connected, the revolving signal and its spindle having a slotted arm, and the crank connecting the horizontal rods with said arms, substantially as described.

3. The combination of the signal-operating truck E, spring K, having lugs *c*, bell-crank L, having journal-pin *e*, the connecting-link *d* between the lugs *c* and the bell-crank L, the rods N and O, arranged alongside the track, the link connecting said rods, to which link one arm of the bell-crank is pivoted, connecting the revolving signal-cylinder H and its spindle I, having slotted arm J, and the crank P, connecting said arm with the link M', attached to rod M, substantially as described.

4. The combination of the spring K, located alongside the track and adapted to be acted upon by the moving car, the bell-crank L, connected movably to the rail, the connecting-link *d* between the bell crank and the spring, the horizontal rods alongside of the track connected by links, to one of which the bell-crank is pivotally attached, the signal-post F, carrying drum G, the cylinder H therein having painted sections, its spindle I, having arm J, and the crank P, connecting arm J with one of the links between the horizontal rods, all substantially as described.



409,649. TICKET AND CASH REGISTERING MACHINE. ISAAC PROSSERMER, New York, N. Y., assignor of one-half to Carl Ballod, same place. Filed Dec. 10, 1888. Serial No. 293,146. (No model.)

Claim.—1. In a coin or ticket registering machine, the combination, with a box or case provided with a slotted opening upon one side thereof adapted to receive a coin or ticket, of a train of registering-wheels, a vertically-extending swinging piece mounted on a pivot near its upper end and outside of said slot, said swinging piece having a projection adapted to extend normally into the said slot, and with which a coin or ticket, when passing through the slot, will contact to move it out of said slot and cause said swinging piece to swing on its pivot, a pawl pivoted upon said swinging piece near the lower end of the latter, and a ratchet-wheel with which said pawl engages to cause the operation of the registering-wheels, said swinging piece being returned to its normal position within the slot after the passage of the coin or ticket, substantially as specified.

2. In a coin or ticket registering machine, the combination, with a box or case provided with a slot or opening upon one side adapted to receive a coin or ticket, of a train of registering-wheels, a movable piece extending into said slot or opening, and a push-piece extending to the exterior of the box or case for moving inwardly the coin or ticket to cause the latter to operate the movable piece to rotate the train of registering-wheels, substantially as specified.

409,650. FURNACE. WILLIAM R. ROWEY, Chicago, Ill. Filed Apr. 1, 1889. Serial No. 305,536. (No model.)

Claim.—1. The combination, with the rocking grate-bars and reciprocating bar connected therewith, of an oscillating part or arm having a uniform range of movement and a rod connecting the reciprocating bar with the said oscillating part or arm and having adjustable connection with the latter, whereby the bars may be given a variable range of oscillation, substantially as described.

2. The combination, with the rocking grate-bars and reciprocating bar E^2, connected therewith, of a power-vibrated bar J^2, having a uniform range of movement and provided with an aperture, and a connecting-rod attached to said reciprocating bar, passing through the aperture in the vibrating arm, and provided with adjustable shoulders or nuts on opposite sides of said arm J^2, substantially as described.

409,651. TREATING FUR OR WOOL FELT FOR HATS, &c. THOMAS SEALY, Newark, N. J., assignor to Amanda Sealy, same place. Filed Apr. 10, 1889. Serial No. 306,731. (No specimens.)

Claim.—1. The process herein described of treating fur or wool felt for the manufacture of hats, bonnets, &c., to wit: first dyeing the felt with the colors desired, then placing the felt upon a block or form having the desired figures or ornamentation raised or in relief thereon or depressed therein, then covering the felt with heated sand or other granulated materials, then subjecting the latter to pressure, and then finishing the surface of the felt by grinding, substantially as described, for the purposes set forth.

2. The process herein described of treating fur or wool felt for hats, bonnets, &c., to wit: dyeing the felt with the desired colors, then producing a nap on the surface of the felt by brushing or carding, then placing the felt upon a block or form having the desired figures or ornamentation raised or in relief thereon or depressed therein, then covering the felt with heated sand or other granulated material, then subjecting the latter to pressure, and then finishing the surface of the felt by grinding, substantially as described, for the purposes set forth.

409,652. SCOURER AND CLEANER. ROBERT SPERL, Philadelphia, assignor of two-thirds to Charles A. Spring and Henry T. Spring, Royer's Ford, Pa. Filed Apr. 24, 1889. Serial No. 308,412. (No model.)

Claim.—1. A scouring-block composed of woody fiber provided upon its wearing-surface with serrations or depressions, the divisions between the depressions being firm and unyielding, substantially as described.

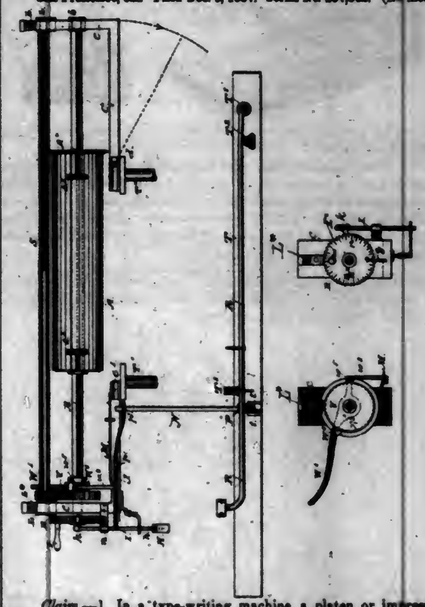
2. A scouring-block composed of woody fiber, the ends of the fiber forming the wearing-surface and being provided with serrations or depressions, the divisions between the depressions being firm and unyielding, substantially as described.

3. A scouring-block provided upon its wearing-surface with serrations or depressions, the divisions between the depressions being firm and unyielding, substantially as described.

409,653. PROCESS OF OBTAINING ZIRCONIUM NITRATE. CARL A. VON WELSBACH, Vienna, Austria-Hungary. Filed Dec. 22, 1887. Serial No. 258,749. (No specimens.) Patented in England July 29, 1886, No. 9,806.

Claim.—The method, substantially as hereinbefore described, of producing zirconium nitrate in a form suitable for an incandescent body by first converting the zirconium into a sulphate, and, after treating with ammonia, dissolving the same in nitric acid, thereby obtaining a precipitate which, when digested with ammonia and dissolved in nitric acid and evaporated, produces zirconium nitrate.

409,654. CAR-SEAT. JOHN T. WENTWOOD, Wheeling, W. Va., assignor of one-third to Benjamin Fisher, same place. Filed May 7, 1889. Serial No. 309,917. (No model.)



Claim.—1. A railway-car seat or chair consisting of standards secured to the floor, arms connected to the seat or chair, hangers connected to said standards and arms, and the bearing or supporting points formed of ball-and-socket joints, whereby the seat is adapted to always maintain a vertical position with relation to the car-floor, substantially as set forth.

2. A support for car-seats, chairs, &c., consisting of a series of hora-shaped standards having balls at their upper ends, the hangers provided with sockets at their ends, and curved arms secured to the under side of the seat and having balls at their lower ends, the balls of the standards and arms engaging the sockets in the ends of the hangers, substantially as set forth.

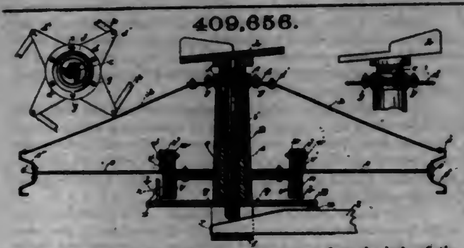
3. A car-seat consisting of arms pendent from the seat, standards secured to the floor, hangers having ball-and-socket-joint connections with said arms and standards, and elevated foot-rests on each side of the seat, substantially as set forth.

409,655. TYPE-WRITING MACHINE. FREDERIC R. GLADWIN, San Francisco, Cal. Filed Dec. 8, 1887. Serial No. 257,262. (No model.)

Claim.—1. In a type-writing machine, a platen or impression-roller, a rotatable shaft on which it is supported and capable of longitudinal movement, in combination with a frame C, bearing said shaft and having its rear end extended forward under said shaft, hinged to the main frame at right angles to said shaft, and extending a distance beyond said main frame, as and for the purpose set forth.

2. The combination, with a rotatable shaft B, a platen-roller A, longitudinally movable thereon and rotating therewith, said roller having a projecting disk A^x on one end, of a rotatable screw or worm S, engaging with the disk A^x, and a frame C, in which the shaft and screw are mounted, as set forth.

3. In a type-writing machine, the combination of a rotatable impression-roller having disk A^x, said roller being capable of longitudinal movement, as described, with a screw-shaft S, mounted in spring-bearings, a ratchet-wheel connected to the screw-shaft, dog W^3, operating upon the ratchet, finger-bar W', for operating the dog, and a spring for retracting the dog, as set forth.



4. In a type-writing machine, the combination, with an impression-roller having longitudinal adjustment and movement upon its axis, of a shaft on which it is mounted, ratchet E, mounted on the end of the shaft, arm I, having downwardly-acting pawl, lever J, connected to arm I, vertical rod or arm N, connected to lever J, and transverse universal spacing-bar P, connected to arm N, and the key-levers for operating the spacing-bar, as set forth.

5. In a type-writing machine, the combination, with type fingers or arms carrying the letters or characters, of key levers or bars formed of spring metal fixed at the rear end in the frame and the bridge-bar T in front of the said point of attachment, substantially as described.

409,656. HOISTING APPARATUS. JAMES H. MONTGOMERY, Denver, Colo. Filed Nov. 4, 1887. Serial No. 254,205. (No model.)

Claim.—1. In a hoisting apparatus, the combination of a base or framing, a king or main post seated thereon, a winding-drum mounted

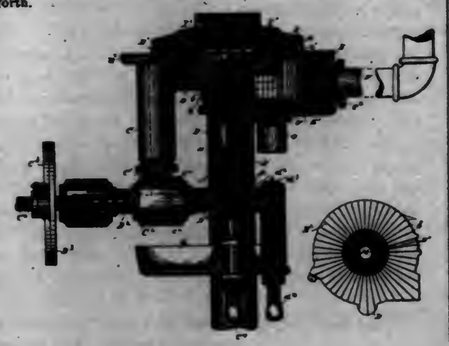
409,656.

on such post or spindle, a clutch member secured to the hub of the drum by a friction-coupling, a second clutch member arranged to receive motion from the prime motor and to mesh with the other clutch member, and a friction-brake and lever for regulating the unwinding of the winding-drum, substantially as set forth.

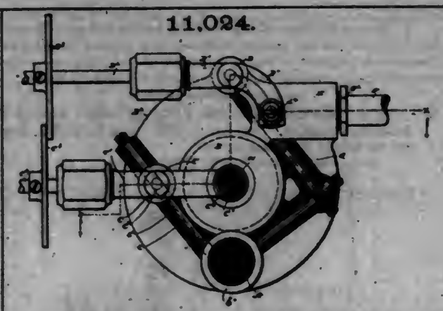
2. A winding drum or wheel consisting of a hub *c*, a clutch member attached thereto by a friction-coupling, radial arms or spokes secured to the hub and carrying a rim, a sectional rim, and inclined brace rods or arms, substantially as set forth.

3. In a winding or hoisting apparatus, the combination of a hollow king-post, a winding-drum journaled thereon, a spindle journaled therein, a connection from the spindle to the winding-drum, and means for communicating motion to the spindle, substantially as set forth.

4. In a hoisting apparatus, the combination of a hollow king-post, a winding-drum having a hub journaled upon such post, a clutch member frictionally united to such hub, a stem or shaft journaled within the hollow king-post and carrying a clutch member to which the power is first applied, and an automatic brake mechanism carried and supported by a flange on the hub of the winding-drum, substantially as set forth.



5. In a winding or hoisting mechanism, the combination of a framing, a hollow king-post seated thereon, a winding-drum having a hub mounted on such king-post, a clutch member united to such hub by a friction-coupling, a spindle journaled within the hollow king-post, a second clutch member situated on such spindle and arranged to receive motion from the prime motor, and a throw-bar having an inclined or wedge-shaped end arranged to be thrust beneath the spindle and lift it and disengage the two clutch members, substantially as set forth.

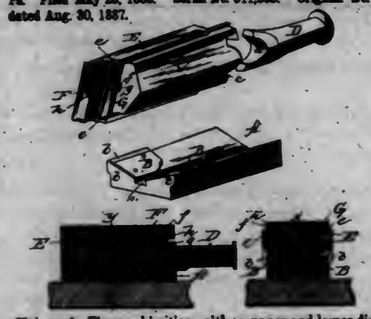


6. In a hoisting apparatus, the combination of a framing, a hollow king or main post seated thereon, a winding-drum having a hub mounted on such king-post and carrying a clutch member, a spindle journaled within the king-post, a second clutch member seated on such spindle, a throw-bar having an inclined or wedge-shaped end adapted to be thrust beneath the lower end of the spindle and lift it for the disengagement of the clutch members, and a lever for operating such throw-bar, substantially as set forth.

REISSUES.

11,024. VAPOR-BURNER. CHARLES H. CHILDS, Cleveland, Ohio. Filed May 20, 1889. Serial No. 312,667. Original No. 309,123, dated Mar. 5, 1889.

Claim.—1. The combination, with the commingling-chamber having a laterally-projecting flange and a series of radial grooves in the top surface of the flange, of a burner-cap having a series of notches or serrations in its under side, said burner-cap being adapted to rest on the flange of the said commingling-chamber, substantially as set forth.



11,024.

2. The combination, with a commingling-chamber having a laterally-projecting flange with a series of grooves on the surface of the flange, substantially as indicated, of a burner-cap having a depending rim with a serrated lower edge, said serrations being made to match the grooves of the generator-flange, and wings connected with the burner-cap for engaging the inner wall of the primary commingling-chamber to hold the cap centrally, substantially as set forth.

3. The combination, with primary and secondary induction-tubes, of valve-arms having ducts and jet-orifices, hand-valves for opening and closing the ducts, and stops mounted on the respective valve-stems, said stops overlapping and abutting each other, with the valves in open or closed position, substantially as set forth.

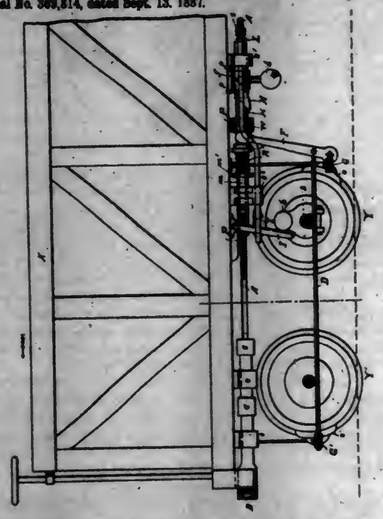
4. In a vapor-burner, in combination, the secondary generator integral with a primary generator, an induction-tube connected with the secondary generator, such tube having an upright arm for illuminating purposes, and a depression or pocket of the secondary generator for receiving the condensed vapor from such induction-tube, and for holding the same until revaporized, substantially as set forth.

11,025. DIE FOR MAKING EYE-BARS. JOHN F. KINSLEY, Athens, Pa. Filed May 23, 1889. Serial No. 311,895. Original No. 308,014, dated Aug. 30, 1887.

Claim.—1. The combination, with an upper and lower die-section, one movable over the face of the other, of an upsetting projection or plunger detachably used in connection with the moving section, substantially as described.

2. The combination, with an upper and lower die-section, one movable over the face of the other, of forming projections detachably connected to one section, and an adjustable upsetting projection carried by the moving section, substantially as described.

3. The combination, with an upper and lower die-section, one movable over the face of the other, of detachably-connected forming projections on the face of one section, and a rammer detachably connected to the moving section, having an upsetting portion extending beyond the face of the die-section, substantially as described.



4. The combination, with an upper and lower die-section angular in cross-section, of forming projections on the face of the lower section and a rammer secured to the upper section having an upsetting portion projecting below the face of the die, substantially as described.

5. The combination, with a lower die-section triangular in cross-section, and an upper die-section, also triangular in section, and a platen arranged above it, of a frame provided with rollers and having dovetailed grooves upon its inner side to engage with similarly-formed tongues on the sides of the upper die-section and platen, substantially as and for the purpose set forth.

6. The combination, with a lower die-section and upper die-section and platen, having central grooves upon their inner sides, of the roller-frame and rollers having enlarged portions to fit in the grooves of the upper die-section and platen, substantially as and for the purpose set forth

7. The combination, with the lower die-section and upper die-section having at one end recesses, as shown, of a rammer having a bifurcated end adapted to engage therewith, whereby said upper die-section is operated, substantially as and for the purpose specified.

11,026. BUFFER-BRAKE FOR RAILWAY-CARS. HOWARD S. RICHARDS, Hatfield, Pa. Filed June 22, 1889. Serial No. 315,278. Original No. 369,814, dated Sept. 13, 1887.

Claim.—1. The combination, with the brake-beams and the buffer-rod provided with a buffer-spring, arranged substantially as described, of a lever connected with said brake-beams and operated by the pushing movement of said buffer-rod through the medium of said spring, substantially as set forth.

2. The combination, with the brake-beams and the buffer-rod provided with a buffer-spring arranged to serve also as a draw-spring, substantially as described, of a lever connected with said brake-beams and operated by the pushing movement of said buffer-rod through the medium of said spring and released by the draw upon the same, all substantially as set forth.

3. The combination, with the brake-beams and the buffer-rod provided with a spring, and a sleeve H, having elliptical head *f*, of a lever connected with said brake-beams and having a bifurcated end engaging said sleeve, substantially as described, and means for turning said sleeve, all arranged and adapted to operate substantially as and for the purpose set forth.

4. The combination, with the brake-beams, the buffer-rod with spring and sleeve H, substantially as described, and lever F, connecting said rod and brake-beams, of a mechanism for automatically turning said sleeve, consisting of a rod W, arranged parallel with said buffer-rod and provided with means, as cam N, engaging an arm *g*, for turning said sleeve, lever I, and axle-crank *b*, all substantially as and for the purpose set forth.

5. In a car, the combination, with a brake-rigging operated by a buffer-rod, and a mechanism for throwing said brake-rigging out of gear, all substantially as described, of a rod W, lever I, and axle-crank *b*, all arranged to automatically operate said mechanism, substantially as set forth.

6. In a car, the draw-bar provided with spring R, sleeve L, sleeve H, with elliptical head, shoulder *m*, and weighted sleeve *y*, with arm *g*, in combination with the brake-beams and connections, lever F, rod W, lever I, and axle-crank *b*, all arranged and adapted to operate substantially as set forth.

7. In a car, the combination, with the draw-bar A and spring R, of the brake-beams and connections, the lever F, and frame P, connected with hand-wheel *z*, all substantially as set forth.

NORRIS PETERS PHOTO-LITH. WASHINGTON, D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE COE.

Decided May 27, 1889.

JOINDER OF INVENTIONS.

When one particular element of a machine is dependent upon and acts with the other elements thereof to produce a single result, it may be claimed in the same application with them without regard to the Office classification.

ON petition.

TURFING-MACHINES.

Application of Charles E. Coe filed December 13, 1888, No. 293,480.

Referred to the Assistant Commissioner, by order of the Commissioner, for hearing and decision.

Messrs. C. A. Snow & Co. for the applicant.

FISHER, *Assistant Commissioner:*

This is a petition from the action of the Primary Examiner requiring a division as to the subject-matter of claims 10, 11, and 12 of petitioner's application.

The invention in question is an implement for turfing fabrics, and all the claims, except the tenth, eleventh, and twelfth, which embrace the specific construction of the needle, cover the various parts of the implement in combination with such needle.

The examiner holds that this needle is an invention separate and distinct from the implement, and is therefore not capable of standing in the same application with it. In this the examiner is in error. The application covers but one improvement in turfing-machines instead of two. The needle is just as much a part of the implement as the crank which drives it or the open presser-foot with which it co-operates. It is not an invention independent of the devices with which it is used, but one actually depending upon and acting with them to produce a single result. This brings the case clearly within Rule 41, without regard to the consideration whether or not the needle might not finally be placed in a different class from the implement itself without the needle. To hold otherwise would sanction the dismemberment of the entire machine merely for the sake of making applicant conform to an arbitrary classification existing mainly for the convenience of the Patent Office.

Division should not be required in this case, and the prayer of the petition is granted.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

WEBSTER LOOM COMPANY *v.* E. S. & N. D. HIGGINS.

Decided July 26, 1889.

1. MEASURE OF DAMAGES—EXCEPTIONS TO MASTER'S REPORT.

The master, having found that the complainant had failed to establish by trustworthy legal proof any basis for the computation of profits, stopped his investigations upon the ground that as the defendants had destroyed the complainant's standard there could be no standard until the complainant voluntarily created one.

2. REPORT RECOMMITTED.

Report recommitted to master, with instructions to estimate the amount of profits in accordance with the rule stated in the opinion of Judge Wallace in a previous case.

Mr. Edward N. Dickerson and *Mr. Edward Stephens* for the complainant.

Mr. Livingston Gifford and *Mr. Walter K. Griffin* for the defendants.

SHIPMAN, *J.:*

The questions in this case arise upon the complainant's exceptions to the master's report. The bill is founded upon the infringement by the defendants of Letters Patent No. 130,961, dated August 29, 1872, to William Webster, for an improvement in looms for weaving pile fabrics.

In the opinion of the Supreme Court in this case (*Loom Company* v. *Higgins*, 105 U. S., 580) the history of the art and the nature of the improvement are stated so far as they were developed in the record which was then before the Court. For the better understanding of the questions which came before the master it is desirable to recapitulate that portion of the opinion.

In weaving pile fabrics—such, for example, as Brussels carpets—the pile or loop is formed by inserting a wire alternately with the filling between the threads of the warp immediately under the woolen or worsted threads, and afterward withdrawing it from the web of cloth. At first these wires were inserted and withdrawn by hand by the aid of an assistant, which made the process a very slow one, so that only a few yards could be woven in a day on a single loom. The first great improvement was introduced about 1840-'50 by Erastus B. Bigelow, of Massachusetts, who invented a mechanical apparatus attached to the side of the loom, which automatically inserted the wires in the shed or opening between the warps and withdrew them from the web. * * * The attachment to pile-fabric looms became generally known as the "wire-movement," and by its aid 35 yards a day could be woven on a single loom without the aid of any assistant. It is seldom that such a complete revolution in one of the useful arts is made at a single jump.

Improvements were made on Bigelow's invention. Among others, William Weild, of England, in about 1855, made a decided improvement, which, after being subsequently perfected, enabled 30 or 40 yards a day to be woven on a single loom. But perfect efficiency

was not attained by Weild's motion, and its defects made it necessary to work the loom more slowly than the other operations required. Webster's improvement "resulted in giving to the loom the capacity of weaving 50 yards a day."

The circuit court, in entering its decree in favor of the complainant in accordance with the instructions of the Supreme Court, directed the master, among other things, to ascertain and state to the court the number of infringing carpet-looms used by the defendants, the number of yards of carpet which they had caused to be woven thereon since October 20, 1873, and the gains or profits which they had received from infringing the exclusive rights of the complainant.

No damages were claimed by the complainant. It was agreed that the defendants had used 61 infringing looms, upon which the master finds that they had woven 8,277,012¼ yards of carpet during the 8 years they were in use.

The complainant insisted that the testimony proved that by means of the infringement the 61 looms produced 4,145,872 yards of carpet over and above what could have been—

produced on a like number of looms fitted with any other wire motion open and free to be used, and that the value of the increased product to the defendants was 36¾ cents per yard, making a total net profit of $1,523,607.96. The 36¾ cents per yard was arrived at by subtracting the entire cost of manufacturing from the selling price.

The master does not find whether the net profit which the defendants made upon their manufactured goods was 36¾ cents per yard, but was of the opinion, as matter of law, that inasmuch as the wire motion related only to an improvement and increased product in the matter of weaving, which was, although the final process, but one of many processes involved in the art of manufacturing carpets from wool, the entire profit upon the increased production from the use of the wire motion was not the rule of profits, but that the true rule was the profit to the defendants in the matter of weaving, and that the proper inquiry was the difference in the cost of weaving the increased quantity of carpet upon the infringing looms and upon any looms free and open to use. He therefore reported that there had been a failure on the part of the complainant to establish a legal basis for a computation of profits.

The complainant selected the Bigelow loom as the standard of comparison by which the amount of increased production by the use of the Webster motion should be estimated. The defendants insisted that a number of wire motions were at the date of the infringement free and open to use, either of which produced results superior to those produced either by the Bigelow or the Webster motion, and consequently that they had made no profits for which they were accountable to the complainant.

The master found that the Johnson wire motion, which had been continuously used by the Roxbury Carpet Company, of Roxbury, Mass., since 1856, until 150 looms furnished with such motions were running at the time when the testimony was taken—

was capable of producing and actually did produce results so vastly superior to the Bigelow as to utterly destroy the latter as a basis of ascertaining the gain, profits, and advantages which were realized by the defendant by reason of the infringement.

He does not find the exact amount of its superiority in point of productiveness to the Bigelow device, or the relation which the Johnson motion bore in its capacity for assisting production to the Webster motion, because he was of opinion that the defendants having shown the superiority of the Johnson motion over the Bigelow—

the burden of furnishing the means for making a computation based upon the superiority of the infringed device over all others open and free to the public use was wholly upon the complainant, and he must do it by trustworthy legal proof. Should any of the factors necessary to ascertain the computation be destroyed by defendants, a new basis must be established by the proofs or the accounting fails.

The master found nothing in regard to the relative superiority or inferiority of any of the other devices in regard to which evidence was offered. Upon both the law and facts he found that the complainant had failed to establish by trustworthy legal proof any basis for the computation of profits.

It will thus be seen that, in addition to the number of infringing looms and the number of yards manufactured thereon, the master found upon the questions of fact only the superiority of the Johnson wire motion to the Bigelow motion

The complainant excepts to all the foregoing conclusions, both of law and fact, which the master reached.

Two questions were presented for his decision: First, did the defendants derive any advantage from using the complainant's invention over what they would have had "in using other means then open to the public and adequate to obtain an equally beneficial result?" and, second, if yea, what were the fruits or the profits which resulted from that advantage? The alleged advantage is a vastly-increased capacity to produce and actual increased production of finished goods.

As the standard of pre-existing success in weaving pile fabrics the complainant selected the Bigelow motion, and apparently from the history of the litigation upon this patent in New Jersey had a right to make such selection. The defendants designated divers motions as superior to the Webster, and, furthermore, offered proof to show that the alleged capacity of the Bigelow motion was too low. From these devices the master properly gave most attention to the Johnson, because, as he says, "there is no question as to its being open and free, and because the proofs seem more direct and reliable." The Roxbury company had had no interest in this infringement, the testimony was derived from the books, which were apparently kept in the ordinary course of business, without reference to this question, during the same years in which the infringing looms were used by the defendants, and the master justly thought that the proof seemed more direct than in regard to the other motions. After having found its superiority to the Bigelow he stopped his investigations, upon the ground that, as the defendants had destroyed the complainant's standard, there could be no standard until the complainant voluntarily created one.

Whether this is or is not a correct application of the doctrine of the burden of proof in other cases I shall not inquire, because it is not, in my opinion, correctly applied to the facts in this case. The question was as to the advantage which the defendants had from the use of the patented invention, and the plaintiff said the advantage is large by reason of its superiority to the acknowledged pre-existing standard. The defendants' testimony was a comparison of the Johnson with the Webster rather than with the Bigelow. It not merely attacked the correctness of the plaintiff's standard, but by testimony which purported to be exact, definite, and mathematically accurate set up a new standard and endeavored to establish the fact that the Roxbury motion gave larger results than the patented motion. The testimony on both sides has closed, and if the Roxbury testimony was credible and was believed by the master it was not merely negative, but, in connection with the criticisms which were made upon it by the complainant's counsel and the analysis which it received from them, it was capable of giving a positive answer to the first question. If the new standard is a true standard, it is not important who introduced it into the case. The master should have found whether any advantage was derived by the defendants from the use of the patented invention over what they would have had in using the Johnson motion.

The next question is one of law, and relates to the rule for the computation of profits in case an advantage is found, or, in other words, what were the fruits of the advantage. The complainant contends that the rule is the net profit which the defendant received per yard upon the increased amount of manufactured carpets. The master thinks that it is the difference, if any, between the cost of weaving the same number of yards upon any loom with or without a wire motion which were free to be used and the cost of weaving upon the infringing looms. This question is both an important and an interesting one; but for the purposes of this case I think that it is settled in this circuit by the decision of Judge Wallace upon the motion of the defendant to direct the master not to require an account of the cost of production and the selling price of said carpets. In the opinion denying the motion Judge Wallace said:

These profits arise because, by using the patented loom, the defendants have produced more yards of carpet than they could have produced by using such looms and appliances as it was open for them to use. Upon this theory, it is to be ascertained to what extent defendants' production has been increased by the use of the patented loom, and then the average profit per yard or the aggregate profit on the increased production that actually accrued to the defendants. * * * The complainant has the right to follow the profits through all the stages of production and all the departments of their business, because the ultimate profit made by the defendants is the measure of their accountability.

This decision was directly upon the proper rule of profits in this case after an argument of the question, and its conclusions are not now open for review on my part. If any advantage is found, the amount of profit should be estimated by the master in accordance with the rule stated in the opinion of the circuit judge.

The defendants offered testimony, which was admitted, respecting the comparative advantages in point of weaving capacity of divers English looms with wire motions, which were patented in England at different dates, but were never patented in this country.

The complainant and the defendants differ upon questions of law, whether those patented devices, or any of them, or which of them, were free and open to be used, and also differ as to the time when a comparison is permitted to be made, the complainant, for example, contending that a device must be free and open at the date of the complainant's patent, and the defendants contending that if it is free and open at or during the time of the infringement, then from and after the time when it becomes free it is a proper subject of comparison.

Inasmuch as the master has found nothing in regard to these devices and is not herein directed to make a new finding respecting them, a decision of these questions is unnecessary.

The report is recommitted to the master, to make a further report in conformity with the views herein expressed.

U. S. Circuit Court—Southern District of New York.

LEGGETT *v.* STANDARD OIL COMPANY.

Decided May 15, 1889.

LEGGETT—LINING BARRELS WITH GLUE.

Letters Patent issued March 10, 1874, to Edward W. Leggett, for an improved mode of lining the inside of oil-barrels with glue, the claims for which were a process "wherein the glutinous material, instead of being produced by reduction from a previously solid state, is permitted to attain only a certain liquid consistency, and is then applied to the package and permitted to harden thereon for the first time," and "a barrel, cask, &c., coated or sized by the material, and by the mode or process whereby it is absorbed into and strengthened by the wood fiber," are void for want of invention.

ON BILL for injunction.

Mr. Edwin M. Felt and *Mr. Edward Wetmore* for the plaintiff.

Mr. Charles C. Beaman and *Mr. Edwin N. Dickerson* for the defendant.

SHIPMAN, *J.*:

This is a bill in equity to restrain the defendant from the infringement of reissued Letters Patent, applied for January 24, 1874, issued March 10, 1874, to Edward W. Leggett, for an improved mode of lining the inside of oil-barrels with glue. The original patent was dated October 21, 1873. The ordinary dried glue of commerce is usually made from the trimmings of skins, which come from slaughter-houses and tanneries, as follows: The skins are soaked in water and lime to remove the fat and grease, and are then thoroughly washed and exposed to the air, or may be treated with a solution of acid to remove the lime, for the presence of lime after it has performed its original office is exceedingly injurious to the glue. The stock is then boiled by the application of steam heat, and when the solution has been effected by boiling, the liquid glue is run into molds and allowed to set and form a jelly. The jelly is cut into slices, which are spread upon nets and dried. The drying part of the process is simply to bring the glue to a condition in which it will keep permanently and can be transported and be a merchantable article; for either liquid glue or jelly glue, unless mixed with antiseptics, quickly and easily attracts impurities from the atmosphere, decomposes, and is spoiled. In order to make glue a commercial article for general use, it must be dried. This part of the process is the most expensive, because the jelly glue is easily influenced by atmospheric changes, and when thus affected will not dry, but melts and becomes worthless. Before 1874 hydrocarbon-oil barrels were prevented from leaking by pouring into them a sufficent quantity of hot glue, rolling the barrels, and thus permitting a lining or coating of glue to be poured upon the inside of the barrels. The liquid glue for this purpose was made in the ordinary way by melting dried glue and heating the solution. The invention consisted in applying directly to the barrels hot liquid glue, or "glue soup," before it had been subjected to the cooling or drying part of the ordinary process of manufacture.

The patentee describes his invention in the specification of the reissued patent as follows:

[It] consists in preparing, from any glutinous substance, glue soup, said soup being permitted to attain but a certain consistency, and then applied directly as a coating or sizing.

In carrying out my invention I proceed as follows: Take any of the materials from which glue may be made, and proceed in the usual or any suitable manner for the manufacture of glue, until the soup has attained a certain consistency.

This consistency must be considerably less than that which is required whereby semi-fluid, solid, or cake glue is to be produced, and while it is in this half-finished state, so to speak, it is applied directly to the inside of the barrel or cask, where, after due evaporation, it will be found that said cask or barrel is lined thoroughly and completely with the material, inasmuch as a pressure of steam generated by heat applied is sufficient to force

the thin glutinous fluid or soup well into the pores, fibers, and recesses of the wood, thus insuring a perfect lining.

I am aware that barrels, &c., have been lined or coated with glue of commerce, when said glue has been subjected to a process of reduction by dilution from its original consistency to a sufficiently liquid state; but I am not aware of any process wherein the glutinous material has been permitted to attain only its proper consistency for the purpose specified, and then applied directly, thus saving the time, labor, and expense heretofore employed by continuing the manufacture of the gelatinous soup until it has attained a glutinous condition, thus necessitating a reduction by diluting and reheating before it is fit for application, as set forth in this specification, traveling over, as it were, the same ground backward and forward two or three times, whereas, by my process, this trouble is entirely dispensed with, by operating as within described.

This invention has nothing to do with the ordinary glue-lined barrel, but relates to a new and inexpensive mode or process of making barrels, casks, &c., better adapted to the purpose designed, by coating or sizing, as set forth, than by the ordinary means.

Heretofore glue has been taken in its completed state as an article of manufacture, reheated, diluted, and then applied; but such a process necessarily carries with it all the expense of preparing the glue at first as an article of trade or commerce.

My process contemplates taking the said soup when at a proper consistency and applying it to the inside of the package, permitting it to harden for the first time upon that surface.

The distinguishing feature of this improvement may be found, on examination, to be the superior integrity of the lining by the use of soup glue. By its peculiar character it is more freely absorbed by the wood, penetrating into fiber deeper than by the ordinary mode. Hence the sizing or coating is not only upon the surface, but penetrates into the wood, thereby presenting a thicker covering to the action of the oil, and this sizing is not liable to be broken off or cracked in handling the cask, as part of the coating is absorbed into the fiber and cells of the wood, which gives additional strength to it.

The claims are as follows:

1. The within-described process of coating or lining the inside of barrels, casks, &c., wherein the glutinous material, instead of being produced by reduction from a previously solid state, is permitted to attain only a certain liquid consistency, and is then applied to the package and permitted to harden thereon for the first time, substantially as herein set forth and described.

2. A barrel, cask, &c., coated or sized by the material, and by the mode or process, whereby it is absorbed into and strengthened by the wood fiber, substantially as herein described.

The patented process has been very extensively used by the defendant. Such use commenced after the date of the patent.

The question which first and most strongly presents itself is that of the patentability of the described and patented process. Upon this question the plaintiff's counsel insist that a solution of glue formed in the course of the original boiling and a solution of glue formed by dissolving the dried glue are not identical; that the latter is subject to changes only partially understood, but positive and efficient, whereby the adhesive property of the gelatine is diminished; that, although this was theoretically known at the date of the invention, and although jelly glue was, at the same date, so treated as to last without decomposition, the use of glue fresh from the tubs was unknown; that dried glue dissolved was the only thing that was used, and glue fresh from the boiling-pot was not a known substitute for dissolved dried glue in the lining of oil-barrels; that no one then knew or believed that it could be used for that purpose, but that Leggett made the practical discovery that glue in the boiling state, and before it was dried, made a more efficient and economical article for the uses of the oil-refiner than remelted dried glue, and that thus a new process was created, by which a large and expensive part of the old process was avoided. It must be regarded as proved that before the date of the invention practical experts believed that remelted dried glue was inferior in adhesiveness and binding qualities to hot and undried glue. Thus it was stated in *Wagner's Yearly Report of Chemical Technology* for 1869 (vol. 15, p. 637) that the adhesive and binding power of glue is greatly diminished in the process of drying in the air. Messrs. Wiedenhold and Plumer, two of the very intelligent witnesses on the part of the plaintiff, knew before the date of the invention that glue hot from the tubs was in the best condition and would penetrate better. It is not important to ascertain whether this inferiority is inevitable in the case of the best dried glue which had been only once remelted, because the frequent liability of glue to suffer deterioration in the process of drying, from one cause or another, is undeniable, and therefore the opinion of the experts was practically correct. While this inferiority was theoretically known, it is also true that glue hot from the tubs was not used, and that its advantages were not introduced to the public, except in the isolated instances to which reference will hereafter be made. The glue jelly manufactured by Stalling, near Dresden, in and after 1869, was a very different thing from the liquid article which is the subject of this patent. Stalling's article was a glue jelly capable of transportation, and was "extracted in a peculiar manner, entirely by treatment of bones with cold water under steam-pressure." The plaintiff, from the fact that inasmuch as the patentee was the first person who showed the public either to use or how to use the liquid article for the inside of barrels, by which a better result and a large saving of expense were effected; draws the conclusion that he is entitled to the benefits which the statutes confer upon first inventors. This conclusion would be correct if Leggett gave to the public the result of invention and did not merely give the commercial suggestions which would naturally occur to a person acquainted with the manufacture of glue. The manufacture of dried glue was a necessity, because the mechanic who has only the ordinary business of his calling must buy, rather than make, his glue. His business requirements do not compel him to be a daily consumer of a large quantity of the article, and it must therefore be purchased in a dry state. The use of hot glue as it flowed into the tubs was not practiced, because there was no occasion for such use; but when the time came that a manufacturer needed daily a very large supply of glue the suggestion of a change in the mode in which he should procure and use glue was made; but the novelty consisted in the suggestion that he should be his own manufacturer. There was no novelty in the idea of the superiority or economy of hot liquid glue, and so much of the claim of the patentee to the character of an inventor as rests upon the discovery of the superior integrity of the lining by the use of "soup glue" is fallacious. Liquid glue had never been manufactured before for daily use simply because nobody needed a large daily supply, and the idea that the patentee exercised the genius of an inventor in first practically introducing the article to the public is without adequate foundation, for it was a business rather than a mechanical suggestion. The thought that the defendant (which was a large daily consumer) could profitably be its own manufacturer of glue came both to the patentee and to Mr. Plumer, who also subsequently communicated the same idea to the defendant; but neither is entitled, on that account, to be considered an inventor, but each is rather to be regarded as having prompt ability to seize upon correct methods of conducting a large business. It is also true that there was no invention in the application of liquid glue taken freshly from the tubs to the inside of barrels. The use of such glue came naturally, and in the ordinary line of thought, to Wiedenhold when the occasion came to him to line barrels. It came also to Baumann, before the date of Leggett's invention, when he was called upon to line neat's-foot-oil barrels in Peter Cooper's glue-factory. Such use was undoubtedly occasionally practiced in that factory in other instances about the same time. The idea was the natural one which would readily occur to the intelligent mechanic in the factory. It is not strange that it did not occur to oil-refiners, for they were not glue-makers. It is not strange that it was not made public, because the occasion had not arrived for its development. It would be useless to the oil-refiner who used but a few barrels daily, for he could not afford to manufacture glue; but when the occasion arose, the proper method of doing the business naturally presented itself to the mind of a person familiar with glue-manufacture.

I do not consider whether an anticipation of Leggett's improvement is clearly proved by the facts which took place in Cooper's factory; but I place the decision upon the lack of patentable invention in the thing patented.

The bill should be dismissed.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth $10 00

INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—

DESIGNS.

19,282 and 19,283.—DISH-COVER.—*Thomas B. Atterbury*, Pittsburg, Pa. Applications filed July 29, 1889. Serial Nos. 319,068 and 319,089. Term of patents 7 years.

19,284 and 19,285.—SPOON, FORK, &c.—*George H. Balch*, Newburyport, Mass.; assignor to *The Towle Manufacturing Company*, same place. Applications filed July 15, 1889. Serial Nos. 317,644 and 317,645. Term of patents 7 years.

19,286.—BURIAL-CASE.—*Alfred W. Glass*, Detroit, Mich. Application filed July 24, 1889. Serial No. 318,557. Term of patent 3½ years.

19,287.—HANDLE FOR SPOONS, &c.—*Louis R. Horton*, Providence, R. I., assignor to *Joseph B. Knowles* and *Stephen M. Knowles*, both of same place. Application filed August 5, 1889. Serial No. 319,838. Term of patent 7 years.

19,288.—HAMES.—*Newton Kelsay*, Evansville, Ind. Application filed June 19, 1889. Serial No. 314,866. Term patent 3½ years.

19,289.—BACE-PLATE FOR SUSPENDERS.—*Thomas O. Potter*, Boston, Mass. Application filed April 15, 1889. Serial No. 307,353. Term of patent 7 years.

19,290 and 19,291.—STRAP.—*Edwin B. Stimpson*, Brooklyn, N. Y. Applications filed August 5, 1889. Serial Nos. 319,836 and 319,837. Term of patents 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,959.—LINIMENT FOR MAN AND BEAST.—*Julia A. Achard*, Lodi, Cal. Application filed June 8, 1889. Used since December 1, 1888.
"The fac-simile signature 'J A ACHARD.'"

16,960.—HOG AND POULTRY CURE.—*The Wm. Hall Medicine Co.*, St. Louis, Mo. Application filed July 5, 1889. Used since November, 1877.
"The name 'WM HALL.'"

16,961.—GRAPE-VINES, GRAPE-VINE SLIPS, AND GRAPES.—*Stephen Hoyt's Sons*, New Canaan, Conn. Application filed July 15, 1889. Used since January 1, 1869.
"The words 'GREEN MOUNTAIN.'"

16,962.—ROASTED COFFEE.—*The Indiana Coffee Company*, Indianapolis, Ind. Application filed July 22, 1889. Used since April 12, 1889.
"The word 'BANNER' and the representation, in any colors desired, of a mounted banner bearing the arms of the State of Indiana."

16,963.—UNDERWEAR.—*J. Meyer & Co.*, New York, N. Y. Application filed July 26, 1889. Used since June 1, 1889.
"The letters 'P R.'"

16,964.—PERFUMES.—*Solon Palmer*, New York, N. Y. Application filed March 11, 1889. Used since June 1, 1887.
"The words 'MAY BLOOM.'"

16,965.—OIL LAMPS OR STOVES AND BURNERS THEREFOR.—*Roughsedge Wallwork* and *Arthur Collings Wells*, Manchester and London, England. Application filed July 1, 1889. Used since January, 1888.
"The words 'WELLS LIGHT.'"

16,966.—DRY YEAST IN POWDERED FORM.—*Charm Manufacturing Company*, St. Louis, Mo. Application filed June 28, 1889. Used since April 16, 1889.
"The word 'YEASTARIDUS.'"

16,967.—CORN CURE.—*Albert B. Paulus & Co.*, Pittsfield, Mass. Application filed July 15, 1889. Used since July 1, 1889.
"The registrant's monogram surmounted by the words 'THIS DOES SETTLE 'EM.'"

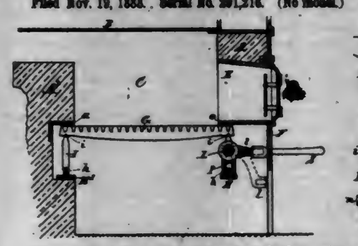
16,968.—CARTS.—*D. M. Sechler Carriage Company*, Moline, Ill. Application filed June 28, 1889. Used since March, 1886.
"The arbitrary symbol 'B-B.'"

LABELS.

6,002.—Title: "AGUE BUSTERS." (For medicines.)—*The Bolling Drug Company*, Little Rock, Ark. Application filed July 2, 1889. (Trade-Mark Registered.)

6,003.—Title: "THE HATCH ROCHESTER LEATHER COUNTER."—*James L. Hatch*, Rochester, N. Y. Application filed August 3, 1889.

6,004.—Title: "KINCAID'S CORN CURE."—*S. J. Kincaid*, Clay Center, Nebr. Application filed July 2, 1889.



6,005.—Title: "PIERCE'S SELECTED CALCINED PLASTER."—*H. H. Pierce*, Toledo, Ohio. Application filed August 5, 1889.

6,006.—Title: "HOG CHOLERA CURED." (For a medical compound.) *George Thomas* and *F. A. Stahl*, Effingham, Ill. Application filed July 1, 1889.

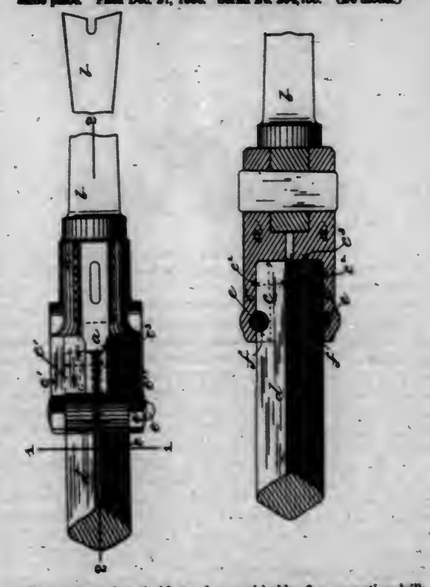
PATENTS

GRANTED AUGUST 27, 1889.

409,657. FURNACE-GRATE. GEORGE L. ALLEN, Worcester, Mass. Filed Nov. 19, 1888. Serial No. 291,216. (No model.)

Claim.—1. A furnace-grate composed of a series of grate-bars, each formed of two longitudinal webs with integral cross-pieces that project beyond the edges thereof said grate-bars having recesses in the under side at their respective ends, a series of stilt-bars having bird-mouth notches at their bottom ends and wedge-shaped top ends that match into said recesses and independently support the respective ends of the grate-bars, the carrier-girts having a wedge-shaped rib on which said stilt-bars rest, and a rocker-shaft that engages with the stilt-bars at one end of the grate by intermatching lugs and recesses, said shaft being provided with means for effecting rocking motion thereof, all substantially as set forth.

2. The combination, substantially as described, of the grate-bars, the carrier-girts, tiltable stilt-bars that independently sustain the respective ends of the grate-bars, the forward stilt-bars being furnished with laterally-projecting lugs alternately disposed above and below the central axis, the operator-shaft provided with a series of openings through which said forward stilt-bars extend, and having side grooves that engage said projecting lugs, and a tongue or socket on said shaft for the attachment of a shaker-handle, for the purpose set forth.



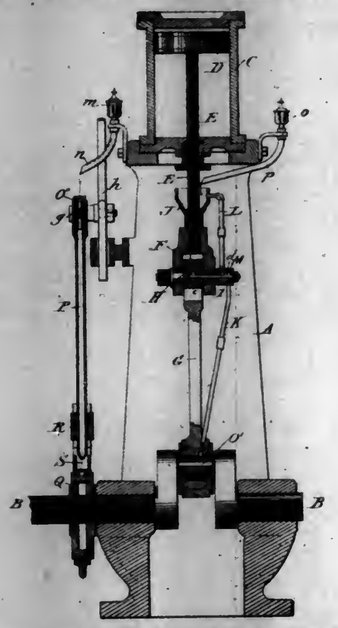
409,658. ATTACHMENT FOR DUST-COLLECTORS. ISAAC E. BAKER, Red Wing, assignor of one-half to Levi S. Hogeboom, Minneapolis, Minn. Filed Mar. 18, 1889. Serial No. 303,684. (No model.)

Claim.—1. The described attachment for dust-collectors, consisting of the vertical annular plate or cylinder B', horizontal covering-plate b', vertical annular exterior wall or plate b^2, horizontal circular top plate b^3, and vertical annular inner wall or plate b^4, such attachment having a tangential exit opening or pipe, as described.

2. In a dust-collector for flouring-mills, the combination, with the separating-chamber having central air-escape opening in the top plate thereof, of the described withdrawing attachment, consisting essentially, of walls forming a central vertical air-escape passage P, plates, as set forth, inclosing the annular overhanging, intercepting, and withdrawing passage p', and walls and plates, as specified, inclosing the annular chamber or passage p^3, overlying the vertical passage p', and provided with tangential exit-opening or passage p^5 for connection by any suitable passage or conduit with the chamber of the purifier-fan, substantially as described.

409,659. STOCK OR TOOL-HOLDER FOR DIRECT-ACTING ENGINES. GUSTAV A. BAKER, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Dec. 27, 1886. Serial No. 204,755. (No model.)

Claim.—1. A detachable stock or tool-holder for connecting drills and like tools with piston-rods, said stock having at one end a tool-socket and at the other a longitudinally-split spring rod-socket, and devices for clamping the same to the rod, substantially as described, whereby the perforation of the rod and stock at the point of greatest jar is avoided.



2. A detachable stock or tool-holder for connecting drills and like tools with piston-rods, said stock having at one end a longitudinally-split spring rod-socket and at the other end a tool-socket, and provided with a transverse slot extending into the upper end of the tool-socket, substantially as and for the purposes described.

3. A stock or tool-holder for connecting drills and like tools with piston-rods, said stock having at one end a longitudinally-split spring-socket of polygonal form for the reception of the end of the piston-rod, clamping-bolts for causing the spring-socket to grip the piston-rod, and a tool-socket at the other end provided with a transverse key-slot and key, substantially as and for the purposes described.

4. A stock or tool-holder for connecting drills and like tools with piston-rods, said stock having at one end a longitudinally-split spring-socket of polygonal form for the reception of the end of a correspondingly-shaped piston-rod having notches in its sides, clamping-bolts passing through the opposite jaws of the spring-socket for causing

them to grip the piston-rod, said bolts engaging the notches in the piston-rod, a tool-socket at the other end provided with a transverse key-slot, and a second key-slot extending into the upper end of the tool-socket at right angles to the other key-slot, substantially as and for the purposes described.

409,660. LUBRICATOR. ROBERT M. BECK, Chambersburg, Pa. Filed Nov. 30, 1888. Serial No. 292,173. (No model.)

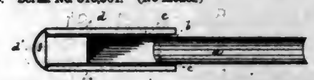
Claim.—1. In a lubricator for upright engines, in combination with the piston-rod, the cross-head, the connecting-rod, and the main crank-shaft of the engine, an oil-reservoir on the piston-rod, an attachment fastened to the cross-head pin having suitable ports and passages therein communicating with passage in said pin, and a pipe leading from the reservoir to the attachment, and also the pipe leading from the attachment to the lower end of the connecting-rod, substantially as and for the purpose described.

2. The combination, with the piston-rod, the cross-head, and connecting-rod, of an oil-reservoir on the piston-rod, cross-head pin having suitable passages therein, an attachment thereto having likewise suitable passages, a pipe extending from the reservoir to said attachment, a movable collar on said attachment, and a pipe extending from said collar to the lower end of the connecting-rod, all arranged substantially as and for the purpose described.

3. In combination with the cross-head pin having suitable passages therein, an attachment having a horizontal passage and two vertical passages connecting therewith, one of which receives oil from a stationary feeder and the other communicates with an annular groove on the attachment, and a loose collar surrounding the grooved portion of said attachment and having a pipe whereby oil is conveyed from the attachment, substantially as described.

4. In combination with a moving cross-head, a connecting-rod, a cross-head pin having suitable oil-passages therein, the attachment for said pin having suitable internal passages, an oil-supply pipe for said attachment, a movable collar surrounding the same, and the pipe attached to the collar for conveying oil from the attachment to lubricate the bearing at the lower end of the connecting-rod, substantially as described.

5. In a lubricator for upright engines, the combination, with the piston-rod having an oil-reservoir thereon, of a stationary oil-feeder for said reservoir attached to the main frame, the cross-head, connecting-rod, cross-head pin having suitable passages therein, an attachment fastened to said pin having likewise suitable passages, a pipe passing from the oil-reservoir to said attachment, a movable collar on the attachment, and a pipe attached thereto and extending to the lower end of the connecting-rod, substantially as described.



6. In combination with the cross-head pin H, having horizontal passage *e* and side passage *f*, the attachment I, screwed into the end of the cross-head pin, having horizontal passage *a* and vertical passages *b c*, said passage *b* communicating with an oil-supply and said passage *c* communicating with an annular groove on the attachment, a loose collar surrounding the grooved portion of said attachment, and a pipe fastened to the loose collar and extending to the lower end of the connecting-rod, substantially as described.

7. The combination, with the piston-rod, cross-head, cross-head pin, connecting-rod, and main engine-shaft, of the reservoir J on the piston-rod, the attachment I for the cross-head pin, the pipe L between the reservoir and said attachment, and loose collar M on said attachment, and the pipe K, fastened to the attachment and to the lower end of the connecting-rod, all substantially as described.

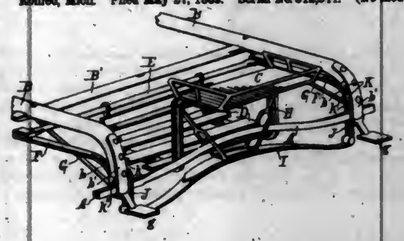
8. The combination, with the moving cross-head, the connecting-rod, and the cross-head pin having suitable passages, of the piston-rod, an oil-reservoir thereon, the attachment I for the cross-head pin having horizontal passage *a*, side passages *b c*, and annular groove *d*, the pipe L, running from the reservoir to the passage *b*, the collar M, surrounding the grooved portion of the attachment I, and the pipe K, extending from said collar to the lower end of the connecting-rod, substantially as described.

9. In a lubricator for upright engines, the combination, with the moving cross-head, its pin having the horizontal passage and a vertical passage, and the connecting-rod, of an attachment to said pin, said attachment having a horizontal passage and vertical passages, and a pipe running to said attachment from an oil-feeding device and another pipe from said attachment to the lower end of the connecting-rod, whereby the upper and lower bearings of said rod may be thoroughly lubricated, substantially as described.

409,661. BOX. MAGNUS BENAS, New York, N. Y. Filed July 3, 1889. Serial No. 316,331. (No model.)

Claim.—1. The combination of a U-shaped cover with a pair of plates *c*, secured to its inner faces, and with a drawer *a*, pivoted to said plates, substantially as specified.

2. The combination of a U-shaped cover with a strip *f*, secured to its back, and with a pair of plates *c*, secured to the inner faces of the cover, and with a drawer *a*, pivoted to said plates, substantially as specified.



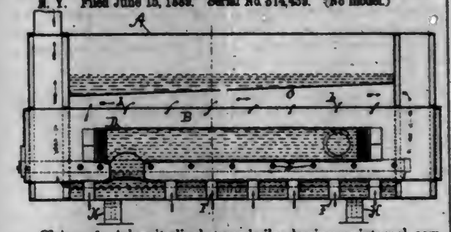
409,662. EXTENSION-TABLE. WILLIAM BLANKNER, Columbus, Ohio. Filed Jan. 5, 1889. Serial No. 295,532. (No model.)

Claim.—1. In an extension-table, the combination, with the frame, its arms *b* and *d*, stationary top portions *c*, and rolling top portions *e*, connected therewith, of the bars *f*, having blocks *g*, on which arms *d* and *b* are adapted to slide, as described, rods *i*, loosely supported against arms *b*, cross-rods *k*, having rollers *m* thereon, brace-rods *n*, connecting rods *k* and bars *f*, blocks *q q*, and connecting central transverse plate *r*, substantially as and for the purpose specified.

2. In an extension-table, the combination, with the frame having legs *a*, and dogs *s*, pivoted to the latter, of the rod *t*, loosely supported against said leg or frame and having its lower ends pivotally connected with said dogs, as described, substantially as and for the purpose set forth.

409,663. ROAD-CART. GEORGE W. BRAND and LORING M. SMITH, Romeo, Mich. Filed May 27, 1889. Serial No. 312,311. (No model.)

Claim.—1. In a road-cart, the combination, with the shafts and a semi-elliptic spring located beneath the axle and supporting the crate or body, of loops located on the ends of said spring, and one or more hooks located on the rear end of each shaft and adapted to engage said loops, the construction being such that the spring, and consequently the crate or body, may be adjusted to a higher or lower level, as desired, substantially as described.



2. In a road-cart, the combination, with the shafts, a semi-elliptic spring located beneath the axle, and uprights engaged to said spring and supporting the crate or body, of a loop engaged to the ends of said spring and embracing the axle, and a series of hooks located at the rear ends of the shafts and adapted for engagement with the loops, substantially as described.

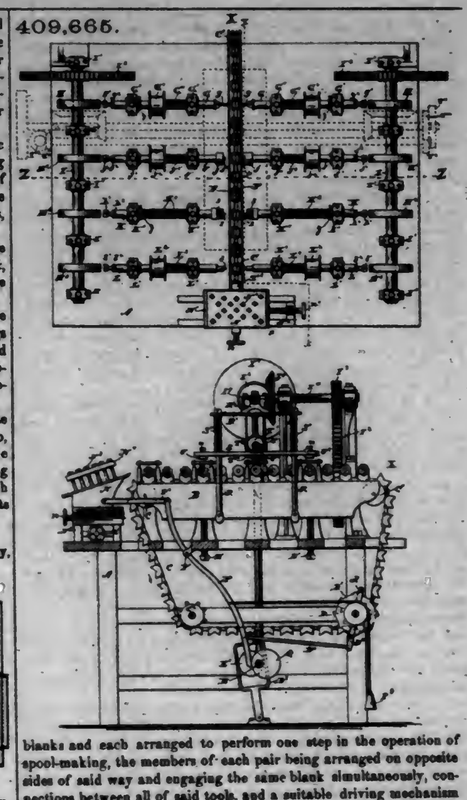
3. In a road-cart, the combination, with the shafts, of the plate K, attached to the inner face of the shaft and provided with hooks *k*, said plate passed beneath the ends of the shafts *k'* and up along the opposite sides at *k*, substantially as described.

4. In a road-cart, the combination, with the shafts and the crate or body, of springs fastened to the under side of the shafts, said springs at their heels constituting the forward shaft-irons for stiffening and strengthening the shafts and at their forward ends secured to and supporting the forward end of the crate or body, substantially as described.

5. In a road-cart, the combination, with the shafts and the crate or body, of springs located beneath the shafts and fastened thereto, said springs at their forward ends engaged with and supporting the forward end of the crate or body and at their rear ends constituting the forward shaft-irons, and with their extreme ends passed through the brace-rods and constituting a part of the clips by which the shafts are engaged with the axle.

409,664. STEAM-GENERATOR. WALTER M. BROWN, Albany, N. Y. Filed June 15, 1889. Serial No. 314,439. (No model.)

Claim.—1. A longitudinal steam-boiler having an internal combustion-chamber running practically the whole length of the boiler and having passage-ways leading from the outside of said boiler to the interior of the internal combustion-chamber and along its length, in combination with burners for the combustion of gas or oil arranged outside of said boiler and along its length, said burner being introduced through said passage-ways leading into the interior of said combustion-chamber in order that the gas or oil flame may be projected into said combustion-chamber and along its length, substantially as described.



2. A longitudinal steam-boiler having an internal combustion-chamber running practically the length of the boiler and having passage-ways leading from the outside of said boiler to the interior of the internal combustion-chamber and along its length, and having other passage-ways leading from the interior of the combustion-chamber along its length through the steam and water space to the outside of said steam and water space that the products of combustion may escape, in combination with burners for the combustion of gas or oil arranged outside of said boiler and along its length, said burners being introduced through said passage-ways leading into the interior of said combustion-chamber, in order that the gas or oil flame may be projected into said combustion-chamber and along its length, substantially as described.

3. A longitudinal steam-boiler having an internal combustion-chamber running practically the whole length of the boiler and having passage-ways leading from the outside of said boiler to the interior of the internal combustion-chamber and along its length, in combination with burners for the combustion of gas or oil arranged outside of said boiler and along its length, said burners being in proximity to said passage-ways, in order that the gas or oil flame may be projected through said passage-ways into said combustion-chamber and along its length, substantially as described.

409,665. SPOOL-MACHINE. EMERSON P. BROWNELL, Beebe Plain, Quebec, Canada. Filed Mar. 17, 1888. Serial No. 267,521. (No model.)

Claim.—1. In a spool-machine, the combination, with a straight-way and a continuous carrier moving intermittingly thereon, having pockets in which the blanks are contained during the operations, of a series of co-operating pairs of tools operating successively upon the

409,665.

blanks and each arranged to perform one step in the operation of spool-making, the members of each pair being arranged on opposite sides of said way and engaging the same blank simultaneously, connections between all of said tools, and a suitable driving mechanism causing them to retreat and advance simultaneously and between the carrier and driving mechanism for causing the feed while the tools are separated, substantially as described.

2. In a spool-machine, the combination, with the straight way or guide, a continuous carrier moving intermittingly thereon, having pockets in which the blanks are contained during the operations, of a series of co-operating pairs of tools operating successively upon the blanks and each arranged to perform one step in the operation of spool-making, the members of each pair being arranged on opposite sides of the way and operating simultaneously upon the same blank, devices—such as cams—for causing the simultaneous approach and permitting the separation of the tools, a presser for holding the blanks rigidly upon the carrier while being operated upon by the series of pairs of tools, and connections between the carrier and driving mechanism, the tool-operating devices, and the presser, whereby the blanks will be fed only while the tools are retracted, substantially as described.

3. The combination, with the straight way or guide and a continuous blank-carrier having pockets in which the blanks are contained during the operations, of a series of co-operating pairs of tools, each pair constructed to perform a single step in the operation of making spools and the members of each pair arranged on opposite sides of the way to operate simultaneously on the ends of the blanks between them, devices—such as cams—for causing the simultaneous approach of the members of all the pairs and permitting their operation, a presser for holding all the blanks being operated on by said pairs of tools stationary upon the carrier, intermittingly-operating mechanism for moving the carrier forward, and connections between the last-mentioned devices, the presser, and the tool-projecting mechanism, whereby the carrier will be moved forward while the tools are retracted and the presser removed, substantially as described.

4. In a spool-machine, the combination, with the blank-carrier, of the series of pairs of co-operating tools for successively operating upon the ends of the blanks, the members of each pair being located on opposite sides of the carrier, said series comprising a pair of boring-bits, a pair of reciprocating circumferential cutting-dies for shaping the ends of the blanks circumferentially, and a pair of blank-holding centers, devices—such as cams—for causing the simultaneous approach

and permitting the separation of the tools, intermittingly-operating mechanism for feeding the carrier forward past the tools in the order named and while they are separated, a presser operating upon the blanks located between the boring-bits, and cutting-dies for holding the blanks stationary while being acted upon, and connections between the carrier-operating mechanism, the presser, and the tool-projecting devices, whereby the presser will be operated and the tools caused to approach and operate upon the blanks between them while the carrier is stationary and the presser in engagement with the blanks, substantially as described.

5. In a spool-machine, the combination of the straight way or guide, the continuous flexible carrier moving thereon, the series of pairs of co-operating tools for operating upon the ends of the blanks, the members of each pair being located on opposite sides of the carrier, said series comprising a pair of boring-bits, a pair of cutting and circumferential embossing-dies for shaping the ends of the blank circumferentially and embossing it, and a pair of blank-holding centers having a centering-pin and suitable characters in relief for entering the blank and rotating it, devices—such as cams—for causing the approach and permitting the separation of the tools, and intermittingly-operating mechanism for feeding the carrier forward past the tools in the order named, substantially as described.

6. In a spool-machine, the combination of the straight guide or way, the continuous flexible blank-carrier moving therein, the series co-operating tools for operating upon the ends of the blanks on the carrier, the members of each pair being located on opposite sides of the carrier, said series comprising a pair of blank boring-bits, a pair of circumferential cutting-dies for shaping the ends of the spool circumferentially, and a pair of blank-holding centers, devices—such as cams—for causing the approach and permitting the separation of the tools, a presser operating upon the blank located between the boring-bits and cutting-dies, a carriage supporting a turning-tool and movable toward and from the blank held between the blank-holding centers, and a connection between the various parts whereby the members of the pairs of tools are caused to approach to operate upon the blanks on the carrier between them, the presser holds its blank, and the turning-tool is brought forward to operate upon the blank between the centers while the carrier is stationary, and all said tools are in retracted position while the carrier moves forward, substantially as described.

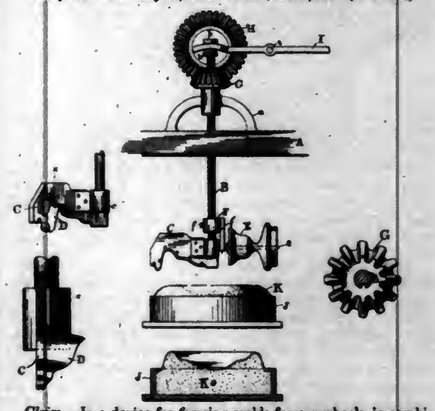
7. The combination of the straight way or guide, the continuous blank-carrier moving thereon, the series of pairs of co-operating tools for operating upon the ends of the blanks, the members of each pair being located on opposite sides of the carrier, said series comprising a pair of boring-bits, a pair of blank facing-tools, a pair of circumferential cutting and embossing dies, and a pair of blank-holding centers, connections for rotating the bits, facing-tools, and holding-centers, devices—such as cams—for causing the approach and permitting the separation of the tools, intermittingly-operating mechanism for feeding the carrier forward past the tools in the order named, a carriage carrying a turning-tool, a presser operating upon the blanks located between the bits, the facing-tools, and the cutting-dies, and connections between the parts whereby when the carrier is stationary the presser will hold the blanks, the tools of the series will be caused to approach and operate upon the blanks between them, the turning-tool moved forward to operate on the blank between the centers, and all said parts will return to normal position, when the carrier will move forward and present a new blank to be operated upon by each of the tools, substantially as described.

8. In a spool-machine, the combination, with a blank-carrier, of a series of tools operating upon blanks carried by said carrier in succession, comprising a pair of boring-bits entering the blanks from opposite ends, a pair of cutting-dies, arranged to shape the spool ends a pair of turning-centers, two shafts at right angles to the spindles having the series of cams thereon operating on opposite spindles for causing the simultaneous approach, set-screws regulating the extent of such approach, and a reciprocating turning-tool, substantially as described.

9. In a spool-machine, the combination, with the horizontally-moving blank-carrier, of the series of pairs of co-operating tools arranged with the members of each pair on opposite sides of the carrier, mechanism, substantially as described, for causing the feed of the carrier intermittingly, a presser-plate moving on vertical ways above and at right angles to the carrier and adapted to rest upon one or more blanks on the carrier and hold them while being operated upon by the tools, and a cam for causing the operation of said plate, substantially as described.

10. In a spool-machine, the combination, with the blank-carrier, of a series of pairs of co-operating tools arranged with the members of each pair on opposite sides of the carrier, mechanism, substantially as described, for causing the feed of the carrier intermittingly, and a plate moving on vertical ways above the carrier, carrying one or more adjustable presser-feet adapted to rest upon one or more blanks on the carrier and hold them while being operated upon, a cam for causing its operation, and a spring for returning said plate to normal position, substantially as described.

11. In a spool-machine, the combination, with a pair of annular cutters for operating on opposite ends of the blank to give the proper circumferential shape thereto, of embossing-dies within said cutters for embossing the end of the spool while being cut, substantially as described.



12. In a spool-machine, the combination, with the pair of annular cutters operating to shape the ends of the spool-blank, of the dies contained within them, their operating-faces being substantially parallel with and below the plane of their cutting-edges, and the cams for causing the gradual approach of the cutters and dies, the cams being provided with the projections thereon for causing the sudden forward movement of the dies, substantially as described.

13. The combination of the spindle, the centering-pin, the removable embossing-die, the removable annular cutter extending beyond the die, and the screw or similar device passing through both center and die for holding the die and cutter in position on the spindle, substantially as described.

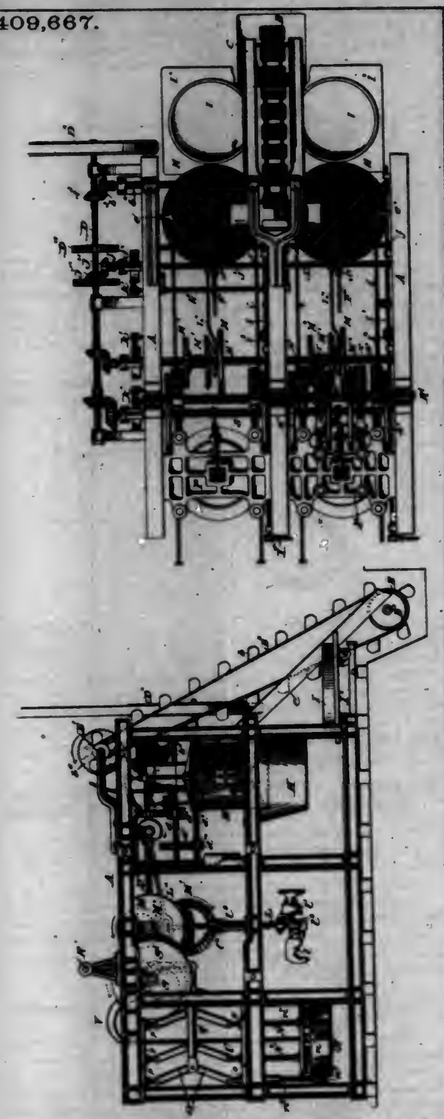
14. In a spool-machine, the combination of the main frame, a longitudinally-movable blank-carrier, and mechanism for moving it intermittingly, of a series of pairs of operating-tools located on the main frame and on opposite sides of the carrier, a stationary way or support on which the carrier runs, a presser for holding the blanks on the carrier connected to the way, means, substantially as described, for operating it when the carrier is stationary, and means, substantially as described, for adjusting the way on the frame toward the tools, substantially as described.

15. In a spool-machine, the combination, with the series of pairs of co-operating tools for operating upon the blanks in succession and shaping their ends, of a continuous carrier arranged between the tools, having pockets with the inclined sides, the bisector of the angles formed by the sides intersecting at right angles the tool-centers, and means for adjusting said carrier at right angles with said centers, whereby blanks of different sizes may be operated upon by adjusting said carrier, substantially as described.

409,666. MOLD-FORMING DEVICE. JOSEPH J. CARR, Wilkes-Barré, Pa., assignor to the Wilkes-Barré Molding Machine Company, same place. Filed May 31, 1888. Serial No. 275,644. (No model.)

Claim.—In a device for forming molds for car-wheels, in combination, a vertical shaft, a roller and a sweeper-arm which radially and horizontally project from the lower end of said shaft, the lower face of the arm and the outline of the roller corresponding to the configuration of the mold to be produced, a projecting flange attached to one side of the arm and following the curvature of the lower face thereof, and vertically-adjustable devices for attaching the roller to the shaft, substantially as set forth.

409,667. MACHINE FOR MAKING SAND MOLDS. JOSEPH J. CARR, Wilkes-Barré, Pa., assignor to the Wilkes-Barré Molding Machine Company, same place. Filed Oct. 25, 1888. Serial No. 289,156. (No model.)



Claim.—1. In a machine for making sand molds, in combination, a sand receiver and deliverer, a sweep mounted to be reciprocated and rotated, a pattern, a driving-shaft, trains of mechanism leading from the driving-shaft to said devices to operate them in due order, a flask, and means for conveying the flask through the machine, substantially as set forth.

2. In a machine for making sand molds, in combination, a sand receiver and deliverer, a sweep mounted to be reciprocated and rotated, a pattern, a driving-shaft, a separate train of mechanism leading from the driving-shaft to each of said devices, means for throwing each of said trains of gearing into and out of operation, a flask, and means for conveying the flask through the machine, substantially as set forth.

3. In a machine for making sand molds, in combination, a sand receiver and deliverer, a sweep mounted to be reciprocated and rotated, a pattern, a driving-shaft, a separate train of mechanism leading from the driving shaft to each of said devices, a clutch mounted in each of said trains of mechanism, and means for automatically throwing said clutch into and out of bite, substantially as set forth.

4. In a machine for making sand molds, in combination, a sand receiver and deliverer, a sweep mounted to be reciprocated and rotated, a pattern, a driving-shaft, a separate train of mechanism leading from the driving-shaft to each of said devices, a truck for conveying the flask through the machine, a clutch forming part of each of said trains of mechanism, and clutch-controlling mechanism constructed to be thrown into or out of action by the travel of said truck, substantially as set forth.

409,667.

5. In a machine for making sand molds, in combination, a sand receiver and deliverer, a sweep mounted to be reciprocated and rotated, a pattern, a driving-shaft, a separate train of mechanism leading from the driving-shaft to each of said devices, a clutch mounted in each of said trains of mechanism, a truck for conveying the flask through the machine, a train of clutch-operating devices mounted in connection with each of said clutches, and toes forming part of each of said train of clutch-operating devices, and which project into the path of, so as to be encountered by, the truck, substantially as set forth.

6. In a machine for making sand molds, in combination, a sand receiver and deliverer, a pattern, a driving-shaft, a separate train of mechanism leading from the driving-shaft to each of said devices, a clutch mounted in each of said trains of mechanism, a truck for conveying the flask through the machine, a train of clutch-operating devices mounted in connection with each of said clutches, and toes forming part of each of said trains of clutch-operating devices, and which project into the path of, so as to be encountered by, the truck, substantially as set forth.

7. In a machine for making sand molds, in combination, a sweep mounted to be reciprocated and rotated, a pattern, a driving-shaft, a separate train of mechanism leading from the driving-shaft to each of said devices, a clutch mounted in each of said trains of mechanism, a truck for conveying the flask through the machine, a train of clutch-operating devices mounted in connection with each of said clutches, and toes forming part of each of said trains of clutch-operating devices, and which project into the path of, so as to be encountered by, the truck, substantially as set forth.

8. In a machine for making sand molds, in combination, mechanisms constructed and arranged to form and compress sand contained in a flask mounted upon a truck which is propelled through the machine, separate trains of gearing communicating power from a suitable source to each of said mechanisms, a clutch mounted in each of said trains of gearing, each clutch consisting of two members, one of which members is provided with peripheral seats, a coupling-plunger mounted upon the opposing member of the clutch and adapted to fit said seats, and means for controlling the movement of said coupling-plunger, substantially as set forth.

9. In a machine for making sand molds, in combination, a truck to convey the flask through the machine, mechanisms which form and compress sand in a mold, trains of gearing which operate said mechanisms, a clutch mounted in each of said trains of gearing, a series of peripheral seats in one clutch member, a coupling-plunger pivotally mounted upon the other clutch member, a clutch-arm constructed, when in the path of the coupling-plunger, to be encountered by and raise and hold the same from engagement with the peripheral seat-provided clutch member, a shaft upon which said clutch-arm is mounted, an arm projecting from said shaft, and a depending rod attached to said projecting arm and having its lower extremity equipped with a projection which extends into the path of the truck, substantially as set forth.

10. In a machine for making sand molds, in combination, a sand-receiver provided with a removable bottom mounted independently of the receiver upon a depending rod, and a lever-arm to which the upper end of said rod is secured, substantially as set forth.

11. In a machine for making sand molds, in combination, a sand-receiver provided with ribs on its side, arms into which the said ribs fit, a removable bottom, a depending rod, the lower end of which is secured to said bottom, a lever-arm to which the upper end of said rod is secured, a counter-weight attached to said lever-arm, and a cam-wheel bearing against said lever-arm, substantially as set forth.

12. In a machine for making sand molds, in combination, a sand-receiver provided with a removable bottom mounted independently of the receiver upon a depending rod, upon which bottom the receiver rests when being filled with sand, and means for at the proper time causing the rod to descend and lower the bottom and receiver until the receiver reaches the limit of its movement and the bottom descends below the receiver, so as to permit the escape of the sand, substantially as set forth.

13. In a machine for making sand molds, in combination, a sand-receiver, a removable bottom, a depending rod, the lower end of which is secured to said bottom, a lever-arm to which the upper end of said rod is secured, a cam-wheel bearing against said lever-arm, a shaft upon which said cam-wheel is mounted, a main driving-shaft, gearing for connecting the main driving-shaft with the cam-shaft, and a clutch for throwing said gearing into and out of operation, substantially as set forth.

14. In a machine for making sand molds, in combination, an open-topped receiver provided with a removable bottom supported by a depending rod extending up to a lever-arm, to which it is attached, and a spider-casting clasping the upper end of the receiver and embodying a guideway for the depending rod, substantially as set forth.

15. In a machine for making sand molds, in combination, a flask,

a receiver arranged to descend and provided with a removable bottom, means to cause said bottom to descend below the receiver, and a hood situated beneath the receiver, adapted to direct the sand from the receiver into the flask, substantially as set forth.

16. In a machine for making sand molds, in combination, rails, a truck adapted to said rails, a spring-bolt mounted upon said truck, a rotatable rod extending parallel to said rails, and bolt-receivers mounted upon said rod, substantially as set forth.

17. In a machine for making sand molds, in combination, a sweep mounted upon a vertical shaft, gearing connected to said vertical shaft, the operation of which causes its descent, gearing connected to said vertical shaft, the operation of which causes its rotation, a power-shaft mounted in connection with said gearing, a clutch mounted in connection with said gearing, clutch-operating devices, a track supporting the flask, and a trip adapted to be encountered by the truck, substantially as set forth.

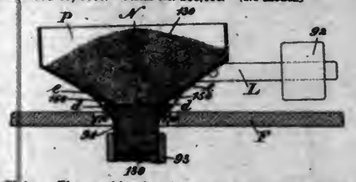
18. In a machine for making sand molds, in combination, a sweep mounted upon a vertical shaft, a link in which the end of said shaft is entered, a wheel provided with a camway in which a projection on said link is entered, and a steadying-arm attached to or forming part of said link and having its outer portion attached to a suitable point of support, substantially as set forth.

19. In a machine for making sand molds, in combination, a pattern, elbow-joints secured to said pattern and to a supporting-plate, links connecting adjacent elbow-joints, reciprocating rods connected to the elbows, rock-arms connected to the reciprocating rods, cam-toes on said rock-arms, cam-grooved wheels in which said cam-toes are engaged, a shaft on which said cam-grooved wheels are mounted, and means for throwing said shaft into and out of operation, substantially as set forth.

20. In a machine for making sand molds, in combination, elbow-joints secured to a pattern and to a supporting-plate, reciprocating rods connected to the elbows, rock-arms connected to the reciprocating rods, cam-toes on said rock-arms, cam-grooved wheels in which said cam-toes are engaged, a shaft on which said cam-grooved wheel is mounted, means for throwing said shaft into and out of operation, a lifting rod attached to the pattern, a lever-arm to which said lifting rod is attached, and means for operating said lever-arm, substantially as set forth.

21. In a machine for making sand molds, in combination, elbow-joints secured to a pattern and to a supporting-plate, reciprocating rods connected to the elbows, rock-arms connected to the reciprocating rods, cam-toes on said rock-arms, cam-grooved wheels in which said cam-toes are engaged, a shaft on which said cam-grooved wheels are mounted, means for throwing said shaft into and out of operation, a lifting rod attached to the pattern, a lever-arm to which said lifting rod is attached, and a cam-wheel bearing against said lifting rod, substantially as set forth.

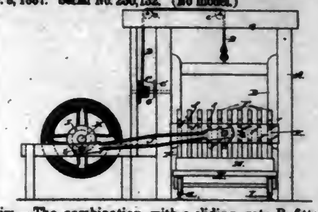
22. In a machine for making sand molds, in combination, a pattern consisting of two independently-moving parts, each of which presses upon a given part of the sand, elbow-joints connected to said patterns and to the supporting-plate, reciprocating rods connected to the elbow-joints of the main pattern, separate reciprocating rods connected to the elbow-joints of the sectional pattern, rock-arms attached to the reciprocating rods of the main pattern, separate rock-arms attached to the reciprocating rods of the sectional pattern, separate cam-grooves in which the cam-toes on said respective rock-arms are engaged, a lifting rod the lower end of which is attached to the main pattern, a lever-arm to which the upper end of said lifting rod is secured, a pivot for said lever-arm, and a cam mounted on the cam-grooved-wheel shaft by which said lever-arm is tilted, substantially as set forth.



23. In a machine for making sand molds, in combination, a pattern, a supporting-plate, elbow-joints secured to said pattern and said supporting-plate, a lifting rod attached to said pattern, and mechanism for causing the lift and drop of said lifting rod, substantially as set forth.

24. In a machine for making sand molds, in combination, a pattern, a supporting-plate, elbow-joints secured to said pattern and said supporting-plate, a lifting rod attached to said pattern, a lever to which the upper end of said lifting rod is attached, and a cam which is adapted to operate said lever, substantially as set forth.

409,668. PURIFYING ALUMINIUM CHLORIDES. HAMILTON Y. CASTNER, London, England. Filed Mar. 19, 1889. Serial No. 303,901. (No specimens.)



Claim.—The hereinbefore-described process of purifying anhydrous chlorides of aluminium, which consists in melting said chlorides with a suitable quantity of a metal, as aluminium or sodium, adapted to reduce the contained iron to a metallic state, and then separating it, substantially as described.

409,669. REGULATOR FOR GRAIN-SCALES. CHARLES H. COOLEY, Hartford, Conn., assignor to the Pratt & Whitney Company, same place. Filed Oct. 15, 1888. Serial No. 288,160. (No model.)

Claim.—The combination, in a regulator apparatus of the class described, of the vertically-movable hopper, the fixed conduit below said hopper, and the flexible connecting-pipe having its upper end outwardly flaring and joined to said hopper around and above the discharge-opening, whereby there is provided a space around the opening in the hopper and within said flaring part, all substantially as described.

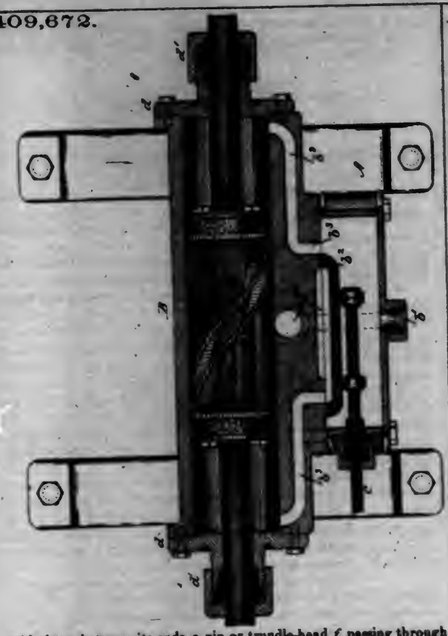
409,670. MACHINE FOR SAWING STONE. GEORGE A. DAVIDSON, Malden, assignor of one-half to Horace T. Caswell, Troy, N. Y. Filed Mar. 8, 1887. Serial No. 230,132. (No model.)

Claim.—The combination, with a sliding gate B, fitted to move up and down in or on the frame-work A and provided with a guide *b*, of a reciprocating cutter-head E, fitted to slide on said guide and provided with a series of rigid pendent cutters F, which are made of flat bars of metal having parallel edges, and which are spaced apart and held in a rigidly vertical position by ribs *e* on said cutter-head, said cutters being fitted to receive a vertical adjustment in said cutter-head independently of the up-and-down feeding movement of the latter, as and for the purpose specified.

409,671. ARTIFICIAL TOOTH-CROWN. SETMOUR R. DEWEY, Cleveland, Ohio. Filed Mar. 18, 1889. Serial No. 303,636. (No model.)

Claim.—The combination of the root A and artificial crown B with a hollow post C, said post being interiorly threaded at one end to receive a retaining-screw D, and cut away near the opposite end, as at *a*, the parts being constructed, arranged, and operating as and for the purpose described.

409,672. STEAM-ENGINE. NATHAN H. EDGERTON, Philadelphia, Pa. Filed June 25, 1888. Serial No. 278,167. (No model.)



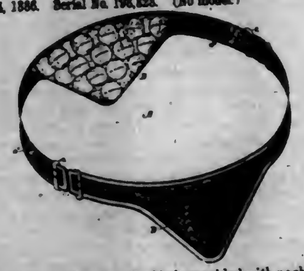
Claim.—1. The combination, with a steam-cylinder B, of a shaft D, having bearings in the ends or heads of the cylinder, the reciprocating piston E on and engaging with shaft D, a spirally-formed groove in the periphery of said piston, said groove being located between the packed or steam-tight ends for said piston, and a pin or trundle-head *f*, projecting from one of the cylinder sides into said groove, substantially as set forth.

2. In a steam or other engine, a cylinder, a shaft having bearings in the cylinder heads or ends, a sliding or reciprocating piston on said shaft, a spirally-formed groove on the periphery of the piston and between its ends, and a pin or trundle-head on the cylinder engaging with said piston-groove for imparting a rotary motion to the piston and shaft as the piston reciprocates on the shaft, substantially as set forth.

3. In combination with an engine-cylinder B, having closed ends *b*, the shaft D, passing through and having bearings in said ends, a reciprocating piston E, having steam-tight or packed ends mounted on said shaft, a spirally-formed groove in the periphery of said piston between its ends, and a pin or trundle-head *f*, passing through the side of the cylinder at or near its transverse center, and valves actuated by said shaft, substantially as set forth.

4. In combination with an engine-cylinder having closed ends *b*, shaft D, having bearings in said ends *b*, sliding piston E on and engaging with said shaft, a spirally-formed groove in the periphery of

409,672.

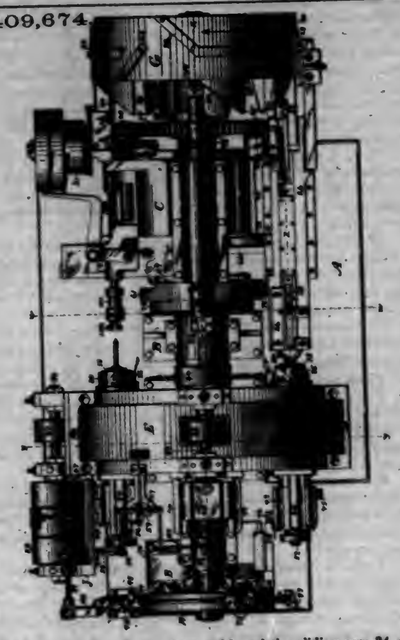


said piston between its ends, a pin or trundle-head *f*, passing through the side of the cylinder and engaging with said piston-groove, cut-off valves for said cylinder, and actuating mechanism interposed between the valves and said shaft, substantially as set forth.

5. In combination with an engine-cylinder B, a shaft D, having bearings in the cylinder heads or ends, and having an angular cross-section between its said bearings, a reciprocating piston E on said shaft having a corresponding angular bore and exterior or outer packed or steam-tight ends, a spirally-formed groove on the periphery of said piston between its ends, and cylinder-pin *f*, engaging with said piston-groove, substantially as and for the purpose set forth.

6. The combination, with an engine-cylinder shaft, of a reciprocating piston E on said shaft having packed or steam-tight joints, with the cylinder and peripheral spiral groove between said ends, a cylinder-pin *f*, for engagement with said piston-groove, and valves for the cylinder actuated by said shaft, substantially as set forth.

409,673. ELECTRIC BELT. CHARLES EVERETT, Denton, Tex. Filed Apr. 14, 1886. Serial No. 198,828. (No model.)



Claim.—The within-described belt provided with pockets B, made of lace or equivalent very thin material, combined with the piles C, each constructed of rear copper plates *c*, nickel-plated on one side, and the forward plate *c'*, of zinc and of the same size and thickness as the copper plates, and the wires *d*, connecting said plates, whereby when said belt is in use the said piles come directly, or substantially so, against the body of the wearer.

409,674. METAL-SCREW MACHINE. GEORGE A. FAIRFIELD and GEORGE R. WITHERELL, Hartford, Conn., assignors to the Hartford Machine Screw Company, same place. Filed May 1, 1888. Serial No. 309,168. (No model.)

Claim.—1. The combination of an intermittently-revolving head, a series of spindles mounted therein and provided with holding-jaws

409,674.

and series of cams 35, the hopper 26, and the sliding cam 34, acting upon confronting edges of the cams 35, substantially as described, and for the purpose specified.

2. The combination of an intermittently-revolving head, a series of spindles mounted therein and provided with holding-jaws, the hopper 26, sliding cam 34, and the cams 35, in the form of a ring, circumferentially adjustable on the spindles, substantially as described, and for the purpose specified.

3. The combination of the intermittently-revolving head, a series of spindles mounted therein, the hopper 26, its plunger 29, the hollow slide 31, for receiving the shank of the plunger, the spring 118, and mechanism for reciprocating said hollow slide and plunger, substantially as described, and for the purpose specified.

4. The combination of the hopper 26, the plunger 29, the screw-adjustable head 30 at the end of said plunger, and mechanism for reciprocating said plunger and head, substantially as described, and for the purpose specified.

5. The combination of a revolving head, the head-operating disk 61, mechanism for oscillating said disk a given fractional part of a revolution, the pawl 70, mounted on said disk, the locking-disk 72, provided with a ratchet for engagement with said pawl and locking-recesses 74, a locking-bolt 75, provided with pin 76, and the hinged cam 78, hinged to said head-operating disk and acting to withdraw said locking-bolt, substantially as described, and for the purpose specified.

6. The combination of an intermittently-rotating head, a series of spindles mounted therein, the crank-pin disk 64, cross-head 67, pitmen 66 and 69, head-operating disk 61, pawl 70, mounted thereon, the hinged cam 78, also mounted on said disk, the locking-bolt 75, and the locking-disk 72, provided with the ratchet and locking recesses, substantially as described, and for the purpose specified.

7. The combination of the spring-pressed locking-bolt 75, its pin or projection 76, the locking-disk 72, provided with notches or recesses and a ratchet, the head-operating disk 61, the pawl 70, mounted thereon, the cam 78, provided with a rabbet 81, the spring 79, for pressing said cam against the disk 61, and mechanism for oscillating said disk, substantially as described, and for the purpose specified.

8. In a machine for threading screws, the combination of the threading-slide 100, mechanism for forcing said slide to its work, the laterally-projecting pin 103, and the adjustable ledge 104, for being engaged by said pin, substantially as described, and for the purpose specified.

9. In a machine for threading screws, the combination of the threading-slide 100, mechanism for forcing said slide to its work, the laterally-projecting pin 103, the adjustable ledge 104, for being engaged by said pin, the pivoted piece 106, provided with a stop-joint

at the end of said ledge, and the spring 107, substantially as described, and for the purpose specified.

10. In a machine for threading screws, the combination of the threading-slide 100, mechanism for forcing said slide to its work, the laterally-projecting pin 108, mounted on said slide, the adjustable ledge 104, the longitudinal shoulder 106, and the spring-pressed pawl 109, for engaging said shoulder, substantially as described, and for the purpose specified.

11. In a machine for threading screws, the combination of the threading-slide 100, the attachable and detachable follower 113, arranged to slide in alignment with said slide, and the cams 24, for pressing upon said follower, substantially as described, and for the purpose specified.

12. The combination of an intermittently-revolving head, a series of spindles mounted therein, the hopper 26, plunger 29, tool-bearing slides 94 and 100, mechanism for driving the spindles when in alignment with said slides, the central shaft D, and the cam-pulley G, substantially as described, and for the purpose specified.

13. The combination of the intermittently-revolving head, a series of spindles mounted therein and provided with friction driving-wheels, the driving-shaft 83, having friction driving-pulley 85, acting upon said wheels at one point for driving them continuously in one direction, the driving-shaft 86, having friction driving-pulley 87 at another point, and shipping mechanism for changing the motion of said driving-shaft 86 to drive the spindles first in one direction and then reversing their motion, substantially as described, and for the purpose specified.

14. The combination of an intermittently-revolving head, a series of hollow spindles mounted therein, the sleeves 37, having spring-jaws 36 and lugs 38, the angle-levers 40, engaging said lugs, the cones 42, and operating mechanism, substantially as described, and for the purpose specified.

15. The combination of an intermittently-revolving head, a series of hollow spindles mounted therein, the sleeves 37, having spring-jaws 36 and lugs 38, the angle-levers 40, engaging said lugs, the cones 42, the sliding carriages 43, carrying said cones, the rollers and projections 45 and 46, stationary cam 47, slides 48, and cams 49 on the cam-wheel H, substantially as described, and for the purpose specified.

16. The combination of an intermittently-revolving head, a series of hollow spindles mounted therein, the sleeves 37, having spring-jaws 36 and lugs 38, the angle-levers 40, engaging said lugs, the cones 42, the sliding carriages 43, carrying said cones, the rollers and projections 45 and 46, and stationary cams 47 and 115, located in the path of said rollers 45 at the discharging and receiving points of said spring-jaws, substantially as described, and for the purpose specified.

17. The combination of the intermittently-revolving head, a series of spindles mounted therein, the knockout-rods 50, springs 51, cams 52 on the ends of said knockout-rods, and a stop lever or levers located with reference to the path of said cams, substantially as described, and for the purpose specified.

18. The combination of the intermittently-revolving head, a series of spindles mounted therein, the knockout-rods 50, springs 51, for forcing said rods in the direction to free said jaws, and the stationary cam 114, located with reference to the path of the ends of said knockout-rods, substantially as described, and for the purpose specified.

19. The combination of the intermittently-revolving head, a series of spindles mounted therein, mechanism at one point in the revolution of said head for driving the spindles first in one direction and then in another, the threading-slide 100, having a projection or pin 103, and an adjustable ledge for holding said slide against rotation up to a given point, substantially as described, and for the purpose specified.

20. The combination of the shaft 86, set of pulleys 88, shipper 89, cams 93 on the cam-pulley H, and mechanism connecting said cams and shipper, substantially as described, and for the purpose specified.

21. The combination of the intermittently-revolving head, the shaft D, concentric therewith, the slides 96 and 100, cam-pulley G, head-operating disk 61, gear-wheel 19, and mechanism for operatively connecting said gear-wheel and head-operating disk, substantially as described, and for the purpose specified.

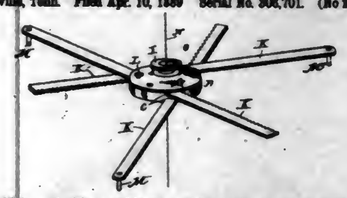
22. The combination of the intermittently-revolving head, a series of spindles mounted therein, the shaft D, the slides 96 and 100, cam-pulley G, head-operating disk 61, gear-wheel 19, mechanism for operatively connecting said gear-wheel and head-operating disk, the shaft 86, having the set of pulleys 88, shipper 89, cams 93 on cam-pulley H of the shaft D, and connecting mechanism between said shipper and cams, substantially as described, and for the purpose specified.

23. The combination of the intermittently-revolving head, a series of spindles mounted therein and provided with holding-jaws, the sliding carriages mounted on ways secured to said head at the ends of said spindles, mechanism actuated by the longitudinal movement of said carriages for operating said holding-jaws, the projections and rollers 45 and 46, stationary cam 47, and the cams 49 on the wheel H, operatively connected with the projections 46, substantially as described, and for the purpose specified.

409,675. ELECTRIC SIGNAL-RECEIVING INSTRUMENT. STEPHEN D. FIELD, Stockbridge, Mass. Filed May 16, 1889. Serial No. 311,016. (No model.)

Claim.—1. An electrical signal-receiving instrument consisting of a closed magnetic circuit in combination with an open magnetic circuit having a movable body of magnetic material interposed in the opening, and a helix in inductive relation to the open magnetic circuit.

2. An electrical signal-receiving instrument consisting of a single magnet having two magnetic circuits between its poles, in combination with a coil of wire inclosing one of said magnetic circuits and adapted on the passage of current therethrough to vary the force in one or both of said magnetic circuits, and a movable body of magnetic material interposed in one of said circuits.



3. An electrical signal-receiving instrument consisting of a single magnet having two magnetic circuits between its poles, one of them incomplete, in combination with a helix or coil of wire inclosing the incomplete magnetic circuit, and a movable body of magnetic material in the gap of the incomplete magnetic circuit.

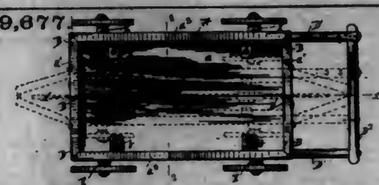
4. An electrical signal-receiving instrument consisting of a single magnet having a substantially-closed magnetic circuit and an incomplete magnetic circuit constituted by two approaching iron projections, in combination with two parallel electric circuits in inductive relation respectively to the two iron projections, and a movable body of magnetic material interposed between said projections.

5. An electrical signal-receiving instrument consisting of a single magnet having a substantially-closed magnetic circuit and an incomplete magnetic circuit constituted by two approaching iron cores as pole-pieces, in combination with two helices wound upon said cores, and a movable body of magnetic material interposed between said cores.

6. An electrical signal-receiving instrument consisting of two or more coils wound on iron cores facing each other and so connected that currents pass through the coils in respectively opposite directions, said cores being attached to a substantially-closed magnetic circuit, and an iron tongue or body interposed between the adjacent ends of said cores.

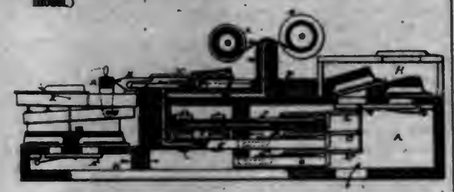
409,676. LINER FOR MACHINERY. WILLIAM V. FISCHER, Knoxville, Tenn. Filed Apr. 10, 1889. Serial No. 306,701. (No model.)

Claim.—1. The combination of the body or case provided with a series of channels at a tangent to a central opening, the pinion mounted in the central opening, the rack-arms arranged in the channels and engaging the pinion, and the spring-tongue arranged over one of the said channels and bearing on the rack-arm therein, substantially as specified.



2. The combination of the body or case provided with suitable channels arranged tangent to a central opening, the spring-tongue arranged over one of the channels, the pinion mounted axially in the said central opening, the rack-arms arranged in the said channels and engaging the pinion, and the set-screw mounted in the body or case and bearing on the said spring-tongue, substantially as and for the purpose specified.

3. In a liner, the combination of the body or case provided with a face-plate, and having an axial centrally-perforated shaft mounted therein, the rack-arms arranged in suitable channels in the body or case and engaging with a pinion on the said shaft, and the set-screw mounted in the face-plate adjacent to one of the rack-arms and adapted to clamp the same in the desired position, substantially as specified.

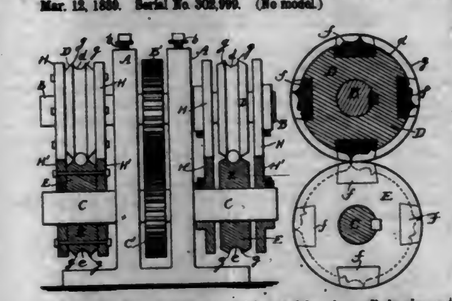


409,677. CHILD'S CARRIAGE. THOMAS K. FORMAN, Waukegan, Ill. Filed Mar. 21, 1889. Serial No. 304,190. (No model.)

Claim.—In a perambulator bisected longitudinally and connected as to its corresponding sections by hinges, the combination of the bolts c^4, securing the axles to the bars D', the bars F F, formed with the notches *f f* on opposite sides in a common arc with said bolts, pivoted to alternate sections of the axles, and the buttons *f' f'*, pivoted on the sides of the axles, substantially as and for the purpose specified.

409,677.

409,678. MECHANICAL MUSICAL INSTRUMENT. MERRITT GALLY, New York, N. Y. Filed Mar. 12, 1888. Serial No. 266,966. (No model.)



Claim.—1. The combination, with the tracker-range and the board having ducts leading therefrom to the operating pneumatic motors, of the manual-keys controlling openings into said ducts, and controlling also a second set of ducts not controllable from the ducts connected with the tracker-range, the parts being arranged and co-operating, substantially as described.

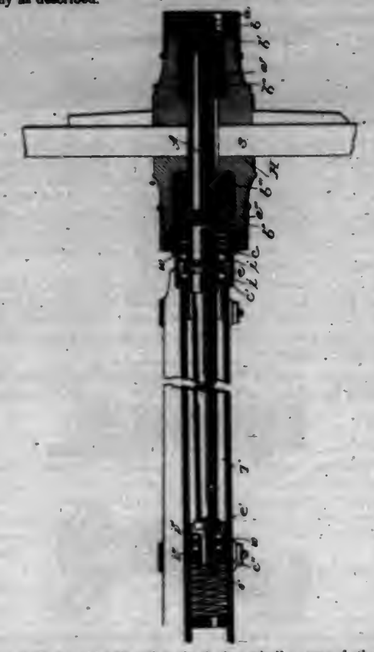
2. The combination, with the groove-board B and the octave groove-board C, having ducts, as described, of the manual-key and a shifting piece connected thereto, the shifting piece in one position controlling both ducts and in another position only one of the ducts, substantially as described.

3. The combination, with the manual-key, as K, of the valve, as S, and its octave-valve, as T, and the duplex operating-lever, as N.

4. The combination, with the operating-valve S and its octave-valve T, of the duplex operating-lever and its adjuster R, as having a movement for rendering the octave-valve operative or inoperative at will, substantially as set forth.

409,679. METAL-ROLLS. JAMES T. HASTINGS, Chicago, Ill. Filed Mar. 12, 1889. Serial No. 302,999. (No model.)

Claim.—1. The combination, with metal forming-rolls having cutting-edges adjacent to their matrices, of guard-rolls concentric therewith and fitted to be brought into peripheral contact with each other, substantially as shown and described.



2. The combination, with metal forming-rolls in which a cutting-edge is formed adjacent to the die-matrix, of guard-rolls concentric with said forming-rolls, respectively, and arranged to be brought into peripheral contact with each other, and means for adjusting the relative positions of the roller-shafts, substantially as shown and described.

3. The combination of the rolls D E, cutting-edges *g*, guard-rolls H H', and set-screws for adjusting the roller-shafts, substantially as shown and described.

409,680. VEHICLE-AXLE. ADOLPH R. HERMAN, Terre Haute, Ind. Filed Feb. 15, 1889. Serial No. 300,066. (No model.)

Claim.—1. In combination, the wheel, the longitudinally-movable spindle secured thereto to revolve therewith, the bearing for the spindle having the anti-friction balls therein, the said spindle having a circumferential flange to afford a bearing for the said balls, substantially as described.

2. In combination, the wheel, the spindle having rotary and longitudinal movement, said spindle having a flange or projection, and the spring for holding the spindle with a yielding pressure, substantially as described.

3. In combination, the wheel, the spindle secured thereto and revoluble therewith, a bearing for said spindle, and yielding means for keeping said spindle in position relative to its bearings and to permit longitudinal movement thereof under strain, substantially as described.

4. In combination, the wheel, the axle, the longitudinally-movable spindle, and the ball-bearings for said spindle, whereby both rotary and longitudinal movement of the spindle is permitted, substantially as described.

5. In combination, the wheel, the spindle secured thereto and revoluble therewith, anti-friction bearings for said spindle comprising the balls, and the yielding means for permitting the spindle to move longitudinally under strain, substantially as described.

6. In combination, the wheel, the spindle secured thereto and having a shoulder or flange, the ball-bearing, and the spring, substantially as described.

7. In combination, the wheel, the spindle secured thereto, the plain tubular bearing part T for receiving the spindle, the anti-friction balls, and the sleeve or bearings for said balls supported by the plain tube T, substantially as described.

8. In combination, the wheel, the spindle secured thereto, the tube T for receiving the spindle, the anti-friction bearing, and the part c', screwed to the end of the tube T and holding the anti-friction balls, substantially as described.

9. In combination, the wheel, the spindle secured thereto, the bearing c', containing the anti-friction balls, a suitable support for the bearing, said bearing being arranged to have sliding movement, and the spring, substantially as described.

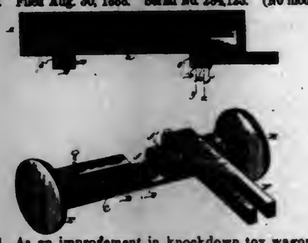
10. In combination, the wheel, the longitudinally-movable spindle, the anti-friction balls and a movable washer for confining said balls, and the yielding holding means for the washer, substantially as described.

11. In combination, the spindle and the wheel secured thereto by an adjustable nut on each side threaded upon the spindle, substantially as described.

12. In combination, the longitudinally-movable spindle with yielding holding means, and the wheel secured to said spindle with yielding bushings, substantially as described.

409,681. CARRIAGE-AXLE NUT. ADOLPH R. HERMAN, Terre Haute, Ind. Filed Feb. 23, 1889. Serial No. 300,955. (No model.)

Claim.—1. In combination, the threaded spindle, the box, a nut having an inward extension threaded upon said spindle, and a flange



extending outside and across the end of the box for keeping the same in place, and extending also beyond the periphery of said box to afford a bearing for the wheel-hub, substantially as described.

2. In combination, the threaded spindle, the box, the inner holding-nut having an extension adapted to the bore of the box and screw-threaded upon the spindle, said inner holding-nut having a flange outside the box extending across the end of the same for retaining said box to the spindle, the washer located between the flange and the end of the box, said flanged nut also having holes in its face to receive the wrench-prongs, and an outer nut bearing upon the perforated face of the inner nut, substantially as described.

3. In combination, the spindle having right-and-left-threaded end, the box, the nut having the flange provided with openings for the wrench, and the outer nut also provided with a flange adapted to fit the face of the inner nut and over the openings in the flange thereof, substantially as described.

409,682. CHILD'S WAGON OR CART. HOWARD H. HIGHAM, Philadelphia, Pa. Filed Aug. 30, 1888. Serial No. 284,123. (No model.)

Claim.—1. As an improvement in knockdown toy wagons and carts, the combination, with the body, of an axle comprising a fixed main portion of greater length than the width of said body, and provided with a longitudinal groove in its top face at one side the center, forming a securing portion *b'*, and a cylindrical rod disposed and adapted to revolve within the single continuous bearing formed by the main portion and body and carrying the fixed wheels at its ends, substantially as and for the purpose set forth.

2. In a two-part axle for children's wagons or carts, the combination, with the stationary portion of the axle having a longitudinal groove in its top face and provided with a transverse groove or recess and with a cylindrical rod bearing in said groove and carrying wheels at its ends, of the handle or tongue piece having its rear end received within said recess and provided with a transverse groove to receive said rod and be thereby locked, substantially as set forth.

3. The combination, with an axle of the class described, comprising a fixed main portion and a longitudinal rotary rod bearing in a groove therefor in said fixed portion and carrying the wheels, of the handle or tongue piece provided with a transverse groove for the reception of said rod and locked thereby, substantially as and for the purpose set forth.

4. In combination with the stationary portion of an axle for children's wagons or carts, having a recess, the handle or tongue portion accommodated within said recess, the tongue-piece and stationary portion being provided with grooves or their equivalent, and the transverse rotary portion of the axle bearing within the tongue-piece and stationary portion and carrying the wheels, substantially as set forth.

5. The herein-described knockdown toy wagon, comprising the body, a rear axle composed of a main fixed portion provided with a longitudinal groove in its upper face, and a rotatable portion bearing in said groove and carrying fixed wheels at its ends, the front axle composed of a fixed main portion provided with a longitudinal and transverse groove in its upper face, and a rotatable portion bearing in said longitudinal groove and carrying fixed wheels at its ends, a tongue-piece received by the transverse groove and provided with a transverse groove to receive said rod and locked thereby, and a tongue secured to said tongue-piece, substantially as and for the purpose set forth.

409,683. CAR-BRAKE. JAMES W. HURST, Hotchkiss, Colo. Filed Feb. 18, 1889. Serial No. 300,474. (No model.)

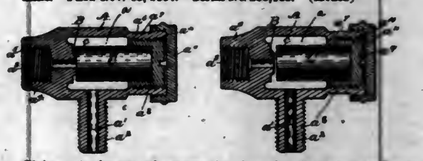
Claim.—1. In a combined wheel and rail brake, the combination of oppositely-disposed brake-blocks, which are adapted to engage both the treads of the car-wheels and the rail, and a wedge located in direct contact with said blocks and adapted to spread them by downward movement, substantially as shown and described.

2. In a combined wheel and rail brake, the combination of oppositely-located brake-blocks and a vertically-sliding wedge, which wedge is located between said blocks and adapted to both spread and depress them when said wedge is moved downward, substantially as shown and described.

3. In a combined wheel and rail brake, the combination, with a rear plate B, slotted as shown, of the brake-block C C, recessed at *c* and *c'*, the wedge D, formed with the oblique arms *c''* and slots *d*, all arranged and adapted to operate substantially as shown and described.

4. In a combined wheel and rail brake, the combination of oppositely-located brake-blocks provided with inclined recesses *c' c'*, a wedge located between said blocks in direct contact therewith and provided with the oblique arms *c'' c''*, and means for raising and depressing said wedge, substantially as described.

5. The combination, with the brake-blocks, of a wedge sliding between the same to lower and spread them, a slotted lever fulcrumed to the side of the car and connected with the sliding wedge to operate the same, a ratchet-bar working in the slot in the lever, and the pawl G, carried within such slot and adapted to engage the teeth of the bar F, substantially as and for the purpose described.

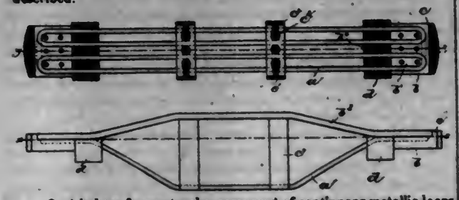


6. In a combined wheel and rail brake, the combination, with the rear plate B, provided with the tongue *b* and slots *a*, of the brake-blocks C C, secured to the same and recessed to receive the wedge D, said wedge being adapted to slide freely within said recesses to spread the shoes, a slotted plate *a*, secured to the side of the car to receive the tongue *b* and hold the brake to the side of the car, a lever E, connected with the top of the wedge and fulcrumed to the side of the car at a point beyond the brake, the ratchet-bar F, pawl G, and ring-loop *g*, all arranged and adapted to operate substantially as shown and described.

409,684. BOSOM-BOARD. THOMAS J. JACKSON, Mattoon, Kans. Filed Sept. 13, 1888. Serial No. 285,274. (No model.)

Claim.—The improved bosom-board herein described, consisting, essentially, of the board A, having the elongated recess in its forward upper side, the collar-block of a form, as shown, having a vertical elongated recess and arranged above the recess in the board, the screw passing through the slot of the block and into the board, the spring arranged in the recess of the board and having one end engaging the collar-block, and the securing-bar journaled at the opposite end of the board by arms, substantially as specified.

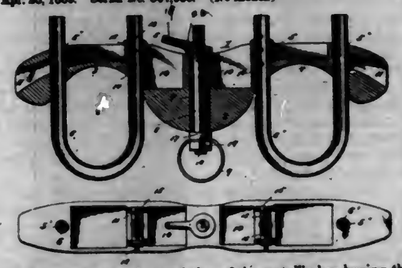
409,685. AUTOMATIC AIR-VALVE. CHARLES JESSUP, Boston, Mass. Filed Nov. 15, 1887. Serial No. 255,185. (Model.)



Claim.—An improved automatic air-valve for steam-radiators, &c., of the class known as "rod-traps," in which the expansion valve-stem controlled by steam heat is composed of the crude, burned, refractory, plastic compound containing forty per cent. or more of refractory mineral substance in conjunction with vulcanizable gum, and known to commerce as "compression-packing," for facing steam-valve seats and joints, substantially as and for the purpose described.

409,686. BOLSTER FOR CAR-TRUCKS. LUTHER K. JEWETT, Boston, Mass. Filed Oct. 12, 1888. Serial No. 287,936. (No model.)

Claim.—1. A bolster for car-trucks, having its lower part or half composed of a continuous loop or band of metal, substantially as described.



2. A bolster for car-trucks, composed of one or more continuous metallic loops or bands, castings to support the said loops at their ends, and a top plate or part secured to said castings, substantially as described.

3. A bolster for car-trucks, composed of continuous metallic loops or bands, castings to support the said loops at their ends, a top plate secured to the end castings, and center braces or castings, substantially as described.

4. A bolster for car-trucks, composed of continuous metallic loops or bands, castings to support the said loops at their ends, and chafe-irons attached to said castings, a top plate secured to the end castings, and center braces or castings, substantially as described.

409,687. OX-YOKE. WILLIAM KIDD, Fisherman's Bay, Cal. Filed Apr. 20, 1889. Serial No. 307,980. (No model.)

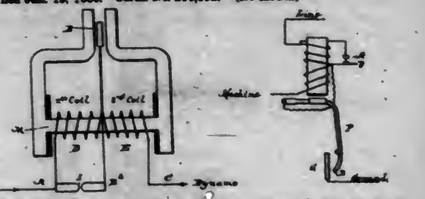
Claim.—1. An ox-yoke consisting of the metallic bar having the recesses formed therein and the vertical apertures, the tubular bows fitted in said vertical apertures, and means for rigidly connecting said bows to the yoke-bar, substantially as described.

2. In an ox-yoke, the combination of a yoke-bar, the perforated bows, and the removable fastening-pins adapted to slide in bearings, rigidly connected to the yoke-bar, and passing through the perforations in the bows to confine the latter against vertical play or movement on the yoke-bar and said bearings, substantially as and for the purpose described.

3. In an ox-yoke, the combination, with a yoke-bar and the bows, of the plates fixed to the yoke-bar and having the perforated ears, and the fastening-pins detachably connected to the plates and adapted to pass through the bows, substantially as described.

4. In an ox-yoke, the combination of a yoke-bar having a vertical central slot, a vertical bolt of less diameter than said slot and having the threaded upper end and a head at its lower end which impinges directly against the lower edge of the yoke-bar, and a ring swiveled on the lower end of said bolt and confined in place between said head and a nut, substantially as and for the purpose described.

409,688. CARRIAGE-SPRING. GEORGE LARSSEN, Omaha, Nebr. Filed Apr. 12, 1889. Serial No. 307,004. (No model.)



Claim.—1. A carriage-spring composed of two brackets secured beneath the body of a carriage, and a spiral spring turning in one of said brackets and provided with a square head at the other end and fitted into a square hole in the bracket on that side, substantially as described.

2. A carriage-spring composed of two brackets secured beneath the body of the carriage, and a spiral spring turning in one of said brackets and provided with a polygonal head at the other end and fitted into a polygonal hole in the bracket on that side, substantially as described.

3. The brackets secured beneath the body of a carriage, one of said brackets having a polygonal bearing and the other having a round bearing, a spring coiled as described, having one end adapted to fit said angular bearing and the other end turning loosely in said round hole, in combination with a lever attached to said spring and adapted to be fastened to the side bar of the carriage, substantially as described.

4. A bracket having a polygonal bearing, a bracket having a round bearing, a spiral spring having a straight portion and having one end of the same squared for fitting into said polygonal bearing, and the other at the end of said straight portion adapted to turn in said round bearing, a portion of said straight portion being polygonal, in combination with a lever provided with a grip adapted to fit over said polygonal portion of the spring and adapted to be fastened to the side bar of the carriage, substantially as described.

409,689. LIGHTNING-ARRESTER. HERMANN LEMP, Lynn, Mass. Filed Jan. 19, 1889. Serial No. 296,962. (No model.)

Claim.—1. The combination, with an arc-rupturing magnet on an alternating-current circuit, of an opposing or neutralizing coil in the normal circuit therewith, as and for the purpose described.

2. The combination, with a lightning-arrester, of an arc-rupturing-magnet coil, an opposing or neutralizing coil in the normal circuit therewith, and a ground connection from a point between the two coils.

3. In a lightning-arrester, the combination of an electro-magnet having differential coils, arrester-points in the field of said magnet, and a connection to the arrester taken from a point between the coils.

4. The combination, with an alternating-current circuit, of an arc-rupturing-magnet coil, an opposing or neutralizing coil in the circuit therewith, and a connection to the point at which the arc is to be ruptured taken from a point between the coils.

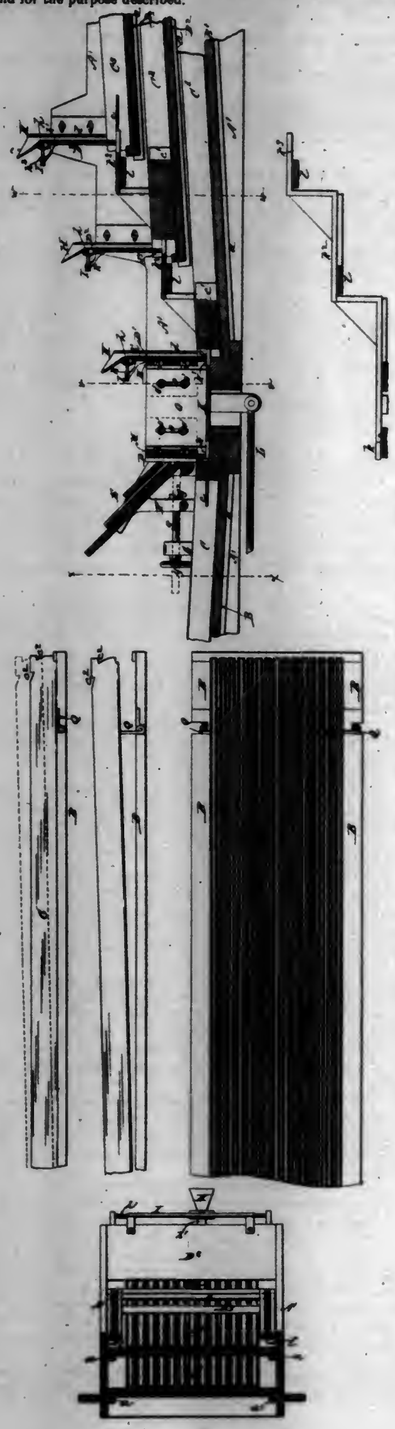
5. The combination, with separated electrodes connected to an alternating-current circuit, of an arc-rupturing magnet having a coil in said circuit, and an opposing coil, said coils having an intermediate connection to said electrodes.

6. The combination, with the electrodes of a lightning-arrester connected to an alternating-current circuit, of an arc-rupturing magnet having coils between said arrester and the point to be protected, and an opposing coil at the opposite side of the point of connection of the arrester.

7. The combination, with the electrodes of a lightning-arrester connected to an alternating-current circuit, of an electro-magnet whose poles are arranged in proximity to said electrodes and having its coils in circuit between the arrester and dynamo, and an opposing coil between the arrester and the line, as and for the purpose described.

8. The combination, with the arc-rupturing magnet, of an opposing coil in the normal circuit therewith, and a branch of normally high resistance and comparatively low self-induction around the latter, as and for the purpose described.

9. The combination of the arc-rupturing-magnet coil in the line, the opposing line-coil, and the safety ground connection between said coils.



10. The combination, with an arc-rupturing magnet on an alternating-current circuit, of an opposing or neutralizing coil in the normal circuit therewith, and a branch connection to a point of the circuit between the neutralizing-coil and the coil of the arc-rupturing magnet.

409,690. TYPE-DISTRIBUTING APPARATUS. ABBOTT A. LOW, Brooklyn, assignor to the Alden Type Machine Company, New York, N. Y. Filed Nov. 12, 1886. Serial No. 218,694. (No model.)

Claim.—1. In a type-distributing apparatus substantially such as described, the combination, with a series of type-containing channels, of a stationary type-channel support B, formed with an end-supporting shoulder for the said channels and with a channel-lifter Q, for elevating the outer ends of the type-containing channels above the said channel-end supports, for the purpose and substantially in the manner described.

2. In a type-distributing apparatus substantially such as described, the combination, with a series of superposed type-containing channels,

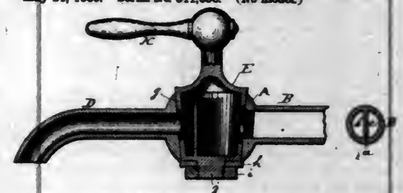
of a reciprocating terraced type-forwarder, substantially in the manner and for the purpose described.

3. In a type-distributing apparatus substantially such as described, the combination, with a supporting frame or carriage, of a series of superposed type-receiving plates pivotally suspended at their lower edges, substantially in the manner and for the purpose described.

4. In a type-distributing apparatus substantially such as described, the combination, with a hand-screw for actuating the movable carriage upon which the type-receiving plates are mounted, of an adjustable shoulder or strip upon the end of the said actuating-screw, for the purpose and substantially in the manner described.

5. In a type-distributing apparatus substantially such as described, the combination, with the type-receiving plates mounted and arranged substantially as described, of a vertical conduit-plate which is adjustable longitudinally, substantially in the manner and for the purpose described.

6. In a type-distributing apparatus substantially such as described, the combination, with the type-receiving plates mounted and arranged substantially as described, of a vertical conduit-plate which is adjustable vertically, substantially in the manner and for the purpose described.

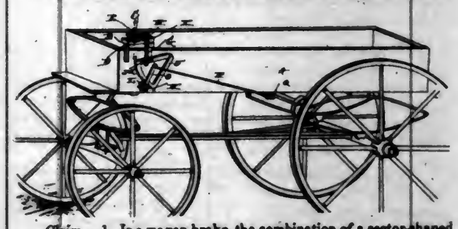


7. In a type-distributing apparatus substantially such as described, a movable type-receiver adapted to slide into coincidence with and to communicate with any of a series of type-channels, substantially in the manner and for the purpose described.

8. In a type-distributing apparatus substantially such as described, the combination, with a movable type-receiver and with a series of type-containing channels, substantially as set forth, of an index for registering the movable type-receiver with relation to the type-channels below, substantially in the manner and for the purpose described.

9. In a type-distributing apparatus substantially such as described, the combination, with a movable type-receiver and with a series of type-containing channels, substantially as set forth, of a series of recesses or notches arranged to receive and hold a pointer or projection upon the said movable receiver, for the purpose and substantially in the manner described.

10. In a type-distributing apparatus substantially such as described, the combination, with a series of type-containing channels, of a type-receiver which is movable laterally above the receiving ends of the said type-containing channels, for the purpose and substantially in the manner described, formed with plurality of receiving and conducting passages, substantially in the manner and for the purpose described.

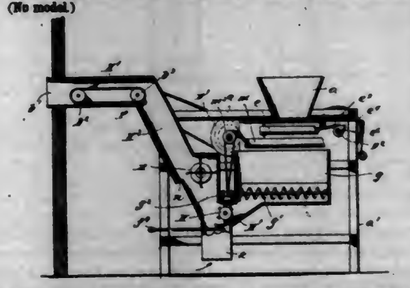


409,691. FAUCET. GEORGE W. MAHLMANN, Chicago, Ill. Filed May 21, 1889. Serial No. 311,630. (No model.)

Claim.—1. In a faucet for the purpose described, the combination, with the shell having an inlet-nozzle divided by a partition for connecting with hot and cold water supply pipes and having a water-outlet spout, of the plug cast hollow and provided with a partition extending from the bottom to near the top of such plug, substantially as set forth.

2. In a faucet for the purpose described, the combination, with shell A, having an inlet-nozzle B, divided by a partition *a*, to provide two separated channels *b* and *c*, one to connect with a cold and the other one with a hot water supply pipe and having an outlet-spout D, of conical plug E, cast hollow and provided with openings *e* and *f*, and with a V-shaped partition *g*, all substantially as set forth.

409,692. WAGON-BRAKE. WASHINGTON M. MASON, Warwick Cross Roads, Tenn. Filed May 25, 1889. Serial No. 312,171. (No model.)



Claim.—1. In a wagon-brake, the combination of a sector-shaped plate mounted pivotally upon the side of the wagon-brake and having a radial slot, a vertically-moving screw-threaded rod having a pin or roller working in the said slot, mechanism connecting the said sector-shaped plate with the brake-levers, a pinion having a central screw-threaded perforation, whereby it is mounted upon the vertically-sliding screw-threaded rod, and mechanism for operating the said pinion, substantially as and for the purpose set forth.

2. In a wagon-brake, the combination of the sector-shaped plate mounted pivotally upon the side of the wagon-bed and having a radial slot, a vertically-sliding screw-threaded rod having at its lower end a pin or roller working in the said slot, a bracket extending laterally from the wagon-bed and having a vertical opening to admit of the passage of the said screw-threaded rod, and provided with an upwardly-extending guard, a pinion having a central screw-threaded perforation, whereby it is mounted upon the vertically-sliding screw-threaded rod between the bracket and the guard, and a spur-wheel mounted pivotally upon the said bracket, provided with a hand-wheel by means of which it may be manipulated and meshing with the said pinion, substantially as and for the purpose herein set forth.

3. In a wagon-brake, the combination of the sector-shaped plate mounted pivotally upon the side of the wagon-brake and having a toothed periphery and a radial slot, a vertically-sliding screw-threaded rod provided at its lower end with a pin or roller working in the said slot and having at its upper end a pinion resting upon a bracket, through which the said vertically-sliding screw-threaded rod extends, a guard arranged upon the said bracket above said pinion, a pinion journaled to the side of the wagon-bed and meshing with the toothed sector-shaped plate, and having an arm or lever secured to its outer face, and a rod connecting said arm with the brake-levers, substantially in the manner and for the purpose herein shown and specified.

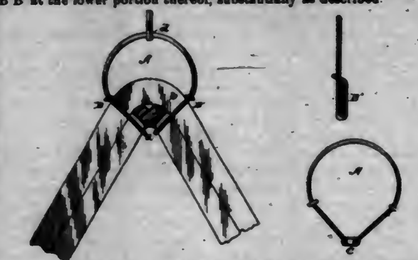
4. In a wagon-brake, the combination of the sector-shaped toothed plate mounted pivotally upon the side of the wagon-body, the vertically-sliding screw-threaded rod connected with and operating the said sector-plate, and a pinion mounted pivotally upon the side of the wagon-bed, meshing with the said sector-plate, and having an arm or lever connected by means of a suitable rod with the brake-operating levers, substantially as and for the purpose shown and specified.

409,693. MACHINE FOR CLEANING REFUSE RUBBER. CHRISTOPH MAYER, Butler, N. J. Filed Aug. 12, 1886. Serial No. 210,757. (No model.)

Claim.—1. The combination of the frame *a'*, hopper *a*, shaking trough *c*, having arm c^2, cam c^3, and shaft D^3, duct a^2, cord or chain c^4, drum E', shaft E^1, pawl E^2, wheel E^3, and hand-wheel E, substantially as described.

2. The combination of the frame *a'* with the trough *g*, screw *g'*, rotary brush H, scrubbing-plate H', fan R, trunks N N', and endless belt or conveyer *d*, substantially as specified.

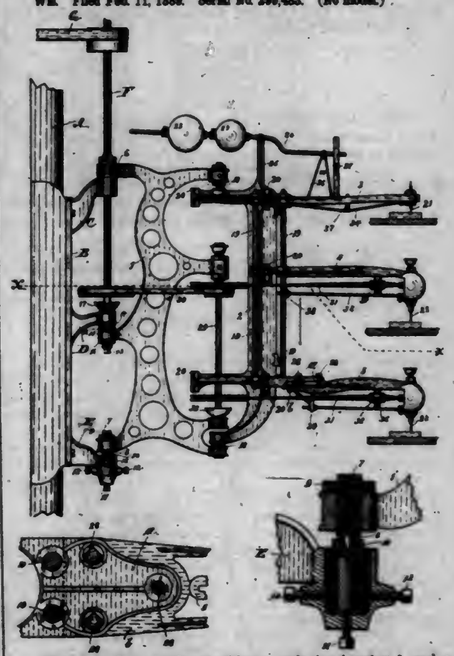
3. The trough *g*, the plate H', and revolving brush H, in combination with the inclined trunk N, communicating with trough *g*, the fan or blower, the horizontal trunk N', and the endless carrier in the lower side of said trunk, substantially as described.



4. The trough *g*, the plate H', the revolving brush H, in contact with said plate, and the screw to feed material to said plate and brush, all in combination, substantially as described.

5. The combination, in an apparatus for cleaning waste rubber, of the plate and revolving brush, the screw to feed material to said plate and brush, and the fan or blower, substantially as described.

6. The trough *g*, having plate H', and revolving brush H, in combination with the inclined trunk N, communicating with trough *g*, and having the mouth *k*, the slide f^3, and the fan or blower, substantially as described.



409,694. ATTACHING DEVICE FOR SUSPENDER-STRAPS. HENRY R. MESSINGER, Williamsport, Pa. Filed Feb. 16, 1889. Serial No. 300,138. (No model.)

Claim.—1. As an improved article of manufacture, a clamping device for the purpose mentioned, consisting of a continuous piece of wire having a general yoke or triangular main portion and the loops B B' at the lower portion thereof, substantially as described.

2. As an improved article of manufacture, a clamping device for the purpose mentioned, consisting of a yoke or triangular-shaped main portion, the loops B B', formed at the lower extremities of the said main portion, and the link C, connecting said loops, substantially as set forth.

409,695. CARVING-MACHINE. STEPHEN F. MOORE, Milwaukee, Wis. Filed Feb. 11, 1889. Serial No. 299,483. (No model.)

Claim.—1. In a carving-machine, a swinging bracket 1, and a fixed bracket B, having three arms, to each of which arms bracket 1 is hinged, in combination with adjusting devices consisting of pins 7 and bearing 10 and pin 13, substantially as described, located in brackets 1 and B at two of the pivotal points, whereby bracket 1 is adjusted to bracket B, as and for the purpose set forth.

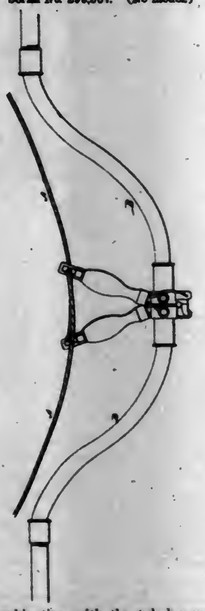
2. In a carving-machine, the means for centering and adjusting a swinging bracket on a fixed bracket, consisting of the combination, with a bearing-pin 10 in a socket in the fixed bracket, and adjusting-bolts 11 and 12 12, turning through the walls of the socket and against the bearing-pin, whereby it can be adjusted longitudinally and laterally, of a pivot-pin 7, adjustable by screw-thread in an arm of the swinging frame, the pin 7 being provided with a jam-nut 9 thereon, substantially as described.

3. In a carving-machine, two or more vertically-moving arms 3 4 5, secured rigidly together and supported on a laterally-swinging standard, on which standard, the arms have their vertical movement, in combination with a lever 24, centrally fulcrumed on an upright 25, rigid on the standard, the lever being provided with a counterpoise 23 on one arm, and a bifurcated post 27, rigid on arm 3, in and by which the lever 24 is guided in its tilting movement against lateral

movement with reference to the arm 3, that one of the lever-arms not having the counterpoise thereon being connected to the arm 3 by a flexible cord, substantially as described.

4. In a carving-machine having two tool-carrying swinging arms, an arm (being one of said tool-carrying arms) in two parts *a* and *b*, overlapping each other at their extremities, and bolts passing through apertures therefor in one of said parts and turning into the other part, the apertures being of greater diameter than the bolts passing therethrough, substantially as described.

5. In a carving-machine, a swinging guide-carrying arm 3 and two tool-carrying arms 4 and 5, rigidly secured to the guide-carrying arm 3, having common vertical and lateral movement, in combination with two bands 31 31, a pulley on the spindle of the cutting-tool in each of said arms 4 and 5, and pulleys on a common shaft 29, having its bearings in the supporting swinging bracket 1, on which pulleys the bands run, the guide and tool carrying arms being supported and pivoted on the bracket 1 in and by the standard 2, substantially as described.

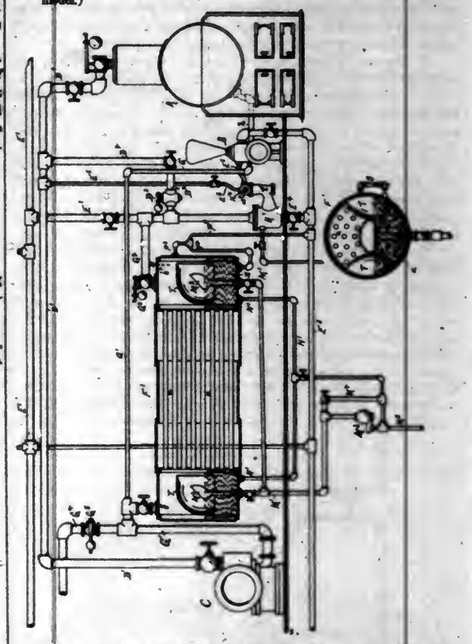


6. In a carving-machine, a swinging tool-carrying arm and a bracket on its outer free end, in which bracket are the bearings of the tool-carrying spindle, in combination with a stay-rod secured at one end rigidly to the spindle-carrying bracket, and at the other end at a distance from the spindle-carrying bracket adjustably secured to a harmoniously-moving part of the machine, substantially as described.

409,696. BOLT. DAVID M. MOTHERWELL, Logan, Ohio. Filed Apr. 25, 1889. Serial No. 308,626. (No model.)

Claim.—As an improved article of manufacture, a bolt having its neck or an enlargement below its head oblong in cross-section, substantially as and for the purpose described.

409,697. PIPE-COUPLER. CHARLES F. MURDOCK, Detroit, Mich., assignor to the Automatic Car Coupler Heating Company, same place. Filed Feb. 11, 1889. Serial No. 299,367. (No model.)



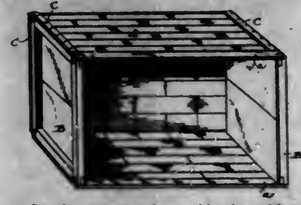
Claim.—1. The combination, with the tubular coupling-bodies, of the hook-shaped lugs D, the interlocking arms E, provided with extensions I, beveled surfaces and recesses, the trunnions on the sides of the coupling-bodies, the flexible bifurcated lever-handles provided with eyes, curved engaging-arms and eye-pieces adapted to receive a pull uncoupling-rope, substantially as specified.

2. The combination of two coupling-sections having on their under sides interlocking rigid lugs or arms and each having a laterally-disposed trunnion and levers journaled to said sections and having a yielding arm or branch adapted to engage the trunnion on the opposite coupling-section, substantially as specified.

3. The combination, with two coupling-sections, each having a rigid arm on its under side adapted to interlock when the adjacent ends of the sections have been brought together, of two locking and unlocking levers having a forked branch, one branch of each lever being respectively journaled on the sides of the coupling-sections and the opposite branch of each lever being adapted to engage a trunnion on the side of the opposite coupling-section, substantially as specified.

4. The combination, with two coupling-sections, each having a laterally-disposed trunnion, of a hinged coupling and uncoupling lever having a yielding branch adapted to engage the trunnion of the opposite section, the said levers having their outer ends adapted to receive a pull-cord, substantially as specified.

409,698. GREASE AND OIL SEPARATOR. EDWARD H. MURPHY, St. Paul, Minn. Filed Apr. 30, 1887. Serial No. 236,736. (No model.)



Claim.—1. In a steam-generating system, the combination, with the generators, pumps, engines, and other apparatus operated by said steam, of a tank through which the exhaust-steam from said pumps, engines, and other motors is conducted and in which the water of condensation is stored, and one or more pipes having flaring mouths in line with the surface of said water and adapted to receive the oil and fatty matter precipitated from said exhaust-steam and conducting it from said tank, and a trap M^3, through which the said water is discharged from said tank and retained at a uniform level therein, substantially as and for the purpose set forth.

2. In a steam-generating system, the combination, with the generators, pumps, engines, and other apparatus operated by said steam, of a tank through which the exhaust-steam from said pumps, engines, and other motors is conducted and in which the water of condensation is stored, safety-pipe P', connected into said tank below the water-line, and with bend P^2 rising above the water-line, and having combined equalizing and overflow pipe P^3 connecting said bend with said tank above the water-line, substantially as and for the purpose set forth.

3. In a steam-generating system, the combination, with the generators, pumps, engines, and other apparatus operated by said steam, of a tank through which the exhaust-steam from said pumps, engines, and other motors is conducted and in which the water of condensation is stored, one or more pipes having flaring mouths in line with the surface of said water and adapted to receive the oil and fatty matter precipitated from said exhaust-steam and conducting it from said tank, a trap M^3, through which said water is discharged from said tank and retained at a uniform level therein, and a by-pass pipe M^4, connecting said piping on each side of said trap, whereby the water may be discharged from said tank without passing through said trap, substantially as and for the purpose set forth.

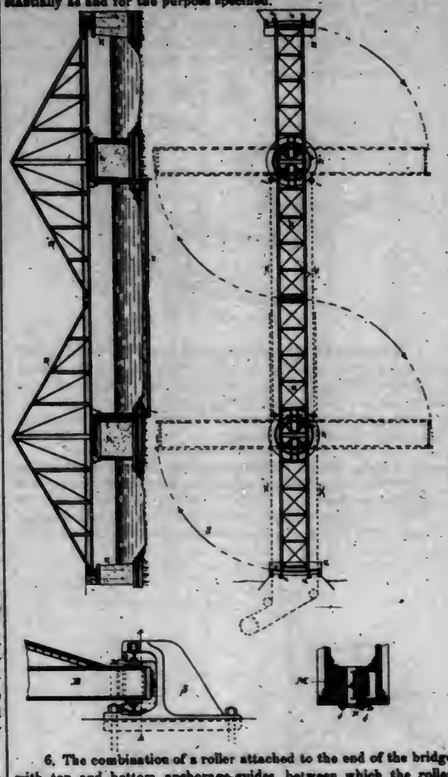
4. In a high-pressure steam-generating apparatus, the combination, with said generating apparatus, of a radiating supply-piping connected to said generator through a reducing-valve, whereby the pressure in said radiator system is less than in said generator, piping, whereby the exhaust from the engines, pumps, and other motors operated by said high-pressure steam is discharged into said radiating system, tank F', through which said exhaust-steam passes and in which the oil and grease from said exhaust-steam are precipitated, flaring-mouthed pipe or pipes M^3, adapted to receive the said oil and grease from the surface of the water of condensation from said exhaust-steam in said tank and conduct it therefrom, piping connecting said radiating system with said generator through a pump or other means for returning the water of condensation to said generators, an equalizing-pipe E^3, connecting said radiating system with said return-piping through a casing H', and a float within said casing adapted to control the valve through which the supply of the steam to said pump or other motors passes, substantially as and for the purpose set forth.

409,699. BOX OR CRATE. CHARLES E. PARER, Watertown, Wis. Filed May 21, 1889. Serial No. 311,544. (No model.)

Claim.—1. In a box or crate, the combination, with suitable end or side pieces, of a continuous fabric formed of a series of single wires, cords, or wooden strips secured to end strips and having a wooden filling woven in and out or over and under said wires, cords, or strips, said fabric forming the sides or ends and bottom of the box or crate in one continuous strip, and being tacked or otherwise secured to the edges of said end or side pieces, substantially as set forth.

2. A box or crate consisting of suitable end or side pieces, in combination with a continuous fabric formed of single wires, cords, or wooden strips interwoven with wooden slats, tacked or otherwise detachably secured to the edges of said end or side pieces to form the other sides or ends of said box or crate, and extending beyond said end or side pieces to form a continuous flexible cover for said box or crate, substantially as set forth.

409,700. BRIDGE. GEORGE H. PEGRAM, Wilmington, Del. Filed Mar. 27, 1888. Serial No. 269,176. (No model.)



Claim.—1. A draw or swing bridge composed of two separate contiguous parts or draws swinging in a horizontal plane about different centers of motion, which parts may be turned independently or together, in combination with connecting mechanism, substantially as set forth, for operating both of said draws simultaneously from one or the other thereof, substantially as and for the purpose specified.

2. A horizontally-swinging draw-bridge consisting of the combination of two pivot-piers and two rest-piers with two horizontally-swinging cantalevers having tail-arms adapted to span the three water-ways between said piers, the middle water-way between the pivot-piers being spanned by the two cantalevers and the side water-ways being spanned by the tail-arms, and means, substantially as set forth, upon said rest-piers to anchor said tail-arms when the bridge is closed to keep the cantalevers in line, but which tail-arms are entirely free when the bridge is open, substantially as and for the purpose specified.

3. A draw-bridge composed of two parts or draws adapted to swing in the same horizontal plane and each having two arms, the respective outer arms of which form two cantalevers, while the inner arms are firmly held in position by rest-piers or abutments, in combination with anchorage-girders attached thereto, and under which the tail-arms of the draws swing, substantially as and for the purpose specified.

4. A draw or swing bridge having a central water-way spanned by two cantalevers arranged upon separate pivots and adapted to swing in a horizontal plane, each of which cantalevers is counterbalanced when open by an unsupported tail-arm, and when closed by said tail-arm, in combination with standards attached to the abutments or rest-piers, the said parts being combined with the said pivot and rest piers, substantially as and for the purpose specified.

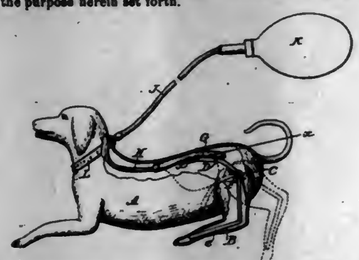
5. The combination, in a draw or swing bridge adapted to swing in a horizontal plane, of an anchorage girder or beam with standards which are anchored to the abutments or rest-piers, the draw when closed being held down directly by the standards, and when moving being guided and held down by the said beam or girder, substantially as and for the purpose specified.

6. The combination of a roller attached to the end of the bridge with top and bottom anchorage-guides, between which the roller runs and by which the end of the draw is guided and its vertical motion limited, substantially as and for the purpose specified.

7. In combination with a draw or swing bridge, an axle carrying a roller to guide the draw when turning, which axle has its end bearing eccentric with the roller-bearing, substantially as and for the purpose specified.

8. In combination with a draw or swing bridge, an axle having its end bearing eccentric with the roller-bearing, and to the end of which axle a disk-plate is attached, by which the axle is turned and held in position, and a roller carried by said axle to guide the draw when turning, substantially as and for the purpose specified.

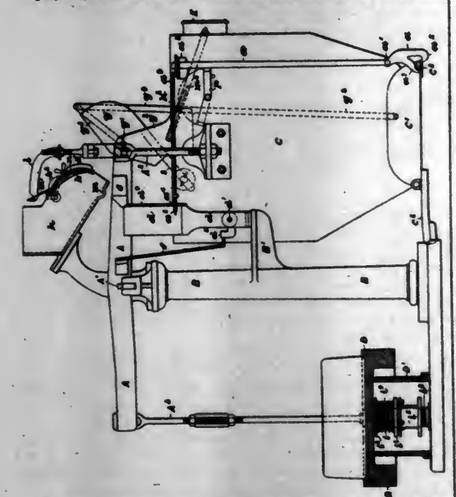
9. In a draw or swing bridge, a ring turning freely about the center or pivot, in combination with locks to secure said ring to said bridge, and chains or ropes secured to said ring, by which the bridge may be turned, substantially as and for the purpose specified.



10. In a pivot or swing bridge, the pivot-pier surrounded by water, in combination with a horizontally-swinging draw pivoted upon said pier, chains or cables extending from the shore or distant place to said pivot-pier and passing under the water, guide-rollers for said chain or cable, and connections between said chain or cable and horizontally-swinging draw, whereby the said draw may be operated from a distant place separated from the pier by water, substantially as and for the purpose specified.

11. The combination, with a draw-bridge composed of two parts or draws on separate piers, of a chain or rope running between the draws under the water and connected to both by means of rings passing around the draw centers outside of the balance-wheels, by which the draws may be operated in unison when desired, substantially as and for the purpose specified.

409,701. TOY. HENRY L. PHILLIPS, New York, N. Y. Filed May 20, 1889. Serial No. 312,030. (No model.)



Claim.—1. A jumping toy having a body, legs hinged to the body, and an inflatable case operating by its expansion to move the legs, in combination with a hand device for supplying air to the case, substantially in the manner and for the purpose herein set forth.

2. The combination, in a toy, with its movable body, of a bent lever pivoted to said body and having one of its arms free to swing outward therefrom, an inflatable case carried by the body in position to bear against the inner arm of said lever, a separate collapsible bulb, and a tube connecting said bulb and case, substantially in the manner and for the purpose herein set forth.

3. The combination, in a toy, of a bent lever pivoted to the body of the toy, a spring actuating the lever to carry its inner arm inward, an inflatable case bearing upon said inner arm to overcome when inflated the tension of the spring, and thereby swing the lever outward, and a device for inflating the case, substantially in the manner and for the purpose herein set forth.

409,702. GRAIN-WEIGHING MACHINE. HENRY POOLEY and JOHN PARKINSON, Liverpool, County of Lancaster, England, assignors to Henry Pooley & Son, same place. Filed June 22, 1887. Serial No. 242,091. (No model.) Patented in England Apr. 29, 1886, No. 5,813; in Austria-Hungary July 13, 1886, No. 42,198, and in Germany July 20, 1886, No. 39,635.

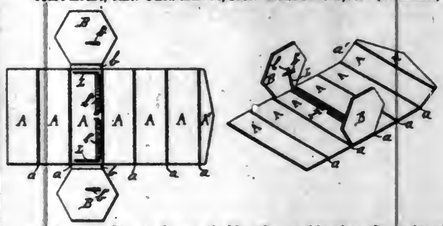
Claim.—1. In an automatic weighing-machine of the type herein described, the combination of the catch-grain *g*, for receiving the flow of grain after the weighing of the material is completed, having trunnions *g'* mounted and working in bearings attached to the sides of the receptacle C, in combination with the discharging-door C' and connecting-lever g^6, whereby the said catch-grain *g* is operated and the flow of grain, after full weight is reached, is caught, substantially as and for the purposes set forth.

2. The combination, with the weight-plate of a weighing-machine, of a screwed base i^3, nut i', lock-nut i^3, spring *i*, and a guard consisting of the plate i^3 and rods i^4, all arranged and operating substantially as and for the purpose shown and described.

3. In a weighing-machine, the combination, with the weigh-beam thereof, of a slide *c*, a weight or hammer *d*, rod a^4, lever *a*, catches a^3, and receptacle C, having a door C', and projections C^3, all arranged and operating substantially as and for the purpose shown and described.

4. In a weighing-machine, the combination, with a feed-chute A, of a valve *k*, link *w'*, device *l*, weight-beam A, weight-plate D, and spring *i*, substantially as described.

5. In a weighing-machine, the combination, with a feed-chute, of a groove over which the grain leaving said chute passes, so that said groove is constantly filled with grain, and a valve the edge of which falls into said groove when closed, which forms a cushion therefor, substantially as described.



6. In a weighing-machine, the combination of a cut-off valve having an aperture for the passage of grain after the valve is closed, and an adjustable shutter attached to said valve to control the size of said aperture, substantially as described.

7. In a weighing-machine of the type herein set forth, the combination, with the discharging-door C', of the receptacle C, the counterbalance-weight C^3, catch-lever *a*, catch-jaws a^3, rod a^4, hammer *d*, and slide *c*, operating together, and whereby the door C' is opened and the receptacle C discharged, and when discharged the door C' is closed and held, substantially as set forth.

8. In a weighing-machine of the type herein set forth, the catches *a*, having jaws a^3, and a hook a^7, mounted on fulcra a', in combination with the rounded nose projections C^3 of the door C', whereby the automatic engagement of the catch-lever *a* with the discharging-door C' is effected, as set forth.

9. The combination of the spring *i*, base i^3, plate i^3, rods i^4, and lock-nut i^3, substantially as and for the purposes set forth.

409,703. BOX FOR NECK-WEAR. EDWIN R. PROCTER, Washington Court-House, Ohio. Filed Mar. 30, 1889. Serial No. 305,446. (No model.)

Claim.—1. In a neck-wear holder, the combination of a series of hinged leaves provided with cavities and adapted to fold back to back or face to face at will, so as to form a prism, and double-lipped spring-clamps having feet adapted to engage said cavities for the reception of the feet of the spring-clamps, said cavities extending within the material of said leaves outward from the slits made on the inner face of said leaves, as and for the purpose specified.

2. In a neck-wear holder, the combination of a series of leaves A, attached at adjacent sides by a series of similarly-working hinges *a*, and provided with the cavities C, made within the material of said leaves, for the reception of the outwardly-pointing foot ends of the spring-clamps, and the clamps J, having the feet F, as and for the purpose specified.

3. In a neck-wear holder, the combination of a leaf A, having the cavities C, and the clamp J, having the lips *e* and the corrugations *x* in its jaws, and the feet F, as and for the purpose specified.

4. In a neck-wear holder, the combination of a series of hinged leaves provided with cavities and adapted to fold back to back or face to face at will, so as to form a prism, and double-lipped spring-clamps whose twin feet are adapted to engage said cavities and whose spring-lips retain within them the articles desired, as and for the purpose specified.

5. In a neck-wear holder, the combination of a series of hinged leaves having cavities therein, and polygonal end leaves hinged at right angles to the opposite ends of one of said series and adapted to stand fastened with plane of their faces at right angles to the plane of said one leaf, and double-lipped spring-clamps whose feet are adapted to engage said cavities and whose spring-lips retain within them the articles desired, as and for the purpose specified.

6. In a neck-wear holder, the combination of the ends B, having the spring-clips *b'*, and the leaves A, having the journaled levers L and the cavities C, and the double-lipped spring-clamp J, having feet adapted to engage said cavities, as and for the purpose specified.

7. In a neck-wear holder, the combination of the ends B and the leaves A, the former hinged to one of latter and the said leaves hinged together by the hinges *b* and *a*, respectively, and the clamp J, having the feet F, adapted to engage the slits S and cavities C in said leaves, as and for the purpose specified.

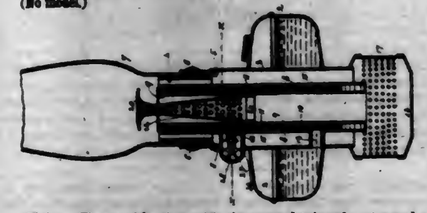
409,704. LOCK FOR FIRE-ARMS. EBERHARD I. PUPKE, New York, N. Y. Filed Dec. 19, 1888. Serial No. 294,063. (No model.)

Claim.—1. In a double-barreled gun, the trigger carrying the star-wheel, as described, in combination with a stationary pawl secured to the lock-casing within the field of movement of said wheel, whereby, when the trigger is operated, said wheel will be carried against said pawl, thereby rotating the wheel, the sears against which said wheel operates when elevated, and a detent-pawl carried by the trigger and engaging with said wheel, whereby the latter is prevented from revolving backward, substantially as shown, and for the purposes set forth.

2. The combination of a trigger carrying a star-wheel whose alternate points are in different vertical planes and are operated to rotate step by step by the springing of said trigger, with the sears of a double-barreled gun, said sears having tails within the operative field of said wheel, substantially as and for the purpose set forth.

409,705. CLOCK-PENDULUM. GEORGE P. REED, Melrose, Mass. Filed June 30, 1888. Serial No. 278,712. (No model.)

Claim.—1. In a clock-pendulum, the combination of a rod provided with a ball, a laminar ring comprising plates of different contractile and expansive capacity, said ring being secured to said ball and cut or opened at a point opposite its attaching-point to form free ends, and the adjustable weights on said ends, substantially as described.



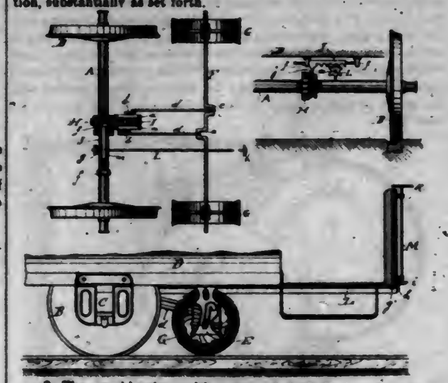
2. In a clock-pendulum, the laminar ring B, comprising the plates *v z*, having the openings *b*, in combination with the sliding weights *f*, adjustably disposed on said ring, the rod A, and means for securing said ring to said rod, substantially as set forth.

3. In a clock-pendulum, the rod A, in combination with the ring B, secured on said rod by the nut D, said ring comprising the bisected plates *v z*, of different contractile and expansive capacities, and the adjustable weights *f*, disposed in said ring, substantially as and for the purpose described.

4. In a clock-pendulum, the combination of the rod A, provided with the ball C, the ring B, comprising the plates *v z*, said ring being cut at *b* and secured to said ball by screws *x*, and the sliding weights *f*, disposed on the free ends of said ring, substantially as set forth.

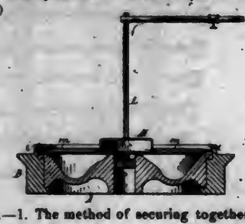
5. In a clock-pendulum, the laminar ring B, formed in sections, each section being secured to the pendulum-ball C in such a manner as to leave the opposite ends of said sections free, substantially as and for the purpose described.

409,706. LAMP. FRANK REED, Brooklyn, assignor of one-half to Charles S. Upton, New York, N. Y. Filed Apr. 8, 1886. Serial No. 198,300. (No model.)



Claim.—The combination, with the central tube of an Argand or central-draft lamp, of a perforated cone, the base of which fits the inner side of said tube, said cone being provided with a solid deflector-button at the top thereof, substantially as shown and described.

409,707. SAFETY ATTACHMENT FOR RAILWAY-CARS. RICARDO G. RIERA, Barcelona, Spain. Filed Mar. 8, 1889. Serial No. 302,853. (No model.)



Claim.—1. The combination, with a car, of a shaft pivotally suspended forward of the wheels thereof, and carrying circular brushes driven from the car-axle to rotate in a reverse direction by two pinions, the one mounted upon the axle to be laterally movable thereon for shifting it in and out of gear, substantially as set forth.

2. The combination, with a car, of shaft F, carrying circular brushes and being journaled in slotted hangers E and supported on bars *n*, suspended on screw-rods *o* for vertical adjustment, and of means for driving such shaft F from the car-axle in a reversed direction, substantially as set forth.

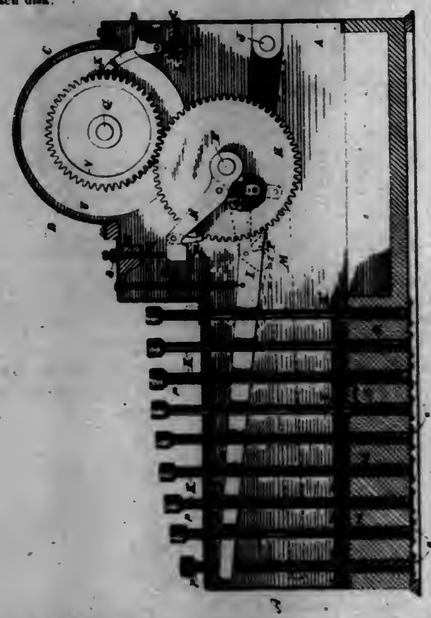
3. The combination, with a car, of shaft F, carrying circular brushes G and being driven from a pinion I, meshing with a pinion H, sleeved upon the car-axle, and laterally movable thereon by a rack-bar J, having fork *j*, and being operated by a shaft L, having pinion *m*, all substantially as set forth, to operate as specified.

409,708. METHOD OF CONSTRUCTING CAR-WHEELS. JAMES RIGBY, Minneapolis, Minn. Filed Jan. 23, 1889. Serial No. 297,342. (No model.)

Claim.—1. The method of securing together the body and tire of a car-wheel, which consists in placing the body within the tire and forcing it against a flange or ledge projecting inward from the inner periphery at or near one face, heating a flange on the other face of the tire to the working temperature, and, after the body is in position, turning such flange inward and hammering it down upon the body, whereby the parts are held securely together without the use of bolts, nuts, or rivets.

2. The method of constructing car-wheels, which consists in forming grooves and interlocking beads or flanges upon the outer periphery of the body and inner periphery of the tire, and a flange projecting from the face of the tire, then placing the body within the tire and interlocking their beads or flanges, and then heating the flange projecting from the face of the tire and hammering it down upon the body for securing them together.

409,709. PLOW. MARTIN L. RINEHART, Richmond, Ohio. Filed Feb. 21, 1889. Serial No. 300,727. (No model.)

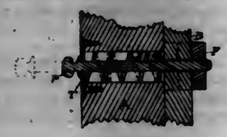


Claim.—The combination of the herein-described beam D, formed of metal and in the shape of channel-iron, and provided with the strengthening-rib F and the blocks *a* and a^6, the clamping-bolt *a'*, and the post or standard A, substantially as and for the purpose specified.

409,710. ADDING-MACHINE. JACOB H. SCHARRENBERGER, Springfield, Ohio, assignor, by direct and mesne assignments, to himself and Thomas Reynolds, same place. Filed Nov. 27, 1888. Serial No. 292,007. (No model.)

Claim.—1. In an adding-machine, the combination, with an arbor, a series of independent rotatable adding-disks mounted thereon and respectively bearing groups of figures from 0 to 9, inclusive, and provided each with an annular row of teeth on one side, and a dog piv-

oted to the side opposite the teeth, save on the last disk to the left, and a fixed cam between each two of the rotatable disks mounted on said arbor, the cam-surfaces of said disks being opposite the numerals 0 and 9 to throw the dog of one disk into engagement with the teeth on the next disk to move it from 0 to 1 as the first-named disk passes from 9 to 0, of a like series of independent gear-wheels meshing with the adding-disks, respectively, a pivoted key-lever for each disk, a pivoted actuating-arm connected to each lever and carrying a pawl which engages with the adjacent gear-wheels, a spring to return each key-lever to normal position, keys for each key-lever agreeing with the groups of figures on the respective disks, and a locking-pawl for each disk.



2. In an adding-machine, the combination, with a series of independent rotatably-mounted adding-disks respectively bearing groups of figures from 0 to 9, inclusive, and provided each with an annular row of crown-teeth on one side and a gear-rim on the other side, a fixed cam-disk between each two of the rotatable disks, and an engaging-dog carried by each of said adding-disks (save the last one to the left) and arranged to be actuated by said cam-disks to engage the crown-teeth of the next disk to the left to move said disk to the left from 0 to 1 as the first-named disk moves from 9 to 0, of a series of independent gear-wheels meshing, respectively, with the gear-teeth of the adding-disks, a pivoted key-lever and a pivoted arm for each gear-wheel, connected together and arranged to actuate the gear-wheel by a depression of the lever, stops to limit the upward movement of said arms, and a detent to prevent the adding-disks from accidentally rotating.

3. In an adding-machine, the combination, with an arbor, of a series of independent rotatable adding-disks, each carrying at one side an annular series of gear-teeth and a like series of crown-teeth, and at the other side a spring actuated and engaging dog, and a series of fixed cam-disks mounted between the adding-disks and having cam-surfaces by which said dogs are projected into engagement with said crown-teeth, the gear-teeth admitting of the adding-disks being actuated by the gear-wheels.

409,711. LADDER. WILLIAM G. SICKLER, Stuyvesant, N. Y. Filed Mar. 20, 1889. Serial No. 305,279. (No model.)

Claim.—In a ladder, the combination of the extension-bar B, movable in a vertical plane in contact with one of the side pieces of a ladder, said extension-bar provided with a series of holes, a presser-

409,711.

foot attached to said bar B, having an upper horizontal portion H and a lower smaller pointed portion C, with a bolt P, passing through the side piece A of the ladder, engaging with the holes in the bar B, said bolt operated by the spiral spring S, placed about the shank of the bolt and secured within the side piece A, all substantially as described, and for the purpose set forth.

409,712. TUBULAR LANTERN. JOSEPH B. STETSON, Lincoln, Me. Filed Apr. 3, 1889. Serial No. 305,985. (No model.)

Claim.—1. The combination, with the tubular lantern-frame provided with a depending tube, and a movable globe-frame which can be raised and lowered on said tube, of a fixed stop formed on said tube, and a laterally-movable stop attached to the globe-frame, substantially as set forth.

2. The combination, with the tubular lantern-frame provided with a depending tube, and a movable globe-frame which can be raised and lowered on said tube, of a fixed stop formed on said tube, and a movable annular stop attached to the globe-frame and provided with a space which enables the movable stop to clear the fixed stop, substantially as set forth.

3. The combination, with the tubular lantern-frame provided with a depending tube, and a movable globe-frame provided with a bell which can be raised and lowered on said tube, of a fixed stop formed on said tube, a movable annular stop provided with a space to clear the fixed stop, and an eyelet secured in the opening of the bell and holding the annular stop, substantially as set forth.

4. The combination, with the tubular lantern-frame provided with a depending tube, and the movable globe-frame provided with a bell which can be raised and lowered on said tube, of a fixed stop formed on said tube, a movable annular stop provided with a space to clear the fixed stop, and with a projecting thumb-piece and a thumb-piece which is secured to the bell and limits the turning movement of the annular stop, substantially as set forth.

409,713. BARREL-BUNG. WILLIAM H. SUNDAY, Scranton, Pa. Filed June 1, 1889. Serial No. 312,851. (No model.)

Claim.—A downwardly-tapering elastic bung C, combined with a bush downwardly tapering on the inside and having the opposite vertical grooves $a' a'$, and provided with the cams a^3 a^3, and the cars D, having wrench-arms $d\,d$ at the top and arms $d'\,d'$ at the bottom, which are adapted to pass through the grooves $a'\,a'$ and engage the cams a^3 a^3, substantially as and for the purpose set forth.

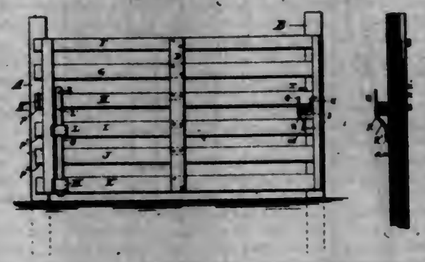
409,714. INDUCTION-COIL. ELIHU THOMSON, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Feb. 12, 1887. Serial No. 227,445. (No model.)

Claim.—1. The combination, with an electric coil, of a bundle of U-shaped iron plates or pieces, between whose legs the conductors of the coil lie, in combination with yoke-pieces consisting of bundles of iron plates fitted into the space between the projecting ends of the legs of the U, and forming a butt-joint with the lateral edges of said

legs, so as to complete a solid magnetic circuit around the circumferential axis of the coil.

2. The combination, with an electric coil, of an enveloping iron mass consisting of a bundle of iron plates passing through the axis of the coil and around the outside thereof, together with a bundle of sheet-iron plates insulated from one another and fitting into the space between the extensions of the first-named iron mass and forming a butt-joint with the edges of the plates making up such mass, as and for the purpose described.

3. The combination, in an induction-coil or converter, of primary and secondary coils whose combined cross-section is a square figure having four sides of equal length, in combination with a series of superposed U-shaped plates passing through said coil, and having legs which project beyond the coils to a distance substantially equal to the thickness of such coil, and a magnetic circuit-closing bundle of iron plates placed between the legs and having a width equal to the width of the legs.



409,715. RAZOR-STROP. JOSEPH B. TORREY, Worcester, Mass. Filed Aug. 20, 1888. Serial No. 283,207. (No model.)

Claim.—1. In a razor-strop, the combination, with the rigid body thereof, of the cushioned stropping part consisting of a flattened stuffed case or tube and a leather strip covering the outer side only of the said stuffed case or tooth, substantially as set forth.

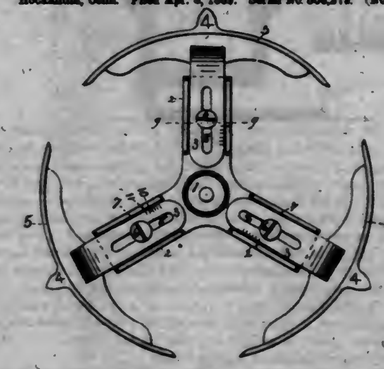
2. In a razor-strop, the combination, with a rigid rectangular body-block having hard stropping-surfaces on two of its opposite faces, of two cushioned stropping parts on the other two opposite faces of said block, each of said cushioned stropping parts consisting of a flattened stuffed case or tube forming a cushion, and a leather stropping-strip covering the outer side only of the cushion, substantially as set forth.

409,716. FARM-GATE. THOMAS A. TWEEDY, Knightstown, Ind. Filed Apr. 4, 1889. Serial No. 305,963. (No model.)

Claim.—1. In combination with a farm-gate, the support Q, having rollers R S, an upward projection for holding the gate in place, a downward projection for attachment to the post, an upward angle on the face of the post, with a point for driving into the post to secure the support in place, the pin T, the foot O, with pins Z and Z' kept in position by staples L M, the half-blocks X X' X^2, interposed between the slats of the gate and the middle upright, so as to allow a passway for support Q, and the staple N and notched slats H I J, for latching the gate when closed, substantially as and for the purposes set forth and described.

2. In combination with a sliding farm-gate, the support Q, having rollers R S and arms R', U, and U', for attaching the same to the post, substantially as and for the purposes set forth and described.

409,717. RUBBER-SHOE ATTACHMENT. JOHN VAN ANDALL and BERNARD A. DOLAN, Keokuk, Iowa. Filed Mar. 6, 1889. Serial No. 302,120. (No model.)



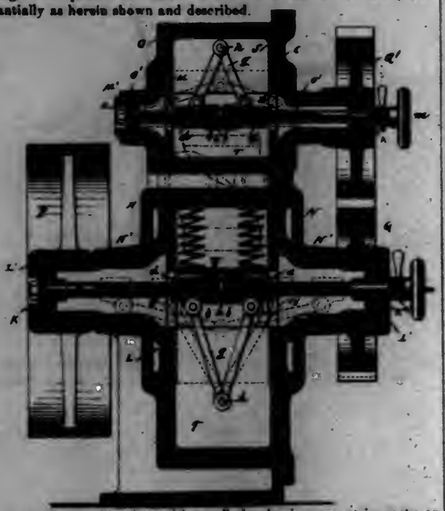
Claim.—1. The combination of a lever pivoted on the outside of the shoe, a spring-clip secured on the inside of the shoe, and a suitable connection between the two, substantially as described

2. In an attachment for overshoes, a clip secured within the shoe, a strip extending down the outside of the same, a lever pivoted to said strip, and a suitable connection between said clip and said lever, substantially as described.

409,717.

409,718. SPACING OR MARKING WHEEL. FRANCIS C. VIBERT, Rockaway, Conn. Filed Apr. 6, 1889. Serial No. 306,279. (No model.)

Claim.—The hub 1 and principal arms 2 2 2, in combination with the extension-arms 3 3 3, marking-points 4 4 4, peripheral segments 5 5 5, screws or bolts 6 6 6, raised lips or projections 7, and slots 8, when arranged and constructed as herein shown and described, and for the purpose set forth.



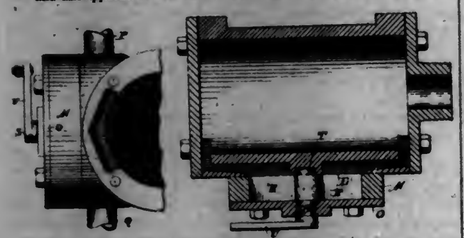
409,719. GAS AND AIR MIXING MACHINE. LEWIS B. WHITE, New York, N. Y. Filed June 28, 1888. Serial No. 278,296. (No model.)

Claim.—1. The combination, with a cylinder, of an eccentric shaft passing longitudinally through the same, a cylindrical piston mounted centrally on the same and in contact along one longitudinal line of its circumference with the inner circumference of the cylinder, which piston is provided with a longitudinal slot, wings within said slot mounted to slide in the direction of the diameter of the cylindrical piston, sliding sleeves on the shaft, links connecting the one wing with said sliding sleeves, and means, substantially as set forth, for adjusting the sliding sleeves, substantially as shown and described.

2. The combination with a cylinder, of an eccentric shaft passed longitudinally through the same, said shaft being threaded, a cylindrical piston mounted centrally on said shaft, which piston is provided with a longitudinal slot, sliding wings in the slot, sliding sleeves on the shaft, nuts on said shaft against which the sleeves can rest, and links connecting the sleeves with one wing, substantially as shown and described.

3. The combination, with a cylinder, of a shaft passed longitudinally through the same, a cylindrical piston mounted centrally on the shaft, said shaft being provided with a right and left hand screw-thread at opposite sides of the central plane of the cylindrical piston, nuts on the left and right hand thread of the shaft, sliding sleeves on the shaft, sliding wings in the cylindrical piston, and links connecting the sleeves on the shaft with one wing, substantially as shown and described.

4. The combination, with a cylinder having eccentric necks on its ends, of a cylindrical piston within the cylinder, necks on the piston mounted to rotate in the necks of the cylinder, bearing-nuts in the piston-necks, a shaft mounted in the bearing-nuts, said shaft having a right and left hand screw-thread at opposite sides of its center, nuts on said shaft, sleeves sliding on the threaded part of the shaft, sliding wings in the piston, and links connecting the sleeves with one of the wings in the piston and a hand-wheel on one end of the shaft, substantially as herein shown and described.



5. The combination, with a cylinder having eccentric necks on its ends, of a cylindrical piston within the cylinder, necks on the piston mounted to rotate in the necks of the cylinder, bearing-nuts in the piston-necks, a shaft mounted in the bearing-nuts, said shaft having a right and left hand screw-thread at opposite sides of its center, nuts on said shaft sliding on the threaded part of the shaft, sliding wings in the piston, and links connecting the sleeves with one of the wings in the piston, and a hand-wheel on one end of the shaft, and a lock-nut on the shaft adjacent to the band-wheel for the purpose of locking the shaft in place, substantially as shown and described.

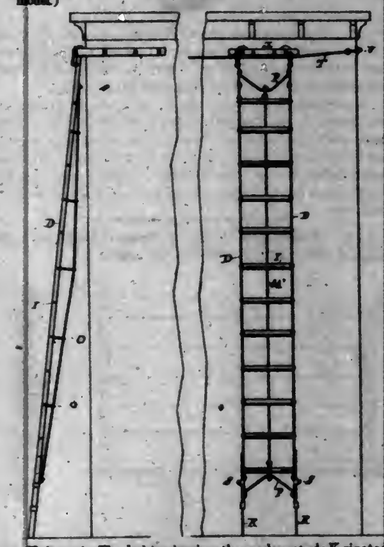
6. The combination, with a cylinder, of a cylindrical eccentric piston in the same, a sliding wing mounted and positively adjustable in said eccentric piston to project a greater or less distance from the same, substantially as shown and described.

7. The combination, with a cylinder, of a cylindrical eccentric piston in the same, having a slot extending in the direction of the length of the piston, and a sliding wing in said slot extending from one end of the piston to the other, and positively adjustable, as set forth, to project a greater or less distance from said piston, substantially as set forth.

409,720. STEAM-ENGINE VALVE. JOHN H. WILLIAMS, Urbana, Ohio. Original application filed June 9, 1888, Serial No. 276,236. Divided and this application filed Oct. 1, 1888. Serial No. 286,908. (No model.)

Claim.—The combination, with an oscillating valve consisting of a central portion and two arms converging in width toward the center, a shaft on which it oscillates, a crank on the shaft, a steam-chest composed in part of an annular body and a cap-plate, and inlet and exhaust-pipes which communicate with the steam-chest at the opposite sides of the valve, of a steam-cylinder whose bore composes the remainder of said chest and which is constructed with steam-ports which occupy a portion of its circumference at their outer ends and converge to points within said chest, and mouths of the same shape and slightly smaller than the arms of the valve.

409,721. FIBROUS LUBRICATOR. JOSEPH WILLIAMS, Jr., Pittsburg, Pa. Filed Apr. 10, 1889. Serial No. 306,726. (No model.)

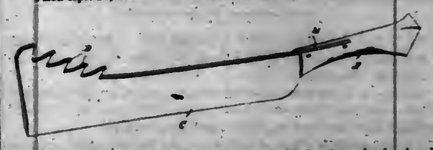


Claim.—1. As a new article of manufacture, a lubricator consisting of a fibrous absorbent core and a fibrous cylindrical covering woven closely together and around the core, whereby when the fibrous body formed by the core and covering is saturated with a lubricant the covering becomes rigid and has its pores and interstices closed to retain the lubricant in the core, substantially as and for the purpose described.

2. As a new article of manufacture, a lubricator consisting of a fibrous absorbent core and a fibrous covering woven closely together and around said core, the ends of the body being closed substantially in the manner and for the purpose described.

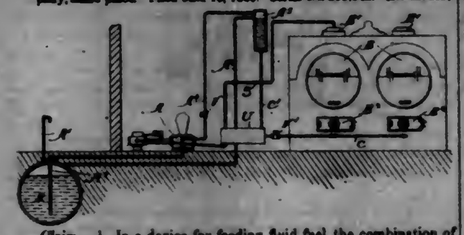
3. As a new article of manufacture, a lubricator consisting of a core and covering composed of a series of closely-woven fibrous layers, which are graduated in diameter and fitted closely around one another, substantially as and for the purpose described.

409,722. FIRE-LADDER. WILLIAM WIBELIN, Newport, Ky. Filed Aug. 12, 1887. Renewed Jan. 28, 1889. Serial No. 297,821. (No model.)



Claim.—1. The ladder having the anchor-studs K riveted thereto and the eyebolts L, connected to said studs, combined with the stiffened brackets O and the tension-ropes M, secured to said anchors at top and bottom, substantially as and for the purpose set forth.

2. The ladder having V-shaped brackets P at top and bottom and eyebolts L, combined with the stiffened brackets O, substantially in the manner and for the purpose set forth.



3. The combination of the ladder D, having extensible legs at its lower end, with the truck X and cable T, substantially as and for the purposes set forth.

409,723. CORN-CUTTING KNIFE. JAMES P. WOOD, Fairbank, Minn. Filed Apr. 26, 1889. Serial No. 308,004. (No model.)

Claim.—The improved corn-cutting knife having the back edge of its blade curved outward toward its free end and provided with a series of teeth on said curved portion, the said teeth projecting from and beyond the back edge of the blade, as specified.

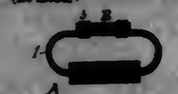
409,724. DEVICE FOR FEEDING FLUID FUEL. WALTER B. WRIGHT, Chicago, Ill., assignor to the International Gas and Fuel Company, same place. Filed Jan. 10, 1889. Serial No. 296,042. (No model.)

Claim.—1. In a device for feeding fluid fuel, the combination of an oil-tank, a fluid-reservoir, a pipe and pump to pass the oil from such tank to such reservoir, two pipes leading from such reservoir, one to the points of discharge and the other back to the tank, the latter opening into the reservoir at a higher point than the former and at a lower point than the first-mentioned pipe, a pipe leading from the discharge-pipe back to the tank, a valve in the steam-supply pipe which leads to the pump, a second valve in the pipe which leads from the discharge-pipe to the tank, and a handle and connecting-bar whereby the two said valves are simultaneously operated in opposite directions, so that when the steam is turned on the valve in the pipe leading from the discharge-pipe to the tank is closed and when the steam is turned off it is open to drain the reservoir.

2. The combination of a fluid-fuel furnace with an oil-tank and an oil-reservoir, the latter situated higher than the tank and the discharge into the furnace, a discharge-pipe from such reservoir to the furnace, a supply-pump, and a pipe from the tank to the reservoir connecting with such pump, and an overflow-pipe from the tank to the reservoir, a pipe leading from the discharge-pipe back to the tank, a valve in the steam supply pipe which leads to the pump, a second valve in the pipe which leads from the discharge-pipe to the tank, and a handle and connecting-bar whereby the two said valves are simultaneously operated in opposite directions, so that when the steam is turned on the valve in the pipe leading from the discharge-pipe to the tank is closed and when the steam is turned off it is open to drain the reservoir.

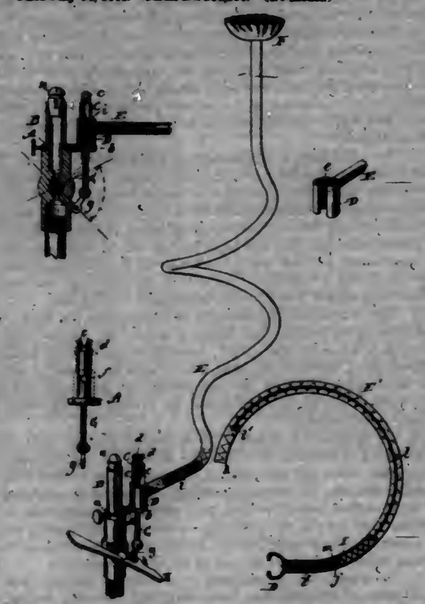
3. In a device for feeding fluid fuel, the combination of a fluid-tank with a reservoir, two pipes—one a supply, the other an overflow—connecting the same, a fluid-pump in the supply-pipe and a discharge-pipe leading from such reservoir to the points of consumption of the fluid, the supply-pipe opening into the reservoir above the overflow-pipe, so that the fluid is circulated through the reservoir, but maintains a constant pressure therein, a pipe leading from the discharge-pipe back to the tank, a valve in the steam-supply pipe which leads to the pump, a second valve in the pipe which leads from the discharge-pipe to the tank, and a handle and connecting-bar whereby the two said valves are simultaneously operated in opposite directions, so that when the steam is turned on the valve in the pipe leading from the discharge-pipe to the tank is closed and when the steam is turned off it is open to drain the reservoir.

4. In a device for feeding fluid fuel, the combination of a reservoir from which the fluid is fed to the point where it is consumed, with a pipe leading therefrom to such point, a tank, a vent-pipe leading from such reservoir to the supply-tank and opening into the reservoir at a different height from the first-mentioned pipe, a connection between said two pipes controlled by a valve, so that communication between the reservoir and tank may be made from points of different heights upon such reservoir, and a pump and supply-pipes connecting the same with the tank and reservoir.



409,725. HEALD OR HEDDLE FOR LOOMS. JOHN YEADON, Idle, near Bradford, England. Filed July 5, 1887. Serial No. 243,235. (No model.)

Claim.—1. The combination, with the heddle-wires provided with central eyes and the eyes at their ends, of the looped yarns or threads E, whereby the heddle-wires are connected with the upper and lower heddle-shafts, respectively, and the rigid guard-wires G, passing through the said eyes at the ends of the heddle-wires, substantially as and for the purpose set forth.

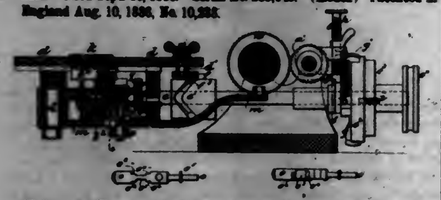


2. The combination, with the shafts, of a heddle, the heddle-wires A, having eyes C and J at each end, the guard-wires passing through the eyes C, the suspending-wires passing through the eyes J, and the series of looped yarns E, attached to certain of the eyes J at intervals greater than the interval between two adjacent heddle-wires, substantially as described.

409,726. HARNESS-LOOP. JOHN H. RAHE, Edgar, Nebr., assignor of one-half to George D. Benjamin, same place. Filed Apr. 12, 1889. Serial No. 307,044. (No model.)

Claim.—In combination with the trace-strap consisting of two layers, the blank to form the loop formed of a single piece passing between the layers and secured therewith by stitches or rivets, and having its ends brought together to form the loop, and provided with a series of openings in each of its ends, and a cap-plate having openings corresponding with those in the ends of the loop, and a double series of rivets passing through these openings and securing these parts, so that if the loop is broken from its attachment to the trace or strap the loop will remain operative, all substantially as described.

409,727. GAS-LIGHTER. DORTHE B. RATTEY, New York, N. Y. Filed July 31, 1888. Serial No. 281,580. (No model.)



Claim.—1. In a gas-igniter, the combination of the removable magazine-tube E, provided with the clamp D, the arm A, fitted to the burner B, the cylinder C, carried by the arm A, the friction-springs c, provided with bowed ends d, extending over the mouth of the cylinder C, the piston G, and a key H, substantially as specified.

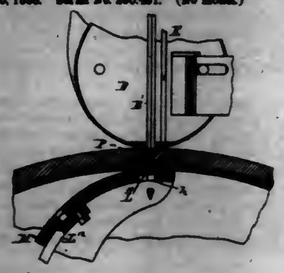
2. In a gas-igniter, the combination, with the burner B, provided with gas-key H, of the arm A, attached to the burner B, the cylinder C, supported by the arm A, the springs c, attached to the cylinder C and provided with bowed ends d, projecting over the upper end of the cylinder, the clamp D, embracing the lower ends of the springs c and the cylinder C, the curved magazine-tube E, attached to the clamp D and provided with the hopper F, the piston G, fitted to the cylinder C, and the link g, connecting the piston G and key H, substantially as specified.

3. As an improved article of manufacture, a gas-igniter constructed and operated as herein described, the same consisting of an adjustable arm having one extremity adapted to fit adjustably upon the gas-burner, the other extremity of said arm having attached to it a pellet-cylinder provided with a side orifice for admission of igniting-pellets, a pellet magazine or tube adapted to fit upon or connect with the pellet-cylinder and deliver pellets thereto, igniting-springs arranged above the upper extremity of the pellet-cylinder, and a piston moving within said cylinder and operated by connections with the gas-key

of the burner, so that when said key is closed the gas will be turned off and the piston brought below the pellet-orifice in the cylinder, so as to admit a pellet above the piston, and by the act of opening the key the gas will be turned on, and the piston will rise and push a pellet through and out of the cylinder between the springs, whereby the pellet will be ignited and the gas lighted, all as set forth.

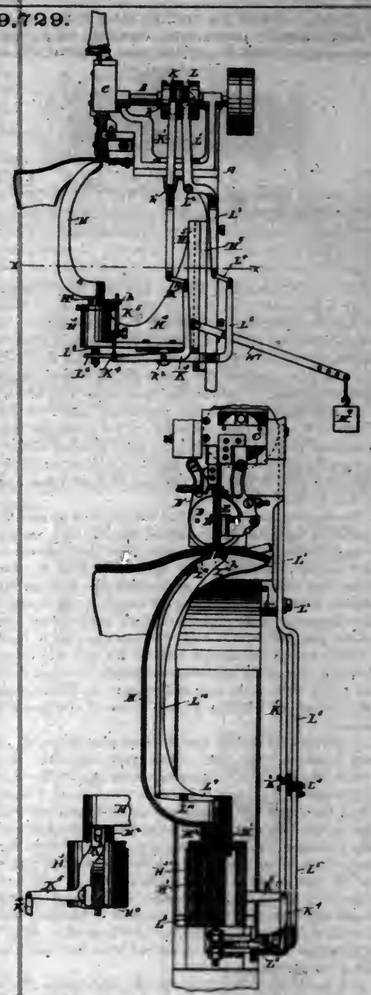
409,728. BUTTON-HOLE SEWING-MACHINE. FRANK H. BENNETT, Twickenham, County of Middlesex, and JAMES DOWLING, London, England. Filed Sept. 10, 1888. Serial No. 285,045. (Model.) Patented in England Aug. 10, 1888, No. 10,286.

Claim.—1. The combination, substantially as hereinbefore set forth, of stitch-forming mechanism, cloth-clamping devices, the longitudinally-moving slide, means for actuating it, the transversely-moving slide, the bed-plate of the machine, a main operating-lever pivoted at one end of the bed-plate of the machine, a cam with which the opposite end of the lever engages, the main driving-shaft, gearing between the main driving-shaft and the cam, a continuously-driven cam, a lever connecting said cam with the main operating-lever *m*, a supplemental lever and a bolt connecting the supplemental lever to the main operating-lever, said bolt being formed with a reduced portion, and shoulders at each end of the reduced portion and on both sides thereof, and lugs on the supplemental lever engaging with the shoulders on the bolt.



2. The combination, substantially as hereinbefore set forth, of stitch-forming mechanism, cloth-clamping devices, a longitudinally-moving slide, means for operating it, a transversely-moving slide, the main operating-lever and a supplemental lever pivoted together, means for oscillating said levers, guide-lugs on the levers, a locking-bolt moving in said guide-lugs, said bolt being formed with a reduced portion and shoulders at each end and on both sides of the reduced portion, means for sliding the bolt back and forth in the guide-lugs, and connections between the levers and the transversely-moving slide.

3. The combination, substantially as hereinbefore set forth, of stitch-forming mechanism, cloth-clamping devices, the longitudinally-moving slide, means for operating it, transversely-moving slide, means for operating it, the main operating-lever, means for operating said lever, the supplemental lever, the locking-bolt, the guide-lugs on the levers within which the bolt moves, and the pivoted link into which the locking-bolt projects.



4. The combination, substantially as hereinbefore set forth, of stitch-forming mechanism, cloth-clamping devices, the longitudinally-moving slide, means for operating it, the transversely-moving slide, means for operating it, the main operating-lever, means for operating said supplemental lever, the lever, the locking-bolt formed with an enlargement at one end, the guide-lugs on the levers within which the bolt moves, and the pivoted link into which the locking-bolt projects and into which also projects the end of the supplemental lever.

5. The combination, substantially as hereinbefore set forth, with the bed-plate, of stitch-forming mechanism, cloth-clamping devices, the longitudinally-moving slide, means for operating it, the transversely-moving slide, the main operating-lever connected with the transversely-moving slide, a supplemental lever, a bolt for locking the two levers together, and a link pivoted to the bed-plate into which the supplemental lever projects and into which also projects the reduced outer end of the locking-bolt.

409,729. PEGGING-MACHINE. JOHN R. BUKFORD, Whitman, Mass. Filed Nov. 10, 1888. Serial No. 290,481. (No model.)

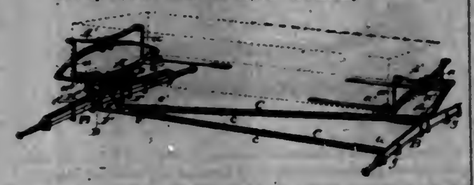
409,729.

Claim.—1. In a pegging-machine, the combination of a feeding turning-horn having an awl and peg orifice and a peg-cutting mechanism and mechanism for holding the horn and shoe stationary during the working of the awl, then feeding the shoe and horn forward together and holding them stationary until the work of peg driving and cutting is completed, and mechanism to feed said horn back when these operations are completed, with a peg-cutter L^{14}, awl E, driver E', and an upper feed mechanism, substantially as and for the purpose set forth.

2. In a pegging-machine, the rotating feeding-horn H, with the slide H^3, arm N, lever K^6 K^5, link K^4, lever K^3, link K^2, lever K, and cam K, substantially as and for the purpose set forth.

409,730. PAPER FILE OR HOLDER. JESSE B. BROWN, Nashville, Tenn. Filed June 17, 1889. Serial No. 314,593. (No model.)

Claim.—1. A holder for bills, papers, files, and the like, consisting of a grooved base, spacing-blocks fitted to the groove, and vertical partitions having each a foot adapted to enter the groove and located between the feet of adjacent partitions in said groove, and a locking device, substantially as described.



2. A holder for bills and the like, consisting of a base provided with a dovetailed groove, spacing-blocks having a similar form, and vertical partitions having feet with straight sides adapted to enter between the blocks in the groove, the blocks being located in the same and between the feet of the partitions therein, substantially as described.

3. The holder for bills and the like, consisting of a grooved base, spacing-blocks, vertical partitions, and horizontal division-partitions, the blocks and partitions being separately movable, substantially as described.

4. The holder for bills and the like, consisting of a grooved base, spacing-blocks, vertical partitions, and horizontal partitions or division-pieces mortised and fitted upon the vertical partitions, substantially as described.

5. The holder for bills and the like, consisting of the grooved base, the spacing-blocks, the vertical and horizontal partitions, and the transverse closure, whereby the pigeon-holes are formed and inclosed, substantially as described.

409,731. VEHICLE-GEAR. JOHN A. CHAPMAN, Milwaukee, Wis. Filed Apr. 7, 1887. Serial No. 233,961. (No model.)

Claim.—1. In a vehicle-gear, the combination, with an elliptic end spring, of a cross-spring attached at the middle to the upper side thereof and crank-shaped body-loops connecting the ends of said cross-springs with the body of the vehicle, substantially as and for the purposes set forth.

2. In a vehicle-gear, the combination, with elliptic end springs, of half-elliptic springs mounted thereon and crank-shaped body-loops secured at their outer ends in the eyes of said half-elliptic springs and attached at their inner ends to the under side of the vehicle-body, substantially as and for the purposes set forth.

3. In a vehicle-gear, a round wood reach, in combination with a perch-iron having a corresponding concave seat for reception of said wood reach, to which it is rigidly secured, substantially as and for the purposes set forth.

4. The combination, in a vehicle-gear, of a round wood reach and a perch-iron having a concave longitudinal seat fitted to the under side of said wood reach and flattened on the under side to provide seats for the nuts of the bolts by which it is secured to said wood reach, substantially as and for the purposes set forth.

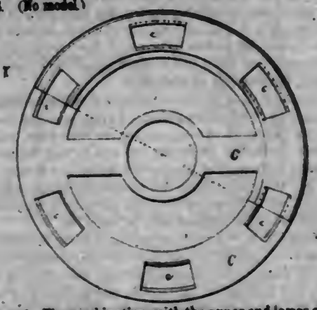
5. In a vehicle-gear, the combination, with the upper and lower sections of the fifth-wheel, of the head-block plate formed with a rearwardly-projecting perch-iron and a forked draft-brace secured at its ends to the axle, and connected at its angle by the king-bolt with said perch-iron behind said axle, substantially as and for the purposes set forth.

6. In a vehicle-gear, the combination, with the front axle of the head-block, of the upper and lower sections of a fifth-wheel formed with flanges adapted, respectively, to said head-block and axle, a head-block plate formed with yokes for the spring-clips, and a rearwardly-projecting perch-iron and a forked draft-brace hinged at its angle behind said axle to said perch-iron, and formed at its ends with yokes for the clips by which it and the lower section of the fifth-wheel are secured to said axle, substantially as and for the purposes set forth.

7. In a vehicle-gear, the combination, with the front axle and head-block, of the upper and lower arc-shaped sections of a fifth-wheel attached, respectively, to said head-block and axle, a head-block plate formed with a rearwardly-projecting perch-iron, a draw-brace hinged thereto at the center of the fifth-wheel behind said axle and rigidly attached to said axle, and a brace attached to the head-block and the upper section of the fifth-wheel, and formed with a lip projecting under and supporting the lower section of said fifth-wheel, substantially as and for the purposes set forth.

8. In a vehicle-gear, the combination, with the front axle and head-block, of the upper and lower sections of a fifth-wheel, a plate in which the head-block is seated, formed with yokes for the spring-clips and a rearwardly-projecting arm branching into the upper perch-irons, a corresponding forked lower perch-iron, between which and the upper perch-irons are secured the front ends of the reaches, and a forked draft-brace hinged at its angle upon the king-bolt between the upper and lower perch-irons at or near the junction of their branching arms, and formed at its ends with yokes for the clips by which it is secured to said axle, substantially as and for the purposes set forth.

409,732. VEHICLE-SHAFT COUPLING. JOHN A. CHAPMAN, Milwaukee, Wis. Filed Mar. 3, 1888. Serial No. 302,062. (No model.)



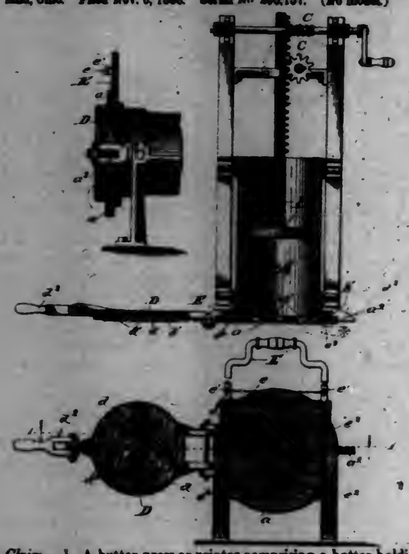
Claim.—1. The combination, in a pole or shaft coupling, with the eye and ears, of a pin passing through and connecting them, a yoke provided with projections which are adapted to overhang the coupling-ears and retain the pin therein, and a metallic spring-loop loosely suspended upon said yoke and adapted to bear against the eye of the coupling, said yoke being provided with shoulders which are seated upon said ears and serve, when it is turned into place, to force said spring-loop against said eye, substantially as and for the purposes set forth.

2. The combination, with the eye and ears of a pole or shaft coupling, of a pin passing through and connecting the same and provided at the ends with notches, a yoke seated upon said ears and provided with projections which engage the notches in said pin and hold the same in place, and a metallic spring-loop loosely suspended on said yoke and adapted to bear against said eye, said yoke being provided with shoulders which are seated upon said ears and serve as an eccentric to force said spring-loop against said eye, substantially as and for the purposes set forth.

3. The combination, with the eye and ears of a pole or shaft coupling, of a pin passing through and connecting the same, a yoke consisting of a cross-bar and end projections extending over the perforations in said ears, so as to retain the pin therein, and provided with oblique shoulders which are seated upon the upper edges of said ears, and a metallic spring-loop loosely suspended at the upper end on said cross-bar and adapted to bear at the other end against said eye, said yoke serving, when turned into place, to force said spring-loop against said eye, substantially as and for the purposes set forth.

4. The combination, with the eye and ears of a pole or shaft coupling, of a pin passing through and connecting the same, a yoke consisting of a cross-bar and end projections which have oblique shoulders adapted to rest upon the upper edges of the ears and extend when in position over the perforations in said ears, so as to retain said pin therein, said yoke being provided with a squared head for turning said projections into and out of range with said pin and for forcing the spring-loop against the eye of the coupling, and a metallic spring-loop loosely suspended upon said yoke and adapted to bear against said eye, said yoke serving, when turned into and out of position, to strain and loosen said spring-loop against said eye, substantially as and for the purposes set forth.

409,733. FIFTH-WHEEL FOR VEHICLES. ABRAM O. CLEMONS and ROBERT H. CLEMONS, Dresden, N. Y. Filed June 3, 1889. Serial No. 312,906. (No model.)



Claim.—1. The combination, with the upper and lower circles of a fifth-wheel, of a circular plate interposed between the same and having openings with inclined walls therein, a removable cap-plate having openings registering with said other openings and formed with oppositely-inclined walls, balls in the openings, and a cross-piece, substantially as described.

2. The combination, with the upper and lower circles of a fifth-wheel, of an interposed circular plate having a cross-piece with an enlarged opening at its center, balls secured in the plate, castings arranged on the circles having lateral flanges of different dimensions extending

through the opening in the cross-piece, a king-bolt G', and a series of balls between the castings, substantially as described.

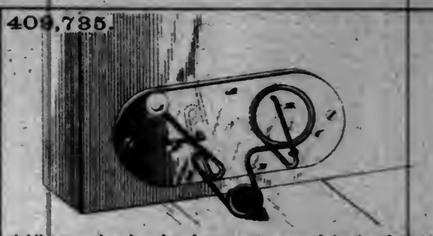
3. The combination, with the upper and lower circles, of the plate C, interposed between the same and formed with openings *c*, the cap E, having openings therein, the flanged castings F F', secured, respectively, to the upper and lower circles, and the balls D and H, substantially as described.

409,734. BUTTER-PRESS OR PRINTER. JOHN M. CRILEY, Loveland, Ohio. Filed Nov. 6, 1888. Serial No. 290,157. (No model.)

Claim.—1. A butter press or printer comprising a butter-holding cylinder having openings in one end beveled outwardly, a cap fitting against such end to close the cylinder and form the pats, a plunger for pressing the butter outwardly through the beveled holes and against the cap, means for actuating the plunger, and a cut-off to separate the pats, substantially as described.

2. A butter press or printer comprising a butter-holding cylinder, a head-plate at one end of the cylinder having openings beveled outwardly, a cap closing and fitting against the head-plate and having dies or molds to form the pats, a plunger for forcing the butter out through the beveled holes and into the dies of the cap, means for actuating the plunger, and a vertically-movable cut-off to separate the pats, substantially as described.

3. A butter press or printer comprising a butter-holding cylinder, a head-plate at one end of the cylinder having openings beveled outwardly, a cap closing and fitting against the head-plate, a removable plate secured inside the cap having dies or molds to form the pats, a plunger for forcing the butter out through the beveled holes into the dies of the removable plate, and a vertically movable cut-off to separate the pats, substantially as described.



4. A butter press or printer comprising a butter-holding cylinder, a head-plate at one end of the cylinder having openings beveled outwardly, a cap closing and fitting against the head-plate, a removable wooden plate dovetailed inside the cap and having dies or molds to form the pats, a plunger for forcing the butter out through the beveled holes into the dies of the wooden plate, means for actuating the plunger, and a vertically-movable frame carrying a wire knife to cut off or separate the pats, substantially as described.

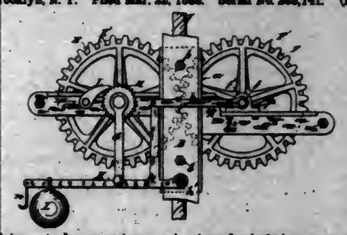
5. A butter press or printer comprising a butter-holding cylinder, a head-plate at one end of the cylinder having openings beveled outwardly, a cap closing and fitting against the head-plate, a lever-lock for securing and holding the cap against the head-plate, a removable plate inside the cap having dies or molds to form the pats, a plunger for forcing the butter out through the beveled holes and into the dies of the removable plate, means for actuating the plunger, and a vertically-movable cut-off to separate the pats, substantially as described.

409,735. DOOR-CHECK. CHARLES H. DUDDY, Port Norris, N. J. Filed Dec. 20, 1888. Serial No. 294,228. (No model.)

Claim.—A door check or holder, as described, consisting of a plate A, for attachment to a door, said plate having a catch or loop, the holder consisting of a single piece of spring-wire one end of which is rigidly attached to the plate, a spring portion located near said

409,735.

rigidly-secured end, and a downwardly-curved portion formed by bending and coiling the wire upon itself to maintain between said coil a rubber or equivalent block, the free end of the wire being bent to engage with a loop, substantially as shown, and for the purpose set forth.



409,736. TELEPHONE RECEIVING-INSTRUMENT. ROBERT D'USSEL, Chicago, Ill. Filed Jan. 15, 1886. Serial No. 208,442. (No model.)

Claim.—1. In a telephone-receiver, a magnet having the coil upon one end and having its other end flattened to form the diaphragm, with the corrugated portion H, substantially as set forth.

2. In a telephone, the combination of the hardened-steel portion E, the soft-metal portion F, the return-bar G, having its end flattened into the diaphragm I, and the corrugated portion H, substantially as set forth.

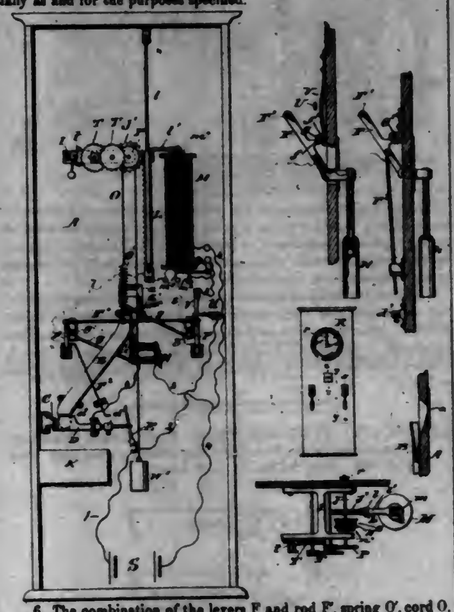
409,737. MECHANISM FOR OPERATING HOISTS. JOHN S. RIENE, Brooklyn, N. Y. Filed Mar. 22, 1888. Serial No. 268,141. (No model.)

Claim.—1. In actuating mechanism for hoisting apparatus, the combination of the power-sheave E, having fixed bearings, the sheave F, with slidable bearings, the weighted lever H, arranged to press the said sheave F automatically toward the said power-sheave E, and the pawl L, and ratchet M, arranged and operating substantially in the manner and for the purpose described.

2. In actuating mechanism for hoisting apparatus, the combination of the power-sheave E and gear-wheel E', having fixed bearings, the sheave F and gear-wheel F', having slidable bearings, the weighted lever H, arranged to press the said sheave F and gear F toward the said power-sheave E and gear E', and the pawl L and ratchet M, the whole arranged and operating substantially in the manner and for the purpose described.

3. In actuating mechanism for hoisting apparatus, the combination of the power-sheave E and gear-wheel E', having fixed bearings, the sheave F and gear-wheel F', having slidable bearings, the weighted lever H, arranged to press the said sheave F and gear F toward the said power-sheave E and gear E', the pawl L, and ratchet M, and the hook *n*, the whole arranged and operating substantially in the manner and for the purpose set forth.

409,738. COIN-OPERATED INDUCTION-COIL. JOHN H. RAPHELD, Chicago, Ill. Filed Oct. 6, 1888. Serial No. 287,440. (No model.)



Claim.—1. The combination of the case A, chute B, lever D, coil S, wire 1, spring-finger E, wire 6, coil W, wires 5 and 4, lever G, and bolts *g*, substantially as and for the purposes specified.

2. The combination of the case A, chute B, lever D, coil S, wire 1, spring-finger E, wire 6, coil W, wires 5 and 4, lever G, and bolts *g*, and spring G', substantially as and for the purposes specified.

3. The combination of the case A, chute B, lever D, coil S, wire 1, spring-finger E, wire 6, coil W, wires 5 and 4, lever G, and bolts *g*, and spring G', handles H, levers F, and rod F', substantially as and for the purposes specified.

4. The combination of the levers F and rod F', rack L, rod *l*, core *m*, operated by said levers, and circuit opening and closing devices, substantially as and for the purposes specified.

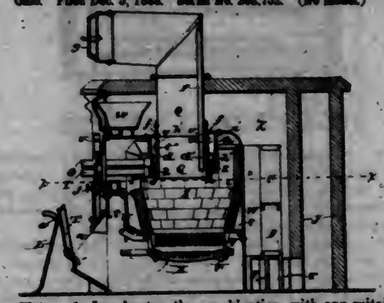
5. The combination of the levers F and rod F', rack L, rod *l*, core *m*, attached to rod *l*, coil M, wires 4 2, spring-fingers U and V, wire 3, screw m^2, armature m^3, wire 9, and wires 7 and 8, substantially as and for the purposes specified.

6. The combination of the levers F and rod F', spring G', cord O, weight W', pulley N, train of wheels provided with escapement-pawl, pulley J', rack L, rod *l*, core *m*, attached to rod *l*, coil M, wires 4 2, spring-fingers U and V, wire 3, screw m^2, armature m^3, wire 9, and wires 7 and 8, substantially as and for the purposes specified.

7. The combination of the case A, chute B, lever D, coil S, wire 1, spring-finger E, wire 6, coil W, wires 5 and 4, lever G, and bolts *g*, and spring G', handles H, levers F, and rod F', spring O', cord O, weight W', pulley N, train of wheels provided with escapement-pawl, pulley J', rack L, rod *l*, core *m*, attached to rod *l*, coil M, wires 4 2, spring-fingers U and V, wire 3, screw m^2, armature m^3, wire 9, and wires 7 and 8, substantially as and for the purposes specified.

8. The combination of the chute B, lever D, provided with cap *d* and weight *d'*, and lug C, substantially as and for the purposes specified.

409,739. WATCH-CASE SPRING. JAMES D. EWING, Philadelphia, Pa., assignor to the Keystone Watch Case Company, same place. Filed Mar. 21, 1888. Serial No. 304,172. (No model.)



Claim.—1. In a watch-case, the combination, with the watch-case center having a smooth or unnotched surface, of a curved spring to control the cover or lid fitting into said center and having integral with itself or attached to itself a spring portion or addition adapted to press upon the smooth portion of said center to secure said watch-case spring therein.

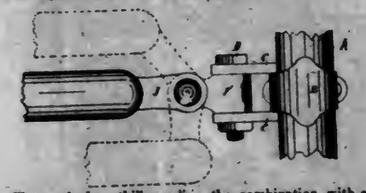
2. In a watch-case, the combination, with the watch-case center having a smooth annular surface, of a curved spring to control the cover or lid and having a non-flexible or body part fitting within said center, provided with a spring portion adapted to press upon said center to secure said spring therein by direct pressure between the spring and center.

3. In a watch-case, the combination, with the center A, of the curved spring B, having the slot or groove E, the slit F in the thin wall of metal formed by said groove, and the raised spring-edge *e*, substantially as and for the purpose specified.

4. A watch-spring for controlling the covers of a watch-case, consisting of a curved spring part provided at one end with a thick non-spring part furnished with a small spring projecting above its surface.

409,740. HOT-AIR AND HOT-WATER HEATER. FRANCIS FARQUHAR, MILTON J. FARQUHAR, and HENRY B. FARQUHAR, Wilmington, Ohio. Filed Dec. 3, 1888. Serial No. 292,732. (No model.)

Claim.—1. In a heater, the combination, with any suitable fire-pot and any suitable fuel-magazine, of the hot-blast flue which surrounds the fire-pot, a second hot-blast flue connected with the first and arranged adjacent to the fuel-magazine, and a water-jacket about the mouth of the second hot-blast flue, substantially as described.



2. In a heater, the combination, with any suitable fire-pot and any suitable fuel-magazine, of the hot-blast flue which surrounds the fire-pot, a second hot-blast flue connected to the first, which surrounds the fuel-magazine and is annular in form, together with a water-jacket about the mouth of the said annular hot-blast flue, substantially as described.

3. In a heater, the combination, with a fuel conduit or magazine, of a hot-blast flue arranged adjacent to the fuel conduit or magazine, together with a water-jacket about the mouth of the hot-blast flue, substantially as described.

4. In a heater, the combination, with a fuel conduit or magazine, of an annular hot-blast flue which surrounds the same and has an annular mouth which is adjacent to the mouth of the fuel-magazine, together with a water-jacket about the mouth of the hot-blast flue, substantially as described.

5. In a heater, the combination of the fuel conduit or magazine with the hot-blast flue arranged adjacent to the lower edge of the same, the water-jacket surrounding the hot-blast flue, the gas-chamber at the top of the fuel-magazine, and the pipe leading from said gas-chamber back to or nearly to the mouth of the fuel-magazine, substantially as described.

409,741. THILL-COUPLING. ROBERT G. W. FOSTER, Toledo, Ohio. Filed Apr. 22, 1889. Serial No. 308,189. (No model.)

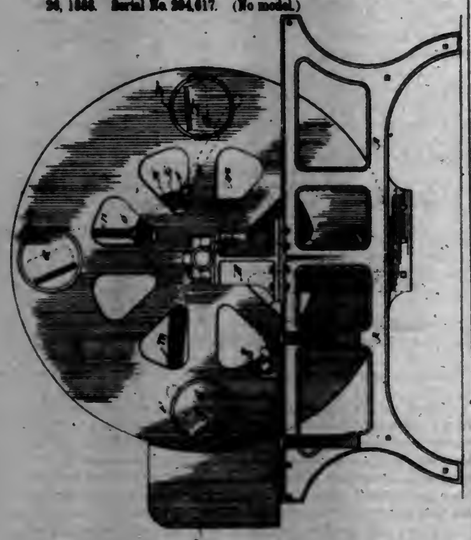
Claim.—1. In a thill-coupling, the combination, with a shackle, of a coupling-section pivotally secured thereto, said section having an upwardly-extended externally-threaded projection, a link-arm having threaded apertures at either end, and a thill-iron threaded at one end adapted to engage one of said threaded apertures, the other working upon the threaded projection, whereby connection is made between the thill and coupling-section, substantially as shown and described.

2. In a thill-coupling, the combination, with a coupling-section having an upwardly-extending externally-threaded projection at its forward part, of a link-arm having threaded apertures at either end thereof, one of said apertures working over the threaded projection and the other adapted to receive the threaded end of the thill-iron, substantially as shown and described.

3. In a thill-coupling, the combination, with the shackle C, of the coupling-section E, formed with the threaded projection F and bore G, the bolt D passing through the same, the bushing G' within the bore and adapted to bear upon the bolt, the binding-screw H, adapted to regulate the pressure of the bushing, the link-arm J, threaded at

either end, and the thill-iron K', threaded at K, all arranged and adapted to operate substantially as shown and described.

409,742. KNIFE-CLEANER. HERBERT E. FOWLER, New Haven, Conn. Filed May 11, 1888. Serial No. 273,603. (No model.)

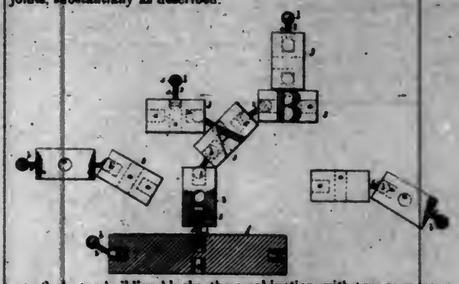


Claim.—1. In a knife-cleaner, the combination, with a base-plate having a yoke or bridge secured thereto, of abrading-pads, confining-plates for the said pads, having slots to receive the said yoke, and yielding connections for the said plates, whereby the under pads may have an upward spring action, substantially as specified.

2. The combination, with a base-plate, of the yoke adapted to serve the additional function of a handle, the short posts secured to the said base, the slotted confining-plates having longitudinal marginal flanges, abrading-pads interposed between the plates, and detachable yielding connections for the two outer plates, substantially as specified.

3. In a knife-cleaner, the combination, with vertical guides, of abrading-pads, confining-plates therefor, and yielding connections for the said plates, whereby the under pads may have an upward spring action and the upper ones a similar action downwardly, substantially as specified.

4. In a knife-cleaner, the combination, with a base, of a yoke, as B, rising therefrom, confining-plates longitudinally slotted to be received by the yoke, said plates having their ends extended, and a yielding connection, such as F, adapted to be detachably applied to the ends of the plates, so as to confine abrading-pads and effect an upward spring action on the lower pads and a similar downward action on the upper pads, substantially as specified.



409,743. BOX-BLOCKER. CARL GAIL, Chicago, Ill. Filed Dec 26, 1888. Serial No. 294,617. (No model.)

Claim.—In a box-blocking machine, the combination, with frame A, table O, and guide R, of the vertically-rotating disk provided with pivotal plane-knife frames, each having a crank coupled with an eccentric-strap rotating on a stationary eccentric-ring to impart an oscillating movement to the plane-knives during their circular course of travel, substantially as and for the purpose set forth.

409,744. TOY BUILDING-BLOCKS. ADOLPH F. C. GARDEN, Minneapolis, Minn. Filed Jan. 21, 1888. Serial No. 261,496. (No model.)

Claim.—1. A set of toy building-blocks consisting of a series of separate blocks detachably connected together by ball-and-socket joints, substantially as described.

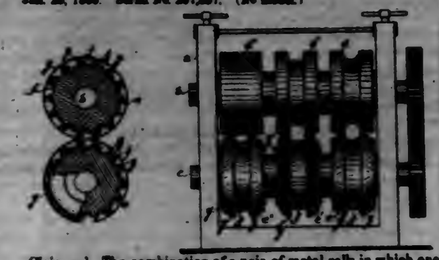
2. In toy building-blocks, the combination, with two or more recessed blocks having recesses adapted to receive a spherical head, of a coupling-block consisting of a pair of spherical heads on opposite ends of a common stem, said heads being adapted to fit the recesses in said recessed block, substantially as described.

3. In toy building-blocks, in combination with two or more blocks, as 1 and 3, provided with recesses, as *a*, of a coupling-block 2, consisting of spherical heads *b* on the opposite ends of the stem *c*, and provided with a peripheral groove *d*, and an elastic packing-ring 5, adapted to fit said groove, substantially as described, for the purpose set forth.

409,745. WATCH-CASE SPRING. HARRY B. GAIL, Philadelphia, Pa., assignor to the Keystone Watch Case Company, same place. Filed Apr. 2, 1889. Serial No. 305,752. (No model.)

Claim.—1. A watch-case spring formed of stamped sheet spring metal, with free ends bent outwardly, and having a slit or slits at its middle part to make that of less width than the end parts and a part projecting from said middle part to act on the lid.

2. A watch-case spring formed of stamped sheet spring metal, made curved and having a slit or slits at its middle part to make that of less width than the end parts, and a part projecting from said middle part to act on the lid, and in which said end parts at their most distant edges are curved in the opposite direction to the main curvature of the spring.



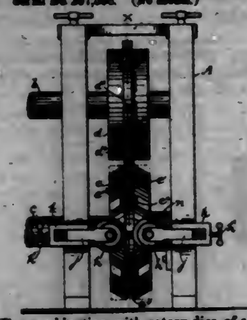
3. A watch-case spring formed of stamped sheet spring metal, made curved and having a slit or slits at its middle part to make that of less width than the end parts, and a part projecting from said middle part to act on the lid, in which said end parts at their most distant edges are curved in the opposite direction to the main curvature of the spring and provided with notches for the insertion of an instrument for their removal.

4. A watch-case spring formed of stamped sheet spring metal, curved to conform to the curvature of the groove of the case-center and having its ends curved outwardly, and also having a portion of its middle formed with a slit or slits and reduced in width and provided with an upwardly and outwardly extending projection which points away from the inner curve of the spring.

5. A watch-case spring formed of stamped sheet spring metal and curved to form a segment of a circle and to conform to the curvature of the groove of the case-center, and having a slit by which a portion of its middle is reduced in width, and an upwardly and outwardly extending projection from said narrowed portion which points away from the inner curve of the spring, in combination with a watch-case center having an inner annular groove, in which the spring is received and held by its elasticity.

6. The combination of the case-center having an internal annular groove with a spring formed like a segment of a circle and of stamped spring metal, and having its ends bent outwardly from the main curvature and shaped to tightly fit in said groove and be retained therein by friction.

409,746. METAL-ROLLS. JAMES T. HASTINGS, Chicago, Ill. Filed Jan. 25, 1889. Serial No. 297,257. (No model.)



Claim.—1. The combination of a pair of metal-rolls in which one of said rolls has a cutting-edge adjacent to the groove or cavity formed therein and concentric with the axis of the roll, substantially as shown and described.

2. A metal-roll having depressions *f* and adjacent cutting-edges *g*, the latter being concentric with the axis of the roll, substantially as shown and described.

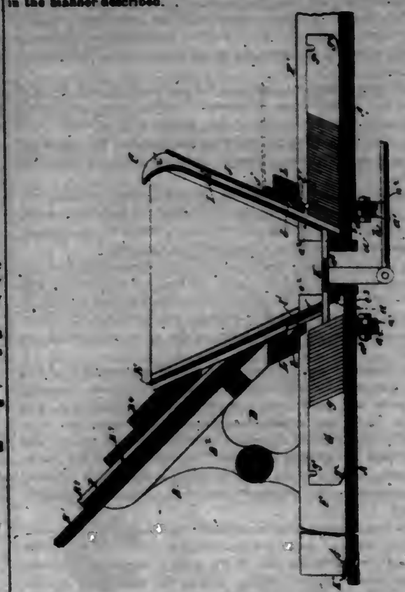
3. In a metal-forming machine, substantially as shown and described, a metal-roll having a continuous knife-edge adjacent to the matrix and concentric with the axis of the roll.

409,747. METAL-ROLLS. JAMES T. HASTINGS, Chicago, Ill. Filed Jan. 25, 1889. Serial No. 297,259. (No model.)

Claim.—1. The combination, with rotary dies, of a cutter placed in operative proximity to the periphery of the matrix-die, whereby the vertical fins formed upon the article rolled may be severed at a single operation, substantially as shown and described.

2. The combination, with rotary dies, male and female, of an adjustable cutter placed in operative proximity to the periphery of the female die, substantially as shown and described.

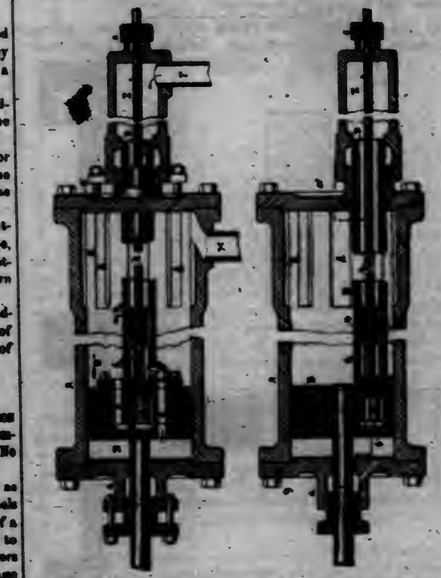
3. The combination, with rotary dies, male and female, of one or more cutters placed in operative proximity to the periphery of the female die, and means for adjusting said cutters with relation to the lips of said female die, substantially as shown and described.



4. The combination, with male and female revolving dies, of cutters placed in operative proximity to the periphery of the female die, sliding rests secured in the frame for sustaining said cutters, and set-screws for adjusting the position of said cutters, substantially as shown and described.

5. The combination, with rotary dies, male and female, of an adjustable cutter arranged in operative proximity to the periphery of the female die, and in a plane substantially perpendicular to that of the roll, substantially as shown and described.

409,748. TYPE-DISTRIBUTING APPARATUS. LOUIS K. JOHNSON and ABBOTT A. LOW, Brooklyn, assignors to the Alden Type Machine Company, New York, N. Y. Filed Nov. 15, 1886. Serial No. 218,961. (No model.)



Claim.—1. In a type-distributing apparatus substantially such as described, the combination, with a series of type-containing channels and type-forwarding mechanism substantially such as described, of a conduit-plate provided with a guard-rail which is recessed, so as to permit types to adapt themselves to the motion of the pusher-fingers when resting thereon, substantially in the manner and for the purpose described.

2. In a type-distributing apparatus substantially such as described, the combination, with a series of type-containing channels and with type-forwarding mechanism substantially such as described, of a vertically-adjustable support for the inner or receiving ends of the said series of type-containing channels, for the purpose and substantially in the manner described.

3. In a type-distributing apparatus substantially such as described, the combination, with a series of type-containing channels and with their outer end-supporting shoulders K, of a series of stops or type-preceders formed with the inclined or curved surfaces g^3, for the purpose described.

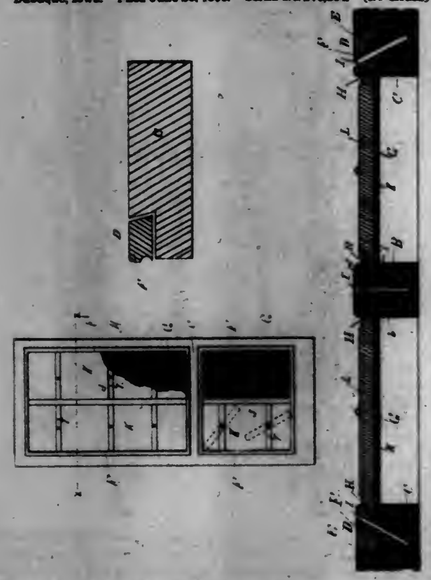
409,749. STEAM STEERING APPARATUS. FREDERICK C. LANE, Hoboken, N. J. Filed Mar. 13, 1889. Serial No. 303,138. (No model.)

Claim.—1. In a steam steering apparatus, the combination, with the pilot-wheel and the rudder, of two interposed cylinders having their respective valves connected with the pilot-wheel and their pistons with the rudder, said pistons in their working-stroke following the travel of the valves, substantially as described.

2. In a steam steering apparatus, the combination, with the pilot-wheel, the rudder, and the tiller-ropes, of two interposed cylinders having their respective valves connected to the ropes from the pilot-wheel and their pistons with the rope from the rudder, said pistons in their working-stroke following the stroke of the valves, substantially as described.

3. In a steam steering apparatus, the combination, with the pilot-wheel and the rudder, of two interposed cylinders having their valves connected with the pilot-wheel and their pistons with the rudder, said pistons in their working-stroke following the travel of the valves and said valves moving with the pistons on the return-stroke, substantially as described.

4. In a steam steering apparatus, two interpolated cylinders having their valves connected with the pilot-wheel and their pistons with the rudder, the motion of said pistons being arrested at any point by the adjustment of the valves, substantially as described.



5. In a steam steering apparatus, two interpolated cylinders having their valves connected with the pilot-wheel and their pistons with the rudder, the motion of the pistons being automatically arrested at any point by the adjustment of a valve, the said stroke of the pistons being the same in length as the stroke of the valve, substantially as described.

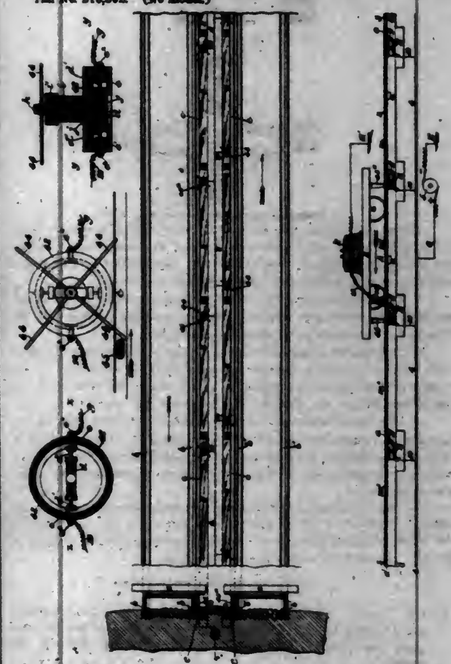
6. In a steam steering apparatus, an engine composed of two cylinders, each provided with a piston, a tubular valve-chest connected with the piston and participating in the movement thereof, a valve fitted to the valve-chest, suitable rope-connections between the valves and the pilot-wheel, or its equivalent, and between the pistons and the rudder, said valves being prevented from moving with the pistons on the working-strokes of the latter by steam-pressure and returned by steam-pressure on the reverse strokes of the pistons, substantially as described.

7. The combination, with the cylinder and its piston, of a valve-chest moving with the piston, a steam-chamber located parallel to the cylinder and directly to one side of the same, a steam-pipe entering the steam-chamber, and a coupling uniting the steam-pipe and the valve-chest and provided with a stuffing-box for the passage of the valve-rod, substantially as described.

8. The combination, with the cylinder and the piston, of a tubular valve-chest attached to the piston, induction and exhaust byways formed in the interior of the valve-chest, a piston-valve provided with two heads for controlling the respective byways, induction and exhaust ports in the piston communicating with the byways and opening through opposite sides of the piston, a valve-stem extending through one head of the cylinder, and a piston-rod, substantially as described, and for the purpose set forth.

409,750. SCREEN AND STORM DOOR. CHRISTIAN LOETSCHER, Dubuque, Iowa. Filed June 26, 1888. Serial No. 278,234. (No model.)

Claim.—1. In a screen-door, the combination, with the frame having a rabbet, the rear wall of said rabbet being inclined, of a molding adapted to fit said rabbet, the central frame having a depression, a molding having a projection secured thereon, and the screen material adapted to be secured by said moldings, substantially as set forth.



2. The combination, with the frame having a rabbet, the rear wall of said rabbet being inclined rearwardly, of a molding having inner faces which correspond to the shape of said rabbet, the outer face of which is provided with a longitudinal groove, screen material, and devices adapted to secure the said screen material between the molding and the rabbet, and the panel and button, substantially as described.

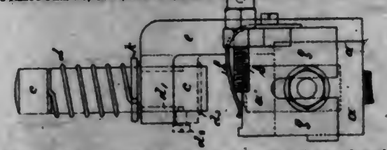
409,751. SAND-BLAST APPARATUS. JEREMIAH R. MATHEWSON, Sheffield, County of York, England. Filed Aug. 30, 1888. Serial No. 284,196. (No model.)

Claim.—In a sand-blast apparatus, the combination of a sand-passage with passages for the impelling-fluid arranged to substantially inclose the sand-passage and inclined to it so as to converge toward the sand-jet and to a point in front of and clear of the mouth-piece.

409,752. SYSTEM OF ELECTRICAL DISTRIBUTION FOR RAILWAYS. WILLIAM J. MCELROY, Pittsburg, Pa. Filed Oct. 16, 1886. Serial No. 216,392. (No model.)

Claim.—1. In a system of electrical distribution for railways, the combination of an insulated or covered main conductor having normally open-circuited branch conductors with exposed terminals or contact-plates, a slot parallel with the railway and adjacent to said plates, and mechanically-operated switches interposed for making and breaking electrical connection between the main conductor and the exposed contact-plates and accessible only through said slot, substantially as and for the purposes described.

2. In a system of electrical distribution for railways, the combination of an insulated or covered main conductor having normally open-circuited branch conductors with exposed terminals or contact-plates, a slot parallel with the railway and adjacent to said plates, and mechanically-operated switches interposed for making and breaking electrical connection between the main conductor and the exposed contact-plates, said switches being accessible only through the slot and movable by passage of the motor-car, substantially as and for the purposes described.



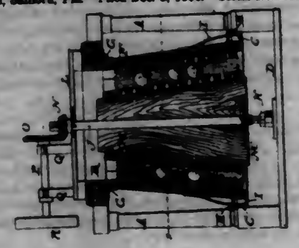
3. In a system of electrical distribution for railways, a main conductor having branch conductors and exposed terminals or contact-plates, in combination with underground switches for making and breaking electrical connection between the main conductor and the exposed terminals, and a motor-car having a projection extending from the car into a slot and arranged to engage said switches therein, substantially as and for the purposes described.

4. In a system of electrical distribution for railways, a main conductor having branch conductors and exposed terminals or contact-plates, in combination with mechanically-operated switches interposed for making and breaking electrical connection between the main conductor and the exposed contact-plates, in combination with a motor-car having projections one in advance of the other, the front projection being arranged to move the switch of the terminal approached by the car to close the circuit between said terminal and the main conductor, and the rear projection adapted to move the switch of the terminal in the rear thereof to open the circuit between it and the main conductor as the motor-car travels on the track, substantially as and for the purposes described.

5. An electrical switch consisting of a tubular arm *d*, bars *d'*, projecting from the ends of the tubular arm, and a spring *f*, bearing on said bars, in combination with a casing containing the switch, substantially as and for the purposes described.

6. In an electric-railway system having an insulated main conductor with branches and exposed contact plates or rails adapted to be temporarily connected with said main conductor by the passage of a car, the combination therewith of a surface-slot along the railway, and capstan-headed switches for making and breaking the required electrical contact, said switches being located under ground and arranged with their capstan-heads in the slot, substantially as described.

409,753. SCYTHE-SHARPENING APPARATUS. JOHANN E. PARRENTIER, Elberfeld, Germany. Filed Apr. 19, 1889. Serial No. 307,873. (No model.) Patented in Germany Dec. 10, 1888, No. 3,782, and in France Jan. 31, 1889, No. 195,509.



Claim.—1. In a scythe-sharpening apparatus, the combination of the main block *a*, with the exchangeable scythe-anvil *a'*, placed into the former and having a face of such shape as to correspond to the form of the cutting-edge to be obtained, the supporting-plates *g g*, fixed at the sides of the block *a*, so that they are adjustable vertically, and provided with set-screws *b b* or pins in their place for horizontal adjustment of the scythe, and the pressure-springs *f f*, fixed to the block *a* and being adjustable vertically thereon or fixed to the plates *g*, as set forth, and for the purpose described.

2. An exchangeable anvil *a*, having a face with a curved circumference and obliquely-broken edges, as described, and shown by Fig. 5.

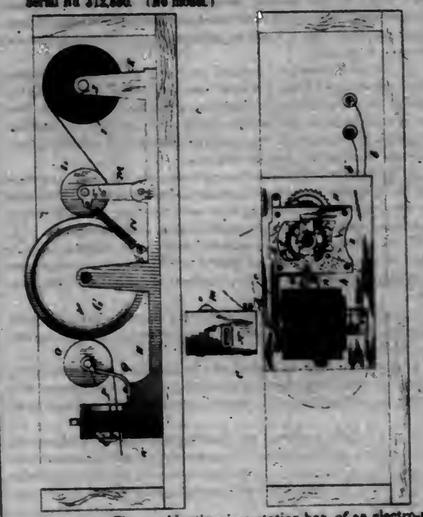
3. In combination with the apparatus described in claim 1, the bracket *c*, holding and guiding in its boss the hammer-bolt *c*, capable of being turned round its vertical axis and pushed upward by a spiral spring *d*.

4. In combination with the apparatus described in claims 1 and 3, a socle *m*, being provided with the angle-bars *l l*, serving as supports for the legs of the operator and for holding the apparatus firmly by pressing it to the ground by the legs resting on the bars *l l*.

409,754. FRUIT-CLEANING MACHINE. LYMAN PHELPS and DAVID P. BURDOS, Sanford, Fla. Filed Dec. 3, 1888. Serial No. 292,530. (No model.)

Claim.—1. In a machine for cleaning fruit, the combination, with a suitable frame, of a rotating brush and a series of bodily-yielding brushes separated at a distance therefrom and adapted to form a chamber thereround.

2. In a machine for cleaning fruit, the combination, with a suitable frame, of a rotating brush and a series of brushes secured to the frame at the receiving end of the machine and adapted to yield at the delivery end thereof.



3. In a machine for cleaning fruit, the combination, with a suitable frame, of a rotating brush and a series of brushes surrounding the rotating brush and movable bodily toward and from the same in lines radial to the latter.

4. In a machine for cleaning fruit, the combination, with the conical internal brush, of the conical surrounding brush-chamber having yielding walls.

5. In a machine for cleaning fruit, the combination, with the internal brush and the surrounding brushes, of springs adapted to urge the latter inward toward the internal brush and stops to limit the movement of the brushes.

6. In a machine for cleaning fruit, the combination, with uprights A A, of hoops B C, secured thereto, brushes F, pivoted to the ring B and provided with springs I and stops H, the latter to engage the hoop C, a shaft J, mounted within the frame and provided with a brush M and pinion N, and a second shaft P, provided with a gear O to engage with wheel N, all substantially as shown.

409,755. STATION-BOX FOR WATCHMEN'S ELECTRIC TIME-DETECTORS. JAMES B. RICHARDS, Cedar Keys, Fla. Filed June 1, 1889. Serial No. 312,890. (No model.)

Claim.—1. The combination, in a station-box, of an electro-magnet, an armature-lever arranged, substantially as shown, to be automatically engaged and disengaged with stops on a disk or wheel in a clock-movement, an escapement, a bell-clapper actuated thereby, a bell or gong, a paper-feeding drum turned by the clock-movement, a rotatable roll of paper, means to press the paper against the feeding-drum, and a cover for the box having a slot located opposite the drum, all combined and operating substantially as and for the purposes set forth.

2. The combination, in a station-box, of an electro-magnet, an armature-lever arranged, substantially as shown, to be automatically engaged and disengaged with stops on a disk or wheel in the clock-movement, an escapement, a bell-clapper actuated thereby, a bell or gong, a paper-feeding drum turned by the clock-movement, a rotatable roll of paper, guide-rollers to confine the paper to the surface of the drum, and a cover for the box having a slot located opposite the drum, all combined and operating substantially as and for the purposes set forth.

3. The combination, in a station-box, of an electro-magnet, an armature-lever arranged, substantially as shown, to be automatically engaged and disengaged with stops on a disk or wheel in the clock-movement, an escapement, a bell-clapper actuated thereby, a bell or gong, a paper-feeding drum turned by the clock-movement, a rotatable roll of paper, a paper-covering device below the drum, and a cover for the box having a slot located opposite the drum, all combined and operating substantially as and for the purposes set forth.

4. The combination, in a station-box, of an electro-magnet, an armature-lever arranged, substantially as shown, to be automatically engaged and disengaged with stops on a disk or wheel in the clock-movement, an escapement, a bell or gong, a paper-feeding drum turned by the clock-movement, a rotatable roll of paper, a paper-severing device below the drum, a die the impression whereof is made upon the paper by the operation of the severing device, and a cover for the box having a slot located opposite the drum, substantially as set forth.

409,756. ELECTRIC-RAILWAY CROSSING.

ELIAS E. RIES, Baltimore, Md., assignor, by direct and mesne assignments, to Ries & Henderson, same place. Filed Oct. 8, 1886. Serial No. 179,316. (No model.)

Claim.—1. A crossing for an electric railway having two intersecting interior conduit-openings containing electric conductors interrupted at the point of the said intersection, said conductors being bent or looped away from the line of travel, in combination with a dependent bar provided with a yielding adjustable yoke carrying current-collectors, as specified.

2. A conduit-crossing provided interiorly with two intersecting conduit-openings merging gradually into longitudinal intersecting surface-slots on the surface of the crossing, and containing electric conductors interrupted at the common point of intersection, in combination with a dependent traveling bar provided with a yielding adjustable yoke carrying the current-collectors.

3. An X-shaped conduit-crossing formed in one single piece and provided with interior conduit-openings intersecting each other at or near the center of said crossing, and each merging vertically into a longitudinal surface slot on the upper surface of said crossing.

4. An X-shaped slotted conduit-crossing for electric railways formed in one single piece and provided with interior conduit-openings having each a central ridge or support for a current-supply conductor.

5. An X-shaped slotted conduit-crossing formed in one single piece having two interior conduit-openings intersecting at or near the center of said crossing.

6. A conduit-crossing formed of a non-metallic substance having two interior conduit-openings intersecting at or near the center of said crossing, in combination with metal protective surface-plates, as set forth.

7. In an electric railway, the combination of an interrupted rail with its ends connected, substantially as described, a bar dependent from a car or motor, and a rigid yoke pivoted to the said bar carrying wheels situated one in the rear of the other, substantially as and for the purpose specified.

8. The combination, with the interrupted conducting-surfaces of the rails of an electric railway-crossing or switch, of a dependent contact-bar having a pivoted yoke and two contact wheels or brushes, one in the rear of the other, said contact-wheels being adapted to adjust themselves to inequalities in height of the interrupted conducting-rails, substantially as specified.

9. A crossing for an electric railway, which consists of two or more intersecting sections of an underground conduit, said sections being formed in a single piece and provided with electric conductors or contact-surfaces extending through them with their conducting-surfaces terminating at or near the point of intersection of the sections of the conduit and their ends connected, substantially as specified.

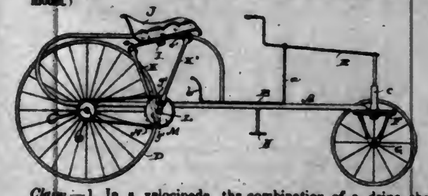
10. A crossing for an electric railway, formed of two or more intersecting conduit-sections formed of insulating or non-electricity-conducting material, conducting-rails or contact-surfaces having their continuity interrupted or broken at or near the intersection of the conduit-sections, and connecting-cables or conducting-loops connecting the ends of the interrupted conductors partially embedded in the material of which the conduit is formed, substantially as and for the purpose specified.

11. A crossing for an electric railway, comprising two or more intersecting conduit-sections formed of insulating or non-conducting material and containing interrupted conducting-rails or contact-surfaces partially embedded in the material of which the conduit is formed, substantially as set forth.

409,757. UNDERGROUND CONDUIT FOR ELECTRIC RAILWAYS.

ELIAS E. RIES, Baltimore, Md., assignor, by direct and mesne assignments, to Ries & Henderson, same place. Filed Sept. 24, 1887. Serial No. 250,668. (No model.)

Claim.—1. In an electric railway, the combination of two coextensive underground conductor-channels, one hermetically closed, the other slotted or open, a continuous main conductor laid in the said closed conductor-channel, and a series of insulated sectional working conductors having exposed surfaces and laid in the slotted or open conductor-channel, each working conductor being electrically connected with a main conductor, as and for the purpose hereinbefore set forth.



2. In an electric railway, the combination, with a slotted underground conduit structure, of two or more coextensive hermetically-sealed conductor-channels, continuous main conductors in the said sealed channels, and two or more series of insulated working conductors having exposed contact-surfaces also laid in said conduit, each working conductor being electrically connected to the main conductor corresponding to its respective series.

3. The combination, with a single conduit structure comprising two conductor-channels, of main conductors laid in one channel hermetically sealed, a series of exposed working conductors placed in the other channel and severally electrically connected with said main conductors, and a current-collector or its equivalent adapted to travel in contact with said working conductors.

4. The combination, with a conduit structure, of a dual set of insulated exposed working conductors located in said conduit in different horizontal planes, each set carrying current differing in tension from that of the other set, and a traveling vehicle provided with an adjustable depending current-collector adapted to make contact with either set of working conductors.

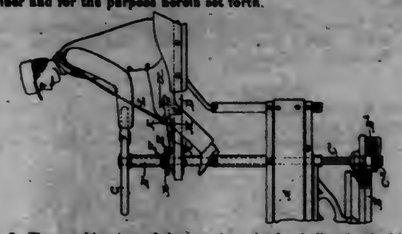
409,758. VELOCIPEDE.

GOTTFRIED SCHLOSSER and EDUARD HAUSKNECHT, Milwaukee, Wis. Filed Dec. 10, 1888. Serial No. 293,132. (No model.)

Claim.—1. In a velocipede, the combination of a drive-shaft geared to an axle of the machine, a shaft supported in bearings on the machine-frame, a seat fast on the latter shaft, and rods shackled at their upper ends to the seat on opposite sides of said latter shaft and having their lower ends connected to said drive-shaft, substantially as set forth.

2. In a velocipede, the combination of a drive-shaft and rear axle carrying sprocket-wheels, a drive-chain arranged on said sprocket-wheels, an oscillating seat and driving-rods connected to said shaft and shackled to said seat on opposite sides of its center, substantially as and for the purpose set forth.

3. In a velocipede, the combination of a drive-shaft geared to the rear axle of the machine, ratchet-wheels fast on the shaft, an oscillating seat, driving-rods shackled to the seat and having serrated lower ends for engagement with said ratchet-wheels, and guides for said rods, substantially as and for the purpose set forth.



4. In a velocipede, the combination of a drive-shaft geared to the rear axle of the machine, ratchet-wheels fast on the shaft, an oscillating seat, driving-rods shackled to the seat and having serrated lower ends for engagement with said ratchet-wheels, elliptical tracks or guides, lugs on said rods arranged to travel on the tracks, and pivoted spring-controlled cams arranged with relation to said tracks, and lugs whereby the latter are kept in frictional contact with the former and locked against backward movement, substantially as set forth.

409,759. HOOK-AND-LADDER TRUCK.

JACOB SCHNEIDLAPP, New York, N. Y. Filed June 8, 1888. Serial No. 313,572. (No model.)

Claim.—1. The combination, with the steering-wheel in a hook-and-ladder truck and with a pivoted lever actuated by a cord adapted to pass around the neck of the pilot, of an intermediate locking device actuated by the movement of said lever, substantially in the manner and for the purpose herein set forth.

2. The combination, in a hook-and-ladder truck, with the steering-wheel and its spindle, of a locking-plate fitted upon said spindle, a movable locking-bar engaging said plate, and a lever actuating said bar to produce its release from the locking-plate, substantially in the manner and for the purpose herein set forth.

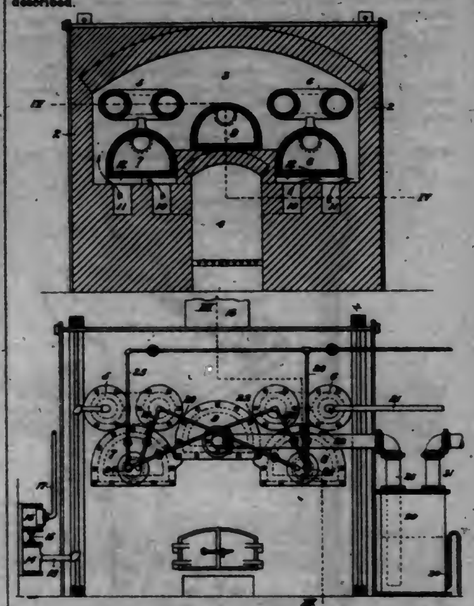
3. The combination of the steering-wheel spindle, the locking-plate thereon, the bar mounted to move into and out of engagement with said locking-plate, the pivoted lever actuating the locking-bar to cause its engagement with the locking-plate, the auxiliary lever actuating the locking-lever, and the cord for operating said auxiliary lever, all substantially in the manner and for the purpose herein set forth.

409,760. CURTAIN-FIXTURE.

JOHN SHIRK, Philadelphia, Pa., assignor of one-half to Abbott F. Fuller, same place. Filed Aug. 23, 1888. Serial No. 283,601. (No model.)

Claim.—In a device for hanging and preserving regularity in the folds of a hanging curtain, the combination of shelf D, a series of hooks secured thereto, and jointed bar having each alternate hinged section thereof formed with an eye to engage said hook, as shown, described, and for the purpose specified.

409,761. APPARATUS FOR THE MANUFACTURE OF GAS.

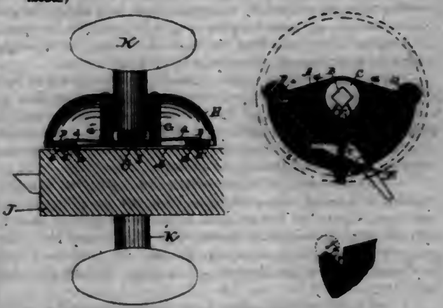


WILLIAM T. STEWART, Pittsburg, Pa., assignor of three-fourths to William H. Donaldson, same place. Filed Jan. 18, 1889. Serial No. 296,727. (No model.)

Claim.—1. In apparatus for the manufacture of gas, the combination, with a furnace or oven and with each other, of a series of five retorts, two of the series being U-shaped superheaters, two of the series gasifying-retorts, and one a fixing-retort, one of the said U retorts or superheaters being connected directly with each of the gasifying-retorts and the other of said U retorts or superheaters being connected with each of the gasifying-retorts by means of intermediate oil-injectors, and each of the gasifying-retorts being connected with the fixing-retort, substantially as and for the purposes described.

2. In apparatus for making gas, the combination, with an oven having a central fire-chamber and reflex-flues parallel therewith, of two gasifying-retorts, a series of spaced tiles for supporting said retorts above the parallel flues which connect the fire-chamber and oven, and a fixing-retort arranged between the gasifying-retorts and over the fire-chamber, substantially as and for the purposes described.

3. In apparatus for making gas, the combination, with an oven, a central fire-chamber therefor, and parallel reflex-flues which connect the fire-chamber and oven, of two gasifying-retorts located over the reflex-flues of the fire-chamber, a fixing-retort located intermediate of the gasifying-retorts and over the central fire-chamber, and superheaters located within the oven and over the gasifying-retorts, substantially as and for the purposes described.



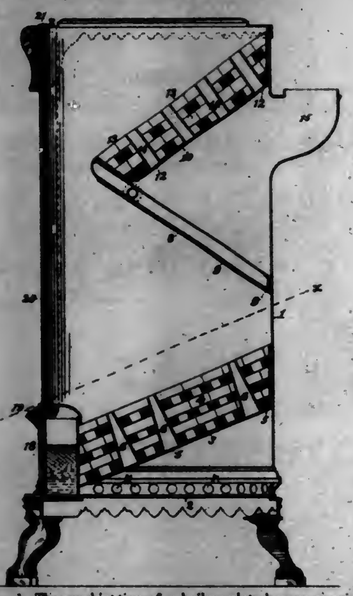
4. In apparatus for the manufacture of gas, the combination, with a furnace and oven communicating with each other by parallel reflex-flues, of two U-shaped superheating-retorts, two gasifying-retorts, and a fixing-retort, one end of one of the U-shaped retorts being connected with an air-pump and the other end with each of the gasifying-retorts by pipes 19 and 20, and the other U-shaped retort connected at one end with a steam-supply, and at the other end with each of the gasifying-retorts by means of pipes 22 and 23 and intermediate oil-injectors 24, and each of the gasifying-retorts communicating with the fixing-retorts by pipes 27, substantially as and for the purposes described.

5. In apparatus for the manufacture of gas, the combination, with an oven having a central fire-chamber and reflex-flues parallel therewith, of two U-shaped superheating-retorts, two gasifying-retorts located on opposite sides of the fire-chamber above the reflex-flues, and a fixing-retort arranged over the fire-chamber, one of said superheaters connected at one end with an air-supply and at the other end with each of the gasifying-retorts by valved pipes 19 and 20, the other superheater connected at one end with a steam-supply and at its other end with each of the gasifying-retorts by valved pipes 22 and 23 and intermediate oil-injector 24, and each of the gasifying-retorts communicating with the fixing-retort by pipes 27, substantially as and for the purposes described.

409,762. DOOR-KNOB ALARM.

HENRY R. STICKNEY and GEORGE W. WAY, Portland, Me. Filed Mar. 27, 1889. Serial No. 304,969. (No model.)

Claim.—1. In a door-knob alarm, the combination, with a knob-spindle and a bell, of one or more bow-springs attached to said spindle, a hammer at the end of each spring, a pin projecting from the under face of said hammer, a plate having a ledge formed in it at an



inclination to the line of motion of said pin, and an inclined surface adjacent to said ledge, whereby said pin is deflected to compress said spring and lifted to release it, substantially as shown.

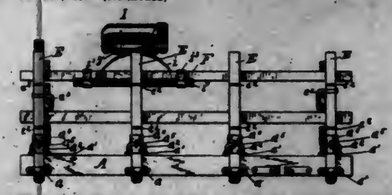
2. In a door-bell alarm, the combination, with a knob-spindle and a bell, of one or more bow-springs attached to said spindle, each having its end turned down to form a pin, a hammer secured to said spring, a plate provided with a ledge formed at an inclination to the line of motion of said pin, and an inclined surface adjacent to said ledge, substantially as shown.

3. In a door-bell alarm, the combination, with a knob-spindle and a bell, of a disk fitting over said spindle, one or more bow-springs attached to said disk, hammers secured to the end of said springs, a pin projecting from the under face of said hammer, and an inclined ledge for tripping said hammer, substantially as shown.

4. In a door-bell alarm, a locking device composed of a disk fitting over the knob-spindle, a tongue connected therewith, a pivoted switch having a notch to receive the end of said tongue, and a stop to swing against the bell to muffle it, substantially as shown.

409,763. **GAS-STOVE.** WILLIAM SWINDELL, Allegheny, Pa. Filed Mar. 19, 1888. Serial No. 267,891. (No model.)

Claim.—1. The combination of a hollow plate burner provided with perforations on its under side and so arranged within a stove or fire-place that the products of combustion will be caused to pass over the front edge of the burner, and a heat absorbing and radiating plate or body arranged below the burner, substantially as set forth.

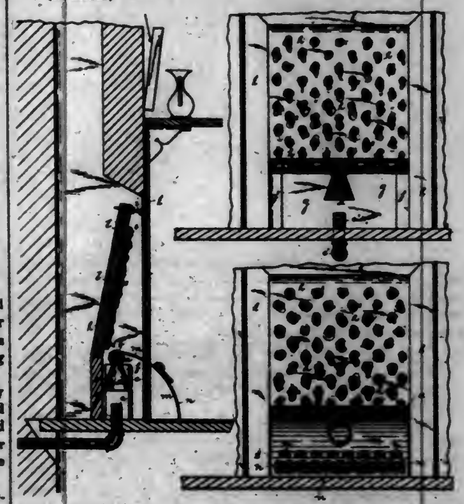


2. The combination of a hollow plate burner inclined upwardly from the back of a stove or fire-place toward the front thereof, and provided with perforations for the escape of gas in its under side, and a heat absorbing and radiating plate or body located below the burner and inclined downwardly from the back of the stove or fire-place toward the front thereof, substantially as set forth.

3. The combination of a hollow plate burner provided with perforations in its under side, a heat absorbing and radiating plate or body located below the burner, and a second heat absorbing and radiating plate or body arranged above the burner and in such relation to the escape-flue that products of combustion are caused to traverse said plate or body, substantially as set forth.

4. The combination of a hollow plate burner provided with perforations on its under side, a heat absorbing and radiating plate or body located below the burner and a second heat-absorbing plate or body provided with openings therethrough and arranged above the burner in such relation to the escape-flue that the products of combustion are caused to pass through said openings, substantially as set forth.

5. The combination of a plate-burner inclined upwardly from the back toward the front of the stove or fire-place and provided with perforations on its under side, a heat absorbing and radiating plate or body located below the burner and inclined downwardly from the back toward the front of the stove or fire-place, and a second heat absorbing and radiating body provided with openings therethrough, said plate resting upon the front edge of the burner and inclining upwardly to the back of the stove, thereby forming a chamber having an exit-flue for the escape of the products of combustion, substantially as set forth.



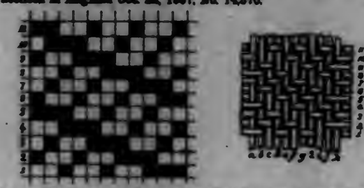
409,764. **HAY-FRAME, STOCK-FRAME, AND SPRING-SEAT COMBINED.** JOHN T. WOODS, Superior, Nebr. Filed May 6, 1889. Serial No. 309,715. (No model.)

Claim.—1. The combination of the lower side rails A, provided with the loops *a*, standard guard-rests *a'*, and perforations *b'* with the cross-beams B, provided with the middle pins a^2 and end pins *b*, lower cross-beams D, standard-guards a^3, which hook round the middle pins a^2, and are provided with the sliding half-sleeves a^4, standards E, having the sloped sides *c'*, and provided with the staples c^2 and elbow-bolt c^3, middle and side sills F, provided with the tongues *f*, adapted to fit in the staples c^2, end-gates G, adapted to fit in the front and rear ends of said frame and to be held in place by the elbow-bolts c^3, hooks *g*, and eyes *g'*, all substantially as shown and described.

2. In combination with my said frame, the seat I, provided with the cross-beams *y*, springs *i*, side beams i', longitudinal slots i^2 in the bottom and near either end of said seat, securing-bolts i^3, passing through said slots into said cross-beams *y*, and hooks i^3, substantially as shown and described, and for the purposes set forth.

409,765. **FIRE-PLACE FOR BURNING GASEOUS FUEL.** ROBERT YOUNG, Allegheny, Pa. Filed Feb. 13, 1889. Serial No. 299,718. (No model.)

Claim.—1. In a fire-place, the combination of a horizontal burner having a row or rows of perforations in the top wall thereof, an inclined tile extending from the back of and upwardly over the burner, and a feeder extending from the burner-body to the hearth and having perforations therein to permit the passage of air to the burner, substantially as and for the purposes set forth.



2. In a fire-place, the combination of the brick tile *g*, the horizontal burner *a* in front of the same, supported on blocks *f*, the inclined tile *h*, resting upon the tile *g* and extending outwardly over the burner, and the feeder *m*, extending from the burner to the hearth and having perforations therein, substantially as and for the purposes set forth.

409,766. **NUT-LOCK.** JOHN I. ARNOLD and GEORGE W. GOLLINGER, Aveene, Pa. Filed Sept. 20, 1888. Serial No. 285,544. (No model.)

Claim.—The combination, with a bolt and nut, of a top plate E, the curved spring bottom plate C, adapted to bite on a fish-plate, and a locking-plate B, the latter passing under plate C, up on opposite sides of the nut, and catching by hooks *b' b'* in holes *c c* of the top plate, as shown and described.

409,767. **TWILLED WOVEN FABRIC.** BENJAMIN BARRACLOUGH, Bradford, England. Filed Nov. 22, 1887. Serial No. 255,894. (No model.) Patented in England Oct. 22, 1887, No. 14,370.

Claim.—The combination, in a twilled fabric, of a series of parallel warps and a series of parallel wefts, each of the latter being floated over the warps in pairs and between said pairs below one of the warps for a number of times, and then at regular intervals below a greater number of warps, substantially as described.

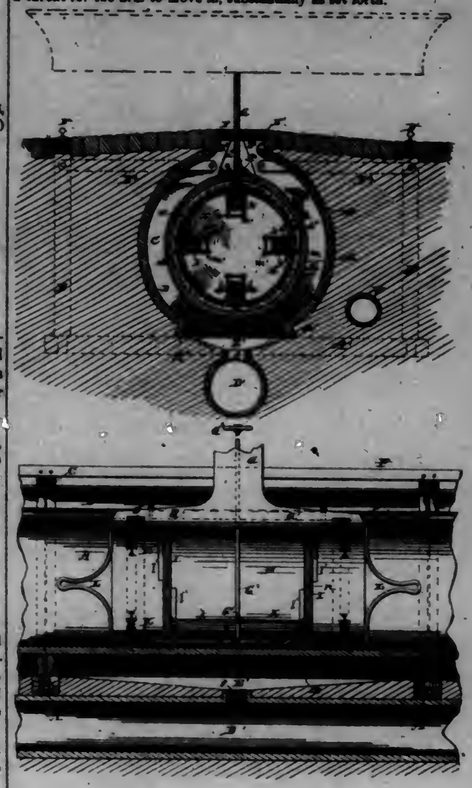
409,768. **MANIFOLD MEMORANDUM-BOOK.** WILLIAM BERINGER, Philadelphia, Pa. Filed Dec. 7, 1888. Serial No. 292,910. (No model.)

Claim.—The combination of the memorandum-book, composed of alternating original detachable and thin copy-leaves, with a downwardly-faced copy-pad composed of a tablet, carbon and protective tissue-leaves alternately disposed, and a fly-leaf, said copy-pad hinged and united into a threefold arrangement, substantially as and for the purposes hereinbefore described.

409,769. **PNEUMATIC-RAILWAY SYSTEM.** MEROLPH BOSENFELD, St. Louis, Mo. Filed Sept. 20, 1888. Serial No. 285,915. (No model.)

Claim.—1. In a pneumatic-railway system, the combination, with two conduit-tubes adapted to receive air under pressure, of a set of guard-valves and a set of main valves, the main valves being adapted to be opened by the piston of the car after the guard-valves are closed, substantially as set forth.

2. In a pneumatic-railway system, the combination, with two tubes, of a guard-valve at one end of one tube, the other tube being provided at one end with a guard-valve and at the other end with a main valve, all of said valves being adapted to be opened by the piston of the car, a pipe connecting one of said tubes with the power-house, and a pipe connecting the tubes, substantially as set forth.



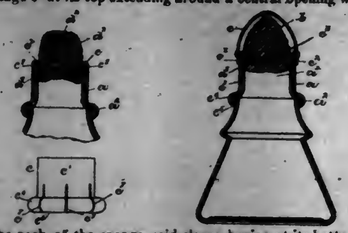
3. In a pneumatic-railway system, the combination, with two conduit-tubes, a cross-branch pipe, and a pipe connecting one of said conduit-tubes with the power-house, of a set of guard-valves, a set of main valves, weights to close these valves, a hollow piston provided with valves, an arm to connect the piston with a car, and a device to open and close the valves in the piston, substantially as set forth.

4. In a pneumatic-railway system, the combination, with a conduit-tube, ribs formed at intervals on the conduit-tube, and a jacket bearing on these ribs, of a drain-pipe located below the conduit-tube and adapted to receive water that enters between the jacket and conduit-tube and convey it away, substantially as set forth.

5. In a pneumatic-railway system, the combination, with a conduit-tube having a slot on its upper side, two flaps that are elastic, and cap-plates that bear on these flaps, all being secured to the tube, of a yielding cover that is secured by one edge to the conduit and located over the flaps, substantially as set forth.

6. The combination, with a tube having a longitudinal slot therein and integral ribs projecting from the tube, by which the latter is secured, of two elastic flaps adapted to close the slot, and a cover fastened to the tube above the flaps and adapted to bear thereon, substantially as set forth.

7. In a pneumatic-railway system, the combination, with a conduit-tube having a slot, of an arm, a movable piston attached to the arm, two gum-flaps that engage the arm and are adapted to close the slot of the conduit-tube, integral ribs formed on the conduit-pipe at intervals of its length, flanges on these ribs, and wear-plates that form a throat for the arm to move in, substantially as set forth.

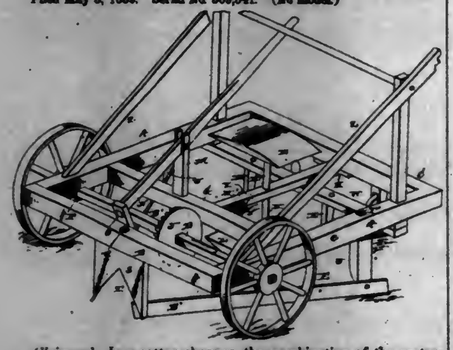


8. In a pneumatic-railway system, the combination, with a conduit-tube having a slot, two gum-flaps that close the slot and yield to pressure, of an arm, a piston affixed to the arm and provided with spring-packing valves in the piston, a shaft that is located in the arm and engages the piston, devices to connect the arm with the piston, and a means of revolving the shaft to open and close the valves in the piston, substantially as set forth.

9. In a pneumatic-railway system, the combination, with a conduit-tube having a slot on its upper side, two gum-flaps fastened to the tube to close the slot, a piston having spring-packing at its ends, an arm that is attached to the piston and works in the slot, a shaft that is located in a longitudinal hole in the arm, valves in the piston, and a device that is attached to the arm and valves to operate the valves, of a series of integral ribs formed on the conduit-tube, flanges formed on these ribs that are adapted to support wear-plates that form a throat-slot above the conduit-slot, and two opposite wear-plates, which are placed in line with the road-bed and permit the piston-arm to travel between them, substantially as set forth.

409,770. **SPONGE-HOLDER FOR MUCILAGE-BOTTLES.** JOHN W. CARTER, Newton, Mass. Filed Oct. 25, 1888. Serial No. 288,194. (Model.)

Claim.—1. The combination, with a bottle having a bead a^2 near its top, of a sponge-holder consisting of a metallic sleeve c', having an annular flange c^2 at its top extending around a central opening which



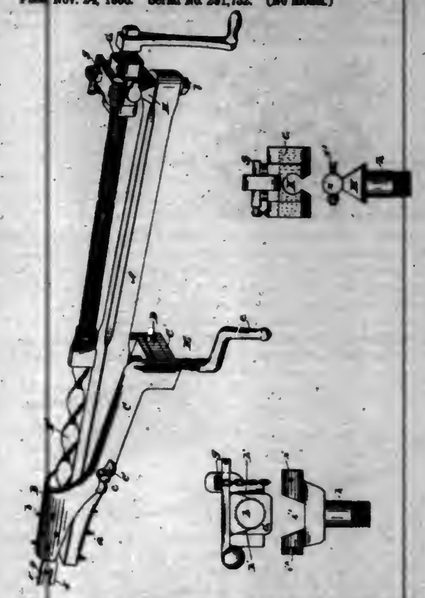
receives the neck of the sponge, said sleeve having at its bottom an enlarged holding section or base c^3, fitting over the bead of the bottle to which the holder is attached.

2. The combination, with a bottle having a bead a^2 near its top, of a sponge-holder consisting of a metallic sleeve c', having an annular flange c^2 at its top extending around a central opening which receives the neck of the sponge, said sleeve having at its bottom an enlarged holding section or base c^3 to fit over the bead of the bottle to which the holder is to be attached, and said base having slits to form two or more yielding grasping-sections to enable the said holder to be easily slipped over said bead in being applied to the bottle.

3. The combination of a sponge-holder having the opening c^2 with the cross-bar d, the bottle and the pin or stud d', having the head d^2, and a loop d^3, through which the cross-bar extends, substantially as described.

409,771. COTTON-CHOPPER. ABRAM CHAMBERS, Bagwell, Tex. Filed May 3, 1889. Serial No. 309,541. (No model.)

Claim.—1. In a cotton-chopper, the combination of the rectangular frame, a longitudinal shaft provided with radial arms carrying chopping-hoes, a pinion at the front end of said longitudinal shaft, a revolving axle made square in cross-section, a gear-wheel upon the said axle, meshing with the pinion upon the longitudinal chopper-shaft, and a lever having a downwardly-extending pivoted arm provided with a shoe adapted to engage the axle and prevent it from revolving, substantially as herein described, and for the purpose set forth.



2. In a cotton-chopper, the combination, with the frame, of a vertical shank mounted centrally in the front beam of the frame and provided at its lower end with a plate having an inverted-V-shaped notch adapted to straddle the row of plants, and diverging scrapers attached to and extending rearwardly from the sides of said notch, substantially as and for the purpose set forth.

3. In a cotton-chopper, the combination, with the frame, of the vertical shank mounted centrally in the front beam of the same, and provided at its lower end with a plate having an inverted-V-shaped notch, the shanks mounted vertically in the sides of the frame and having downwardly-extending standards, and the forwardly-converging scrapers attached to the said standards and to the inner sides of the V-shaped notch in the vertical front plate, substantially as and for the purpose herein set forth.

4. In a cotton-chopper, the combination of the frame, the vertical plate secured to the front beam and having an inverted-V-shaped notch, the standards secured to the side beams of the frame, the scrapers connecting said standards with the sides of the V-shaped notch, the longitudinal shaft carrying the radial chopping-hoes adapted to work between the diverging rear ends of said scrapers, and mechanism for transmitting motion to the said longitudinal chopper-shaft from the axle of the machine, substantially as and for the purpose set forth.

5. In a cotton-chopper, the combination of the frame, the vertical plate at the front end of the same having an inverted-V-shaped notch, the standards extending downwardly from the sides of the same, the scrapers connecting said standards with the sides of the V-shaped notch, the longitudinal chopper-shaft, means for transmitting motion to the latter from the axle of the machine, and a transverse frame-beam having downwardly-extending standards provided with sweep-plows, substantially as and for the purpose herein set forth.

409,772. MINING-MACHINE. ALFRED J. COOPER, Duryea, Pa. Filed Nov. 24, 1888. Serial No. 291,732. (No model.)

Claim.—1. In a mining-machine, the combination, with the supporting bar or frame and the jaw pivoted thereto having the opening through the same on one side of the bar or frame, and the adjusting-screw on the opposite side of the bar or frame for moving the pivoted jaw away from the bar or frame, of the nut mounted on the bar in line with the opening through the pivoted jaw, and the bit mounted in said nut and working through the opening in the jaw, substantially as described.

2. In a mining-machine, the combination, with the supporting frame or bar, of the hollow jaw pivoted thereto having the two rearwardly-extending arms passing diagonally across the frame or bar—one on each side—the cross-piece uniting the arms, and the adjusting-screw passing through the cross-piece and engaging the bar, whereby the jaw and bar may be separated, substantially as described.

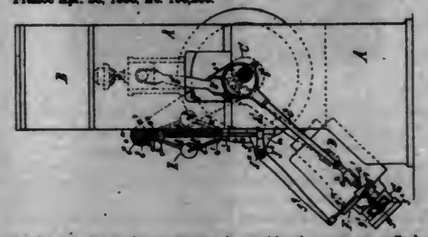
3. In a mining-machine, the combination, with the supporting frame or bar, of the jaw pivoted thereto having the rearwardly-extending arms, the removable nut held by the arms, and the adjusting-screw passing through the nut and engaging the bar to separate the jaw and bar, substantially as described.

4. In a mining-machine, the combination, with the supporting frame or bar, the hollow jaw pivoted thereto having the rearwardly-extending arms and the cross-piece uniting their ends, of the socket in the cross-piece and the removable nut therein, the adjusting-screw passing through the nut and engaging the bar, and the bit to adjust the hollow jaw mounted on the bar in line with the opening through the jaw and adapted to operate between the jaw and bar, substantially as described.

5. In a mining-machine, the combination, with the frame or bar having the end for engaging the coal and the nut carrying the bit on the opposite end, of the jaw pivoted to said bar having the end for engaging the coal of larger area than that of the bar, and means for separating the ends of the bar and jaw, whereby the bar will be forced into the coal and its outer end elevated to bring the bit into line with the hole being bored, substantially as described.

6. In a mining-machine, the combination, with the frame or bar having the ends for engaging the coal and the hollow jaw pivoted thereto having the end for engaging the coal of relatively larger area than that of the bar, of the rearwardly-extending arms having the connecting-piece with the adjusting-screw passing through the same and the bit mounted on the bar and in line with the opening through the jaw, whereby it is adapted to work between the bar and jaw, substantially as described.

7. The combination, with the frame or bar and bit having the screw-shank, of the nut for said shank having the open bearing in the bottom and the swivel-piece mounted on the bar and having the pintle fitting within the open recess in the nut, substantially as described.

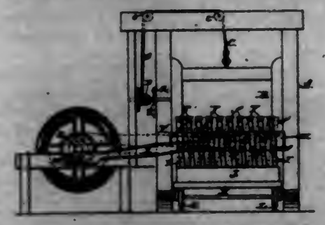


8. The combination, with the frame or bar and bit having the screw-threaded shank, of the nut for said shank having the open bearing therein with the contracted bottom and the swivel-piece mounted on the frame or bar and having the round pintle engaging the bearing in the nut, substantially as and for the purpose specified.

9. The combination, with the frame or bar, the bit having the screw-threaded shank and the nut therefor having the open bearing therein, of the swivel-piece mounted on the bar and having the round pintle with the central portion cut away for the passage of the screw-shank, substantially as described.

10. The combination, with the frame or bar, the bit having the screw-threaded shank and the nut therefor having the open bearing with the contracted lower portion, of the swivel-piece pivotally mounted on the frame or bar and having the round pintle engaging the open recess, the lug at one end, the cut-away portion at the center, and the pin at the other end, substantially as and for the purpose specified.

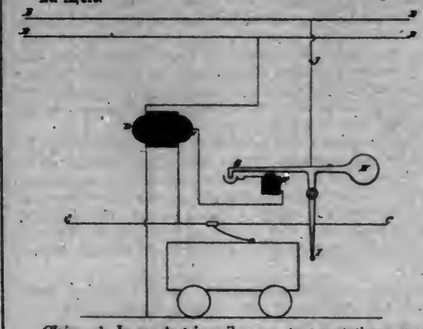
11. An improved cutter for rotary mining-drills, having the twisted shank with the forwardly-extending circumferential cutting-teeth having the cutting-surfaces of substantially the same width from top to bottom and the tooth between and below the plane of the cutting-edges for breaking the central core left by the circumferential cutting-teeth, substantially as described.



409,773. AIR-COMPRESSOR. HENRY DAVEY, Westminster, County of Middlesex, England. Filed Oct. 2, 1888. Serial No. 286,900. (No model.) Patented in England July 20, 1887, No. 10,835, and in France Apr. 23, 1888, No. 190,269.

Claim.—1. In an air-compressor, in combination, a steam-cylinder B, an air-compressor D, provided with chambers $g\,g'$ at one of its ends, reverse-acting spring-valves $g^2\,g^3$, applied, respectively, in said chambers, an air-supply valve of valve-chamber g', a reciprocating valve-rod f^2, an automatic governor E, wedge f^7, interposed between rods f^2 and c^3, and connected to the governor by lever f^6, main shaft C, eccentric c^4 on said shaft, eccentric rod c^5, and pulley b^2 of governor driving-belt, substantially as described.

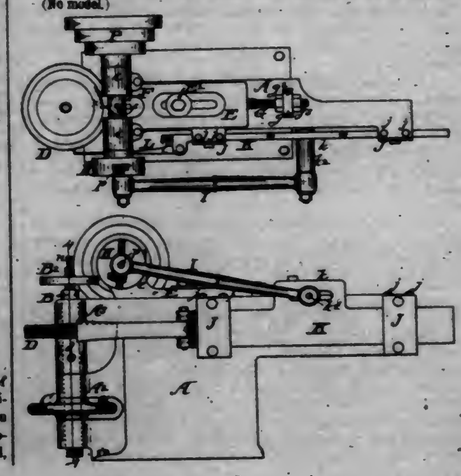
2. In an air-compressor, in combination, wedge f^7, interposed between shafts f^2 and c^3, and connected to the governor by lever f^6, the sliding governor-spindle e in contact with and operating lever f^6, eccentric c^4 and its connecting-rod c^5, operating said shafts c^3 and f^2, and an air-supply valve, substantially as described.



409,774. STONE-SAWING MACHINE. GEORGE A. DAVIDSON, Malden, assignor of one-half to Horace T. Cantwell, Troy, N. Y. Filed Mar. 8, 1887. Serial No. 230,133. (No model.)

Claim.—1. In a stone-sawing machine whereby the operation of sawing is effected by the aid of loose abrading material, the combination of a vertically-sliding gate having a horizontal guide thereon and a reciprocating cutter-head fitted to slide on said guide and provided with a series of pendulous cutters pivoted to said cutter-head, said cutters being formed of parallel flat bars of metal, their vibrations in said cutter-head being limited by ribs formed on the latter, and the angular space formed under the lower end of the cutter at each change of direction of the movement of the cutter-head affording an opening for the abrading material to accumulate in preparatory to the next following change of direction, as and for the purpose herein specified.

2. In a stone-sawing machine, the combination of a reciprocating cutter-head and a series of pendulous cutters formed of parallel bars of metal and pivoted to said cutter-head, said cutters being vertically adjustible in said cutter-head independently of the up-and-down feeding movement of latter, as and for the purpose herein specified.



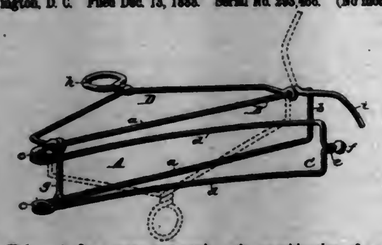
409,775. ELECTRIC RAILWAY. SEBASTIAN Z. DE FERRANTI, Hampstead, County of Middlesex, England. Filed Sept. 24, 1888. Serial No. 286,208. (No model.) Patented in England Sept. 13, 1887, No. 12,412.

Claim.—1. In an electric railway or transportation system, the combination of relatively short sections of conductors, from which the motors are fed with currents of comparatively low tension, a circuit supplied with high-tension alternating current, converters interposed between the sections of conductors and the high-tension circuit, and circuit making and breaking devices controlled by the train when upon a section of conductor, by which the converters are thrown into and out of action.

2. In an electric railway or transportation system, the combination of relatively short sections of conductors, from which the motors are fed with currents of comparatively low tension, a circuit supplied with high-tension alternating current, two converters interposed between each short section of conductors and the high-tension circuit, one of said converters being a constantly-acting small converter and the other of larger dimensions, and circuit-controlling devices interposed between the two converters, whereby the larger one is brought into action by the increase of current passing through the small one during the passage of a train over the section, substantially as set forth.

409,776. MACHINE FOR CUTTING GEAR. GEORGE W. DRUMHELLER and CHARLES H. NORTH, Cleveland, Ohio, assignors of one-half to Standish M. York, same place. Filed Dec. 1, 1888. Serial No. 292,420. (No model.)

Claim.—1. In combination, the vertical spindle B, supported in bearings A^3 A^3 of standard A and having blank-holder B^2, and the rotating shaft F, having cutting-tool *f* and journaled in bearings *e e* of adjustable plate E, which is provided with clamping-screw E^2, and the adjusting-screw G and nuts *g g*, by which said shaft and cutting-tool may be adjusted for cutting different sizes of gear-wheels.



2. The combination, with the rotating shaft F, of the cutting-tool *f*, having one end provided with square cutting-edge for facing the periphery, and the other end provided with end and side cutting-edges for cutting teeth in the periphery of the blank, substantially as specified.

3. In combination, the spindle B, supported in bearings A^3 A^3 on standard A, and having the index-wheel D attached, also having the hand-wheel nut C attached and located between the bearings A^3 A^3, the spindle being screw-threaded, so that when rotated by the index-wheel it will also be moved upward through said nut, substantially as and for the purpose specified.

4. The combination, with the spindle B, supported in bearings A^3 A^3 of the standard A and provided with index-wheel D and nut C, of the rotary shaft F, having the crank-disk H attached, the pitman I, connecting said disk H with sliding bar K, playing in bearings J J on the side of the standard and having pawl L engaging with the index-wheel D, for imparting intermittent rotative motion to the spindle, substantially as and for the purpose specified.

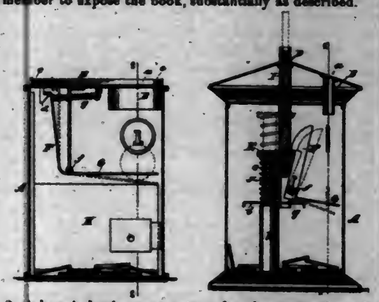
5. The combination, with standard A, of the adjustable plate E, provided with the bearings *e e* for the rotating tool-holding shaft F, having the crank-disk H, and the pitman I, adjustably connected with the sliding bar K, playing in the bearings J J on the side of the standard A and provided with pawl L, engaging with the index-wheel D, whereby the tool-holding shaft may be adjustably set in relation to the blank-holder, substantially as described, and for the purpose specified.

409,777. TROUSERS-STRETCHER. JAMES F. DUHAMEL, Washington, D. C. Filed Dec. 13, 1888. Serial No. 293,466. (No model.)

Claim.—1. In a trousers-stretcher, the combination of a clamping-frame having two portions movable one in relation to the other, and a bail or hanger pivotally attached to one of said portions and bearing upon the other, whereby the parts are pressed and held together.

2. In a device for stretching trousers, the combination, with a frame comprising two parts hinged or pivoted together and adapted to clamp and hold the trousers between them, of a movable bail or hanger carried by one of said parts and arranged to move into and out of engagement with the other, substantially as set forth.

3. In combination with a frame A, comprising a rigid back part B and a part C, connected with the part B by coils *c c*, the bail or hanger D, pivotally secured to the part B and provided with an arm to engage the part C.

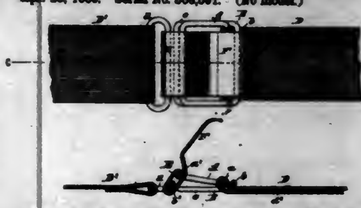


4. In trousers-stretchers, the combination, with the clamping-frame A, made of a single piece of wire and comprising a rear part B and front part C, connected by coils *c c*, of means for holding the parts B C together.

5. In combination with part B, comprising arms *a a*, upright *b*, and coils *c c*, the part C, comprising arms *d d* and *e*, bail D, secured to upper arm *a* and provided at one end with an arm *i* to engage the arm *e*.

6. In a device for stretching trousers, the combination, with the rear frame B, of the front frame C, hinged or pivoted to the latter, and a bail or hanger D, pivoted to frame B and having an arm to engage the frame C.

409,778. MONEY-BOX. MAX EMANUEL, London, England, assignor to George Borgfeldt & Co., New York, N. Y. Filed Feb. 21, 1888. Serial No. 300,736. (No model.) Patented in England May 11, 1883, No. 7,051, and in Germany Oct. 13, 1883, No. 46,850.



Claim.—1. The combination, with a box having an aperture for the entry of a coin and a movable member to hold a book, of a latch for holding said movable member down, and a platform in direct connection with said latch and extending in line with the coin-aperture, whereby as an entering coin strikes said platform it will move said platform, which will actuate the latch and thereby permit the movable member to expose the book, substantially as described.

2. A box A, having an aperture for the entry of a coin, and a movable member E, combined with a spring *c* for actuating said movable member, and with a latch F for holding said movable member, and a platform G in direct connection with said latch and extending in line with the coin-aperture, whereby when the entering coin strikes the platform it will release the latch to permit the movable member to expose a book, substantially as described.

3. The box A, having a coin-aperture, and the movable member E, having a hook *d*, combined with a spring-latch F within the box and adapted to engage the hook *d*, and with the platform G, carried by the latch and extending in line with the coin-aperture, all arranged and operating substantially as herein shown and described.

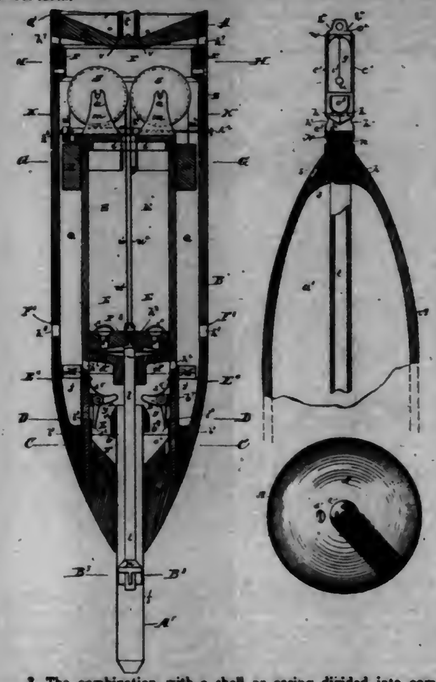
409,779. CLASP. SHERWOOD B. FERRIS, Lakewood, N. J. Filed Apr. 25, 1889. Serial No. 308,501. (No model.)

Claim.—1. The combination of the loops A B, adapted to grasp a tape or strap, with the swinging hinge E, having one opening to receive corresponding sides of the loops, so that one loop can be moved on the other to tighten and loosen a tape, and with means, substantially as described, for swinging said hinge, substantially as described.

2. The combination of the loops A B, adapted to grasp a tape, with the swinging hinge E, for holding and sliding said loops, and the handle or lever F, connected to the hinge for swinging the hinge to move the loops one upon the other, substantially as described.

3. The combination of the loops A B, adapted to grasp a tape, with the swinging hinge E for said loops, handle or lever F, and means, substantially as described, for holding the handle or lever from movement, substantially as herein shown and described.

4. The loops A B, both connected to the tape D, combined with the link *d* and its tape D^2, and with the swinging hinge-piece E and means, substantially as described, for swinging said hinge E, and means, substantially as described, for connecting both loops A B with the link *d*, substantially as described.



5. The loop B, having the depressed sides *e f*, combined with the loop A, that rests upon said sides *e f*, whereby two sides of the loop A are brought about in line with two corresponding sides of the loop B, and with a hinge for holding the loops A B, substantially as described.

409,780. RHEOBATHOMETER. HENRY FLAD, St. Louis, Mo. Original application filed June 30, 1887, Serial No. 243,968. Divided and this application filed Nov. 13, 1888. Serial No. 290,701. (No model.)

Brief.—An instrument designed to indicate depth of water and direction and velocity of currents.

Claim.—1. A rheobathometer constructed to present an equal resistance to its passage through the water in the direction of its axis both in ascending and descending, and provided with a detachable sinker and sinker holding and releasing devices, the latter being located within the shell of the rheobathometer.

2. A rheobathometer the shell or casing of which is formed to present an equal resistance to its passage through the water in the direction of its axis both in ascending and descending through the water, said shell being divided into two compartments, one to contain liquid, which serves to give buoyancy to the shell, and the other to contain the devices for operating the rheobathometer, substantially as set forth.

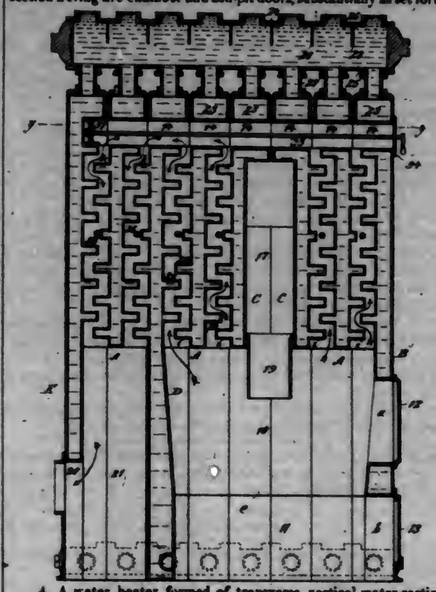
3. The combination, with a shell or casing divided into compartments, of a tube open at the upper end and descending to the bottom of one compartment set apart for containing the liquid used for giving buoyancy to the rheobathometer for the purpose of equalizing the inside and outside pressure, the said tube being perforated at its bottom.

4. The combination, with a shell or casing divided into compartments, of a sinker secured to the shell and so shaped that when in place the outside surface of the instrument at its lower end is of the same form as the upper end.

5. The combination, with a shell or casing divided into compartments and a sinker so arranged that when in place the outside surface of the instrument at its lower end is of the same form as the upper end, of a follower for restoring the symmetrical form of the surface of the buoy when the sinker has been discharged.

6. In a rheobathometer, the combination, with shell or casing, a timer, and a sinker, of a releaser for discharging the sinker both by striking bottom and by the timer.

7. The combination, with a rheobathometer, of a timer by means of which the sinker may be discharged after a certain lapse of time, for the purpose heretofore stated.



8. The combination, with a rheobathometer, of the indicator for indicating by light or sound, or by both light and sound, the reappearance of the rheobathometer at the surface.

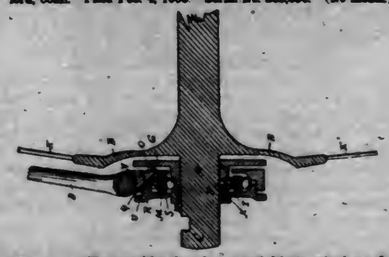
409,781. STEAM-GENERATOR. DOC W. FLETCHER, St. Louis, Mo., assignor of one-fourth to Walter Rodgers Fletcher, same place. Filed Dec. 3, 1888. Serial No. 292,595. (No model.)

Claim.—1. A water-heater formed of vertical transverse spaced sections having longitudinally-extending interlocking pockets 22, forming zigzag flues *i*, substantially as set forth.

2. A water-heater formed of vertical transverse spaced water-sections having aligned lower openings 10, forming the fire-chamber, longitudinally-extending interlocking pockets above said openings forming zigzag flues *i*, and aligned openings near their upper ends forming a horizontal flue 14, into which the flues *i* discharge, substantially as set forth.

3. A water-heater formed of vertical transverse spaced water-sections A B C D E, having interlocking longitudinally-extending pockets forming zigzag flues, aligned openings near their upper ends forming flue 14, communicating with the flues *i*, outlet-opening 20 in the lower end of the rear section E, a water-back formed by section D, the fire-chamber 10, formed in front thereof, and soot-chamber in rear thereof, a pipe connecting the lower ends of said sections and a distributer communicating with the upper ends of said sections, the front section having fire-chamber and ash-pit doors, substantially as set forth.

4. A water heater formed of transverse vertical water-sections having aligned openings forming a fire-chamber, interlocking longitudinally-extending pockets forming zigzag flues *i*, and openings forming top flue 14, two of said sections above the fire-chamber having a fuel-magazine 17 formed between them, substantially as set forth.



5. In a water-heater, the distributer 24, having aligned openings in its top and bottom, and transverse deflecting-plates 28, depending from the upper side of the interior of the distributer between each top opening, substantially as set forth.

6. In a water-heater, the combination, with a series of sections formed with side pockets, and flue-sections 14 and flues *i k*, of flue-cleaners 31 and 36, arranged substantially as described.

7. The combination, with a water-heater having vertically-ranging flues and a horizontal flue communicating with the upper ends thereof, of the horizontal and vertical cleaners having operating-rods extending to the outer sides of the heater, substantially as set forth.

8. A water-heater made up of sections A, B, C, D, and E, whereby there are formed flues *i k* and 14, a fire-chamber, an ash-pit, and a soot-pit, substantially as described.

409,782. ANTI-FRICTION BEARING. LEONARD B. GAYLOR, Stamford, Conn. Filed Feb. 4, 1888. Serial No. 263,050. (No model.)

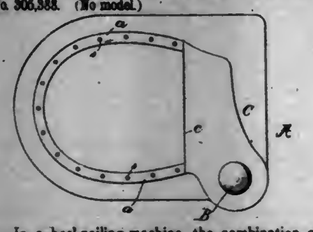
Claim.—1. The combination, in an anti-friction device, of a plurality of rows of balls or rollers, an annulus placed between them in contact only with the balls themselves arranged to revolve independently with either row of balls or rollers, and adjustable bearings attached to the shaft or axle, substantially as set forth.

2. The combination, in an anti-friction device, of a plurality of rows of balls or rollers, an annulus placed between them in contact only with the balls themselves arranged to revolve independently with either row of balls or rollers, and adjustable bearings attached to the hub or journal box, substantially as set forth.

3. The combination, in an anti-friction device, of a plurality of rows of balls or rollers, an annulus placed between them in contact

only with the balls themselves arranged to revolve independently with either row of balls or rollers, and adjustable bearings for the balls upon the shaft or axle and upon the hub or journal box.

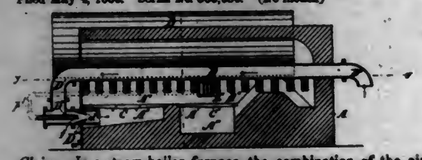
4. The combination, in an anti-friction bearing, of one or more circles of balls interposed between the axle and an annulus or bearing, said annulus being free to revolve inside of other circles of balls, and adjustable bearings on the outer side of the outer circles of balls and on the inner side of the inner circle of balls to compress them toward the annulus as a means of taking up wear or adjusting the bearing, substantially as set forth.



5. The combination, in an anti-friction device, of a plurality of rows of balls or rollers and an annulus placed between them, the ball-receiving groove in the annulus being in different radial planes and in substantially the same horizontal plane, whereby the diameter of the hub or journal is reduced, substantially as set forth.

6. The combination, in an anti-friction device, of a plurality of rows of balls or rollers, an annulus placed between them in contact only with the balls or rollers themselves, the ball-receiving grooves in the annulus being in different radial planes, and adjustable bearings for the balls, whereby the wear thereof may be compensated or "taken up," substantially as set forth.

7. The combination, in an anti-friction bearing, of lateral adjustments both upon the shaft or axle and upon the journal-box or bearing as a means of adjusting or taking up wear either toward or from the axle, or in both directions at once, as the condition of the bearing may require.

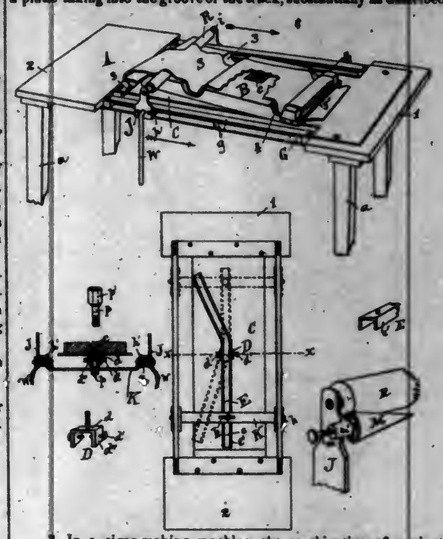


8. The combination, in an anti-friction bearing, of a clamp Z in the under side of the bearing-case, for the purpose set forth.

409,783. **TOP-LIFT PLATE.** CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Mar. 30, 1889. Serial No. 305,383. (No model.)

Claim.—In a heel-nailing machine, the combination of a nail-box, the pivoted top-lift plate C, having a shoulder, as *c*, to receive against it the breast of the top lift, and having a rigid curb, as *a*, extended around the edge of the said pivoted top-lift plate, thus leaving a socket or chamber, down into which the top lift is laid, substantially as described.

409,784. **STEAM-BOILER FURNACE.** JOHN GOOD, Napanee, Ontario, Canada, assignor of one-half to James R. Herring, same place. Filed May 4, 1889. Serial No. 309,659. (No model.)



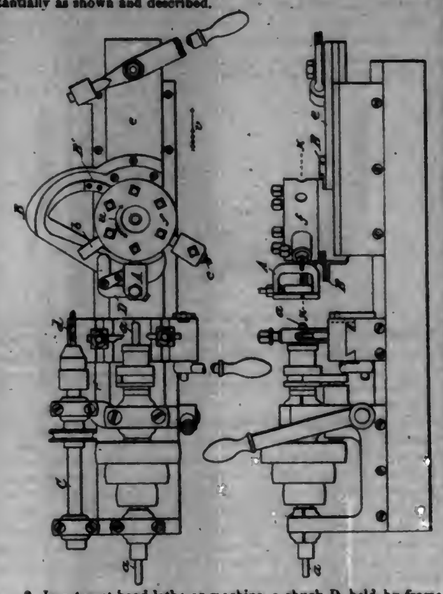
Claim.—In a steam-boiler furnace, the combination of the air-pipe D, passing longitudinally through the flue and having its front end returned and entering the air-tight ash-pit, and provided with a nozzle d''', the superheater E, placed transversely under the boiler, steam-pipe F, connecting the superheater with the boiler, pipe F', connecting the discharge end of the superheater and passing through the front end of the air-pipe and terminating in the nozzle d''', forming a jet-exhauster, the grate C and secondary grate C', and the air-tight ash-pits A'' and A''', substantially as set forth.

409,785. **CIGAR-MACHINE.** MORRIS GREENFIELDER, Baltimore, Md. Filed Dec. 19, 1888. Serial No. 294,043. (No model.)

Claim.—1. The bunch-bed pivotally connected midway of its length to the bed-plate and adapted to swing thereon on a horizontal plane, a bent track attached to the bunch-bed arranged under said bed-plate, in combination with a reciprocating roller and apron secured at one end to a transverse rod on the bed-plate and at its opposite end to the bunch-bed, with suitable means for traveling in the bent track, substantially as described.

2. The combination of the bunch-bed B, having lateral surface-troughs at its opposite ends and a loosely overlying apron attached at one end to a rod on the bed-plate and at its opposite end to the bunch-bed, said bunch-bed being connected with the bed-plate by a pivotal pin passing through said plate, having at its lower end a hanging stirrup provided with fastening devices to firmly grip a bent track attached to said bunch-bed with the track, a transverse bar arranged to reciprocally traverse the track, said bar having uprising therefrom a pintle taking into the groove of the track, substantially as described.

3. In a cigar-making machine, the combination of a pivoted bunch-bed arranged to move upon a horizontal plane, a bent track attached to the under side of the bunch-bed, the table A, having open side ways G, the traveling-blocks A, flanged at their inner faces, said blocks having connected to their lower ends transverse bar K, carrying midway of its length vertical pintle *p*, intermeshing with the groove of the bent track, the opposite outer side of each block A having attached thereto an arm J, provided with the revoluble roller R, extending transversely across and above the bed B, and an apron, one end being connected to the bunch-bed and the other to the framing, as and for the purpose intended, substantially as described.

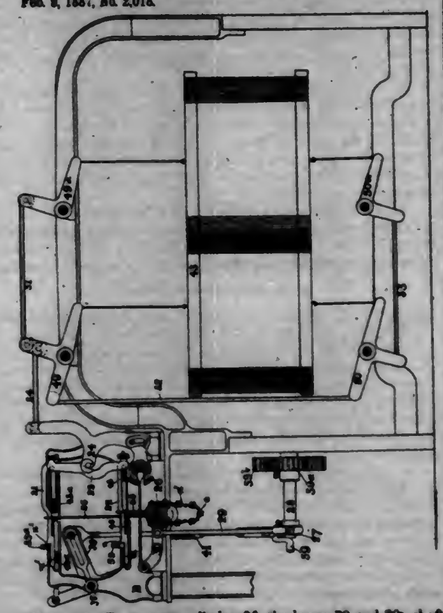


4. The bunch-bed pivotally connected to a bed-plate and adapted to swing on a horizontal plane, a bent track attached to the under side of said bunch-bed, in combination with said track, the reciprocating roller, an apron secured at one end to the bunch-bed and at its opposite end to the bed-plate, and suitable means for traveling in said track, and the cone-limiter adjusted to be laterally projected against the roller, as and for the purpose set forth.

5. The combination of the table A, provided with a permanently-attached bed-plate C, and open parallel side ways G, a pivoted and removable bent grooved track E, pintle *p*, engaging said track, a reciprocally-movable cross-bar K, carrying the pintle-blocks A, sliding within the ways G, reciprocating roller R, journaled in plates J, apron S, fastened at one end to the bed-plate and at its opposite end to the bunch-bed, the plates J, lever-arms W, which, when actuated, will move said blocks within their ways and simultaneously propel the pintle *p* within the grooved track, thereby turning the same laterally, which in turn will cause the bed B, attached to the upper end of the common pivot, to swing in coincident direction, as and for the purpose intended, substantially as described.

6. The apron S, secured as set forth, the reciprocating roller R, horizontally-swinging bunch-bed B, bent and grooved track E, secured to said bunch-bed, and sliding pintle *p*, arranged and combined as set forth and illustrated, whereby, when motion is imparted to the several actuating members of the device, portions of the apron will be folded over to form a pocket tapering in alignment correspondingly with the divergence and bend of the track E, substantially as described.

409,786. **TURRET-LATHE HAVING A SUPPLEMENTAL DRILL-SPINDLE.** JAMES HARTNESS, Torrington, Conn. Filed Dec. 7, 1888. Serial No. 292,951. (No model.)



Claim.—1. In a turret-head machine having an auxiliary spindle carrying a tool, the combination of a chuck attached to the turret for the purpose of taking the work cut from the rod of stock held in the main spindle to the said auxiliary spindle, there to be operated upon by the tool held in the said auxiliary spindle, the said chuck being pivoted on the clamping-screw E, which is secured to the turret by frame A, with a non-revolving cam B, by which the said pivoted chuck is caused to turn on its pivot when the said turret turns, substantially as shown and described.

2. In a turret-head lathe or machine, a chuck D, held by frame A, attached to the turret-head *f*, combined with cam B, for the purpose shown and set forth.

3. In a turret-head lathe, the combination of a frame A, clamping-screw E, chuck D, lever F, plunger O, and stud *p*, with cam B and auxiliary spindle C, substantially as shown and described.

409,787. **SHEDDING MECHANISM FOR LOOMS.** RICHARD L. HATTERSLEY and JAMES HILL, Keighley, County of York, England. Filed May 4, 1887. Serial No. 237,022. (No model.) Patented in England Feb. 8, 1887, No. 2,018.

Claim.—1. The pattern-cylinder 26, the levers 30 and 30*, shaft 31, rod 29, eccentric 27, the motor-shaft 28, peg-lags *e*, each lag having two rows of pegs *d*, the needles 25, bars 46 and 46*, means for operating said bars 46 and 46*, catches 21 and 22 of bended or cranked form about midway between their extreme ends, levers 23 and 24, and healds 43, all in combination, each part being arranged to operate in connection with the other parts, substantially as specified.

2. The needles 25, constructed with their upper ends open to span the catches and their lower ends bent to form greater surfaces for pegs to operate upon, the pattern-chain *c*, and pegs *d*, means for operating said pattern-chain *c*, the catches 21 and 22, the draw-bars 46 and 46* and their actuating devices, and levers 23 and 24, in combination, all being arranged to operate substantially as specified.

3. The catches 21 and 22, having elongated ends *m* and *m'* and catches *n* and *n'*, respectively, also being of bended form and having their other ends respectively terminating in hooks, the needles 25, the pattern-chain *c*, and pegs *d*, means for operating said pattern-chain *c*, the bars 46 and 46*, means for operating these bars, the stop-rails 55 and 55*, the levers 23, the outer ends of which are formed with the prongs *f*, pins *g*, and pieces *h* to retain the hooked ends of catches 21 and 22 when in one position, but to allow them to be detachable in another, the reciprocating bars 45 and 45*, means for operating said bars 45 and 45*, the levers 24, the healds 43, and the means for joining said levers 24 to said healds 43, by which said healds are raised and depressed without the aid of springs or weights, substantially as specified.

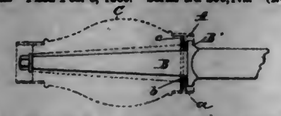
4. The bars 46 and 46*, means for operating them, the rods 47 and 47* and the bars 45 and 45*, 55 and 55*, the catches 21 and 22, having ends *m* and *m'* and catches *n* and *n'*, and the levers 23, combined with the levers 24, said levers 23 being constructed to lay hold of the pins *k k*, formed or attached to the levers 24 and also being of bended form, so as to lay securely hold of the pins *k* on the levers 24 when in one position, in which position the ends of the levers 24 may abut against said levers 23, but be detachable when moved into another position, the healds 43, and the means for joining said healds to said levers 24, substantially as specified.

409,788. **CORN-HUSKING IMPLEMENT.** RICHARD W. HUBBARD, Ashtabula, Ohio. Filed May 18, 1889. Serial No. 311,275. (No model.)

Claim.—1. A husking implement consisting of a single wire bent to form a rounded point and double shank at one end and a handle at the opposite end, substantially as set forth.

2. A husking implement consisting of a single piece of wire bent or doubled to form a broad rounded and sharpened point, and a double shank at one end and a loop at the opposite end, substantially as set forth.

3. A husking implement consisting of a single piece of wire, a portion of which is straight and slightly bent at one end and thence doubled to form a rounded end and double shank, and finally to form a loop for the fingers, substantially as set forth.

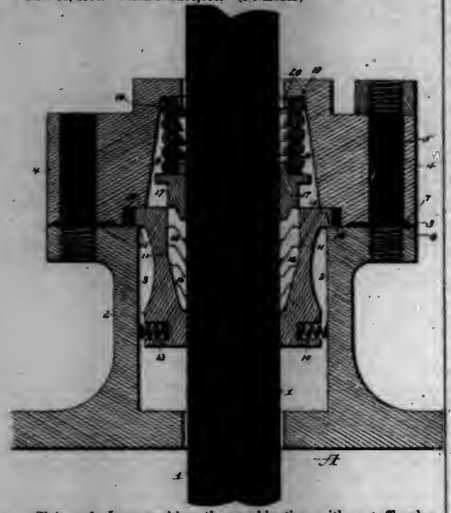


409,789. **HAIR-SPRING STUD FOR WATCHES.** STEPHEN JENKIN, New York, N. Y. Filed June 8, 1888. Serial No. 276,463. (No model.)

Claim.—1. A fastening for the springs of clock-movements, consisting in the combination, with the back plate A', having the post H secured rigidly thereto, of the stud I, having rotary bearings in said back plate and formed with the clamping-head *c*, projecting to one side and at sufficient distance from the back plate to impart elasticity to the clamping-fastening, whereby the free end of the spring is clamped between said post and head by a turning movement of the stud, and is held with a yielding pressure.

2. A fastening for the springs of clock-movements, consisting in the combination, with the back plate A', having the post H secured rigidly thereto, of the stud I, having rotary bearings in said back plate and formed with the clamping-head *c*, projecting to one side, and with the squared end *i*, protruding to the rear of the back plate, by which to turn said stud.

409,790. WASHER FOR VEHICLE-AXLES. CHARLES C. JEROME, Chicago, Ill. Filed Feb. 8, 1889. Serial No. 299,172. (No model.)



Claim.—1. A hub and axle washer having a thin yielding flange formed on its body and projecting inwardly therefrom, substantially as set forth.

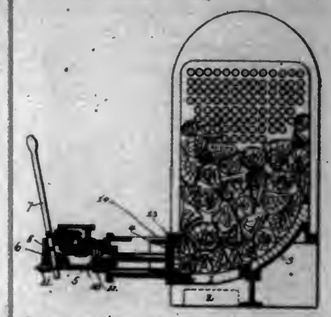
2. A hub and axle washer having a thin yielding flange formed on its body and projecting outwardly therefrom, substantially as set forth.

3. A hub and axle washer having a thin flange integral with its body and extended inwardly in line with one of its ends, and also a thin flange projected outwardly in a line with the opposite end of said washer, substantially as set forth.

409,791. ROD-PACKING. CHARLES C. JEROME, Chicago, Ill. Filed Feb. 13, 1889. Serial No. 299,750. (No model.)

Claim.—1. In a packing, the combination, with a stuffing-box, of a packing-cone, and elastic devices bearing on said packing-cone for preventing unequal pressure of the packing and cone upon the rod, substantially as set forth.

2. In a packing, the combination, with a stuffing-box and a rod, of a packing-cone, packing-rings therein, and elastic devices bearing on said packing-cone for preventing unequal pressure of the packing rings and cone upon the rod, substantially as set forth.



3. The combination, with a stuffing-box and a gland, of a packing-cone having one end in a steam-tight joint between the stuffing-box and gland, and elastic devices bearing on the packing-cone for preventing an unequal pressure at the opposite ends of the packing-cone, substantially as set forth.

4. The combination, with a stuffing-box and gland, of a packing-cone having a flange thereon projecting into a steam-joint at one end, and provided with springs for holding the cone in line with the rod and preventing an unequal pressure on the packing, substantially as set forth.

5. The combination, with a stuffing-box, a gland secured thereto and having an annular joint formed therein contiguous to the stuffing-box, a packing-cone having a flange extending into the joint, said cone having a packing-cavity therein, and springs for holding it in position in the box, of lap packing-rings, a follower, and spring bearing on said follower, substantially as set forth.

409,792. FURNACE. EVAN W. JONES, Portland, Oreg. Filed June 7, 1888. Serial No. 313,480. (No model.)

Claim.—1. A furnace provided with a lateral fuel-supply opening beneath the fire, a supporting bottom for the fire sloping upward and backward from the supply-opening, grate-bars forming a portion of said bottom, a dead-plate forming the remaining portion of said bottom, and a ram on the side of the furnace for forcing fuel into the opening, whereby fuel may be readily pushed up into the fire and will be firmly supported independently of the position of the feeding mechanism.

2. A furnace comprising a downwardly-contracting fuel-chamber having grate-bars in the lower portion thereof and forming at all times a firm support for the fuel, a lateral supply-opening in the lower part of the fuel-chamber, and a ram for forcing fuel through the opening, said fuel being forced up into the fire by the sloping wall of the fuel-chamber.

3. A furnace provided with a fuel-chamber having an inclined bottom and a fuel-opening opposite the lower edge of the bottom, a ram for forcing fuel through the opening against the inclined bottom, whereby it will be forced up into the fire, and grates in the fuel-chamber, the upper portion of the fuel-chamber spreading laterally and being provided with auxiliary grates, as and for the purpose set forth.

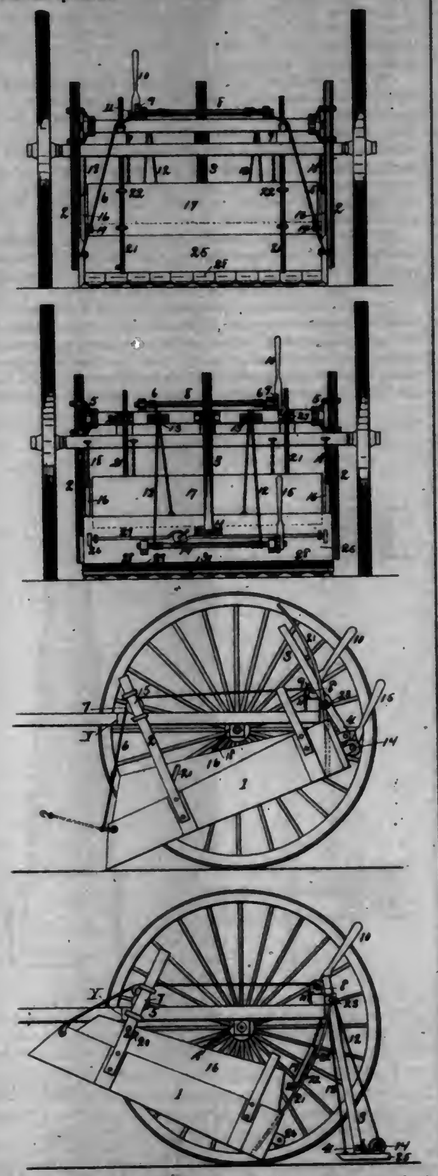
4. A furnace provided with a fuel-chamber having an upwardly-inclining side and a fuel-supply opening below the line of fire, means for forcing fuel up into the chamber, and air-supplying grates in the side or sides of the chamber.

5. A furnace having a fuel-chamber provided with an upwardly-expanding cross-section, vertical grate-bars in the side of the chamber and between it and the furnace-walls, said grate-bars having their faces inclining toward the front of the furnace to facilitate raking.

6. In a furnace, the combination of a fuel-chamber having an upwardly-expanding cross-section, vertical grate-bars in the lower side walls of said chamber, horizontal grate-bars 22 in the upper part of said chamber, and a fuel-supply opening in the lower part of the chamber below the line of fire.

7. In a furnace, the combination of a fuel-chamber having an upwardly-expanding cross-section, vertical grate-bars in the lower side walls of said chamber, horizontal grate-bars in the upper part of said chamber, a fuel-supply opening in the lower part of the chamber below the line of fire, and a fire-door in the upper part of the chamber for building the fire.

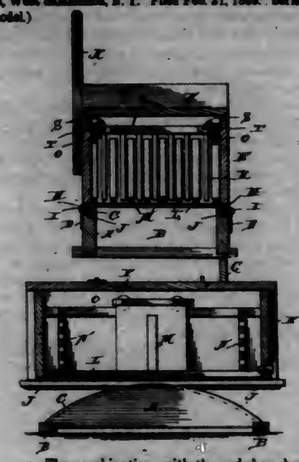
8. In a furnace, the combination of the fuel-chamber having an upwardly-inclining bottom, a fuel-supply opening opposite said bottom below the line of fire, a fuel-box in front of the opening, a ram for forcing the fuel from the box up into the chamber, a piston connected to the ram, a valve-shifting lever for controlling the direction of movement of the piston, and a cut-off operated by the ram on the completion of its stroke.



9. In a furnace, the combination of a fuel-chamber having an upwardly-inclining bottom and a fuel-supply opening opposite said bottom below the line of fire, and a ram for forcing fuel into the opening, said ram having a fire-brick lining on the side entering the opening.

409,793. SELF-LOADING CART. JOHN C. KELSHER, New Richland, Minn. Filed Dec. 31, 1888. Serial No. 296,008. (No model.)

Claim.—1. In combination with the frame-work mounted upon wheels, the scoop suspended therefrom by chains or equivalent means, and arms rigidly secured to said scoop and mounted in longitudinally-oscillating guide-bearings upon the frame-work, and means for winding and unwinding said suspension devices, substantially as described, whereby said scoop may be raised or lowered by said arms sliding in said bearings.

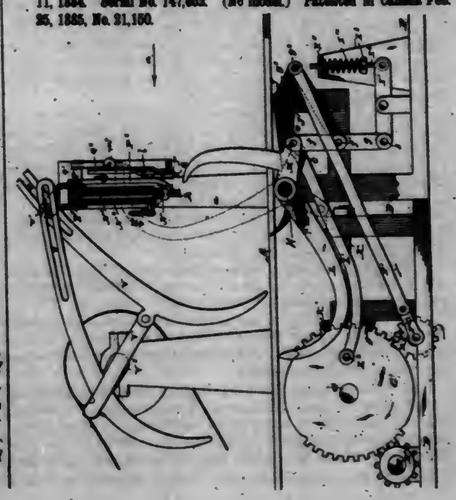


2. In combination with the frame-work mounted upon wheels, the scoop suspended at front and rear therefrom by means of cords or chains, upright arms rigidly secured to said scoop and mounted in oscillating guide-bearings upon the frame-work, and ratchet-operated shafts at front and rear, to which said suspension devices are attached, respectively, whereby either the front or rear end of the scoop may be raised or lowered independently, the said arms sliding in said guide-bearings, substantially as and for the purpose specified.

3. In combination with the frame-work mounted upon wheels, the scoop held in lateral position with reference thereto by means of upright arms rigidly secured to said scoop and mounted in longitudinally-oscillating guide-bearings upon said frame-work, suspending cords or chains attached at one end to the front of the scoop and at the other to a ratchet-lever-operated shaft upon the frame, similar cords or chains secured at one end to the rear end-gate of said scoop, passing over a sheave upon the frame-work, and attached at the other end to a ratchet-lever-operated shaft mounted upon said end-gate, and means for detaching said end-gate, substantially as and for the purpose herein specified.

4. In combination with the frame-work mounted upon wheels, the scoop held in lateral position with reference thereto by means of upright arms rigidly secured to said scoop and mounted in longitudinally-oscillating guide-bearings upon said frame-work, cords or chains suspending said scoop from the frame-work, and means, substantially as described, for raising or tilting said scoop in said bearings, and additional sides and ends suspended from said frame independently of said scoop, substantially as and for the purpose herein specified.

409,794. WASHING-MACHINE. HENRY C. KNIGHT and DAVID H. STERNS, West Salamanca, N. Y. Filed Feb. 21, 1889. Serial No. 300,602. (No model.)



Claim.—1. The combination, with the suds-box having internal ways near the top, of the vertical posts rising from the bottom thereof at the center of the same, and the traveling agitator mounted on the ways of the suds-box, moving over the posts and having a series of depending vertical arms arranged in alternate planes with said posts, as set forth.

2. The combination, with the suds box, of the longitudinal bars secured upon the bottom of the same, the vertical posts erected on said bars at the centers of the same, the perforated vertical plates arranged transversely on said bars near the ends of the suds-box, and the traveling agitator mounted in the said box and moving between the perforated plates and past the posts, as set forth.

3. The combination of the suds-box having the cleats or ways, the traveling agitator provided with rollers resting on said cleats, the perforated plates N, arranged transversely within the suds-box, and between which plates the agitator works, the posts M, rising from the bottom of the suds-box, and the arms depending from the agitator and adapted to pass between the posts, as set forth.

4. The combination of the suds-box having the series of bars L secured to its bottom, which extend the entire length thereof and have the series of posts M, which extend upward to near the top of the suds-box, so as to practically divide the suds-box into two compartments, and the traveling agitator having a series of arms R, which depend therefrom and register with the spaces between the posts M, as set forth.

409,795. GRAIN-BINDER. SAMUEL D. MADDUX, Miamisburg, Ohio, assignor to Mary Maddux and Amadee Tetrault, same place. Filed Nov. 11, 1884. Serial No. 147,663. (No model.) Patented in Canada Feb. 25, 1885, No. 21,160.

Claim.—1. In a grain-binder having the knotting mechanism supported from a standard overhanging the platform and the needle pivoted below the platform, a pivoted lever extending above and below the platform, and reciprocating connecting-rods jointed at their ends to the said lever and connected, respectively, with the knotting mechanism above the platform and the driving mechanism below the platform, substantially as described.

2. The combination of the knotting mechanism of a grain-binder supported above the platform by an overhanging arm, a pivoted operating-lever extending above and below the platform, an intermediate sliding frame and connecting-rods jointed at their ends to the lever and connected, respectively, with the sliding frame and with the driving mechanism, substantially as described.

3. In a grain-binder, the combination, with the needle, the compressor, and the discharge-arm, all hung below the platform, and the knotting devices above the platform, of a rotating disk G', arranged below the platform, and which drives all of said devices, a wheel K', mounted in a plane at substantially right angles to the disk and driven directly thereby and arranged between the latter and the knotting mechanism, and connections between the wheel K' and the knotting devices, substantially as described.

4. In a grain-binder, the combination of the knotting devices above the platform, the needle, the compressor, and the discharge-arm, all mounted below the platform and supported upon parallel shafts, a disk G' in a plane at right angles thereto, the wheel K', a reciprocating rod operating in a plane parallel with the shafts driven by the wheel K', and reciprocating connections between the rod and the knotting devices, substantially as described.

5. In a grain-binding harvester, the combination, with a binder-platform, the needle, the compressor, the discharge-arm, and the knotting devices, the latter being above the platform, of a main revolving disk G', mounted below the platform to drive the needle, the compressor and the discharge-arm, a wheel K', a rod driven thereby below the platform, a pivoted lever extending above and below the platform, and a second rod connecting the lever with the knotting mechanism, substantially as described.

6. The combination of the rotating knotter-hook, the cord-clamping disk, the cord-controlling lever T, supported adjacent to the hook, and a reciprocating frame and connections, whereby the moving of the frame in one direction is caused to operate the said parts to form the knot, substantially as described.

7. The combination of the needle, a compressor pivoted upon the needle-shaft, a toggle-brace which supports the compressor, and a trip for the toggle independent of the needle for vibrating one of the toggles of the brace to permit the descent of the compressor, substantially as set forth.

8. The combination, with an intermittently-moved disk and the needle driven therefrom, of the pivoted compressor, the supporting toggle-links pivoted to compressor and to a support carried by the frame of the machine, and a trip connected with the toggle-links and arranged to move them to break the support for the compressor, the trip being positively operated, independently of the needle, by a link connected with the said intermittently-moved disk, substantially as described.

9. The combination, with an intermittently-moved disk, of the pivoted compressor, the supporting toggle-links pivoted to the compressor and to a support on the frame of the machine, the discharge-arm positively operated from the said disk, a trip connected to the toggle-links and to the discharge-arm, and a link connecting the discharge-arm with the disk, whereby the toggle-links are moved to permit the withdrawal of the compressor upon the advancement of the discharge-arm, substantially as described.

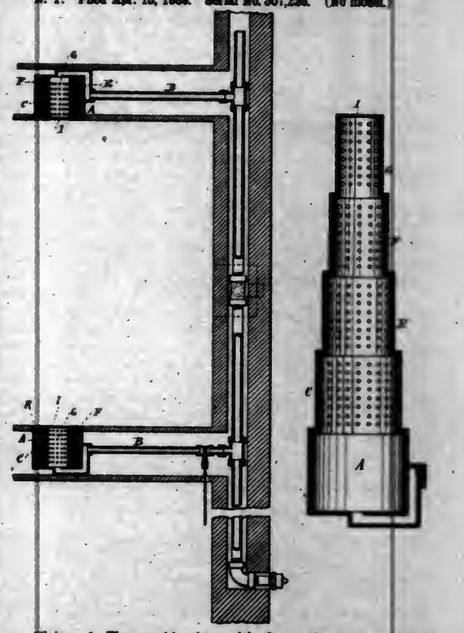
10. The combination of the compressor-arms hung directly to a shaft or pivot below the platform, the toggle-links connected to the said arms, and to a support carried by the frame of the machine, and a reciprocating rod pivoted to the central joint of the said toggles, whereby it operates them both to support the compressor-arms and to let them fall, substantially as described.

11. The combination of the pivoted compressor-arm, the toggle-links, the trip for the toggle-links, the lever I', and a spring-bearing for the said lever, substantially as described.

12. The combination of the compressor-arm, the toggle-links, the trip of the toggle-links, the lever l', the bar l^2, and the spring and nut, substantially as described.

13. The combination of the compressor and discharge arms, the toggle-links, the support therefor carried by the frame of the machine, the connecting-rod g', and the operating-crank and connecting-rod F', substantially as described.

14. The combination, with the binder-platform, the knotting devices, a needle, the discharge-arms, and the compressor, of a rotating disk G', connected to drive the needle, and having the spur-gear segment F^4 and the bevel-gear segment K^2, the shaft F, driven by the gear-segment F^4 and connected to drive the discharge-arms, the shaft K, arranged at an angle to the shaft F and provided with a crank, a rod driven by the crank, and a pivoted lever connected with the knotting devices driven by the link, substantially as described.



15. The combination of the binder-frame, the drive-wheels of equal size supporting the said frame and both connected to drive the operating mechanism, a cutting apparatus and grain-platform on one side of the binder-frame, an elevator delivering the grain from the grain-platform over the inner one of said wheels, a binder-platform supported by the binder-frame between and extending over the wheels on the stubble side of the machine, and a binder supported by the frame between the wheels and provided with ejector-arms arranged to discharge the bound bundles from the platform over the last said wheel, substantially as described.

16. The combination of the binder driving-wheels of substantially equal size, both connected to drive the operating mechanism, an elevator delivering the cut grain over the inner one of said wheels, the binding-table arranged above and projecting over the wheel on the stubble side of the machine, a frame supported by and between the wheels below the binding-table and supporting the shafts and their connections of the grain-binder, and an arm projecting above the platform and the cord knotting and cutting devices supported by said arm, substantially as described.

17. The combination, with the elevator and binder, of the horizontally-arranged pulleys and the chains provided with jointed feeding-teeth passing around the pulleys, and a bar, adjustable, supporting the pulleys next to the binder, substantially as set forth.

18. The combination, in a harvester, of a binder supported between two wheels, a vertically-adjustable cutter-frame outside the wheels, an elevator-frame jointed at the lower end to the adjustable cutter-frame, and a frame carrying a grain-conveyer jointed at the outer end to the upper portion of the elevator-frame and at the inner end adjacent to the platform of the binder, substantially as set forth.

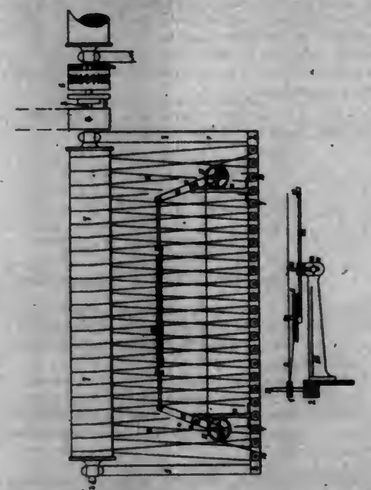
409,796. FIRE-EXTINGUISHER. MICHELE MAGALDI, New York, N. Y. Filed Apr. 15, 1889. Serial No. 307,236. (No model.)

Claim.—1. The combination, with the stationary water-supply pipes within a building, of the automatic extensible sprinkler formed of perforated tubular sections sliding one within the other automatically by the pressure of the water, substantially as set forth.

2. The combination, with the stationary water-pipes in a building and the valves or cocks therein, of the automatic extensible sprinklers in the floor, walls, or ceiling, each sprinkler being composed of perforated tubular sections sliding telescopically one within the other, substantially as set forth.

409,797. GATE-LATCH. MELVILLE M. MOORE, Springfield, Mo. Filed June 21, 1888. Serial No. 277,797. (No model.)

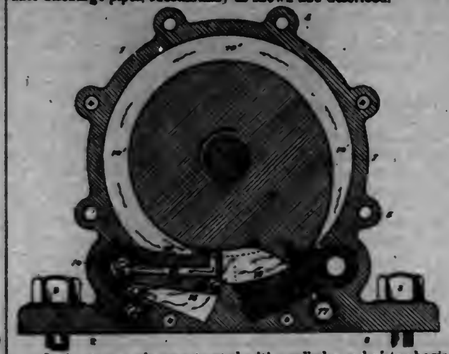
Claim.—The combination, with a vertically-movable angular bolt provided with a lateral projection and a beveled lower end, and a block or casing having a seat corresponding in shape to the cross-section of the bolt, so as to permit the bolt to slide therein, but prevent it from moving laterally, of a block located below the bolt and having a flat upper face, forming a rest for the pin or bolt on the gate, and a beveled face which forms a guide for the pin or bolt on the gate, substantially as set forth.



409,798. WHIFFLETREE. MURDOCK M. MCKINNON, Laurinburg, N. C. Filed Apr. 11, 1889. Serial No. 306,831. (No model.)

Claim.—The improved whiffletree consisting of the whiffletree-bar having a transverse opening at its center near one side, a hook loosely mounted in said opening and having a divided ring at its rear end, and a stud projecting from the rear side of the whiffletree-bar adjacent to the transverse opening therein and adapted to contact with the free end of the divided ring, as set forth.

409,799. TENSION-REGULATING DEVICE FOR SPINDLE-DRIVING BANDS. ABRAHAM HERBERWOOD, New Brunswick, N. J. Filed Mar. 26, 1889. Serial No. 304,944. (No model.)



Claim.—The combination, with the drum 7, the spindles 10, having whirls 9, and the endless band 8, of the stands 15, the studs 13, means to adjust said studs vertically on said stands, the levers 12, pivoted on said studs and provided with the eyes 19 and the pins 20, the idler-wheels 11 on said pins, and the spring 14, substantially as shown and described.

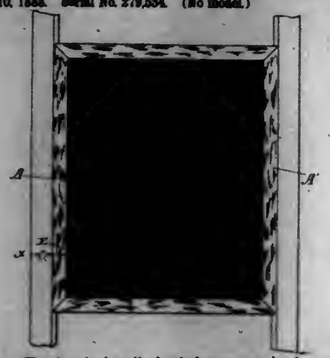
409,800. ROTARY ENGINE. FREDERICK D. OWEN, Washington, D. C. Filed Oct. 12, 1888. Serial No. 287,903. (No model.)

Claim.—1. In a rotary engine constructed with a cylinder and piston, a valve-chamber communicating with the cylinder and with a supply-pipe, an oscillating abutment-valve located within the valve-chamber and having supply-ports communicating with the valve-chamber and adapted to rest on a cushion of steam therein, and the cylinder and discharge-ports communicating with the cylinder and a discharge-pipe, substantially as shown and described.

2. A rotary engine constructed with a cylinder and piston, valve-chambers communicating with the cylinder and alternate supply-pipes, an oscillating abutment-valve located within each of the valve-chambers, said abutment-valve having alternate supply-ports communicating with each of the valve-chambers and the cylinder, and alternate discharge-ports communicating with the cylinder and alternate discharge-pipes, substantially as shown and described.

3. A rotary engine constructed with a cylinder and piston having a rib bearing against the interior surface of the cylinder, a valve-chamber communicating with the interior of the cylinder, an oscillating abutment-valve located in the valve-chamber and having a hollow hinge communicating with the discharge-pipe and through the valve with the cylinder, and supply-ports communicating with the cylinder and the valve-chamber, and a supply-pipe communicating with the valve-chamber, substantially as shown and described.

4. In a rotary engine, a piston constructed from a cylinder placed upon a shaft located within an outer cylinder or casing, with one portion enlarged longitudinally and carrying an expansive rib bearing against the interior wall of the outer casing, forming with said cylinder and the enlargement a convex longitudinal surface, and to the opposite side of said rib a concave longitudinal surface, in combination with an oscillating abutment-valve located within a chamber communicating with the cylinder in the wall of the outer casing, substantially as shown and described.



5. A rotary engine constructed with a cylinder and piston having a rib bearing against the interior surface of the cylinder, an inclosed valve-chamber opening into the cylinder with a supply-pipe, an oscillating abutment-valve located within the valve-chamber and having an upper curved surface exposed to the interior of the cylinder and forming a part of the interior surface of the cylinder, said abutment-valve having supply and discharge ports communicating, respectively, with the valve-chamber and cylinder and the cylinder and a discharge-pipe, substantially as shown and described.

6. A rotary engine constructed with a cylinder and piston with a rib bearing against the interior surface of the cylinder, a valve-chamber communicating with the interior of the cylinder, an oscillating abutment-valve located in the valve-chamber and having supply-ports in a face of the valve which is movable over the wall of the valve-chamber, the supply-ports communicating with the interior of the cylinder, and the valve-chamber having a supply-pipe and discharge-ports communicating with the interior of the cylinder and a discharge-pipe, the openings of the supply-ports being in a different plane in the valve from that of the openings of the discharge-ports, whereby the supply is cut off automatically before the discharge by the action of the piston, substantially as shown and described.

7. A rotary engine constructed with a cylinder and piston, a valve-chamber communicating with the interior of the cylinder, and an oscillating abutment-valve located in the valve-chamber and having supply-ports communicating with the interior of the cylinder and with the valve-chamber having a supply-pipe, and discharge-ports communicating with the interior of the cylinder and a discharge-pipe, the openings of the discharge-ports being in a different place or height relative to the base of the cylinder from the openings of the supply-ports, whereby the supply is automatically cut off before the discharge by the piston moving the valve back in its chamber, substantially as shown and described.

8. In a rotary engine, a piston constructed upon a shaft with a longitudinal enlargement, carrying an expansive rib bearing against the interior wall of the outer casing or cylinder, said piston having to one side of said enlargement a longitudinal concave surface extending below and which is less than the radial distance from the shaft of the cylindrical or convex portion of said piston, in combination with an oscillating abutment-valve having supply and discharge ports and located within a chamber communicating with the cylinder in the wall of the outer casing, whereby an effective admission of steam is admitted and cut off before the finish of the stroke, substantially as shown and described.

409,801. WINDOW-SCREEN. JOHN W. PRASE, Portland, Me. Filed July 10, 1888. Serial No. 279,534. (No model.)

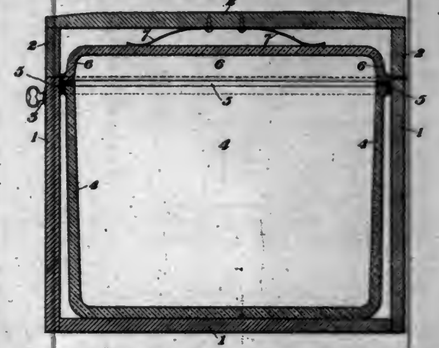
Claim.—The herein-described window-screen, having apertures through the side bars and friction-plugs therein, a spiral spring back of each plug for forcing it outward, a plate secured to the inner edge of the said side bar covering said aperture and a hole in said plate, a stem passing through said hole, having its inner end secured to said plug, its outer end being enlarged to prevent it from passing through said hole, and a notch in said stem adapted to engage said plate for holding said plug in a retracted position, substantially as shown.

409,802. PENCIL-SHARPENER. EDWIN G. PHILLIPS, Charleston, S. C., assignor of two-thirds to Samuel Wetzkoff and Thomas P. Livingston, both of same place. Filed June 15, 1889. Serial No. 314,343. (No model.)

Claim.—1. A pencil-sharpener having a recess made U-shaped in cross-section and having sides convergiag from the middle of the recess toward the ends, substantially as described.

2. A pencil-sharpener provided with the recess *a'*, made U-shaped in cross-section, its bottom inclining downward toward the middle of the sharpener, and its upper edge converging from the middle toward the ends, whereby a rubbing-surface free from angles is provided, substantially as described.

409,803. BARREL-COVER. THOMAS R. RAGLAND, Atlanta, Ga. Filed June 6, 1889. Serial No. 313,377. (No model.)

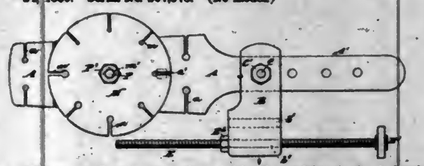


Claim.—1. A barrel-cover formed with a central opening and compartments surrounding the same, in combination with a transparent receptacle E, adapted to close the opening in the cover, substantially as specified.

2. A barrel-cover provided with a central opening surrounded by compartments covered with transparent plates, in combination with a transparent receptacle adapted to cover the central opening, substantially as specified.

3. A barrel-cover having a central opening, in combination with a transparent globular receptacle adapted to cover the said opening and have its main body assume a position above the cover, substantially as specified.

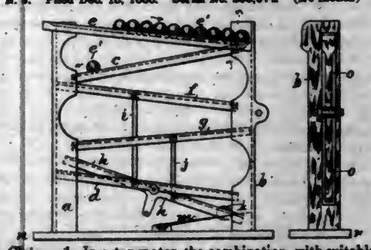
4. A barrel-cover formed from a single piece, with an annular recess in its under side to receive the chine of a barrel, a central opening, compartments surrounding the opening and lined with porcelain, glass plates covering the compartments, and a central transparent globular receptacle adapted to cover the central opening in the cover, substantially as specified.



409,804. BOX FOR TOBACCO, &c. DANIEL C. RIPLEY, Pittsburg, Pa. Filed May 10, 1889. Serial No. 310,908. (No model.)

Claim.—1. In a case for cigars and like articles, said case having an outer box or shell provided with a cover and an inner receptacle of less diameters to form an air-space between the two, said inner vessel provided with a cover, the combination therewith of a gasket extending across the air-space from the outer to the inner vessel and adapted to hermetically seal the inner vessel and maintain its position with relation to the outer case or shell, substantially as and for the purposes described.

2. In a case for cigars and like articles, said case having an outer box or shell provided with a cover and an inner receptacle of less diameters to form an air-space between the two, said inner vessel provided with a cover, the combination therewith of a gasket extending across the air-space from the outer to the inner vessel and adapted to hermetically seal the inner vessel and maintain its position with relation to its outer case or shell, and a spring interposed between the inner and outer covers to prevent vertical motion, substantially as and for the purposes described.

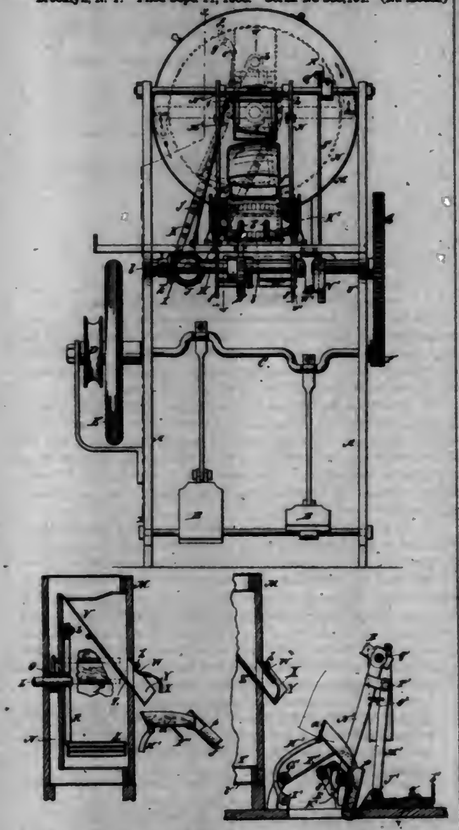


409,805. SAW-SET. PATRICK RYAN, New York, N. Y. Filed Jan. 24, 1889. Serial No. 297,375. (No model.)

Claim.—1. In a saw-set, the combination, with a body A, having the slits *a*, of the arm B, adapted to slide on the shank A', holding means C C', and the gage-screw E, fitted exchangeably in the holes *b b'*, as herein specified.

2. The saw-set described, having the body A *a*, shank A', sliding arm B, having the holes *b b'*, holding means C C', and gage-screw E E', in combination with each other and with the disk M, having slits *m* and fastening means P P', arranged for joint operation substantially as herein specified.

409,806. MOTOR FOR TOYS. HOWARD R. SCHUREMAN, Newark, N. J. Filed Dec. 15, 1888. Serial No. 293,674. (No model.)



Claim.—1. In a toy motor, the combination, with suitable guides for leading the balls thereto, of the troughs *f* and *g*, inclined in opposite directions and pivoted at opposite ends, as described, the oscillating lever *h*, and the links *i* and *j*, connecting the troughs with the lever at opposite sides of its fulcrum, as and for the purpose set forth.

2. In a toy motor, the combination, with the fixed troughs *c* and *d*, of the movable troughs *f* and *g*, pivoted at opposite ends between the troughs *c* and *d* and inclined in opposite directions, guides to lead the ball from one trough to another, as set forth; the lever *h*, the links connecting the movable troughs with such lever at opposite sides of its fulcrum, and a weight upon the lever to normally raise the free end of the upper trough, substantially as herein shown and described.

3. In a toy motor, the combination, with the bed *a* and posts *a* and *b*, forming guides for the balls, as set forth, of the troughs *c*, *d*, and *e*, arranged as described, the latter having an inclined passage *e'*, connecting the troughs *c* and *c*, and said trough *c* having the incline *c'* to retain the ball at the head thereof, the movable troughs *f* and *g*, pivoted as described, the lever *h*, linked to the troughs *f* and *g*, and the arm *o*, arranged as set forth, and operated to push the balls successively into the trough *c*, as and for the purpose set forth.

409,807. CIGAR-BUNCHING MACHINE. FREDERICK A. SCHUTH, Brooklyn, N. Y. Filed Sept. 11, 1888. Serial No. 285,101. (No model.)

Claim.—1. The combination, with the feeding-vessel N, having an opening or passage, and the receiving-vessel M, of a movable scraper P and a spout Y, substantially as described.

2. The combination, with the feeding-vessel N, having an opening or passage, and the receiving-vessel M, of a stirrer or commiuuter S, a scraper P, and a spout Y, substantially as described.

3. The combination, with the feeding-vessel N, having an opening or passage, and the receiving-vessel M, of a movable scraper P and a spout Y, provided with an overflow-trap Z, substantially as described.

4. The combination, with the feeding-vessel N, having an opening or passage, and the receiving-vessel M, of a scraper P and a spout provided with an adjustable lid W X, substantially as described.

5. The combination of the spout Y, mechanism for feeding the material to the spout, the oscillating arm H, the receiver *a* on the arm, the chute *p* on the receiver, the chute-lever E F, the lever D', acting upon the chute-lever, and the cam B', for operating the lever D' at intervals to lift the receiver and chute, substantially as described

6. The combination of the apron *g*, the support *r*, the actuating-roll K', the pivoted lever *s*, with which one end of the apron is secured, the shaft H, and the pin A', for intermittingly moving the levers to extend the apron, substantially as described.

7. The combination, with the apron *g* and its support, of the frame or support M', having a roller J', the frame or support N', having a roller K', the spring O', and pivoted intermittingly-swinging levers *s*, connected by a cross-bar, to which one end of the apron is attached, substantially as described.

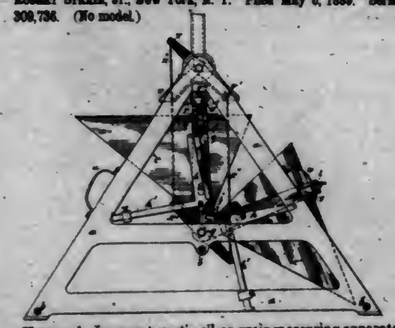
8. The combination, in a cigar-machine, of the feeding-vessel N, having an opening or passage, the receiving-vessel M, the scraper P, the incline V, having spout Y, oscillating hopper having chute *p*, apron *g*, and carrying oscillating frame N', having the bight-forming roller K', oscillating frame M', having a binder-holding roller J', a connecting-spring O' for said frames, and a bunch-receiver, substantially as described.

9. The combination, with feeding-vessel N, having an opening or passage, and the receiving-vessel M, provided with perforation U, of a scraper P and a spout Y, substantially as described.

10. The combination, with the feeding-vessel N, having an opening or passage, and a vessel M, adapted to receive material such as tobacco, and having a spout Y, of a scraper P, provided with a loosening arm or rod *c'*, substantially as described.

11. The combination, with the feeding-vessel N, having an opening or passage, the receiving-vessel M, the movable scraper P, the incline V, extending from the upper part of the feeding-vessel, and the feed-spout Y, substantially as described.

12. The combination, with the feeding-vessel N, having an opening or passage, the receiving-vessel M, and the spout Y, of mechanism for feeding material from the lower part of said receiving-vessel to the upper part thereof, and an incline leading from the upper part of said vessel to the spout, substantially as described.



13. The combination, with a concave or hollow support *r* and bunch-shaped apron, of curved rollers J' K' and actuating-arms M' N' for said rollers, said arms being supported or pivoted above said support *r*, substantially as described.

14. The combination, in a cigar-machine, with a flexible bunch-rolling apron permanently concave in two directions on its working-surface and convex on its back surface, respectively, of two curved traveling rollers—namely, an actuating or bight-forming and a binder-holding roller—located, respectively, on opposite sides of said apron, substantially as described.

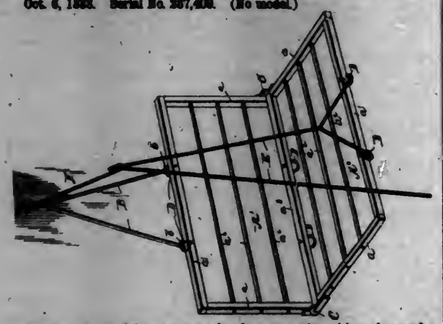
15. The combination, in a cigar-machine, of a rolling bed concave in two directions, a bunch-rolling apron secured at its ends thereto, permanently curved in two directions to form a concave working-surface and having a convex back surface to rest in the concavity of the bed, a curved binder-holding roller located on the upper working-surface, and an actuating or bight-forming bunching-roller located on the opposite side of the apron, substantially as described.

16. The combination, in a cigar-machine, of two independent curved sectional rollers and a bunch-forming apron provided with permanently concave and convex surfaces in two directions, and located between and coacting with said sectional rollers to impart a cigar shape to the bunches, substantially as described.

409,808. AUTOMATIC GRAIN OR OIL WEIGHING APPARATUS. ROBERT STRAIN, Jr., New York, N. Y. Filed May 6, 1889. Serial No. 309,736. (No model.)

Claim.—1. In an automatic oil or grain measuring apparatus, the combination of the buckets *c c'*, having studs *f f f f*, with the end frames *a a*, the slotted standards *d d*, and scale-beams *h h'*, connected to and oscillating with said standards and buckets, substantially as described.

2. In an automatic oil or grain measuring apparatus, the combination of buckets *c c'*, having studs *f f f f*, with the end frames *a a*, the slotted standards *d d*, the scale-beams *h h'*, connected to and oscillating with said standards and buckets, the sliding bolt *m*, connected

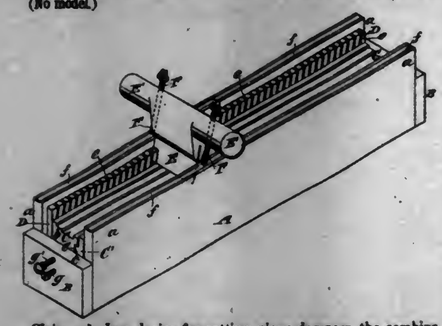


by a spring *q* and retained against the action of this spring by a lever *r*, and a notched bar *o*, substantially as described.

3. In an automatic oil or grain measuring apparatus, the combination of buckets *c c'*, having studs *f f f f*, with the end frames *a a*, the slotted standards *d d*, the scale beams *h k'*, connected to and oscillating with said standards and buckets, the sliding bolt *m*, connected by a spring *q* and retained against the action of this spring by a lever *r*, a notched bar *o*, and pivoted levers *x x'*, substantially as described.

4. In an automatic oil or grain measuring apparatus, the combination of buckets *c c'*, having studs *f f f f*, with the end frames *a a*, the slotted standards *d d*, the scale-beams *h k'*, connected to and oscillating with said standards and buckets, pivoted levers *x x'*, connections *x'' x'''*, and a two-way cock *w*, substantially as described.

5. In an automatic oil or grain measuring apparatus, the combination of the slotted standards *d d*, with the scale-beams *h k'* pivoted thereto, the lever-bar *i*, which bar is pivoted at *j* to one of the standards *d*, and a bucket having a knife-edge *l*, operating in a slot in said bar *i*, substantially as described.

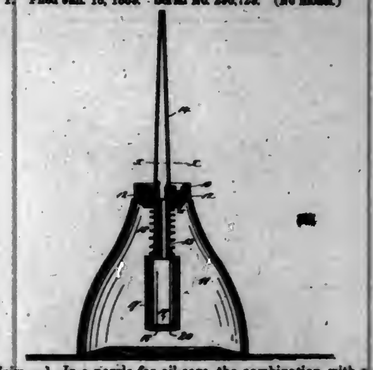


409,809. CLOTHES-DRIER. LEMA B. STUDLEY, Rockland, Me. Filed Oct. 6, 1888. Serial No. 287,409. (No model.)

Claim.—1. A drier composed of two sections hinged together and provided at their ends with rings, one of the sections having a cross-piece a^2 arranged across the center of the drier and provided with rings, and a supporting-piece having hooks at its lower end and provided with a loop at its upper end, substantially as described.

2. A drier comprising a drier-frame composed of two sections hinged together and provided with rings at its ends, a supporting-piece provided at its apex with an eye or loop and at its ends with a hook to engage the rings at the upper end of the drier-frame, a cord or chain secured to the rings at the lower end of said frame, and a supporting-rod having at its ends hooks, one of which is adapted to engage the said eye or loop and the other to receive the rope or chain, whereby the lower section of the frame may be held in a horizontal position, substantially as and for the purpose described.

409,810. DEVICE FOR CUTTING DAMPER-FELTS FOR PIANOS. JOHN SWENSON, New York, N. Y. Filed Apr. 30, 1889. Serial No. 307,971. (No model.)



Claim.—1. In a device for cutting piano-dampers, the combination, with a base-piece provided with a recess, of a detachable holder within said recess, a gripper for gripping a card of felts to be formed into dampers, upright portions extending from said base, each provided upon their inner sides with a series of angularly-extending grooves arranged opposite each other, and a knife passing downwardly through said grooves successively to cut the felt, substantially as specified.

2. In a device for cutting piano-dampers, the combination, with a base provided with a recess, of a holder for cards of felt to be cut into dampers, a gripper for gripping said cards, adjusting-screws for adjusting said holder into position, and set-screws for retaining it in position when adjusted, substantially as specified.

3. In a device for cutting piano-dampers, the combination, with a base, of a holder for cards of felt to be cut into dampers, a gripper for gripping said cards, uprights extending upwardly above said base, each provided upon their inner sides with a series of angularly-extending grooves arranged opposite each other, a knife passing downwardly through said slits or grooves to cut the felt, and adjusting-screws bearing upon said uprights for varying the depth of the cut of the knife, substantially as specified.

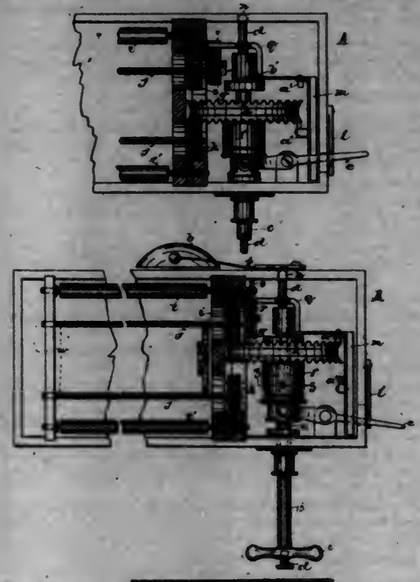
409,811. OIL-CAN NOZZLE. CHARLES B. UNDERHILL, Lancaster, N. Y. Filed Jan. 18, 1889. Serial No. 296,720. (No model.)

Claim.—1. In a nozzle for oil-cans, the combination, with a centrally-apertured cap provided with an air-vent, of a reservoir extending downward from the cap and provided with a valved aperture in its lower end, and a spring-actuated valve controlling the vent-aperture in the cap, substantially as shown and described.

2. In a nozzle for oil-cans, the combination, with a centrally-apertured cap provided with air-vents, of a reservoir screwed into the cap-aperture from below, provided with an opening in the lower end and a valve controlling said opening, a valve held to slide upon the reservoir adapted for contact with the under face of the cap, and a delivery-nozzle screwed to the outer extremity of the said reservoir, substantially as shown and described.

3. In an oil-can nozzle, the combination, with a centrally-apertured and exteriorly-threaded cap cup-shaped upon the upper face and provided with air-vents at each side of the central aperture, a tube screwed from the under side of the cap into the said central aperture, which tube is of greatest diameter at the lower end and provided at said lower end with a screened opening and an inwardly-opening valve covering the said opening, of a spring-supported valve held to slide upon the said tube and adapted to be seated against the under face of the cap, and a delivery-nozzle screwed to the upper end of the tube, all combined for operation substantially as shown and described.

409,812. STATION-INDICATOR FOR RAILWAY-CARS. EMILE VERPILLIER, Newark, N. J., assignor of two-thirds to Louis Dumont, same place, and Bernard Bernigole, New York, N. Y. Filed Mar. 22, 1889. Serial No. 304,298. (No model.)



Claim.—1. In station-indicators, the rollers *j, j, t,* and *t'*, having canvas or other flexible material fastened and distended thereon, with tension-springs *y y*, and provided with the pinions *i* and *k*, in combination with the master-wheel *h* and cylinder *f*, vertically adjustable by means of the lever *e* upon the barrel *c*, and engaged therewith by means of the key *o*, substantially as described.

2. The rod *d*, having a beveled end *n* at its upper extremity to operate the bell-hammer *p*, and provided with the arm *q*, to communicate with the slot *v* in a flanged wheel *r* and ratchet *g*, and movable within the barrel *c*, independently thereof, for the purpose specified.

3. The combination, in station-indicators, of the rod *d*, sliding within the barrel *c*, the bell-hammer *p* at the top, provided with a spring *x*, a flanged wheel *r*, having slots *v v*, and communicating with the distending-roller *t*, the barrel *c*, engaging the nave *f*, vertically adjustable thereon, the master-wheel *h*, engaging with the pinions *i* or *k*, and the rollers *j j*, to which said pinions are attached, all substantially as set forth.

4. In station-indicators, the combination of a canvas band or belt with the stations to be announced distended upon rollers *t* and *t'* and attached to rollers *j j*, with a master-wheel *h*, vertically adjustable upon a barrel or tube *c*, engaging therewith, so as to reverse the order of announcement without changing the direction of the operating-

lever *c'*, and rod *d*, sliding within the tube *c*, and operating the bell-hammer *p* simultaneously with the announcement of the station at *a*.

409,813. LOOM FOR WEAVING WIRE. CHESTER F. WICKWIRE, Cortland, N. Y. Filed Feb. 11, 1887. Serial No. 227,273. (No model.)

Claim.—1. The combination, with the loom-frame and cloth-guiding and cloth-winding rollers, of a gravitating frame hinged to the rear end of the loom-frame and having its free end under the front end of said frame, a cloth-tensioning roller mounted on the front end of the gravitating frame, segmental racks secured to the sides of the front end of the loom-frame, a horizontal shaft journaled to the front end of the pivoted frame, and pinions secured to the ends of said shaft and traveling in the racks, substantially as and for the purpose set forth.

2. The combination, with the loom-frame, cloth guiding and winding rollers, and the actuating-shafts and gears of said winding-roller, of a clutch for throwing the actuating-shaft of a winding-roller in and out of gear, a gravitating frame under the front portion of the loom-frame, a cloth-tensioning roller mounted on said gravitating frame, a weighted arm, and a crank or eccentric pivoted in common on the loom-frame to operate in unison, a rod connecting the crank or eccentric with the movable member of the aforesaid clutch, and a coupling adapted to transmit motion from the gravitating frame to the weighted arm in the approach of the frame to the extremes of its movements, substantially as set forth.

3. The combination, with the loom-frame, cloth guiding and winding rollers, and the actuating-shafts and gears of said winding-roller, of a clutch for throwing the actuating-shaft of the winding-roller in and out of gear, a gravitating frame under the front portion of the loom-frame, a cloth-tensioning roller mounted on said gravitating frame, a weighted arm, and a crank or eccentric pivoted in common on the loom-frame, a rod connecting the crank or eccentric with the movable member of the aforesaid clutch, a rod depending from the weighted arm, a rod extended from the gravitating frame and having an eye loosely embracing the pendent rod, and collars fixed to the pendent rod above and below the aforesaid eye, with a vertical play for the latter between the collars, substantially as described and shown.

4. In combination with the counter-shaft K', provided with the pinion *r'*, and the feed-cylinder B, provided with the gear-wheel Q, the pinion R, and worm-wheel S, fixed to one and the same shaft, the shaft T, having the worm T', the bevel-pinion *n*, mounted loosely on the shaft T and provided with the clutch-face *o'*, the clutch member *o*, the bevel-pinion *n'* and pinion *r* on one and the same stud and meshing, respectively, in the pinion *n* and pinion *r'*, substantially as described and shown.

5. In combination with the driving-shaft K, counter-shaft K', gears transmitting motion from the said driving-shaft to the counter-shaft, the pinion *r'* on the latter shaft, and the feed-cylinder B, provided with the gear-wheel Q, the pinion R, and worm-wheel S, fixed to one and the same shaft, the shaft T, having the worm T', the bevel-pinion *n*, mounted loosely on the shaft T and provided with the clutch-face *o'*, the clutch member *o*, the bevel-pinion *n'* and pinion *r* on one and the same stud, and meshing, respectively, in the pinion *n* and pinion *r'*, substantially as described and shown.

6. In combination with the loom-frame, shaft K', pinion *r'*, and the shaft T, provided with the bevel-pinion *n*, the collar V, secured to the frame and provided with the slot *s*, the bolt *t*, passing through said slot and clamped adjustably on the said collar, and interchangeable pinions *n' r*, journaled on said bolt, substantially as described and shown.

409,814. REED-ORGAN. MORRIS S. WEBSTER, Worcester, Mass. Filed Feb. 8, 1889. Serial No. 299,206. (No model.)

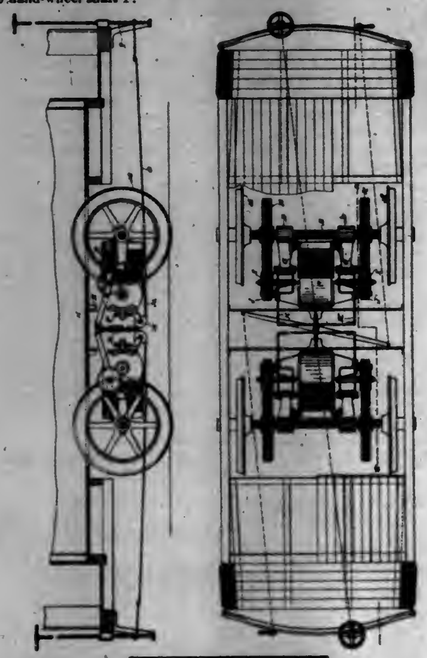
Claim.—1. The combination, in a reed-pan for a reed-organ, with the reed-supporting piece E, cut or cored out, as described, of the single piece marked A and A', cut or cored out, as shown at B and C, to form an ingress air-passage B', and the lower half of the qualifying-tube D, substantially as and for the purposes set forth.

2. The combination, with the reed F and the projections *e* and *g* on the base of the reed-frame F', of the shoulders *f* and *h*, whereby a separate plugging-piece is avoided, substantially as and for the purposes set forth.

3. The combination, with the air-chamber B and reed F, of the reed-frame supporting-piece E, extended beyond the base of the reed-frame F' and cored out to form the air-chambers E' E'', and provided with shoulder *f* on its upper side, substantially as and for the purposes set forth.

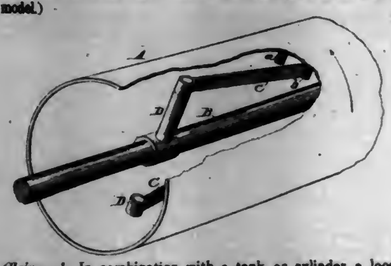
4. The combination, with the reed-supporting piece E and air-chambers E' and E'', cut or cored therefrom, of the convex port D'', as and for the purposes set forth.

5. The combination, with the qualifying-chamber I' and air-chambers E' E'', of the bottom concave port J, substantially as and for the purposes set forth.



409,815. ELECTRICALLY-PROPELLED VEHICLE. RICHARD H. ALLEN, Cleveland, Ohio. Filed May 22, 1889. Serial No. 311,656. (No model.)

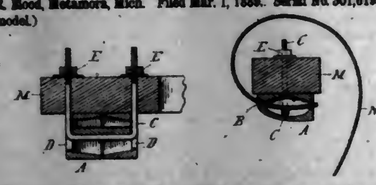
Claim.—1. In an electric-motor car, the combination, with one of the car-axles provided with a friction-disk, of a motor the armature-shaft of which is provided with a friction-disk, a yielding frame carrying a friction-disk arranged to operably connect the disks of the car-axle and the motor-shaft, and connections between said frame and the car-body by which the disk of the frame may be applied to the other disks with the desired pressure.



2. In combination with the car-axles and the motor-shaft, each carrying friction-disks, the movable frame and its friction-disk, and an elastic or yielding connection between said frame and a hand-wheel shaft extending to the car-conductor's position.

3. In combination with the car-axles and motor armature-shaft, each carrying friction-disks, the movable frame H and its friction-

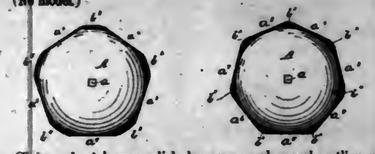
disk I, the spring L, attached to the frame, and the connection with the hand-wheel shaft P.



409,816. COMBINED AGITATOR AND CONVEYER. VALERIUS D. ANDERSON, Cleveland, Ohio. Filed Jan. 16, 1889. Serial No. 296,481. (No model.)

Claim.—1. In combination with a tank or cylinder, a loosely-pivoted flight and stops to limit the movement of said flight, said stops being located in such positions that when arrested by one the flight shall be held in alignment with, and when arrested by the other it shall be oblique to, the axis of the cylinder.

2. In combination with a cylinder and with a post or arm D, a blade or flight C, pivotally attached to said post or arm and free to swing about its pivot when in operative adjustment, and stops *a* and *b*, serving to limit the play of the free end of the blade or flight in opposite directions.



409,817. SPRING-TOOTH FASTENER FOR CULTIVATORS. BERA P. ATHERHOLT, Addison, Oakland County, assignor of one-half to George R. Hood, Metamora, Mich. Filed Mar. 1, 1889. Serial No. 301,619. (No model.)

Claim.—1. The combination, with the carrying-bar of the spring-tooth, of the holding-box provided with bearing for the spring-tooth in its front and rear walls only, and of the securing-staple transversely engaging through the sides of the box between said front and rear bearings in vertical slots in the side walls of said box, substantially as described.

2. The combination, with the carrying-bar of the spring-tooth harrow, of the two-part holding-box A, provided with bearing B for the spring-tooth in its front and rear walls only, and the screw-threaded securing-staples C, transversely engaging in vertical slots D in the side walls of the holding-box and susceptible of free vertical adjustment therein, substantially as described.

409,818. HARROW-DISK. JOHN T. BELL, Dayton, Ohio, assignor to the Ohio Rake Company. Filed June 29, 1889. Serial No. 316,068. (No model.)

Claim.—1. A harrow-disk having a polygonal outline with cutting-edges along the periphery.

2. A harrow-disk having a polygonal outline with alternating reaches of varying length.

3. A harrow-disk having a polygonal outline with alternating reaches touching radii of varying length.

4. A harrow-disk of a polygonal outline having straight reaches united at their intersection by curves.

5. A harrow-disk having a polygonal outline with alternating straight and curved reaches, the latter touching longer radii than the straight reaches.

6. A harrow-disk, substantially as described, having peripheral straight reaches perpendicular at their centers to short radii and united by curved reaches described upon longer radii, both straight and curved reaches having cutting-edges.

409,819. ANILINE-BLACK DISCHARGE. JOHN BRACKWELL, North Adams, Mass. Filed Feb. 9, 1889. Serial No. 299,319. (No specimens.)

Claim.—1. The described process of drying and printing discharges on aniline-black colors—that is to say, first treating the cloth with the prepared solution of aniline-black color, as described, then drying the same in an atmosphere at a temperature below 90° Fahrenheit, and finally printing an alkali discharge thereon in patterns before the oxidation of the aniline color, substantially as described.

2. The described process of drying and printing discharges on aniline-black colors—that is to say, first treating the cloth with the prepared solution of aniline-black color, as described, then drying the same to a moist state by steam or atmospheric heat above 90° Fahrenheit, and completing the drying in an atmosphere at a temperature of less than 90° Fahrenheit, and finally printing an alkali discharge thereon in patterns before the oxidation of the aniline color, substantially as described.

409,820. PIGMENT-RESIST. JOHN BRACKWELL, North Adams, Mass. Filed Feb. 9, 1889. Serial No. 299,320. (No specimens.)

Claim.—1. The described process of applying and fixing pigment-resist patterns and aniline-black grounds upon cloth—that is to say, printing the resist compounded of a pigment color and alkali on the cloth in a pattern and drying it, and afterward printing, padding, or blotching over the same the aniline-black color, and lastly aging and developing and fixing the aniline-black and pigment colors by means of moisture and heat, substantially as described.

2. The described process of applying and fixing pigment-resist patterns and aniline-black grounds upon cloth—that is to say, printing the resist compounded of a pigment color and alkali on the cloth in patterns and drying it, and afterward printing, padding, or blotching over the same the steam aniline-black color, and lastly developing and fixing the aniline black and pigment-resist colors by steam under pressure, substantially as described.

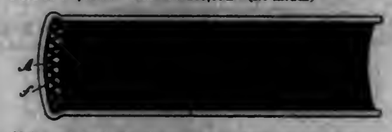
409,821. PROCESS OF PRINTING ANILINE-BLACK. JOHN BRACKWELL, North Adams, Mass. Filed Feb. 15, 1889. Serial No. 299,983. (No specimens.)

Claim.—1. The described process of forming printed patterns on aniline-black grounds—that is to say, first printing, padding, or dyeing on the cloth the aniline-black ground color; then printing thereon a discharge mixture before oxidation of the ground color in the desired pattern, and finally fixing and developing the aniline-black and the discharge mixture simultaneously by the application of steam thereto under pressure, substantially as described.

2. The described process of forming printed colored patterns on aniline-black grounds—that is to say, first printing, padding, or dyeing on the cloth the aniline-black ground color, then printing thereon in the desired pattern a discharge mixture compounded with a pigment before oxidation of the ground color, and finally fixing and developing the ground and pattern colors and completing the action of the discharge mixture simultaneously by the application of steam thereto under pressure, substantially as described.

409,822. ANILINE-BLACK. JOHN BRACKWELL, North Adams, Mass. Filed Feb. 15, 1889. Serial No. 299,984. (No specimens.)

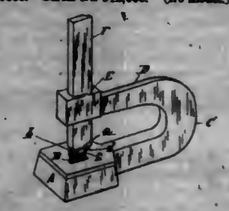
Claim.—1. The aniline-black color formed of ferro-cyanide of soda, chlorate of potash, and aniline salts prepared for use in such a manner as to be free from the presence of hydrochloric acid, substantially as set forth—that is to say, with the ferro-cyanide in amount sufficient to take up the aniline and prevent the formation of chlorate of aniline in injurious quantity in the color, substantially as described.



2. The aniline-black color formed of ferro-cyanide of soda, chlorate of potash, and aniline salts prepared for use in such a manner as to be free from the presence of hydrochloric acid, substantially as set forth—that is to say, with the ferro-cyanide in quantity sufficient to take up the aniline and the chlorate in quantity not less than thirty-five per cent. of that of the aniline, substantially as described.

409,823. PROCESS OF PRINTING ON ANILINE-BLACK. JOHN BRACKWELL, North Adams, Mass. Filed Feb. 15, 1889. Serial No. 299,985. (No specimens.)

Claim.—1. The described process of producing patterns on aniline-black grounds by the action of live steam—that is to say, first printing the pattern in an alkali resist upon the cloth and drying, then treating the cloth with the prepared solution of aniline-black, as described, and drying, and finally developing and fixing the aniline-black rapidly by the action of steam under pressure, substantially as described.

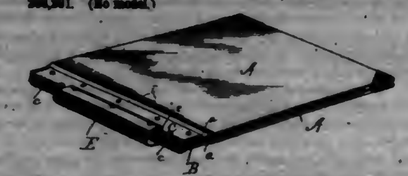


2. The described process of producing colored patterns on aniline-black grounds by the action of live steam—that is to say, first printing the pattern in an alkali resist colored with pigments upon the cloth and drying, then treating the cloth with the prepared solution of aniline-black, as described, and drying, and finally developing and simultaneously fixing the aniline-black and resist pigment by the action of steam under pressure, substantially as described.

409,824. BOOK-BINDING. LIVERMET BRAINARD, Hartford, Conn. Filed Jan. 7, 1889. Serial No. 295,604. (No model.)

Claim.—A book the signatures of which are attached to a continuous stub-strip formed of two layers of thin flexible material, between which are held a short distance apart strips of much thicker material of nearly the width of the stub-strip when folded, the said stub-strip being secured to the covers by bridge-strips, substantially as described.

409,825. SAW-GUMMER. JAMES F. BROWER, Rodney, Mich. Filed May 20, 1889. Serial No. 312,000. (No model.)



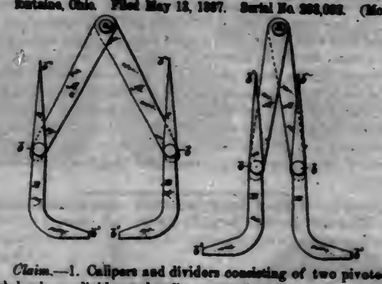
Claim.—1. In a saw-gummer, the combination, with the bed provided with the bed-die, of a guide-arm having the vertical bearing and the punch adapted to have a vertical motion in said bearing, and provided at its lower end with a die having an inclined bottom and a stop, substantially as described.

2. In a saw-gummer, the combination, with the bed-die, of the extension C, guide-arm D, having a vertical bearing E, punch F, having a shoulder A, die *b*, and inclined edge *c*, whereby a shearing cut is obtained, and a stop *d*, the parts being arranged to operate substantially as and for the purpose described.

409,826. COPYING-SHEET. HOWARD W. BROWN, Oakland, Cal. Filed Oct. 14, 1887. Serial No. 253,376. (No specimens.)

Claim.—As an improved article of manufacture, a copying-sheet having an absorbent coating of glycerine, gelatine, water, glue, and alum, combined in the proportions specified, and on this a surface-coating of pulverized alum and lycopodium, as set forth.

409,827. ORDER-HOLDER. JOHN P. BROWN, Chicago, Ill., assignor to Albert B. Baker, Indianapolis, Ind. Filed Sept. 24, 1888. Serial No. 286,301. (No model.)



Claim.—1. As a new manufacture, an order-holder having a hinge-joint uniting the sides thereof, and a sheet-metal clamping-spring E, placed outside the hinge and having flexibility to allow the leaves of the holder to open and carry its points of attachment outside of the axis of the hinge, whereby said spring is rendered double-acting, substantially as set forth.

2. The combination, with the sides of an order-holder, of a hinge uniting said sides and having bosses *f* stamped thereon, and a clamping-spring E, applied to said hinge and having inturned edges engaging with said bosses, substantially as specified.

3. The combination, with the order-holder, the sides whereof are hinged together by a hinge C D, of a spring-clamp attached to the sides, as shown, and adapted to yield sufficiently to carry its points of attachment beyond the axis of the hinge, substantially as set forth.

409,828. CALIPERS AND DIVIDERS. MARTIN I. CORBETT, Bellefontaine, Ohio. Filed May 13, 1887. Serial No. 288,092. (Model.)

Claim.—1. Calipers and dividers consisting of two pivoted bars, each having a divider and caliper-arm pivoted thereto, substantially as described.

2. Calipers and dividers consisting of two bars pivoted together, and each having a divider and caliper-arm pivoted at about its center to the free end of the said bars, substantially as herein shown and described.

3. Calipers and dividers consisting of two pivoted bars and two arms having pointed and bent ends pivoted to the free ends of the said bars, substantially as described.

409,829. WAGON-GEAR. MARTIN CONRAD and GERHARDT HOYE, Chicago, Ill. Filed Apr. 23, 1889. Serial No. 308,208. (No model.)

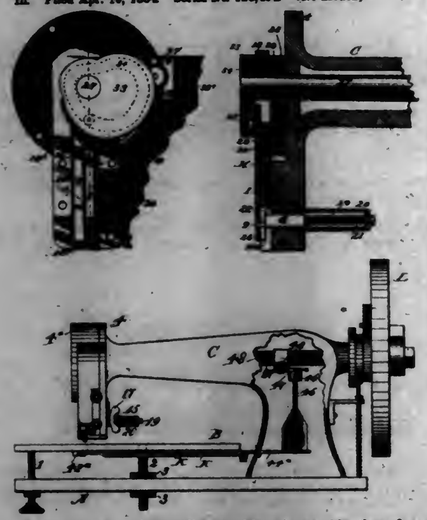
Claim.—1. The combination, with a metal axle, of a sand-board or bolster located over and extending the full length of the axle and rigidly clamped to the said axle at two or more separate points near each end of the same, substantially as described.

2. The combination, with a metal axle, of a sand-board or bolster and metal parts or castings secured to each end of the axle adjacent to the axle-arm, each of said metal parts or castings being provided with two or more elevated tables or plates, by which the sand-board or bolster may be rigidly secured to the axle at two or more separate points near each end of the same, substantially as described.

3. The combination, with a metal axle, a sand-board or bolster, and front or rear hounds, of metal parts or castings secured to the axle near the axle-arms, said castings being each provided with table or plate near its outer end to engage the sand-board or bolster, and with a second table near its inner end to engage the hounds, and bolts

or clips securing the sand-board or bolster and hounds to the said casting, substantially as described.

4. The combination, with a sand-board or bolster and a metal axle, of metal sleeves placed around the axle near the ends of the same, said sleeves being each provided with two tables or plates, by which the sand-board or bolster may be rigidly secured thereto at two separate points, substantially as described.



5. The combination, with a metal axle and sand-board, of castings secured upon the axles adjacent to the axle-arms and provided with upwardly-extending horizontal plates or tables supporting the sand-board free from the axle, a reach passing beneath the sand-board, and a metal casting for supporting the reach secured to the upper surface of the axle, substantially as described.

6. The combination, with a metal axle and sand-board which are connected with each other with a space between them, of a reach having an aperture in its front end, and a metal casting for supporting the reach, secured to the upper surface of the axle and provided with an upwardly-projecting cylindric part forming a pivot for the reach, the top of said cylindric part being located below the adjacent surface of the bolster a distance not less than the thickness of that part of the reach which engages the said cylindric part, substantially as described.

7. The combination, with a metal axle and sand-board which are connected with each other with a space between them, of a reach having an aperture in its front end, and a metal casting for supporting the reach, secured to the upper surface of the axle and provided with an upwardly-projecting cylindric part forming a pivot for the reach, and a horizontally-swinging detent or dog pivoted to the reach and adapted to enter between the top of the same and the lower surface of the sand-board, substantially as described.

8. The combination, with a metal axle and sand-board which are connected with each other with a space between them, and a king-bolt, of a reach having an aperture in its front end, and a metal casting for supporting the reach, secured to the upper surface of the axle and provided with an upwardly-projecting cylindric part forming a pivot for the reach, and a horizontally-swinging detent or dog pivoted to the reach and adapted to enter between the top of the same and the lower surface of the sand-board, the said dog or detent being provided with a hole or aperture to receive the king-bolt, substantially as described.

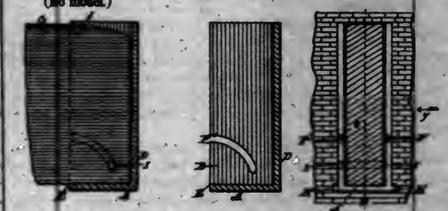
409,830. WIRE-STITCHING MACHINE. JOHN F. DAGGETT, Elgin, Ill. Filed Apr. 19, 1884. Serial No. 128,494. (No model.)

Claim.—1. In a wire-stapling machine, the combination of a revolving shaft, a reciprocating former and driver, cams on said shaft in direct engagement with the former and driver, and a work-supporting table below said former and driver, substantially as described.

2. In a wire-stapling machine, the combination of a revolving shaft, a reciprocating former and driver, cams on said shaft in direct engagement with said former and driver, and an adjustable work-supporting table below said former and driver, substantially as described.

3. In a wire-stapling machine, the combination of a revolving shaft, cams on said shaft, a former and driver respectively actuated by said cams, and a wire-feed actuated by one of said cams, substantially as described.

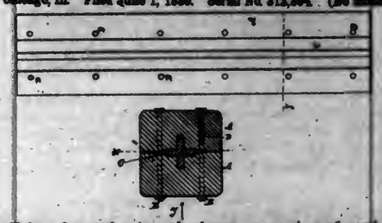
4. The actuating-cams and shaft thereof, in combination with a former and driver projecting between and engaging said cams, substantially as described.



5. The combination, with the cutter, a support therefor, and a pivoted connection between said cutter and support, of an adjustable screw-rod for bodily moving the cutter back and forth to adapt it for cutting wires of different lengths, substantially as described.

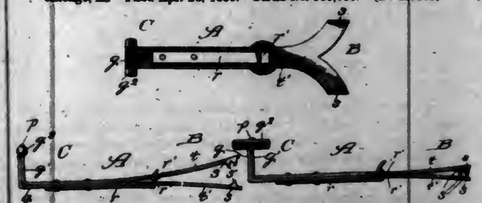
6. The clinching-jaws and the levers pivoted together and supporting said jaws in combination with a pivoted connection between said jaws and levers, substantially as described.

7. The table, the clinching-jaws, and levers pivoted thereto and to each other, in combination with means, substantially as described, for adjusting said jaws and table, substantially as described.



8. The levers K and the clinching-jaws thereof, in combination with the rock-shaft and a blade on said shaft projecting between said levers, and means, substantially as described, for rocking said shaft and oscillating the plate, substantially as described.

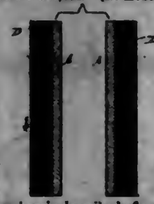
409,831. WALL SOCKET-PLATE FOR BUILDING-TIMBERS. WILLIAM H. DRAKE, Chicago, Ill. Filed June 1, 1889. Serial No. 312,892. (No model.)



Claim.—An improvement in wall socket-plates for building-timbers, consisting of a bottom and back plate and two side plates with segment-grooves or segment-slots formed in said side plates, in combination with a pin put through said slots or grooves and through the engaging timber, as and for the purpose specified.

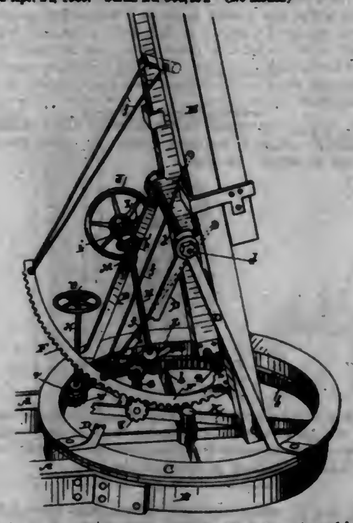
409,832. COMPOUND FIRE-PROOF COLUMN. WILLIAM H. DRAKE, Chicago, Ill. Filed June 1, 1889. Serial No. 312,894. (No model.)

Claim.—In wood and metal columns, two sections of wood which placed together form a square, and the inner face of each section provided with semi-cruciform grooves, in combination with a cruciform metal central portion inserted in said grooves and the wood sections clamped to the iron portion, as and for the purpose specified.



409,833. CUFF-HOLDER. MAX EISEMAN and JOSEPH KAHER, Chicago, Ill. Filed Apr. 26, 1889. Serial No. 308,700. (No model.)

Claim.—1. In a cuff-holder, the stem A, provided toward one end with button mechanism C, comprising parallel strips q q' in spring relation to each other and bent to an angle to the stem to afford a shank, a bar q^3, pivotally mounted upon the end of the strip q' and rotatory thereon in a plane at or approximately at right angles to the shank, and shoulders o', forming a recess o between them on the end of the strip q' and projecting into the path of the bar q^3, and a clamp toward the opposite end of the stem, substantially as and for the purpose set forth.

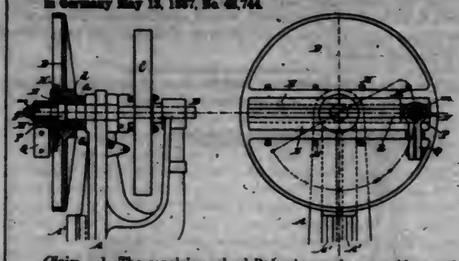


2. In a cuff-holder, the stem A, provided toward one end with button mechanism C, comprising parallel strips q q' in spring relation to each other and bent to an angle to the stem to afford a shank, a bar q^3, pivotally mounted upon the end of the strip q' and rotatory thereon in a plane at or approximately at right angles to the shank, and shoulders o', forming a recess o between them on the end of the strip q' and projecting into the path of the bar q^3, and a clamp B, comprising normally-open jaws l l' in spring relation to each other, and a catch r to hold the jaws together when closed, substantially as and for the purpose set forth.

409,834. PROCESS OF MAKING ORNAMENTAL GLASS PANELS. JOSEF REDERS and EDUARD SCHNELLE, Long Island City, N. Y. Filed Apr. 13, 1889. Serial No. 307,181. (No model.)

Claim.—The process herein described of ornamenting glass panels, which consists of the following steps: first, coating the rear surfaces of two glass plates of equal size with oil or other color; secondly, placing the painted surfaces in contact and separating the same, so as to produce uncolored figures of irregular size on both plates; thirdly, painting the uncolored portions with a color different from the first applied, and, lastly, covering the entire rear surface of the panels with a protecting coating of varnish, substantially as set forth.

409,835. FIRE-LADDER TRUCK. JOHN H. PERRY, Stockton, Cal. Filed Apr. 24, 1889. Serial No. 308,484. (No model.)



Claim.—1. In a fire-ladder truck, the hinged or pivoted ladder, in combination with the curved rack or toothed segment secured to the ladder, and gearing for operating said rack or segment, consisting of the counter-shaft with its pinion and worm-gear, the shaft H, with its worm and pinion, and the shaft I, with its pinion and crank-wheel, substantially as described.

2. In a fire-ladder truck, the turn-table, the standards thereon, and the ladder pivoted to said standards, in combination with curved rack or toothed segment secured to the ladder, the counter-shaft G, mounted in bearings on the turn-table and having a pinion on one end and a worm-gear on the other end, the shaft H, mounted in bearings on the turn-table and standards thereof and having a worm on one end and a bevel-pinion on the other end, and the shaft I, mounted on the standard and having a bevel-pinion on one end and a crank-wheel on the other end, substantially as described.

3. In a fire-ladder truck, the combination of the fixed ladder-support having the fixed rack on its inner surface, the turn-table mounted on said support, the standards on the turn-table, the ladder pivoted to the standards, the curved rack or toothed segment secured to the ladder, the shafts G, H, and I, carried by the turn-table and having the pinions, worm-gear, worm, and crank-wheel, whereby the ladder is raised and lowered, and the shaft N, carried by the turn-table and having the pinion and crank-wheel, whereby the ladder is turned to position, all arranged and adapted to operate substantially as described.

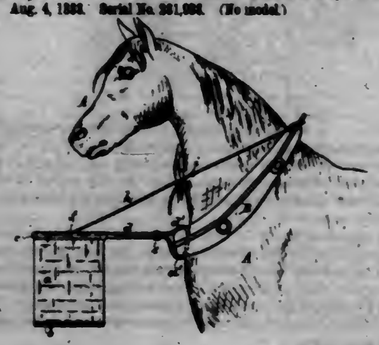
409,836. DROP-HAMMER. ERNST HAMMESFAHR, Solingen, Prussia, Germany. Filed May 14, 1888. Serial No. 310,743. (No model.) Patented in Germany May 13, 1887, No. 43,744.

Claim.—1. The revolving wheel D, having a slot or guideway d across its outer face, in combination with the block M and connection therefrom to a hammer W, as herein specified.

2. The wheel D and means for revolving it, carrying adjustable ledges E and means H for setting the latter at will, in combination with each other and with the block or carriage M, eye P, connection Q, and hammer W, arranged for joint operation, substantially as herein specified.

409,837. EMERY-WHEEL. ROBERT W. HARDER, Albany, N. Y. Filed Sept. 6, 1886. Serial No. 294,769. (No model.)

Claim.—1. An emery-wheel having a series of sections similar in composition to each other arranged alternately with sections differing in composition from the sections of said series, substantially as shown and described.

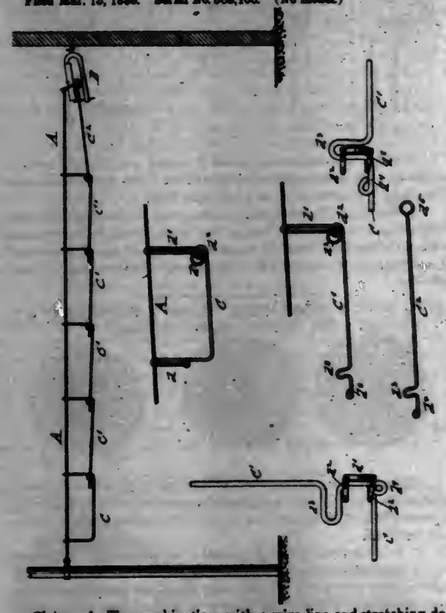


2. An emery-wheel having a series of sections similar in composition to each other arranged alternately with sections differing in composition from the sections of said series, all of said sections extending to the periphery of the wheel in a curved line, substantially as shown and described.

3. An emery-wheel having a series of sections similar in composition to each other arranged alternately with sections differing in composition from the sections of said series, in combination with circular disks having a uniform composition throughout, substantially as shown and described.

4. An emery-wheel having a series of coarse sections similar in composition to each other arranged alternately with sections finer in composition than the sections of said series, substantially as shown and described.

5. An emery-wheel having a series of sections similar in composition to each other arranged alternately with sections differing in composition from the sections of said series, in combination with circular disks of uniform composition throughout, forming the sides of the wheel, substantially as shown and described.



409,838. FEED-BAG. BENJAMIN T. HARRIS, Brooklyn, N. Y. Filed Aug. 4, 1888. Serial No. 281,994. (No model.)

Claim.—1. The combination, with a feed-bag and a suspending device *h*, extending from the bag to the upper part of the collar, of the rim *c* for the bag, having a projecting arm *d* at one side thereof, with the two downwardly-projecting bent ends *d'*, one of which hooks above and behind the front portion of the collar and the other rests against the front of the collar, substantially as set forth.

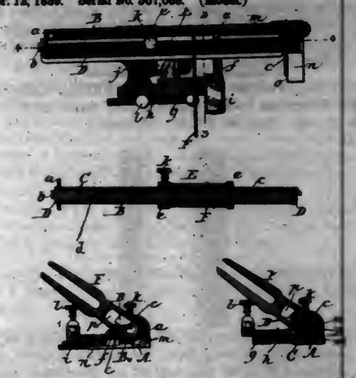
2. The combination, with the bag *a* and ring *a*, of the supporting-arms *d*, the bent engaging ends *d'*, formed upon the ends of said arms, the sliding ring *c*, the eyes *f*, and the strap *h*, substantially as and for the purposes set forth.

409,839. HANGER FOR CLOTHES. HENRY HEBBIE, Paterson, N. J. Filed Mar. 13, 1889. Serial No. 303,100. (No model.)

Claim.—1. The combination, with a wire line and stretching device, of a U-shaped header-link formed with loop-shaped front and rear ends, and eyes at the lower angle of the rear end, intermediary wire links formed with loop-shaped rear ends, eyes at the lower angle of said rear ends, and with a lateral bend at the front end, and of a tail-link provided with a lateral bend at the front end and an eye at the rear end, substantially as set forth.

2. In a clothes-hanging device, a header-link provided with a loop-shaped front and rear end for being suspended on the line and with eyes at the lower angle of the rear end, substantially as set forth.

3. In a clothes-hanging device, an intermediary link provided with a loop-shaped rear end, eyes at the lower angle of the rear end, and a laterally-bent front end, substantially as set forth.



409,840. CLOTHES-LINE STRETCHER. HENRY HEBBIE, Paterson, N. J. Filed Mar. 13, 1889. Serial No. 303,101. (No model.)

Claim.—1. A stretching device for clothes-lines, composed of a U-shaped frame having a rack at the inner face of one of its legs, guideways at the other leg, a pinion moving along said rack and ways, a crank-shaft for turning the pinion, and a wire link applied to said crank-shaft and provided with an eye for attaching the clothes-line, substantially as set forth.

2. A stretching device for clothes-lines, composed of a U-shaped frame having a rack at the inner face of one of its legs, guideways at the other leg, a pinion moving along the rack and ways, a crank-shaft for moving said pinion, a U-shaped link or bail applied to said crank-shaft and provided with an eye at its outer end, and a stop device for arresting the pinion and preventing its escape from the frame, substantially as set forth.

409,841. TUCK-MARKER FOR SEWING-MACHINES. FRANK HENRY, Chicago, Ill., assignor to Louisa M. Goodrich, same place. Filed Apr. 12, 1889. Serial No. 307,069. (Model.)

Claim.—1. In a tuck-marker, a bed-plate A, provided with a lower marker and with the part *a*, tube B, secured in the part *a*, shaft C, having a longitudinal groove and a socket *d*, and rod *e*, located in the groove of the shaft and having one end secured in the socket *d* and its other end formed into a marker, in combination with the sleeve E, bar D, secured to the shaft C, and lever F, substantially as and for the purpose specified.

2. In a tuck-marker, a bed-plate A, having the part *a*, tube B, secured in the part *a*, shaft C, having a longitudinal groove and a socket *d*, and a rod *e*, located in the groove of the shaft and having one end in the socket *d*, in combination with the sleeve E, bar D, secured to the shaft C, and lever F, having an opening near its lower end, through which the bar D passes, substantially as and for the purpose specified.

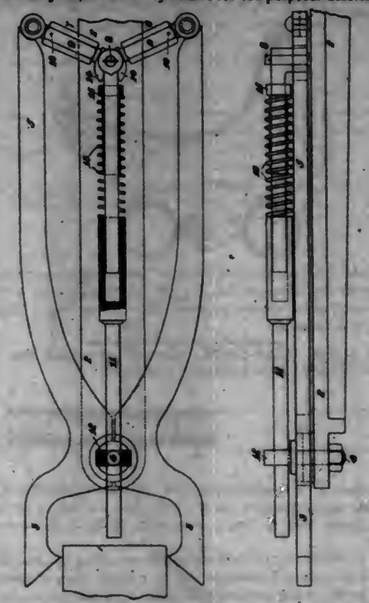
409,842. COMBINED VIOLIN-SUPPORT AND GARMENT-PROTECTOR. FRANK P. HOHLSCHER, Newport, Ky. Filed Mar. 15, 1889. Serial No. 303,392. (No model.)

Claim.—The combined violin-support and garment-protector consisting of a pad 5, forming the support, a flap 6, forming the garment-protector and connected to the former, and hooks whereby the whole device is held in position, as shown and described.

409,843. FURNACE-TONGS. THOMAS JAMES, Braddock, Pa. Filed Apr. 15, 1889. Serial No. 307,943. (No model.)

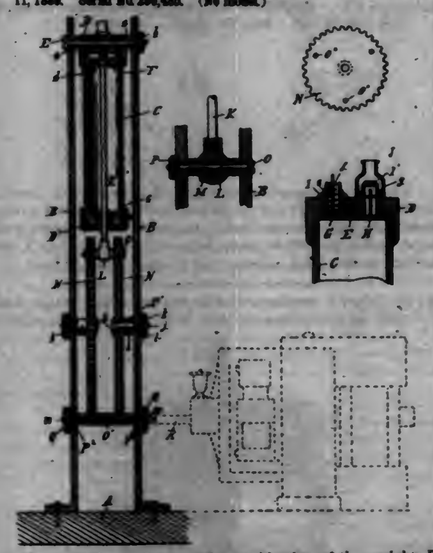
Claim.—1. Tongs having pivoted jaws and arms, in combination with a rod which projects between the jaws and toggle-levers connecting the rod with the arms, substantially as and for the purposes described.

2. Tongs having pivoted jaws and arms and a rod which projects between the jaws and is connected with the arms to operate them, substantially as and for the purposes described.



3. Tongs having pivoted jaws and arms and a rod which projects between the jaws and is connected with the arms to operate them, said rods being made in movable parts and provided with a spring, substantially as and for the purposes described.

4. The combination of a longitudinally-moving carriage or frame, tongs carried thereby and provided with movable jaws and arms, and mechanism connected with said arms and adapted in the movement of the carriage to engage a stop to operate the jaws, substantially as and for the purposes described.



5. In furnace-tongs, the combination of the pivoted gripping-jaws, provided with obliquely-slotted connections, and a spring which permits motion of the jaws in said slotted connection to cause their approach, substantially as and for the purposes described.

6. In furnace-tongs, the combination of the pivoted gripping-jaws,

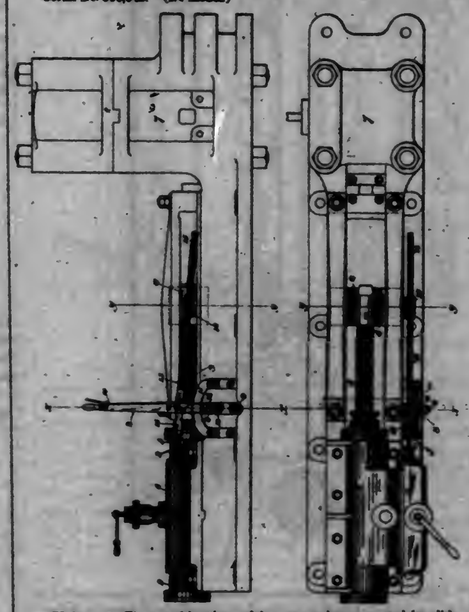
provided with obliquely-slotted connections, which permit the approach of the jaws, substantially as and for the purposes described.

409,844. AIR-PUMP. JOHN C. KENNEDY, Detroit, Mich. Filed Feb. 11, 1889. Serial No. 299,435. (No model.)

Claim.—1. In an air-pump, the combination of the uprights B and the drive-pinion O', journaled therein and connected with the actuating-shaft of a motor, of the crank-wheels N, engaging with said drive-pinion and journaled upon stub-shafts secured to the uprights B, the wrist-pin M, clamped between these crank-wheels, the reciprocating piston-rod K, provided with the cross-head L, engaging with said wrist-pin, and the oscillating cylinder C, substantially as described.

2. The combination, with the cylinder C, of the reciprocating piston F, provided with the brush *d* and the lower head D', forming the well *e* for the reception of a lubricant, substantially as described.

3. The combination, with the head D, of the bushing T, provided with the eduction-valve H, and the nipple J, secured thereto and forming the well *g*, substantially as described.



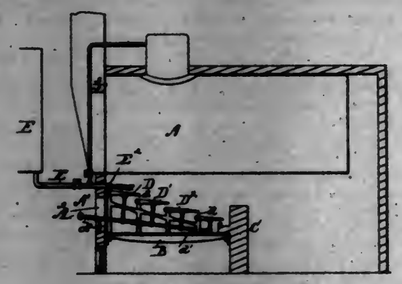
4. The combination of the standards B, the drive-pinion O', the bushings Q, in which the pinion is journaled, the crank-wheels N, engaging with the pinion, the stub-shafts P', provided with the head A, the cylindrical portion *i*, the shoulder *k*, the screw-threaded portion *j*, and the nuts *l*, the wrist-pin M, the clamping-bolt O, provided with the nut P, the reciprocating piston-rod K, provided with the cross-head L, the cylinder C, provided with the heads D and D', and the bolt E, detachably secured through the standards A and head D and provided with the washers *a*, substantially as described.

5. In an air-pump, the combination, with the oscillating cylinder and piston, of the actuating crank-wheels N, the tubular wrist-pin M, secured between these crank-wheels, the clamping-bolt O, provided with the nut P, securing the wrist-pin between the crank-wheels, and the piston-rod K, provided with the cross-head L, loosely engaging with said wrist-pin, substantially as described.

6. The combination, in an air-pump, of the two vertical standards, a cylinder oscillatingly suspended between said standards, a reciprocating piston-rod provided at its lower end with a cross-head, two crank-wheels peripherally geared and journaled upon stub-shafts secured to the standards, a wrist-pin carried between the two crank-wheels and engaging with the cross-head of the piston, and a single drive-pinion journaled in the standards below said crank-wheels and engaging with both of them, substantially as described.

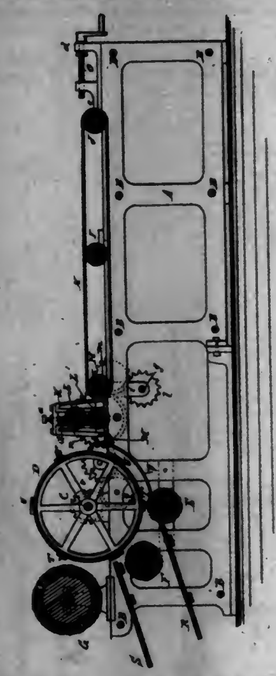
7. The combination, with the reciprocating piston of an oscillating air-pump, of two actuating crank-wheels journaled upon opposite sides of the piston and peripherally geared, a drive-pinion engaging therewith, a wrist-pin detachably secured between these crank-wheels, and a series of corresponding adjusting-holes in said crank-wheels for varying the adjustment of the wrist-pin, substantially as described.

409,845. VALVE-GEAR FOR STEAM-HAMMERS. MILTON B. KERSE, McKee's Rocks, Pa. Filed May 2, 1888. Renewed Apr. 23, 1889. Serial No. 308,345. (No model.)



Claim.—1. The combination, with a steam-hammer and its slide-valve, of an interposed bell-crank lever connected at its angle to the slide-valve, having one arm fulcrumed on an operating-lever and its opposite arm in moving contact with the steam-hammer respectively, substantially as and for the purposes described.

2. The combination, with a steam-hammer and its slide-valve, of an interposed bell-crank lever connected with the slide-valve and with an operating-lever, and having one of its arms inclined to the line of motion of the steam-hammer and in moving contact therewith, substantially as and for the purposes specified.

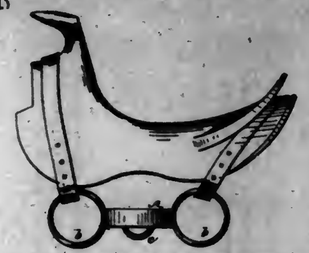


409,846. OIL-BURNING APPARATUS FOR STEAM-BOILERS. FREDERICK LEADBEATER, Detroit, Mich. Filed Oct. 20, 1888. Serial No. 288,702. (No model.)

Claim.—In an oil-burning apparatus for boiler-furnaces, the combination, with a series of oil-diffusing plates arranged at different levels

one in advance of another and each inclined slightly downward at its forward end, which overlaps the next succeeding lower plate, of a transverse longitudinally-perforated discharge-pipe located above the upper diffusing-plate, an oil-supply pipe communicating with said discharge-pipe, and a steam-injecting pipe leading into the oil-supply pipe, substantially as described.

409,847. DECORTICATOR FOR RAMIE, &c. MICHEL J. LEBOUTE, New Orleans, La., assignor to himself, Leonard Sewell, and William Blake, same place. Filed Jan. 31, 1888. Serial No. 262,453. (No model.)



Claim.—1. In a decorticating-machine, the combination of a pair of fluted rollers adapted to crush the stalks and stems, a series of points arranged to receive the crushed fiber, a decorticating-cylinder provided with series of teeth and beater-ribs, rotary brushes for cleaning the fiber as it is carried forward by the cylinder, a brush for removing the cleaned fiber from the decorticating-cylinder, and means for imparting motion to the rollers, cylinders, and brushes, substantially as specified.

2. In a decorticating-machine, the combination, with the cylinder D, provided with teeth T and ribs U, of the teeth *b*, adapted to hold the crushed fiber while it is acted on by the said cylinder D, the concave V, and the cleaning-brushes F E, substantially as specified.

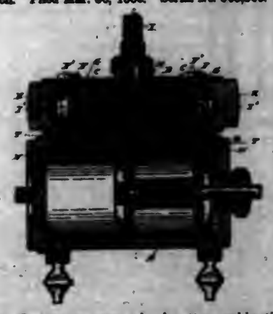
3. The combination, in a decorticating-machine, of the endless apron N, the fixed rolls H I, the adjustable roll J, the fluted crushing-rolls L L', the roll L being adjustable, means for adjusting said rolls J and L, the cylinder D, provided with teeth T and ribs U, the concave V, the cleaning-brushes E F, the brush G, and means for imparting motion to the said apron and rolls, substantially as described.

409,848. CONNECTING-BAR FOR RIDING-SADDLES. WILLIAM W. LEWIS, Cheyenne, Wyo. Filed Jan. 16, 1889. Serial No. 296,697. (No model.)

Claim.—As an improved article of manufacture, a girth-rig connecting-bar for riding-saddles of rigid construction, with a ring or loop at each of its opposite ends and with a center ring or loop, substantially as specified.

409,849. GAGE-KNIFE. FRANK W. LOWE, Boston, Mass. Filed Nov. 16, 1888. Serial No. 291,084. (No model.)

Claim.—1. A combined knife and apple-corer consisting of a flat blade and handle stamped out of a single piece of metal, the handle portion being bent to form a corer, substantially as shown and described.

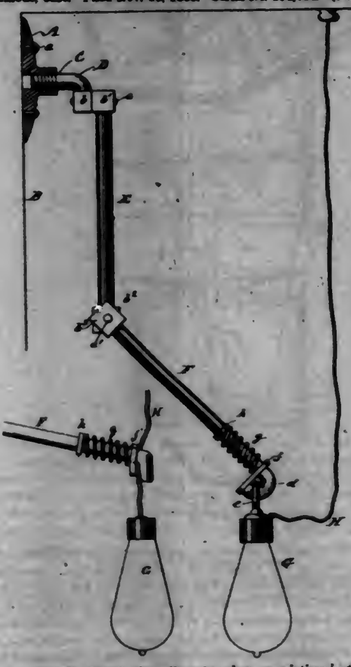


2. A combined knife and apple-corer consisting of a flat blade A and handle portion B, stamped out of a single piece of metal, the handle portion being provided with ears *a a b b*, said portion and ears being bent to form a handle and apple-corer, substantially as shown and described.

409,850. HORSESHOE-BAR. HOWARD C. MACKINNON, Chicago, Ill. Filed Sept. 12, 1888. Serial No. 285,254. (No model.)

Claim.—A horseshoe-bar bounded by the upper face A, exterior face B, interior face D, and the faces C and C^2, constituting a re-entrant angle or groove in the face D, the face C^2 of said groove making an acute angle with the lower edge of the exterior face B, substantially as shown and described, and for the purpose set forth.

409,851. STEAM-ACTUATED VALVE. ELON A. MARSH, Battle Creek, Mich. Filed Mar. 30, 1889. Serial No. 305,369. (No model.)



Claim.—1. In a steam-actuated valve, the combination of a steam-chest provided with induction-ports and a valve provided with passages, and preadmission-ports leading to end chambers beyond the ends of the valve, whereby said valve and the engine may be started, notwithstanding the valve may have come to rest with the main induction-ports closed, substantially as described.

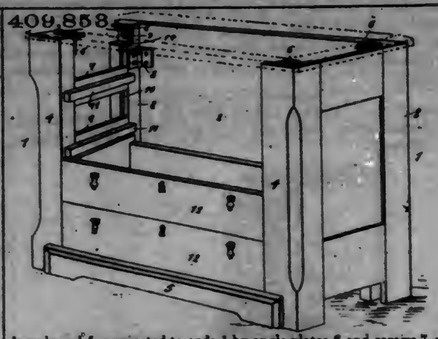
2. The combination, with the cylinder of an engine, of a valve-chest having chambers at each end and relief-ports leading through the main steam-passages to the cylinder, substantially as described.

3. The combination of a cylinder of an engine, a valve-chest having ports or passages connecting the central and end chambers thereof with the middle and the ends of the cylinder, respectively, and an annularly-chambered piston, whereby live steam is admitted alternately in volume to the outer ends of the end chambers of the valve-chest to promptly move the valve to reverse the engine, substantially as described.

4. In an engine, the combination of a steam-actuated valve, a cylinder, a central live-steam port communicating with the same, ports leading from said cylinder to chambers in the valve-chest, and an elongated chambered piston, substantially as described.

409,852. BRACKET FOR ELECTRIC LAMPS. JOHN S. MERRILL, Columbus, Ohio. Filed Nov. 16, 1888. Serial No. 291,014. (No model.)

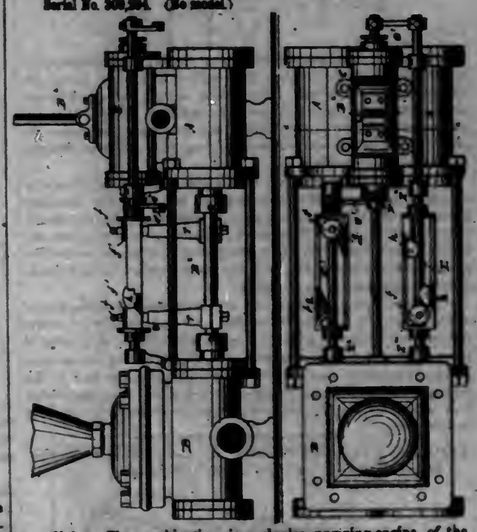
Claim.—1. The herein-described bracket, consisting in the plate A, having a screw-threaded aperture, the rod D, having a screw-threaded inner end entering said aperture and provided with a head *b*, the rod E, having a head b', pivoted to the head *b*, to swing transversely to rod D, and having at its opposite end a head b^2, the rod F, having a head b^3, pivoted to head b^2 at right angles to the pivot of heads *b* b', and having its opposite end bent outward, a plate or arm sliding on the outer end of rod F, and a spiral spring encircling the rod and pressing the plate toward the said outward-bent end, substantially as set forth.



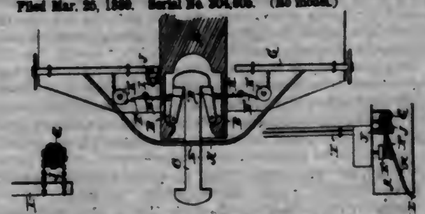
2. In a bracket, the rod F, having an outward-projecting arm at its outer end, an apertured plate sliding on said rod, and a spiral spring encircling the rod and pressing the plate against the inner face of said outward-projecting arm, said plate and arm forming parallel clamping-surfaces, between which a wire may be held, substantially as set forth.

409,853. BUREAU. OREN D. MILES and HOWARD F. SCOLLAY, Templeton, Mass. Filed Mar. 5, 1889. Serial No. 301,896. (No model.)

Claim.—A case of drawers formed with the framed panel ends 1, having front posts 4, rear posts 8, and strips 9, extending between posts 4 and 8, and having cleats 11, serving as slides for drawers, a back 2, connected to ends 1 by hinges 3, and a detachable top 13 and front



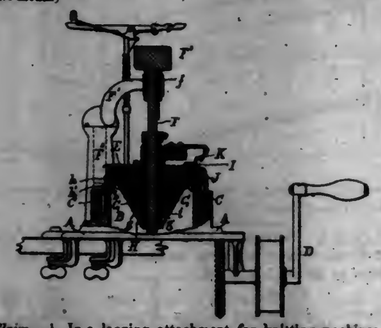
409,858.



base-board 5, connected to ends 1 by angle-plates 6 and screws 7, substantially as shown and described.

409,854. VALVE-GEAR FOR PUMPING-ENGINES. MICHAEL MEIG and EDUARD SCHWEBEL, Brooklyn, N. Y. Filed May 1, 1889. Serial No. 309,294. (No model.)

Claim.—The combination, in a duplex pumping-engine, of the steam-cylinders, a steam-chest intermediately between said cylinders, independent oscillating valves in said steam-chest, an interior shoulder between the inner ends of the said valves, spindles secured to the oscillating valves and passing through opposite heads of the steam-chest, cam-rods supported in bracket-bearings, a crank-connection between the spindles of the valves and the cam-rods, fixed cams applied at opposite ends and sides of one cam-rod and hinged cams applied at opposite ends and sides of the other cam-rod, upright pillars attached to the piston-rods of the steam and pump cylinders and provided with heads at their upper ends for engaging said cams and imparting oscillating motion to the slide-valves, substantially as set forth.

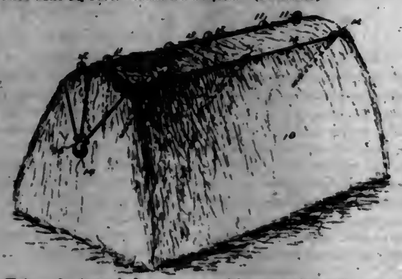


409,855. CAR-COUPLING. CORNELIUS D. MEEKS, Pursley, W. Va. Filed Mar. 25, 1889. Serial No. 304,805. (No model.)

Claim.—The combination of the draw-head, the coupling-jaws mounted therein, the pulleys arranged on the under side of the car and on opposite sides of the draw-head, the arms projecting from the coupling-jaws through the draw-head, the rock-shaft journaled on the

under side of the car, the chains passing around the pulleys and secured to the rock-shaft, the arms projecting from the coupling-jaws, the springs, the rotary shaft mounted on the end of the car, and the chain secured to the lower end of said shaft and to the rock-shaft, as specified.

409,856. LOOPING ATTACHMENT FOR KNITTING-MACHINES. EDWARD MURBY, Detroit, Mich. Filed May 1, 1889. Serial No. 309,272. (No model.)

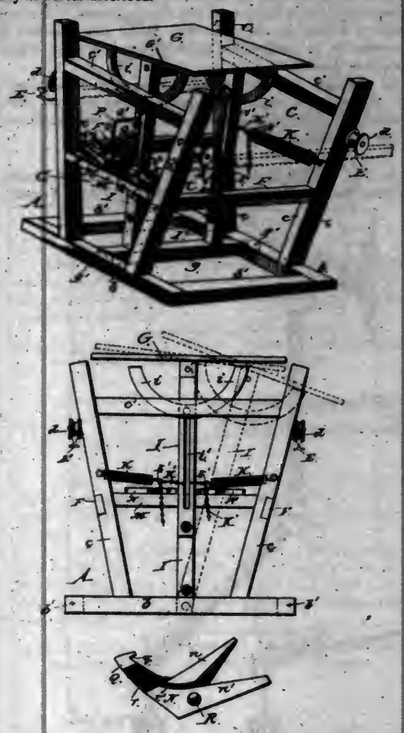


Claim.—1. In a looping attachment for knitting-machines, the combination, with the needles, the needle-cylinder, and means for operating the needles and cylinder, of a conically-shaped plate supported within said needle-cylinder and adapted to be revolved therewith, a series of points supported by said cone-plate, and means for projecting the points upward in a diagonal direction when desired, substantially as described.

2. In a looping attachment for a knitting-machine, the combination, with the needles, the needle-cylinder, and means for operating the needles and cylinder, of a cone-plate supported within the needle-cylinder and adapted to be revolved therewith, a series of points supported by said cone-plate, and a cam-groove in which the heels of the points are engaged for projecting the points upward in a diagonal direction, substantially as described.

3. In a looping attachment for a knitting-machine, the combination of the needle-cylinder, the needles, a cone-plate supported within the needle-cylinder and adapted to be revolved therewith, a series of points supported by said cone-plate, a cone-cam having the grooves *g* and *g'*, a standard having an arm for supporting the stem of the looping attachment, and a weight supported on the upper end of said stem to hold the looping mechanism down to its work, substantially as described.

409,857. STACK-FASTENER. WILLIAM L. MURDY, Alvin, Kans. Filed June 14, 1888. Serial No. 277,052. (No model.)



Claim.—1. A stack-fastener comprising two plates 15, each having a series of apertures, stakes or pins adapted to be thrust into the stack and having eyes at their outer ends, and ropes to be thrown over the stack, passed through said eyes, and secured at their ends to said plates, substantially as set forth.

2. A stack-fastener comprising two or more series of steadying-stakes adapted to be thrust into the stack, having eyes or apertures at their outer ends, a rope passing through the eyes of each series, said ropes being all connected at their opposite ends to a single weight suspended thereby at each end of the stack, substantially as set forth.

409,858. HAY-DISTRIBUTER. ALEXANDER MCCOLLUM, Raymond, Iowa. Filed Dec. 5, 1888. Serial No. 292,744. (No model.)

Claim.—1. In an apparatus for storing hay in barns, the combination, with the frame A, of a platform pivotally mounted therein and provided upon one of its supports with a projecting rigid rod, and a spring-arm and levers upon the frame coacting with said rod and arm to permit the platform to automatically discharge the material as it is deposited thereon alternately upon one side and the other, substantially as herein described.

2. In an apparatus for storing hay in barns, the combination, with the frame having the uprights, of a platform pivotally mounted in said uprights, springs connected at the corners of the said frame and with the uprights, and adjustable chains adapted to regulate the tension of said springs, substantially as and for the purpose described.

3. In an apparatus for storing hay in barns, the combination, with the frame, of a platform pivotally mounted therein and connected therewith by springs, said platform being provided with a projecting rod upon one of the supports and with a projecting spring-arm secured above the same, and the levers pivoted upon the frame, adapted to coact with said rod and arm to permit the platform to discharge the material as it is deposited thereon alternately upon one side and the other, substantially as described.

4. In an apparatus for storing hay in barns, the combination, with the frame and the platform pivotally mounted therein and provided upon one of its supports with a rigid projecting rod and a spring-arm, of levers pivoted to the frame and comprising the inclined diverging arms and the inwardly-projecting recessed arm, said levers being adapted to coact with said rod and spring-arm, substantially as and for the purpose set forth.

5. The herein-described, levers comprising the V-shaped portion composed of inclined divergent arms, said portion being recessed, as at *r'*, and an inwardly-projecting arm at an angle to said portion and provided with the recesses *g* and *r*, substantially as described.

6. In an apparatus for storing hay in barns, the combination, with the frame having upwardly-diverging side and longitudinal beams secured thereto provided with wheels adapted to move upon tracks, of a platform pivotally mounted in said frame and adapted to automatically discharge the material as it is deposited thereon alternately upon one side and the other, substantially as and for the purpose set forth.

409,859. REFLEURAGE. GUSTAVE D. HELLEMANS, Amsterdam, Holland. Filed Dec. 12, 1888. Serial No. 293,253. (No model.)

Claim.—1. The within-described process of obtaining perfumes from flowers and other substances, which consists in extracting the volatile oils or aromatic parts therefrom by exposing them in a vacuum, so that evaporation of the volatile parts takes place at ordinary temperature and condensation of them at a lower temperature, as set forth.

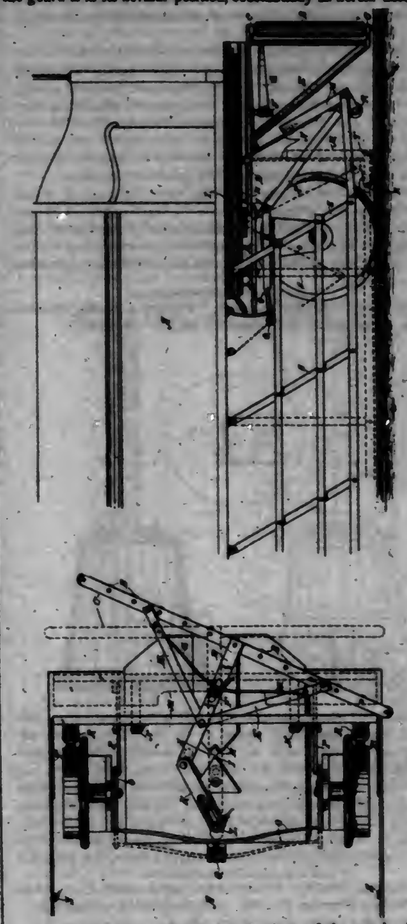
2. In the within-described process of extracting volatile oils or aromatic essences from flowers and other substances, first exposing said flowers or substances in a vacuum, whereby evaporation of the volatile parts takes place, then condensing the volatile oils or extracts at a lower temperature also in vacuo, and finally intercepting and absorbing any escaping volatile parts not previously condensed, substantially as specified.

409,860. RAILROAD-TIE. ALDEN C. HINKLEY, Gloversville, N. Y., assignor of one-half to William W. Whitaker, same place. Filed Dec. 11, 1888. Serial No. 293,203. (No model.)

Claim.—1. A metallic tie for railroads slitted spirally in the direction of its length, substantially as and for the purpose described.

2. A metallic tie for railroads constructed of a tubular helix, substantially as and for the purpose described.

3. A metallic tie for railroads constructed of a tube slitted spirally in the direction of its length, and thereby adapted to yield longitudinally and transversely, substantially as and for the purpose described.



4. A tubular metallic tie for railroads slitted spirally in a longitudinal direction and having a flattened rail-receiving surface, substantially as and for the purpose described.

409,861. SAFETY-GUARD FOR CARS. CHARLES H. OHM, San Francisco, Cal. Filed May 9, 1888. Serial No. 310,149. (No model.)

Claim.—1. The combination, with the car, of a vertical guard pivoted to a king-bolt beneath the front of the car and adapted to swing about said bolt, so as to stand at an obtuse angle with the line of the track upon either side of the center, substantially as herein described.

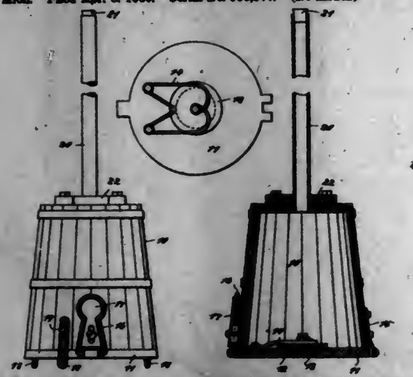
2. A guard consisting of the vertical rollers journaled in a frame-work which extends across the front of the car, said frame-work turning upon a king-bolt beneath the car, so as to throw the roller-guard to one side or the other of the center and in an obtuse angle with the line of travel, in combination with a supporting-bar and a spring rotating device, whereby said guard is held at right angles with the line of track when not in action, substantially as herein described.

3. The roller-guard extending across the front of the car, a supporting-bar and frame-work extending horizontally therefrom, a king-bolt or pin passing through a longitudinal slot in said bar or frame-work, so that the guard may be moved backward and forward upon said king-bolt, a spring whereby the guard is forced toward the front, a pin in the rear end of the frame-work, and a V-shaped notch into which said pin falls and is retained by the action of the spring when the guard is in its normal position, substantially as herein described.

4. The guard extending across the front of the car, having the rearwardly-extending bar or frame-work slotted and movable upon a fulcrum-pin, the V-shaped notch and the pin upon the frame-work engaging said notch, and a spring whereby it is held in contact therewith, in combination with an angular guide fixed to the car behind said catch, so that when said frame-work is forced backward it will be released from the latch and will be forced to one side or the other by striking the angular projection, substantially as herein described.

5. The guard extending across the front of the car, the bar or frame-work attached to the same extending horizontally backward and pivoted so as to allow the guard to turn to one side or the other of the center, the latch by which the guard is held in its normal position, and a guide by which it is thrown to one side or the other when forced backward, in combination with the link K, connected with the rear of the bar or frame-work and acting as a stop when the guard is turned to one side or the other, substantially as herein described.

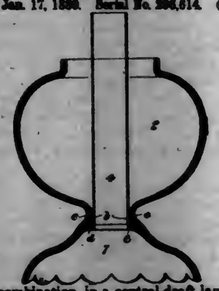
6. The guard extending across the front of the car, having a frame-work extending horizontally backward and fulcrumed beneath the car, so as to allow the guard to turn from side to side about the vertical pivot, in combination with the transverse board or scraper suspended behind the guard, the yoke fulcrumed beneath the car and connected with the scraper by rods, and the latch by which said yoke



is held and the scraper maintained out of contact with the track, substantially as herein described.

7. The scraper suspended beneath the car, and the yoke fulcrumed beneath the car, having its ends connected with the scraper by rods and the rear portion suspended by the spring latch or catch, in combination with the swinging guard fulcrumed across the front of the car, a rearwardly-extending frame, and the link K, actuated thereby and adapted to disengage the catch and allow the yoke to drop when the guard comes in contact with an object, substantially as herein described.

8. The transverse board or scraper suspended by links from the car, a lever-yoke, connecting-rods, and a latch whereby said scraper is normally held out of contact with the track and road-bed, a swinging guard extending across the front of the car and adapted to disengage the latch and drop the scraper, in combination with rollers fixed upon the rear portion of the scraper, so as to come in contact with the forward wheels of the car and be rotated in the opposite direction when the board is dropped, substantially as herein described.



9. The transverse scraper suspended from the front of the car, and a lever and links which permit it to be depressed about its point of suspension when released, in combination with the suspended rising and falling side rails upon the car, and rods connecting them with the scraper, so that they will be moved simultaneously therewith, substantially as described.

409,862. CISTERN-CLEANER. WILLIAM A. PALMER, Plymouth, Mich. Filed Apr. 3, 1889. Serial No. 306,377. (No model.)

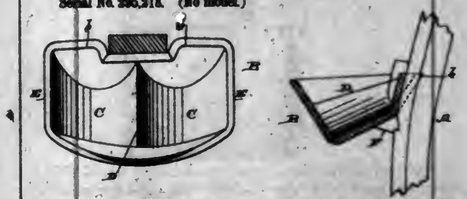
Claim.—The combination, with a hollow body having an open lower end, a plate adjustably hinged to the body covering the said open end and provided with an inwardly-opening valve, a keeper-block adjustably secured to the outer face of the body, and a hasp hinged to the bottom plate capable of contact with the keeper-block, of legs adjustably secured to the exterior of the body extending below the bottom plate, a tube projected from the upper end of the body, and a plug or stopper detachably inserted in the upper end of the tube, all combined for operation substantially as shown and described.

409,863. CENTRAL-DRAFT LAMP. ARCHIBALD W. PAULL, Wheeling, W. Va. Filed Jan. 17, 1889. Serial No. 296,614. (No model.)

Claim.—1. The combination, in a central-draft lamp, of a bowl-section and a base-section of glass and a central metal draft-tube, said bowl and base-section being united directly with each other and with the central-draft tube by welding, substantially as and for the purposes described.

2. In a central-draft glass lamp, the combination of a bowl-section, a base-section, and a metal draft-tube having a flange interposed between and welded with both sections, substantially as and for the purposes described.

409,864. JUG-TOP. ARCHIBALD W. PAULL, Wheeling, W. Va. Filed Mar. 13, 1889. Serial No. 303,093. (No model.)

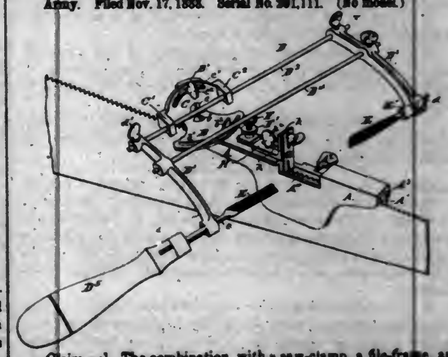


Claim.—1. As a new article of manufacture, a jug-top consisting in the combination of the collar and cap, a hinge-piece secured to the collar, and a peripheral wire on the cap which passes through perforations on the hinge-piece and forms the pintles of the hinge, substantially as and for the purposes described.

2. As a new article of manufacture, a jug-top consisting in the combination of the collar and cap, a hinge-piece secured to the collar, a peripheral wire on the cap which passes through perforations on the hinge-piece and forms the pintle of the hinge, and a coiled spring encircling said pintle, substantially as and for the purposes described.

3. As a new article of manufacture, a jug-top consisting in the combination of the collar comprising a zone 7, which encircles the jug-top, a zone or portion 8, forming the spout, an intervening gutter 9, a cap, and a hinge-piece connecting the cap and collar and having a tongue which fits against the under side of the said gutter and is braced thereby, substantially as and for the purposes described.

409,865. WATER-WHEEL. LESTER A. PELTON, Nevada City, assignor to Albert P. Brayton, Jr., San Francisco, Cal. Filed Jan. 7, 1889. Serial No. 295,918. (No model.)



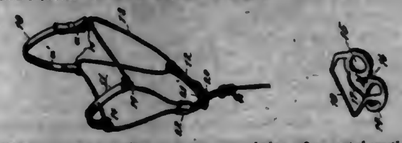
Claim.—1. The buckets of a water-wheel, having the curved bottoms meeting at an apex or sharp ridge in the center and continuous with the inclined discharge sides, the bucket-fronts curved in the arc of a circle and inclined so as to narrow the buckets from the top toward the bottom, and the bottom and dividing ridge also declining from the rear toward the front, as shown and described.

2. The buckets of a water-wheel, having the curved bottoms meeting at a central apex or sharp ridge and continuous with the discharge sides, the convex front, and the inclined bottoms, with the projecting angular lugs fitted to corresponding depressions or notches in the rim in which they are adjusted and retained, substantially as herein described.

3. The buckets of a water-wheel, with the curved bottoms meeting in a central apex or ridge and continuous with the discharge sides, the convex front, and the rear walls inclining backward upon each side of the wheel-rim, substantially as herein described.

409,866. SAW-FILING MACHINE. WILLIAM H. PENDER, U. S. Army. Filed Nov. 17, 1888. Serial No. 291,111. (No model.)

Claim.—1. The combination, with a saw-clamp, a file-frame, and a guide for the frame attached to the clamp, of an adjustable stop on the clamp which engages the frame and regulates the depth of the cut.



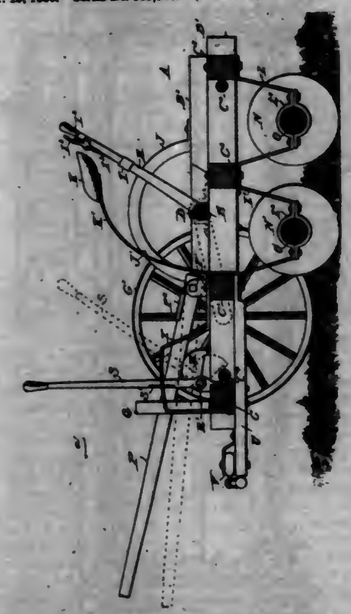
2. The combination, with a saw-clamp carrying a reciprocating file-frame, of a gage consisting of a longitudinally-adjustable bracket

H and a vertically-adjustable gage-point secured to said bracket, all substantially as described.

3. The saw-clamp provided with the removable guard-strips of wood or similar material resting on the tooth-points.

4. The combination of the saw-clamp provided with the notch A^4, turn-block B, having the vertical arm B', the turn-block C, pivoted to the arm B', the file-frame D, having a rod D' parallel with the file and running in guides on the turn-block C, and also with the parallel intermediate rod D^6, the adjustable stop F, the gage-bracket H, secured adjustably to the clamp, and the gage-plate G, secured to the bracket H.

409,867. HALTER. JAMES H. PHILPOTT, Rising City, Nebr. Filed Dec. 17, 1888. Serial No. 293,579. (No model.)

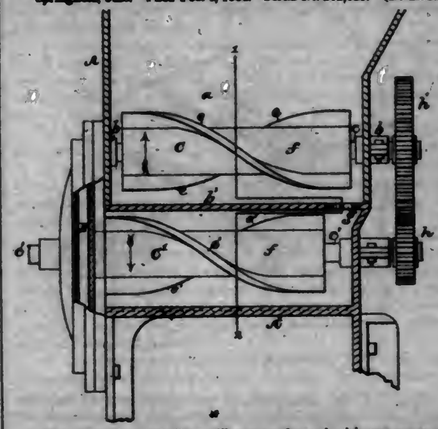


Claim.—1. In a halter, a runner consisting of a metal casting having upwardly-curved ends and provided with an aperture in each end, a pin or stud projecting from the upper face of the casting between the apertures, and a lateral apertured projection for securing the runner to the halter, substantially as herein shown and described.

2. In a halter, a runner consisting of a metal casting having its ends bent upward in the same direction and provided with an aperture in each end, having a central cross-bar, a pin projected from the upper face of said cross-bar, and a guide-flange integral with one side at the center, and attaching means, substantially as shown and described.

3. In a halter, the combination, with a head-strap and nose-strap and metallic runners attached to the extremities of said straps, consisting of a casting provided with an aperture at each end, having a central cross-bar, a pin projected from said cross-bar, and a guide-flange at one side of the runner, of a chin-piece having a loop at each end and a ring attached to the forward loop, a rope passing through the said ring and the several runners and the rear loop of the chin-strap, and a contracting slide adapted to slide upon the said rope between the ring of the chin-strap and the nose-strap, substantially as shown and described.

409,868. SOD-CUTTER. LEWIS T. PENN, Endicott, Wash. Filed Mar. 15, 1889. Serial No. 303,378. (No model.)



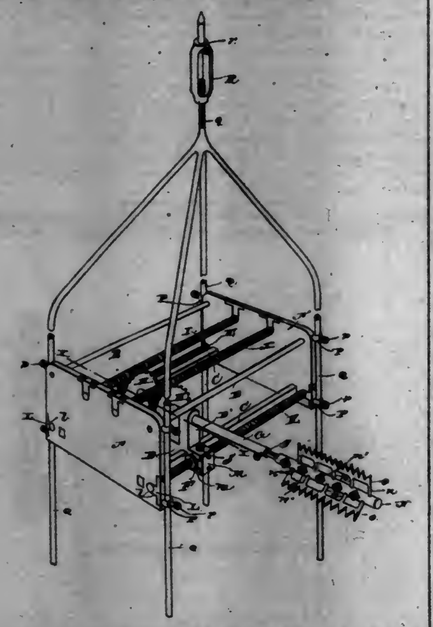
Claim.—1. In a sod-cutter, the combination, with a frame mounted on wheels, cutting-disks carried by the frame, and means for raising and lowering the said frame, of a tongue pivoted to the frame, a shaft journaled below the tongue, a cam on the shaft, a hand-lever secured to the shaft, and means for locking the lever in the position into which it is moved, substantially as described, whereby provision is made for adjusting the tongue according to the position of the frame, as set forth.

2. In a sod-cutter, the combination, with a frame mounted on wheels, cutting-disks carried by the frame, and means for raising and lowering the said frame, of a tongue pivoted to the frame, a guide through which the tongue projects, a shaft journaled below the tongue between its pivoted end and the guide, a cam on the shaft for engaging the under side of the tongue, a hand-lever on the said shaft provided with a lug, a notched guideway and a spring secured to the lever and projecting down into the guideway and serving to press the lug of the lever into one of the notches of the said guideway, substantially as herein shown and described.

3. In a sod-cutter, the combination, with a frame, hangers depending from the frame, and cutting-disks mounted in the hangers, of the shaft E, journaled in the frame and provided with the downwardly-extending arms F and F', the wheels G and G', mounted on the said arms, the lever H, secured to the shaft, the arm I, mounted to slide on the said lever, the spring-pressed hand-lever I^2, pivoted to the lever H and connected to the arm I by link I^3, and the notched segment secured to the frame and with which the arm I engages, substantially as herein shown and described.

409,869. CRUSHER FOR GRINDING-MILLS. THOMAS ROBERTS, Springfield, Ohio. Filed Feb. 1, 1888. Serial No. 262,635. (No model.)

Claim.—1. In a grinding-mill, a case formed with two compartments, situated one above the other, and oppositely-rotating crushers in said compartments, the lower of which crushers is so situated as to leave a space between its end and the end of said case, in combination with a plate between said crushers serving to divide the case into its compartments, and having a discharge-opening in its end immediately above the space at the end of the lower crusher.



2. The combination, with a case having two compartments, situated one above the other, of a grinding or crushing roller in each of said compartments, the lower of which rollers has its ends located out of transverse vertical alignment with the ends of the upper roller, as shown, whereby one end of said lower roller will be in contact with or near to one end of the case, and its opposite end will be sufficiently far away from the other end of the case to leave a space beneath the corresponding end of the upper roller, and a plate between said roller serving to divide the case into its compartments and formed with an opening above the space located at the end of the lower roller.

3. The combination, with a case having two compartments, situated one above the other, and a burr located at the end of the same and mounted upon a shaft passing through the lower compartment, of a grinding or crushing roller in each of said compartments running in opposite directions, the lower of which rollers is mounted upon the same shaft as said burr and has its ends located out of transverse vertical alignment with the ends of the upper roller, so as to have one end extend nearly into contact with the burr, and its opposite end sufficiently far away from the end of the case to leave a space beneath the corresponding end of the upper roller, and a plate between the rollers serving to divide the case into its compartments and formed with an opening above the space beneath the end of the upper roller, for the purpose set forth.

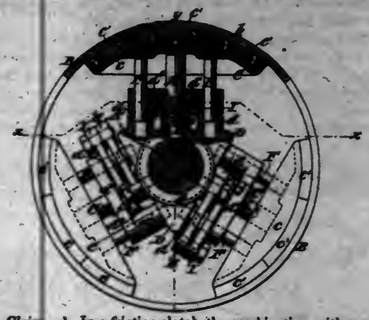
4. The combination of a case having two compartments, situated one above the other, and formed on the bottom of the lower compartment with grooves or mortises, and a burr located at the end of

said case and mounted on a shaft extending longitudinally through said lower compartment, and oppositely-rotating differently-speeded crushing-conveyers in said compartments, the lower of which is mounted on the same shaft as said burr and has its ends located out of transverse vertical alignment with the ends of the upper crushing-conveyer, and a plate serving to divide the case into its compartments and having a discharge-opening in its end immediately above the space at the end of the lower crushing-conveyer.

409,870. COAL-CUTTING MACHINE. JAMES C. ROBERTSON, Morrisdale Mines, assignor of one-half to Alexander Hood, Phillipsburg, Pa. Filed Aug. 28, 1888. Serial No. 283,962. (No model.)

Claim.—1. The combination of the end plates A A', the longitudinal rods connecting the same, the feed-screws journaled in the end plates, the carriage mounted transversely on the feed-screws, the cutter-shaft mounted on the carriage, and mechanism for simultaneously rotating the feed-screws and the cutter-shaft, substantially as set forth.

2. The combination of the end plates A A', the rods B and bars C, connecting the said plates, the carriage supported transversely on the bars C, the worm-shafts journaled in the end plates and extending over the carriage, the cutter-shaft mounted on the carriage, and mechanism for simultaneously rotating the worm-shafts and sliding the carriage off the bars C, as set forth.

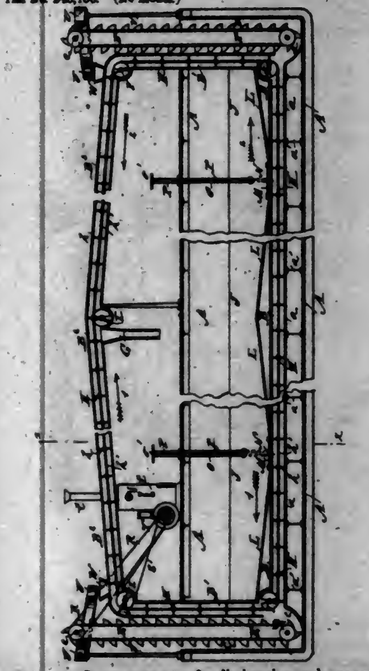


3. The combination of the end plates A A', the rods B and bars C, connecting said end plates, the carriage mounted transversely on the bars C and provided with standards D' on its upper side, the cutter-shaft journaled in said standards, and mechanism for simultaneously rotating the cutter-shaft and sliding the carriage on the bars C, as set forth.

4. The combination of the end plates A A', the rods B and bars C, connecting said end plates, the feed-screws journaled in the end plates, the carriage mounted transversely on the bars C and having its ends engaging the feed-screws, the worm-shafts journaled in the end plates above the carriage, the cutter-shaft mounted on the carriage and provided with worm-wheels engaging the worm-shafts, and mechanism for simultaneously rotating the feed-screws and the worm-shafts, as set forth.

5. In a mining-machine, the combination, with the frame, the carriage, and the feed-screw, of the sleeve internally threaded to fit the feed-screw, made in the two halves and externally threaded and screwed in the said carriage, and the set-screw for holding the sleeve in place, substantially as described.

6. The combination, with the arbor having diametrical openings, of the blades O, each having a series of arms n, passing through said openings and provided with screw-threaded extremities, and the nuts n', mounted on said extremities and adapted to be turned up against the arbor, as set forth.

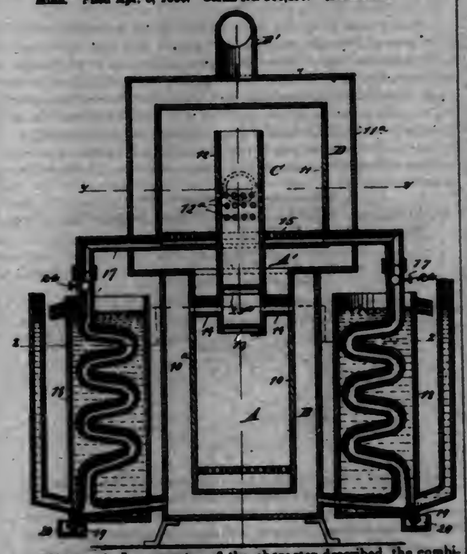


409,871. FRICTION-CLUTCH. EDVARD SAVORAL, New York, N. Y. Filed June 15, 1889. Serial No. 314,457. (No model.)

Claim.—1. In a friction clutch, the combination, with two shafts, of a hollow flanged clutch member mounted upon one shaft, a block mounted upon the other shaft, clutch members arranged within said flanged member, guide-rods on said last-named clutch members and guided in said block, screws secured to said last-named clutch members and extending radially from the shaft last named, nuts adjacent to said block and engaging said screws, a collar on the shaft last named and adapted to be slid thereon, levers rigidly connected to said nuts, and links connecting said collar to said levers, substantially as specified.

2. The combination, with the shafts A A', of the hollow flanged clutch member B, mounted on the shaft A, the clutch members C within the clutch member B, the block D, rigidly secured to the shaft A' and provided with the tubular portions *d*, guide-rods F, extending from the clutch members C and into the tubular portions *d*, screws K, rigidly secured to the members C and extending radially from the shaft A', nuts J, arranged between the tubular portions *d* and engaging the screws K, a sliding collar G on the shaft A, levers I, rigidly secured to the nuts J, and links H, connecting said levers with the collar G, substantially as specified.

409,872. APPARATUS FOR DISCHARGING AND CONVEYING COAL. CHARLES S. SCHENCK, New York, N. Y. Filed June 3, 1887. Serial No. 240,138. (No model.)



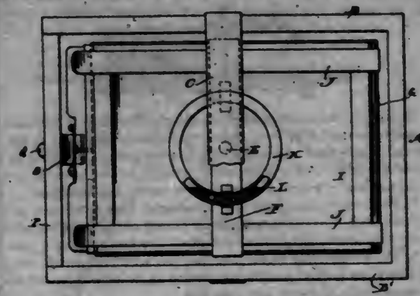
Claim.—1. In an apparatus for discharging and conveying coal or other material, the combination, with an endless-belt conveyer discharging into a well or pocket, of a bucket-elevator lifting the material from the well, and a chute receiving the material from the elevation and delivering it to the upper trough in which the conveyer-belt works for carriage by the conveyer to a distant point of discharge, substantially as herein set forth.

2. In an apparatus for discharging and conveying coal or other material, the combination, with an endless-belt conveyer discharging into a well or pocket, of a bucket-elevator lifting the material from the well, and a chute pivoted to turn sidewise and receiving the material from the elevator, and adapted to discharge the elevated material either to the upper trough in which the conveyer-belt works for carriage to a distant point of discharge, or to discharge said material directly, substantially as described, for the purposes set forth.

3. In an apparatus for discharging and conveying coal or other material from vessels, the following elements in combination: a trough B B' B², having gated openings M N and opening into wells or pockets *c d* at each end of the trough portion B, an endless conveyer H, working in the trough and adapted to deliver material to either well *c d*, and two bucket-elevators E F, either of which is adapted to lift the material from said wells and deliver it to points of discharge, substantially as herein set forth.

4. In an apparatus for discharging and conveying coal or other material from vessels, the following elements in combination: a trough B B' B², having gated openings M N and opening into wells or pockets *c d* at each end of the trough portion B, an endless conveyer H, working in said trough and adapted to deliver material to either well *c d*, two bucket-elevators E F, either of which is adapted to lift the material from said wells, and pivoted discharge-spouts U, receiving the material from the elevators and adapted to deliver it either to the upper section B² of the conveyer-trough or outboard for direct discharge, substantially as shown and described.

409,873. CHARCOAL APPARATUS. JACOB SCHREPTIUS, Winona, Minn. Filed Apr. 6, 1889. Serial No. 306,155. (No model.)



Claim.—1. In apparatus of the character described, the combination of the fire-chamber and the charring or calcining chamber, each being formed by a jacketed inclosing-case forming chambers surrounding the same, the chamber surrounding the fire-chamber being in communication with the charring-chamber, and the fire-chamber being in communication with the charring-chamber through a dampered connecting-pipe, and also in communication with the chamber surrounding the charring-chamber, substantially as described.

2. The combination, with fire and charring chambers, of a dampered pipe extending from the former into the latter, chambers surrounding both the fire and charring chambers, communication being established between the fire-chamber and the chamber surrounding the charring-chamber and between the latter and the chamber surrounding the fire chamber, and condensing-pipes connecting the charring-chamber and the chamber surrounding the fire-chamber, substantially as described.

409,874. PHOTOGRAPHIC CAMERA. GEORGE SKERSLEY, New York, N. Y. Filed Mar. 16, 1889. Serial No. 303,570. (No model.)

Claim.—1. In a photographic camera, the combination, with a swing-back, of a universal joint connecting the said swing-back with the camera-casing, substantially as shown and described.

2. In a photographic camera, the combination, with a weighted swing-back, of a universal joint connecting the said swing-back with the camera-casing, substantially as shown and described.

3. In a photographic camera, the combination, with a swing-back universally jointed to the camera-casing, of a tube held on the said swing-back and containing a loose material which always seeks its level and throws the swing-back into a vertical position, substantially as shown and described.

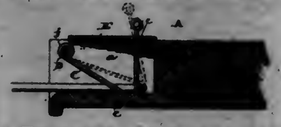
4. In a photographic camera, the combination, with a swing-back adapted to support the plate-holder, of a universal joint held centrally on the said swing-back in the rear of the said plate-holder and universally jointing the said swing-back with the camera-casing, substantially as shown and described.

5. In a photographic camera, the combination, with a swing-back adapted to support the plate-holder, of a universal joint held centrally on the said swing-back in the rear of the said plate-holder and universally jointing the said swing-back with the camera-casing, and means, substantially as described, for automatically moving the said swing-back into a vertical position, as set forth.

6. In a photographic camera, the combination, with a swing-back adapted to receive a plate-holder, of a universal joint held centrally on the said swing-back in the rear of the said plate-holder and universally jointing the said swing-back to the camera-casing, a circular tube held on the said swing-back concentric with the said universal joint, and a heavy liquid contained in the said circular tube, substantially as shown and described.

7. In a photographic camera, the combination, with a swing-back adapted to receive a plate-holder, of a universal joint held centrally on the said swing-back in the rear of the said plate-holder and universally jointing the said swing-back to the camera-casing, a circular tube held on the said swing-back concentric with the said universal joint, a heavy liquid contained in the said circular tube, and means, substantially as described, for locking the said swing-back in place after being automatically adjusted, as set forth.

8. In a photographic camera, the combination, with a swing-back adapted to receive the plate-holder, of a universal joint held centrally on the said swing-back and universally jointing the latter to the camera-casing, and a guide-plate held on the said swing-back for guiding the latter when seeking its normal position, substantially as shown and described.



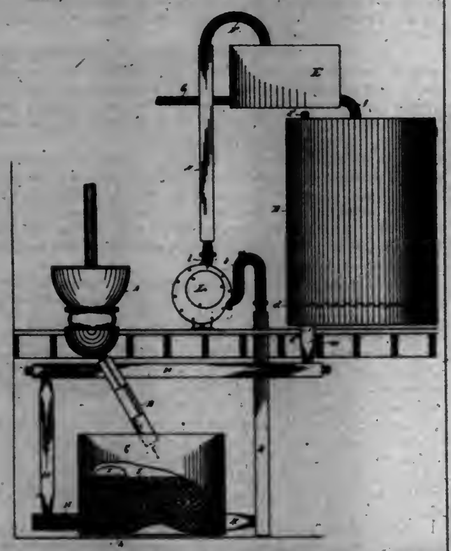
9. In a photographic camera, the combination, with a swing-back adapted to receive the plate-holder, of a universal joint held centrally on the said swing-back and universally jointing the latter to the camera-casing, a guide-plate held on the said swing-back for guiding the latter when seeking its normal position, and means, substantially as shown and described, for locking the said guide-plate onto the said swing-back and the camera-casing, as set forth.

10. In a photographic camera, the combination, with a camera-casing, of a swing-back held in the rear of the said camera-casing and a universal joint for connecting the said swing-back with the said camera-casing, substantially as shown and described.

11. In a photographic camera, the combination, with a camera-casing, of a swing-back held in the rear of the said camera-casing, a universal joint for connecting the said swing-back with the said camera-casing, and means, substantially as described, for adjusting the said swing-back on the rear end of the said casing, as set forth.

12. In a photographic camera, the combination, with a camera-casing, of a swing-back held in the rear of the said camera-casing, a universal joint for connecting the said swing-back with the said camera-casing, means, substantially as described, for adjusting the said swing-back on the rear end of the said casing, and a locking device for fastening the said swing-back in place after being adjusted, as set forth.

409,875. CAR-COUPLING. WILLIAM T. SIBB, Yazoo City, Miss. Filed June 26, 1889. Serial No. 315,596. (No model.)

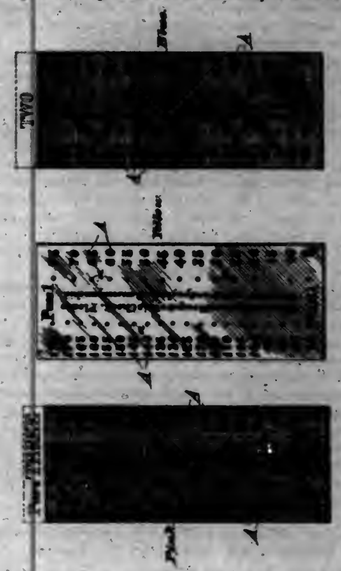


Claim.—1. The combination, with the chambered draw-head and the transverse shaft B, of the coupling-hook loosely sleeved at its forward end on said shaft and formed of a bar comprising a downwardly and rearwardly inclined portion and a vertical portion joined to the inclined portion by a bend, substantially as shown and described.

2. The combination, with the chambered draw-head and the transverse shaft B, of the coupling-hook formed of a metallic bar having an eye at one end sleeved on said shaft and bent to form a rearwardly and downwardly inclined portion and a vertical portion connected with the inclined portion and formed at its upper end with an eye, substantially as shown and described.

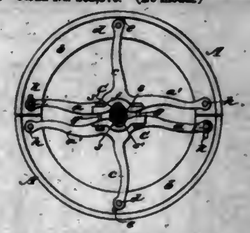
3. The combination, with the chambered draw-head having in its bottom wall a depression *e* and the transverse shaft B, of the coupling-link loosely sleeved at its upper end on said shaft and formed with a downwardly and rearwardly extending portion and a rear vertical portion, the bend connecting the vertical and inclined portions being adapted to rest in said depression, substantially as shown and described.

409,876. PROCESS OF LEACHING TAN-BARK. EDWARD P. SMITH, Corry, Pa. Filed Oct. 26, 1888. Serial No. 289,949. (No specimens.)



Claim.—1. A method and process of handling and leaching tan-bark, consisting in delivering the ground bark directly from the bark-mill into a tank of fluid with which it is intermixed, and then conveying the intermixed bark and fluid into a steam-box, where they are steamed during their passage through said steam-box, and from whence they pass into the top of the leach, substantially as and for the purpose set forth.

2. A method and process of handling and treating tan-bark, consisting, first, of saturating and intermixing the ground bark with fluid; second, of conveying the bark and fluid so intermixed into a steam-box, and, third, of steaming the intermixed bark and fluid during their passage through such steam-box, after which they pass into the top of the leach, substantially as and for the purpose set forth.

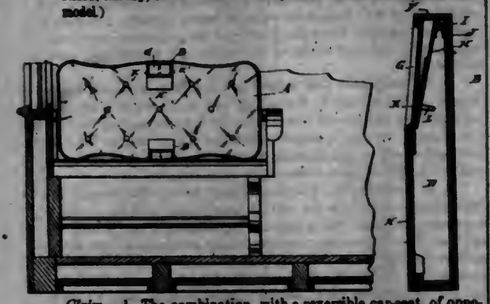


409,877. SERVICE, CASH, AND PASS CHECK. GEORGE D. SMITH, New York, N. Y. Filed Oct. 27, 1888. Serial No. 289,278. (No model.)

Claim.—1. A service, cash, and pass check having marginal rows of cash-value numerals increasing in value from end to end, and provided with a passport-character, a serial number, and a printed description of the use of the check, whereby said check is adapted to entitle the holder to be served, to register the value of single or cumulative orders, to act as voucher to receiving-cashier, and to enable the holder to pass out unquestioned, all substantially as described.

2. The series of service, cash, and pass checks, each having marginal rows of cash-value numerals increasing in value from end to end, a serial number, and a printed description of the use of the checks, together adapting a check to secure service, to register the value of single or cumulative orders, and to act as voucher to receiving-cashier, the said checks being also provided with passport-characters, as described, whereby one check of the series is adapted to be exchanged for and used in place of a number of other checks of the series and to enable a corresponding number of persons to pass out, all substantially as set forth.

409,878. PULLEY. NATHANIEL P. SMITH, Memphis, Tenn. Filed Dec. 1, 1888. Serial No. 292,379. (No model.)



Claim.—1. In split pulleys, the combination of the rim-sections A A, the pivoted and adjustable spider-sections C C, constructed with opposite partial hub portions *f f*, of angular and irregular contour on their interior, and each provided with arms *a a'*, connecting the opposite ends of their respective pulley rim-sections, and the uniting or clamping bolts *g g*, the arms *a' a'* being pivotally connected with the rim-sections of the pulley on opposite sides of the axis of the latter, and the arms *a a* being adjustably connected with the like rim-sections on reverse sides of said axis, substantially as specified.

2. In a split pulley, the combination of the rim-sections A A, having inner flanges *b*, provided with conical-recesses *n* and slots *k* on reverse sides of the axis of the pulley, and with the slot *k* of either pulley-section on the opposite side of said axis to the slot *k* of the other pulley-section, the spider-sections C, provided with conical projections *m*, adapted to fit the conical recesses *n*, the pivotal bolts A, passing through the conical projections *m*, and the bolts *i*, passing through the slots *k* in the flanges of the pulley-sections and through the spider-sections C, substantially as specified.

3. In a split pulley, the combination of the rim-sections A A, having a central inner flange *b*, provided with slots *k k*, the spider-sections C C, having partial hub portions *f*, of irregular contour on their interior, and opposite arms *a a'*, the bolts A, pivoting the spider-sections on opposite sides of the axis of the pulley to the rim-sections, the bolts *i i*, arranged to pass through the slots *k k* and connecting the opposite ends of the spider-sections with the rim-sections, and the clamping-bolts *g g*, all for operation in relation with the shaft carrying the pulley, essentially as shown and described.

409,879. TICKET-CASING FOR CAR-SEATS. REMSELAER J. SMITH, Albany, N. Y. Filed Nov. 3, 1888. Serial No. 290,268. (No model.)

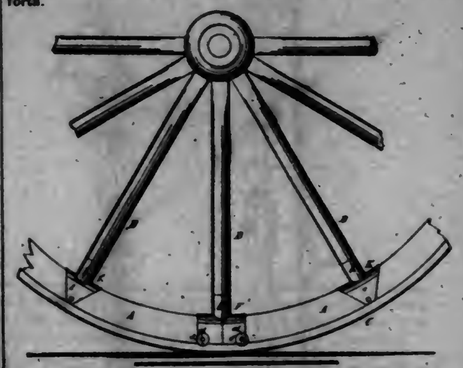
Claim.—1. The combination, with a reversible car-seat, of oppositely-arranged fare boxes secured to the back thereof at its upper and lower edges, whereby one fare-box will always be in position to receive the fare, substantially as set forth.

2. A fare-box comprising a casing having a slot in its top, the transparent front G, the lower door, the outwardly-swinging plate hinged at its upper end within the casing just below the said slot, a spring throwing the lower edge of the plate to the front of the casing, and a pin projecting from the plate through a slot in the casing, substantially as set forth.

3. The combination, with a casing having slots in its top, of a transverse partition dividing the interior of the casing into compartments to which said slots lead, a hinged spring-plate held in each of the said compartments, a transparent front held in the said casing in front of the hinged plates, and a pin projecting from each of the hinged plates through slots in the sides of the casing, substantially as shown and described.

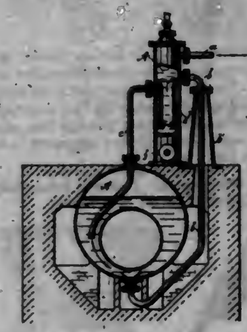
4. The combination, with a casing having slots in its top, of a transverse partition dividing the interior of the casing into compartments to which the said slots lead, a hinged spring-plate held in each of the said compartments, a transparent front held in the said casing in front of the hinged plates, and a pin projecting from each of the hinged plates through slots in the sides, and a door adapted to be locked and held in the lower part of the casing for removing the accumulated tickets from both compartments, substantially as shown and described.

409,880. CLOTHES-PIN. JOHN A. STEWART, Whitesborough, Tex., assignor of one-half to Robert B. Bolton, same place. Filed Apr. 12, 1889. Serial No. 307,043. (Model.)



Claim.—1. A wire clothes-pin composed of a pair of spring-coils connected by a loop, the free ends of the wire forming said spring-coils being extended in the direction of said loop and connected by a ring or link which affords a bearing for the said loop when the latter is inserted between the free ends of the wire, substantially as herein set forth.

2. A wire clothes-pin composed of a wire bent to form a pair of spring-coils connected by a loop, the free ends of the wire extending from said spring-coils being connected by means of a ring or link, and provided with the loops G G, substantially as and for the purpose set forth.



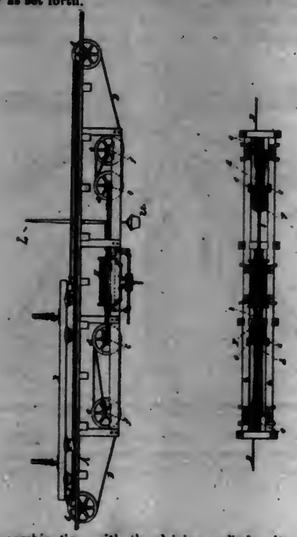
3. A clothes-pin comprising a wire bent to form the loop B, having angles I I, spring-coils C C, obtuse angles E E, facing each other, and angles F F and loops G G, formed upon the free parallel ends of the wire, in combination with a ring or link seated in the angles F F and connecting the free ends, and affording a bearing for the loop B, which is inserted between said free ends, substantially as and for the purpose herein set forth.

409,881. SPOKE AND FELLY FASTENING. HENRY D. TERRELL, Conyers, Ga. Filed Feb. 7, 1889. Serial No. 299,018. (No model.)

Claim.—A spoke-socket comprising a curved head or plate adapted to embrace the felly and forming the bottom of a socket extending from the convex side of said curved head and adapted to receive the end of a spoke, in combination with bolts or rivets passing transversely through the felly and through said head or plate, and washers extending over the edge of the tire, substantially as set forth.

409,882. FEED-WATER PURIFIER FOR BOILERS. LUDWIG H. THIELMANN, Brunswick, Germany. Filed Mar. 22, 1888. Serial No. 304,437. (No model.) Patented in Germany Oct. 9, 1886, No. 45,708.

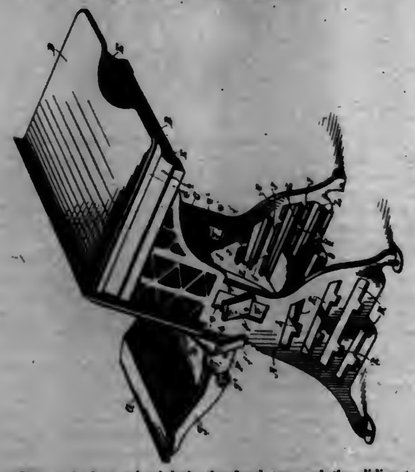
Claim.—1. In a feed-water purifier for steam-boilers, the combination, with a boiler, of a pipe connected with the lower part thereof and extending through the boiler furnace or flue to a point above the water-level of the boiler, a vessel arranged above the water-level of the boiler and communicating with the pipe, and a pipe connected with the vessel and extending into the water-space of the boiler, substantially as specified.



2. In a feed-water purifier for boilers, the combination, with the boiler, of a circulating-pipe connected with the water-space of the boiler and extending upward to a point above the water-level of the boiler, a purifying-vessel formed of a cylinder provided with a downwardly-projecting nozzle, the said circulating-pipe being connected with the separating-vessel above the nozzle, and a return-pipe connected with the separating-vessel below the nozzle and communicating with the water-space of the boiler, substantially as specified.

3. In a feed-water purifier, a separating-vessel formed of the hollow cylinder A, the cylindrical nozzle *d*, attached at its upper end to the walls of the hollow cylinder, the said cylindrical vessel being provided above the nozzle with two iodection-pipes—one for feed-water, the other connected with the lower part of the boiler and extending through the boiler-furnace—the said cylindrical vessel A having below the attachment of the nozzle *d* an eduction-pipe, substantially as specified.

409,883. POWER-FEED MECHANISM FOR LOG-CARRIAGES OF SAW-MILLS. CHARLES F. THOMPSON, Norwood, Ohio. Filed Aug. 28, 1886. Serial No. 212,117. (No model.)



Claim.—1. The combination, with the saw-mill log-carriage, of a power-cylinder having its piston-rod projected at both ends, and carrying at each end a pulley-block arranged as a cross-head, a fixed pulley-block or set of pulleys attached at each end of the framing, beyond and in the line of stroke, and wire ropes connected to the carriage at each end and carried around fixed idlers at the ends of the carriage-runway, and thence rove around the movable and fixed pul-

leys, in succession, to a terminal fastening upon the cylinder-framing, substantially as set forth.

2. The combination, with the driving-cylinder, its cross-head guided by friction-wheels upon the cylinder-stanchions and carrying a set of pulleys, and a fixed set of pulleys secured to the stanchions, of the eyes or loops carried upon the shaft of the fixed set of pulleys, and the rope secured thereto and carried first over and then under the cross-head pulleys and opposite fixed pulleys alternately to the carriage, substantially as set forth.

409,884. SCHOOL-DESK. CHARLES B. TOWLE, Vallejo, Cal. Filed Apr. 10, 1888. Serial No. 306,734. (No model.)

Claim.—1. In a school-desk, the fixed top, and the sliding top separated therefrom to form a receptacle, in combination with the fixed side cleats, the runners secured to the sliding top and resting and moving on the side cleats, and guide-bars between the runners and side cleats, substantially as described.

2. In a school-desk, the fixed top, and the sliding top separated therefrom to form a receptacle, in combination with the fixed side cleats, the runners secured to the sliding top and resting and moving on the side cleats, and flanged guide-bars connecting the cleats and runners, substantially as described.

3. In a school-desk, the fixed top, and the sliding top separated therefrom and forming a receptacle, in combination with the fixed side cleats, the runners secured to the sliding top and resting and moving on the side cleats, and guide-bars secured in the runners and adapted to fit and move in a groove in the side cleats, whereby said runners and cleats are connected, said guide-bars having double-flanged portions, substantially as described.

4. In a school-desk, the fixed top and the sliding top, in combination with the fixed side cleats, the runners secured to the sliding top and resting and moving on the side cleats, whereby a suitable space is formed between the two tops, guide-bars secured in the runners and adapted to fit and move in grooves in the side cleats, and having one of their flanges cut away to form a shoulder, and stops in said grooves against which the shoulder of the guide-bars come in contact to limit the movement of the sliding top, substantially as described.

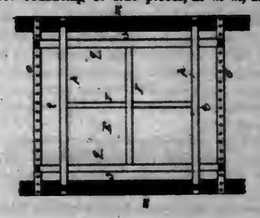
5. In combination with a fixed and a sliding part, the double-flanged guide-bar fixed in the sliding part and movable in the fixed part, said bar having one of its flanges cut away or omitted for a certain distance, forming a stop-shoulder, and a fixed stop in the fixed part against which said shoulder comes in contact to limit the movement of the sliding part, substantially as described.

6. In a school-desk, the sides thereof having the forward and back ratchet-teeth and the seat, in combination with the brackets supporting the seat, fitting against the desk-sides and having the grooved-faced separating bearing-plates overlapping and fitting against the desk-sides and engaging with their grooved faces the ratchet-teeth of said sides, the removable independent strip H between the seat and the desk-back, and the toothed irons or pawls A, carried by said strip and adapted to fit within the front bearing-plates and engage the forward ratchet-teeth of the desk-sides, whereby the brackets are locked in position, substantially as described.

7. In a school-desk, the vertically-adjustable brackets F, secured to the desk-sides and the seat G, in combination with the pivoted links g', connecting the inner end of the seat with the brackets, and the shorter links g^2, pivoted to said seat and brackets at points forward of the respective connections of the links g' therewith, whereby the seat may be turned from a horizontal to a vertical position, its inner end falling and its outer end rising, and fixed stops carried by the brackets for holding the seat in a horizontal position, substantially as described.

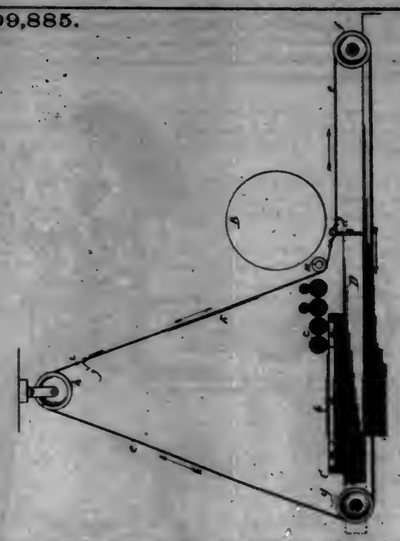
8. In a school-desk, the vertically-adjustable brackets F, secured to the desk-sides and the seat G, in combination with the pivoted links g', connecting the inner end of the seat with the brackets, the shorter links g^2, pivoted to said seat and brackets at points forward of the respective connections of the links g' therewith, whereby said seat may be turned from a horizontal to a vertical position, its inner end falling and its outer end rising, and the fixed stops on the inner surface of the brackets against which the seat-irons come in contact to hold the seat in a horizontal position, substantially as described.

9. In a school-desk, the sides thereof having on their inner surfaces the series of ledges J with spaces or openings j, in combination with the removable and adjustable foot-rest I, adapted to rest on the ledges, and having the locking-bar i on its under side adapted to fit in the spaces or openings j of the ledges, substantially as described.



10. In a school-desk, the sides thereof having in their inner surfaces the series of ledges J with spaces or openings j, the series of openings K with offsets k in one of said sides, and the series of guard-flanges L on the other side, in combination with the removable and adjustable foot-rest I, adapted to rest on the ledges, and having the locking-bar i on its under side adapted to fit in the spaces or openings j of the ledges, substantially as described.

11. In a school-desk, the sides thereof having on their inner surfaces the ledges J, with spaces or openings j, said ledges being arranged in lines in vertical series, the lines being inclined at different angles with a horizontal plane, in combination with the removable and adjustable foot-rest I, adapted to rest on the ledges, and having the locking-bar i on its under side adapted to fit in the spaces or openings j of the ledges, whereby said foot-rest may be set at different inclinations, substantially as described.



409,885. PRINTING-MACHINE. MICHAEL UHLEMSTOCK, Chicago, Ill. Filed Dec. 10, 1888. Serial No. 292,232. (No model.)

Claim.—1. In combination with the sliding bed of a printing-press, a frisket connected by cables with such bed, substantially as and for the purpose specified.

2. A frisket consisting of side pieces, as m m, and adjustable

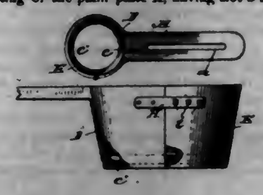
409,885.

straps, in combination with cables connected with the frisket and with the sliding bed of a printing-machine, substantially as and for the purpose specified.

3. The combination of the sliding bed of a printing-press, a frisket connected with cables, and pulleys over which the cables run, substantially as and for the purposes specified.

4. In combination with the sliding bed of a printing-press, a flexible frisket connected with the sliding bed by means of cables, and a guide-roller u, substantially as and for the purposes specified.

409,886. SEA-OILING CARTRIDGE. ALBERT H. WALKER, Hartford, Conn. Filed Apr. 17, 1888. Serial No. 270,942. (No model.)



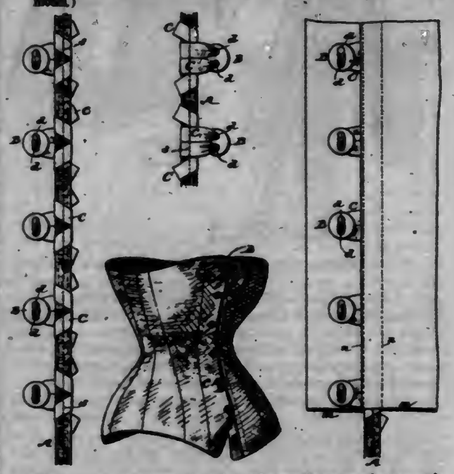
Claim.—1. A sea-oiling cartridge consisting of a projectile containing oil and having one or more unobstructed rearward circumferential openings from the interior to the exterior thereof, combined with a cartridge-shell containing powder and having the rearward end of the projectile inclosed and hermetically sealed by the forward part of the cylindrical walls of the cartridge-shell, all substantially as described.

2. A sea-oiling cartridge consisting of the shell A, provided with the block B and one or more unobstructed rearward circumferential openings C and D, and the oil-chamber E, in combination with the cartridge-shell F, provided with the powder-chamber G and closing the outward ends of those circumferential openings, all substantially as described.

3. The combination of a shell containing oil and having one or more unobstructed rearward circumferential openings from the interior to the exterior thereof, with a shell covering those openings, but adapted to be held back, and thus to uncover them, when the oil-shell is forced forward, all substantially as described.

409,887. LAMP ATTACHMENT. CATHARINE S. WALKER, Galveston, Tex. Filed Sept. 29, 1888. Serial No. 286,789. (No model.)

Claim.—The lamp attachment herein shown and described, the same consisting of the plain plate A, having slot a and formed at its

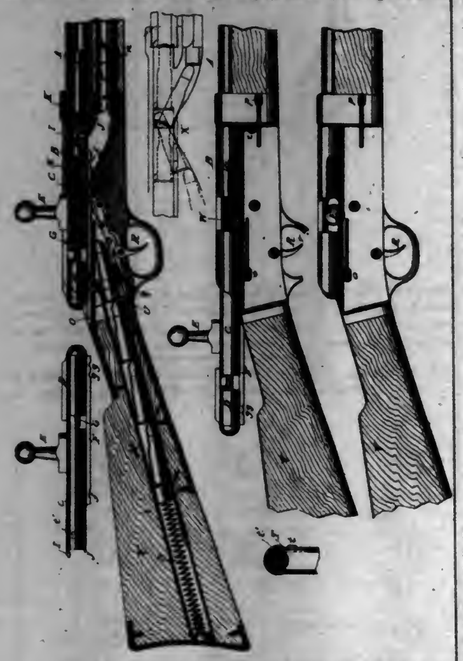


409,887.

outer end with the concaved section D, in combination with the section E, hinged to the section D and provided with a fastening device, the plate A being adapted to be secured in horizontal position to the surface of the table by a bolt and nut, substantially as described.

409,888. BUTTON-STRIP. EDWARD K. WARREN and JOSEPH H. AMES, Three Oaks, Mich. Filed Dec. 26, 1888. Serial No. 294,966. (No model.)

Claim.—As an improved article of manufacture, a button-strip consisting in a resilient blade A, a series of independent tapes stitched thereto at given distances apart, the stitches extending through the resilient blade, and buttons on said tapes, substantially as set forth.



409,889. MAGAZINE FIRE-ARM. CHARLES P. H. WEATHERBY, New York, N. Y. Filed Oct. 24, 1887. Serial No. 253,173. (No model.)

Claim.—1. A sear pivoted at one end and provided with a ring through which cartridges pass to and from the magazine in the stock of the fire-arm, a detent extending from the under side and rear of said ring for arresting the succeeding cartridges while the preceding one is being discharged and its shell extracted, and the top of said ring being adapted to engage in cocking-notches in the under side of the bolt-pin, said sear and its actuating parts being made in one solid piece.

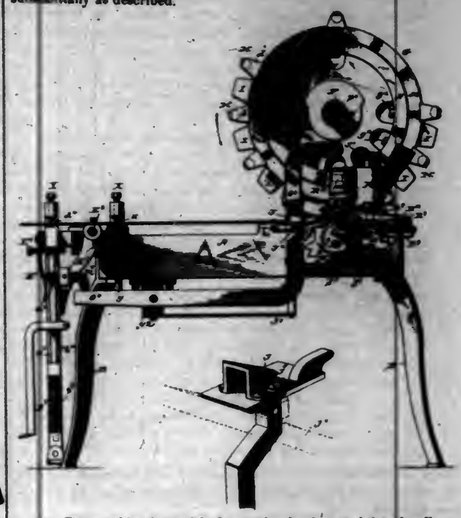
2. The combination of a combined sear and ring through which cartridges pass to and from the magazine in the stock of a fire-arm, a detent projecting from the rear and under side of said ring for arresting the movement of the succeeding cartridges in the magazine until the preceding one is discharged and its shell extracted, the top of said ring being adapted to engage in cocking-notches in the under side of the bolt-pin, with an independent trigger, which, by its independent action, permits the detent in the rear of the ring to positively obstruct the forward movement of the cartridges until relieved by said trigger.

3. In the herein-described magazine fire-arm, the combination of the magazine in the stock of said fire-arm, and the actuating spring therein, with a sear and ring through which the cartridges pass to and from said magazine, the extension or detent on the rear of said ring

for arresting the forward movement of the cartridge while each preceding one is being discharged from the fire-arm, the top of said ring being adapted to engage in cocking-notches in the under side of the bolt-pin, and the independent trigger engaging and operating said sear.

4. In combination with a fire-arm, a magazine extending from the butt to the muzzle thereof, and being provided with an actuating-spring in the extreme ends, while the central portion of the magazine terminates in the double inclined plane, the apex of which terminates beneath and within the plane of the under side of the reciprocating breech-bolt, whereby the cartridges from either magazine can be forced by their respective springs up the inclines when the breech-bolt is retracted in alignment with the bore of the barrel of said fire-arm.

5. In combination with a double magazine the entire length of the fire-arm, provided with actuating-springs in the extreme ends, while the inner ends terminate by means of a double incline in an aligning cartridge-chamber, through which the breech-bolt reciprocates, the two slide-plates which, when in position, arrest alternatingly the forward and backward movement of the cartridges in their respective magazines at the will of the operator while the fire-arm is being discharged.



6. In a magazine fire-arm, the combination of a front and rear cartridge-magazine having terminal inclined planes terminating in an apex in the plane of the aligning chamber and beneath and within the plane of the under side of the reciprocating breech-bolt, the detent-slides for opening and closing alternately the ingress to said aligning chamber, whereby the cartridges can be forced alternately from their respective magazines up their respective inclines into the aligning chamber and forced by the breech-bolt into the bore of the barrel, thereby equalizing the diminishing weight of said magazine fire-arm while in use.

409,890. MACHINE FOR FORGING HORSESHOE-NAILS. DAVID F. WILLIAMS, Plattsburg, assignor of one-third to Timothy J. Sullivan, Albany, N. Y. Filed Apr. 4, 1888. Renewed Feb. 11, 1889. Serial No. 299,558. (No model.)

Claim.—1. In a horseshoe-nail machine, the combination, with an anvil, of a revolving carrier provided with a series of peripheral rollers and with a series of cam-surfaces, said rollers and cam-surfaces being on a disk common to both, horizontally-arranged hammers and dies, and an adjustable cutter or finishing-die, substantially as described.

2. In a horseshoe-nail machine, the combination, with the anvil, of a revolving carrier provided with a series of peripheral rollers and with peripheral bearing-surfaces alternating with the said rollers, and horizontally-arranged hammers provided with dies, substantially as described.

3. The combination, with the main frame and the revolving carrier and its rollers, of an adjustable frame supporting an anvil, a forming-die, and cutter-blade adapted to be operated by one of said rollers, substantially as described.

4. The combination, with the carrier having peripheral rollers, as described, and formed on each side with centrally-arranged cam-surfaces, of pivoted hammers with projecting rollers arranged in contact with said surfaces, substantially as described.

5. The combination, with the carrier having peripheral rollers and formed on each side with two series of alternating cam-surfaces, of pivoted hammers provided with dies and with projecting rollers arranged in contact with said cam-surfaces, whereby the dies of said hammers are alternately thrown inward and retracted, substantially as described.

6. The combination, with the revolving carrier and its rollers, of a movable and adjustable frame within which are supported the anvils, an adjustable former, and a spring-pressed arm carrying a cutter, said arm being depressed by contact with one of the rollers on the carrier, substantially as described.

7. The combination, with the carrier and its rollers, of one or more flat plain anvils and a beveled anvil, substantially as described.

8. The combination, with the frame, which supports the anvils, of guards and a die, and an adjustable former arranged within the die, substantially as described.

9. The combination, with the carrier and peripheral rollers thereon, of spring-pressed arm adapted to be pressed by contact with one of the rollers of the carrier, and an adjustable blade or cutter, substantially as described.

10. The combination, with the main frame, the carrier, and its rollers, of a frame arranged below said carrier and supporting the anvil or anvils, and the finishing devices, said frame being provided with appliances, substantially as described, whereby it is moved and retracted, substantially as described.

11. In a horseshoe-nail machine, the combination, with the revolving carrier and the horizontally-moving hammers and dies, of a stationary grip and a vibrating grip, substantially as described.

12. The combination, with the dies and the reciprocating punch, of the spring-actuated former arranged to move vertically, as set forth.

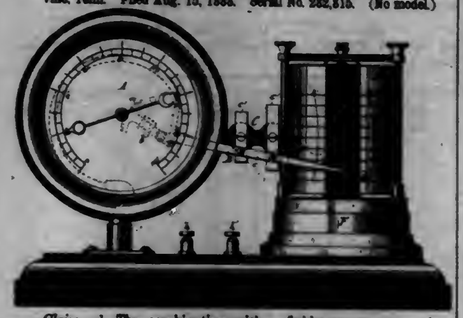
13. The combination, with the anvil R and the pivoted die-stock carrying the punch, of the guard R^3 and the guards, substantially as and for the purpose described.

14. The combination, with the block O and its attached appliances, of the carriage, the main shaft, and the cam T^{16} on the main shaft, and the connection between the carriage and the block, substantially as and for the purpose described.

15. The combination, with the block O and its attachments, of the carriage, the rod connecting said carriage and block, the cam T^{16} on the main shaft, the slide S^{13}, and the standards pivoted to said slide and carrying friction-rollers engaging said cam, substantially as and for the purpose described.

16. The combination, with the block O, its anvil and shearing-dies, and the former, of the nail-pusher, substantially as and for the purpose specified.

17. The combination, with the block O, its anvil and shearing-dies, and the former, of the inclined nail-pusher, substantially as described.



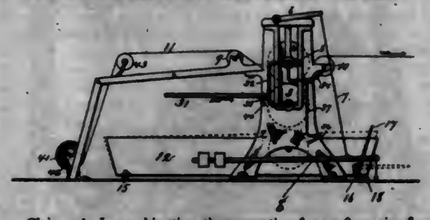
18. The combination, with the block O, its anvil and shearing-dies, and the former, of the inclined forked nail-pusher, substantially as described.

19. The combination, with the feed-arm b^4 and the spring-actuated rod c^4, arranged in bearings on said feed-arm, of the lever pivoted on said feed-arm and connected with said rod, substantially as and for the purpose specified.

20. The combination, with the movable grip, the feed-arm, and the rod c^3, of the lever m^4, pivoted on said arm and engaging said rod, the cam p^4 on the main shaft, and the lever o^4, substantially as described.

21. The combination, with the feed-arm and the spring E^3, of the lever E^7, bearing on the feed-arm in opposition to the said spring, substantially as described, and for the purpose specified.

409,891. ELECTRIC RECORDING-GAGE. JOSEPH WILLS, Nashville, Tenn. Filed Aug. 15, 1888. Serial No. 282,815. (No model.)



Claim.—1. The combination, with a fluid-pressure gage, of an arm adapted to move in accordance with the variations of the fluid-pressure, and an electro-magnet located adjacent to said arm and provided with pole-pieces extended across the field of movement of said arm, the armature of the said magnet being connected with the moving arm, as set forth.

2. A fluid-pressure gage and a chart, in combination with an arm carrying a stylus and moving in accordance with the variations of the fluid-pressure, and an electro-magnet located adjacent to said arm and provided with pole-pieces extended across the field of movement of said arm, the armature of the said magnet being connected with the moving arm, as set forth.

3. A fluid-pressure gage, a moving chart, and a clock-work for imparting to said chart a regular movement, a circuit-closer operated at regular intervals by said clock-work, all in combination with an arm geared to the moving element of said gage and adapted to move in front of said chart, a stylus connected with said arm, and an electro-magnet whose circuit is controlled by said circuit-closer and whose pole-pieces are extended across the field of movement of said arm, the armature of the said magnet being connected with the moving arm, substantially as described.

409,892. MACHINE FOR COATING CONTINUOUS STRIPS OF PAPER. OLIVER WOODWORTH and HENRY O. WOODWORTH, New London, Conn. Filed Sept. 8, 1888. Serial No. 284,959. (No model.)

Claim.—1. In combination, the supporting-frames 2, a pair of superimposed rollers journaled in said frames, a tank, a distributing-roll journaled in said tank adjacent to the lower roll of said pair, as set forth, cams 18, and operating-lever 17, attached to said tank, as described, by means of which the tank may be raised, all being substantially as and for the purpose specified.

2. In combination, three superimposed rollers, the lower one of the series being journaled in a vertically-movable tank, intermeshed gears on the shafts of said rollers, a vertically-movable tank beneath the lower roller, as set forth, a tubular scraper parallel with and in contact with the perimeter of said lower roller when the latter is raised, and a steam-pipe connected with said scraper, and devices for raising the tank, all being substantially as and for the purpose specified.

3. In combination, three superimposed rollers and a vertically-movable tank, as set forth, the lower one of the series of rollers being journaled in said tank, a cylindrical roller located at or about the level of the upper roller of the series, a tubular scraper parallel with and in contact with the perimeter of said lower roller when the latter is raised, steam-pipes leading to said cylindrical roller and to said tubular scraper, and cam and lever mechanism, as described, for raising the said tank and its attached roller, all being substantially as and for the purpose specified.

4. In combination, in a coating-machine of the class referred to, the following elements: three superimposed rollers and a vertically-movable tank, as set forth, the lower roller of the series being journaled in said tank, a cylindrical delivery-roller 10, located at about the level of the upper roller of the series, a tubular scraper parallel and in contact with the lower roller when the latter is raised, steam-pipes leading to and connected with the two upper rollers of the series, to the delivery-roller 10, and to the said tubular scraper, as set forth, intermeshed gears on the shafts of said superimposed rollers, and driving and raising mechanism, substantially as described, connected therewith.

409,893. LOCK-JOINT FOR BEAMS. ROBERT WRAY, New York, N. Y., assignor to himself, Walter S. Hamilton, and R. Knox Little, same place. Filed Apr. 3, 1888. Serial No. 305,819. (No model.)

Claim.—1. A lock-joint for beams, formed in two parts consisting of a socket portion to receive the end of a beam, and a hook portion to engage with a beam, the socket portion being connected to the hook portion by a dovetail projection on the socket portion engaging a dovetail socket in the hook portion, substantially as described.

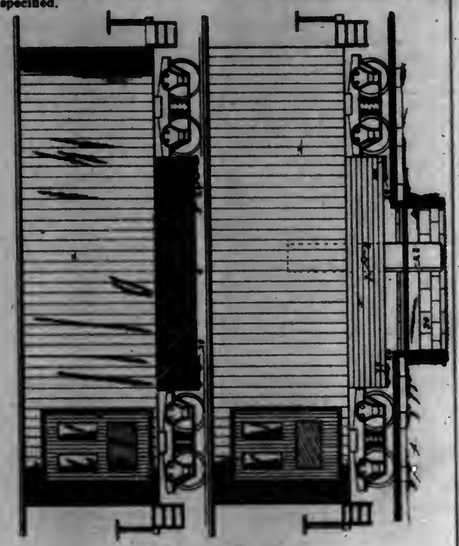
2. In a lock-joint for beams, the dovetail-socket portion 2, having a hook 1, to engage and rest on a beam, substantially as described.

3. A lock-support for beams, formed in two parts consisting of the dovetail-socket portion 2, with hook 1, for engaging a beam, and the socket portion 4, to receive the end of a beam, with the dovetail projection 6, engaging the socket 3 in the hook portion 1, substantially as described.

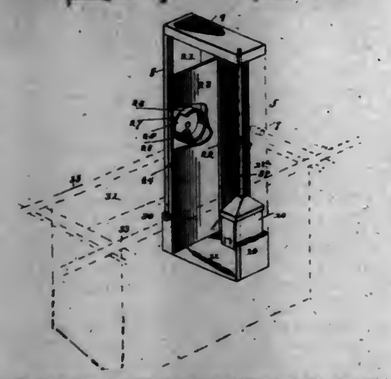
409,894. CAR FOR THE TRANSMISSION OF SPECIE. GEORGE T. YORK, Caseyville, Ill. Filed Apr. 24, 1888. Serial No. 308,395. (No model.)

Claim.—1. A safety-car provided with a compartment adapted to swing in combination with a box located in the compartment, a pivoted latch mounted on the compartment, and a pendulous bolt mounted above the latch and directly over an opening therein, substantially as and for the purpose set forth.

2. The combination, with a car-body, of a frame pivoted therein, at one end of which is located a compartment, means for automatically unlocking the compartment when in a vertical position, and a second compartment pivotally mounted within the frame, and means for unlocking the same when in a vertical position, substantially as specified.



3. The combination, with a car-body, of a pivoted frame provided with a compartment at one end and a counterbalancing-weight at the opposite end, substantially as specified.

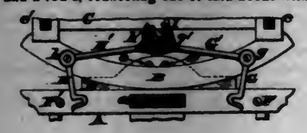


4. The combination, with the car-body, of the pivoted frame mounted therein, and a compartment pivotally mounted in the frame and of a width considerably less than the frame, substantially as specified.

5. The combination, with the car-body, of the pivoted frame mounted therein and provided at one end with a compartment, a pivoted latch mounted on the compartment and adapted to engage with the door thereof and provided with an opening, and a tube secured to the side of the frame and provided with a bolt terminating about flush with the latch and adapted to be brought over the opening therein, substantially as specified.

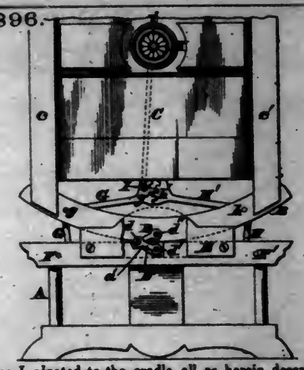
6. The combination, with the car-body, of a pivoted frame depending therefrom and provided with a compartment, and a second compartment pivoted within the frame and narrower than the same.

said narrow compartment being adapted for swinging downward into a vault agreeing in size therewith and too small to receive the frame, and the frame to swing into a wider compartment, substantially as specified.



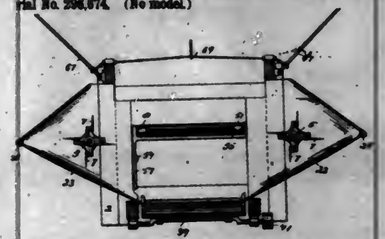
7. The combination, with the pivoted frame, of the pivoted box provided with the door and fixed bolt, and of the weighted disk mounted in the box and having an angular flange extending partially around the same, and an intermediate recess adapted to be brought into line with the bolt when the box is in a vertical position, substantially as specified.

409,895. **WATER-FILTERING MEDIUM.** JOHN B. ZIEGLER and JOHN F. ZIEGLER, Air Line Junction, Ohio. Filed Mar. 12, 1889. Serial No. 303,035. (No specimens.)



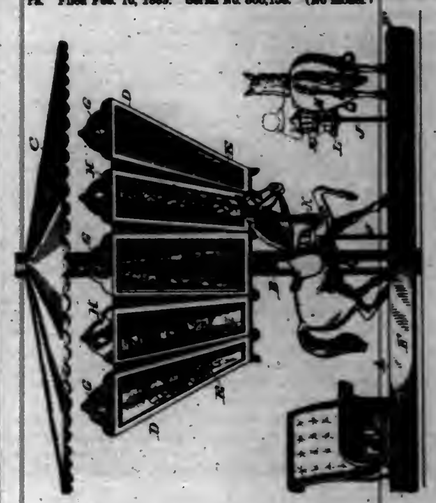
Claim.—The hereinbefore-described filtering composition composed of aluminous clay, alluvial or quick sand, and wood pulp, in about the proportions set forth.

409,896. **CRIB OR CRADLE.** PETER ACKER, Cincinnati, Ohio. Filed May 6, 1889. Serial No. 309,800. (No model.)



Claim.—In combination with a crib or cradle rocking upon a supporting base or stand, the pins F F', projecting from said base, the bell-crank hooks G G' H H', pivoted to the cradle at *g h*, respectively, and having at their inner ends segmental gears *g' h'*, which engage with each other and thereby produce a simultaneous movement of said hooks, and a rod I, connecting one of said hooks with the treadling device J, pivoted to the cradle, all as herein described and set forth.

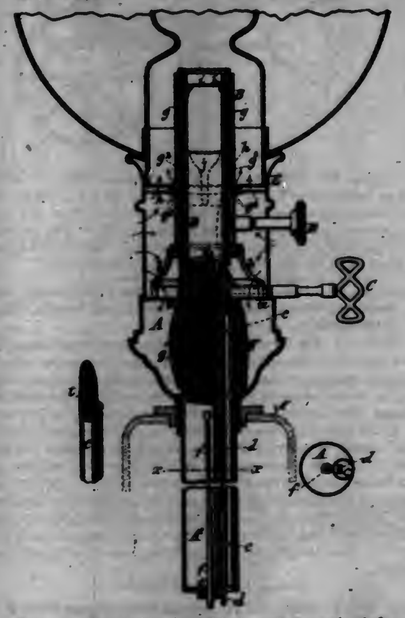
409,896.



409,897. **BAND-CUTTER AND FEEDER FOR THRASHING-MACHINES.** WILLIAM H. ALSTON, Buffalo, Dak. Filed Jan. 17, 1889. Serial No. 296,674. (No model.)

Claim.—1. The combination, in a machine of the class described, with the main frame 2, and the revolving shafts provided with the series of knives 7, of the inclined tables 23, arranged at each side of the main frame and having their lower ends resting upon said frame 2, the rods 25, extending transversely and supporting the upper ends of said tables, the inclined brace-rods 27, extending to the frame below said tables, pivoted to said rods 25 and provided with hooks engaging staples upon said frame 2, and the inclined brace-rods 29, extending to the frame above said table, and also provided with hooks engaging staples upon the frame, for the purpose set forth.

2. The combination, with the inclined tables 23 and knives 7, of the rack 67, pivoted above said tables and arranged to cover said tables, and the cords 69, secured to said racks, for the purpose specified.



409,898. **MERRY-GO-ROUND.** JAMES R. APPLEGATE, Philadelphia, Pa. Filed Feb. 16, 1889. Serial No. 300,158. (No model.)

Claim.—1. A merry-go-round having a central vertical beam with a frame surrounding the same, the frame being of the form of a frustum of an inverted pyramid and having stationary mirrors thereon, and figures on the platform of the device, said parts being combined substantially as described.

2. A merry-go-round having a central beam and revolving platform, a frame of the form of the frustum of an inverted pyramid secured to said beam and provided with mirrors, a figure secured to said platform, a column between said figure and beam, a seat with foot-rest secured to said column, and a brace connecting said column and figure, said parts being combined substantially as described.

409,899. **MODERATOR OR CARCEL LAMP.** CHARLES D. ARIA, London, County of Middlesex, England. Filed Feb. 28, 1888. Serial No. 265,067. (No model.) Patented in England Nov. 22, 1887, No. 14,073; in France Dec. 3, 1887, No. 187,371; in Germany Dec. 3, 1887, No. 44,117; in Canada Feb. 22, 1888, No. 28,736; in Belgium Mar. 24, 1888, No. 80,758; in Austria-Hungary July 10, 1888, No. 8,888 and No. 34,804; in India Nov. 3, 1888, No. 106; in New South Wales Nov. 20, 1888, No. 1,085; in South Australia Nov. 20, 1888, No. 1,178, and in Italy Jan. 31, 1889, 24,687/246.

Claim.—1. The combination, with the main reservoir A' of a moderator or carcel lamp, of the secondary reservoir A, comprising a cup connected to said main reservoir, having a tubular extension A^3, depending therein and provided at its top with a ledge or rim *a*, a skeleton frame *b*, rising from the latter, the wick-case B, detachably secured to the upper end of the frame, the wick *g* in the wick-case, the auxiliary feed-wick *g'*, descending through the skeleton frame and the ledge or rim into the secondary reservoir, the moderator-rod *f*, rising in the tubular extension, and the oil-overflow tube *c*, rising through the tubular extension and cup comprising the secondary reservoir and terminating below and adjacent to the aforesaid ledge or rim for conveying an excess of oil back to the main reservoir, substantially as described.

2. The combination, with the main reservoir A' of a moderator or carcel lamp, of the secondary reservoir A, comprising a cup screwed into the former, having at its top the ledge or rim *a*, and at its bottom the tubular extension A^3, depending in the main reservoir, a skeleton frame *b*, rising from the ledge or rim and internally screw-threaded at its upper end, the wick-case B, screwed into the latter, the wick *g* in the wick-case, the feed-wick *g'*, descending through the skeleton frame and the ledge or rim into the secondary reservoir, the moderator-rod *f*, rising in the tubular extension, and the oil-overflow tube *c*, rising in the latter and terminating at its top end below and adjacent to the aforesaid ledge or rim, substantially as described.

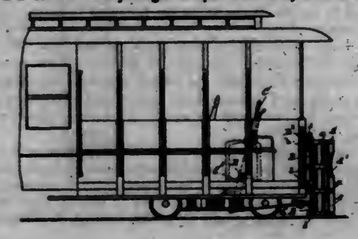
3. The combination, with the main oil-reservoir A' of a moderator or carcel lamp, of a secondary oil-reservoir A, secured to and above the former and comprising a tubular extension A^3, depending therein, a moderator-rod *f*, and oil-overflow tube rising in the latter and terminating below the top thereof for conveying excess of oil back to the main reservoir, a wick-case B, supported above the secondary reservoir, and wick leading from the wick-case into the secondary reservoir, substantially as described.

4. The combination, with the main reservoir of a moderator or carcel lamp, of a secondary reservoir A, comprising a cup secured to and above the main reservoir, and a tubular extension A^3, depending in the latter, an overflow-tube *c*, rising in the tubular extension, open to air circulation, and terminating at its upper end below the top of the cup portion of the secondary reservoir, and a wick-case B, supported above the secondary reservoir, substantially as described.

5. The combination, in a moderator or carcel lamp, of the main reservoir, a secondary reservoir mounted thereon and communicating therewith, and comprising a cup provided at its top with an inwardly-projecting rim *a*, a chimney-supporting gallery E, supported by the cup, a skeleton frame *b*, arranged within the gallery and resting upon and supported by the said inwardly-projecting rim, a wick-case detachably secured to the upper end of the skeleton frame, and a wick passing from the secondary reservoir upwardly through the inwardly-projecting rim and skeleton frame, substantially as described.

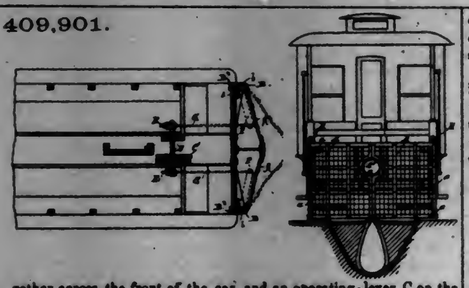
6. The combination, in a moderator or carcel lamp, of the main reservoir, a secondary reservoir supported by the latter and comprising a cup having at its top an inwardly-projecting rim *a*, an overflow-tube *c*, rising within the secondary reservoir and terminating at a point beneath the said projecting rim, a skeleton frame *b*, resting on and supported by the rim, a chimney-supporting gallery E, inclosing the skeleton frame, a wick-case carried by the upper end of the skeleton frame, and a wick passing from the secondary reservoir through the rim and skeleton frame, substantially as described.

409,900. **TURFING IMPLEMENT.** MELVILLE C. AYER, Biddeford, Me. Filed Dec. 15, 1888. Serial No. 293,671. (Model.)



Claim.—1. A turfing implement comprising the sliding needle and grooved looper-blocks held face to face and recessed longitudinally on their adjacent faces, the needle secured rigidly to the inner face of the needle-block, the looper pivoted in the groove of the looper-block to rock toward and from the needle, a lever engaging the said looper and projecting into the path of the needle-block and positively operated by said block, substantially as set forth.

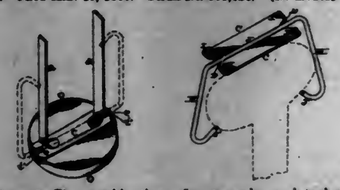
2. The combination, with a grooved needle-block carrying the needle and provided with fixed pins extending transversely through said groove, of a looper-block held to slide on the said needle-block, a looper pivoted in the said looper-block, a bell-crank lever fulcrumed in the said looper-block and engaging with one arm to said looper and having its other arm extending between the said fixed pins in the needle-block, substantially as shown and described.



3. The combination, with a grooved needle-block carrying the needle and provided with fixed pins extending transversely through said groove, of a looper-block held to slide on the said needle-block, a looper pivoted in the said looper-block, a bell-crank lever fulcrumed in the said looper-block and engaging with one arm the said looper and having its other arm extending within the range of the said fixed pins in the needle-block, and a set-screw held in the said looper-block and serving to limit the motion of the said looper, substantially as shown and described.

409,901. **PILOT OR WHEEL-GUARD FOR STREET-CARS.** GEORGE H. BAHRS, San Francisco, Cal. Filed Apr. 24, 1889. Serial No. 308,496. (No model.)

Claim.—1. A pilot or wheel-guard for the front of a car, consisting of the hinged frames A A, attached at the outer edges to uprights B B on the car by hinges to open outwardly and to close to-



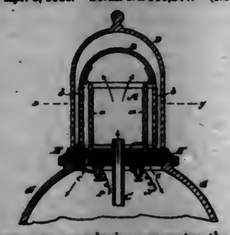
409,901.

gether across the front of the car, and an operating-lever C on the car, having suitable connection with said frames to throw them outward and move them in the opposite direction or toward each other, as hereinbefore described, for operation as set forth.

2. In a safety-pilot or wheel-guard for the front of a car or dummy, the combination of hinged frames or wickets A A, attached by hinges at the outer edges to open and close in opposite directions across the front of the car, the hand-lever C, rock-shaft D, lever-arms E E F F, and connecting-rods G G, applied to operate as set forth.

409,902. RAILWAY-TORPEDO. WALTER C. BECKWITH, Fostoria, Ohio. Filed Mar. 19, 1889. Serial No. 303,838. (No model.)

Claim.—1. The combination of a torpedo, a detachable clip, means for attaching it to the torpedo, and a wire for attaching the clip to the rail, substantially as shown.



2. The combination of a torpedo with a detachable clip and means for attaching the clip to the torpedo, substantially as described.

3. The combination of the torpedo having flanges with the detachable clip, provided with turned-up ends for catching over the flanges, and the wire shaped so as to attach the torpedo to the rail, substantially as set forth.

4. The combination of the torpedo provided with flanges with the detachable clip having turned up ends and the bent wire attached to the torpedo by the clip and provided with the turned-up ends, substantially as specified.

5. The combination of a torpedo with a detachable clip and a fastening device for attaching the torpedo to a railroad-rail, substantially as shown.

409,903. OZONE APPARATUS. HILARION A. R. H. DE VARS, Paris, France. Filed Apr. 6, 1889. Serial No. 306,577. (No model.)

Claim.—1. In an ozone-producing apparatus, the combination of a receiver G, for the storage of the air, the stand E, having openings *c*, which communicate with the receiver, a cylinder A, mounted at one end on the stand, open at the opposite end and lined with foil *a*, the bell-cover B, inclosing the cylinder, mounted on the stand and lined with foil *b*, said cylinder and bell-cover being arranged with the openings in the stand between them, and wires N P, connecting the cylinder and bell-cover with an electric generator, substantially as described.

2. In an ozone-producing apparatus, the combination of an ebonite or other suitable stand E, provided with openings in the part between the grooves in which the cylinder A and the bell cover B respectively fit, such openings being intended to convey the air into the receiver G to be stored, a tube C, passing through the ebonite or other stand, a glass bell-cover D, covering the whole, and wires N P, connecting the cylinder and bell-cover with an electric generator, substantially as described.

3. In an ozone-producing apparatus, the combination of an ebonite or other suitable stand E with a cylinder A, the inner surface of which is covered with tin-foil *a*, connected by a wire N with the negative pole of an induction-coil, and a bell-cover B, the outer surface of which is covered with tin-foil *b*, connected by a wire P with the positive pole of an induction-coil, substantially as described and set forth.

409,904. PAINT COMPOUND. NEHEMIAH R. BONNER and IRA L. BURLINGAME, Pana, Ill. Filed Apr. 25, 1889. Serial No. 308,540. (No specimens.)

Claim.—The herein-described paint composition, consisting of mortar-cement, yellow ocher, Venetian red, rosin, sulphur, alum, burnt umber, lamp-black, asbestus, asphaltum, liquid japan, and coal-tar, in or about the proportions specified.

409,905. RICE-HULLING MACHINE. ARTHUR A. BOURGEOIS, Ariel, La. Filed Jan. 22, 1889. Serial No. 297,173. (No model.)

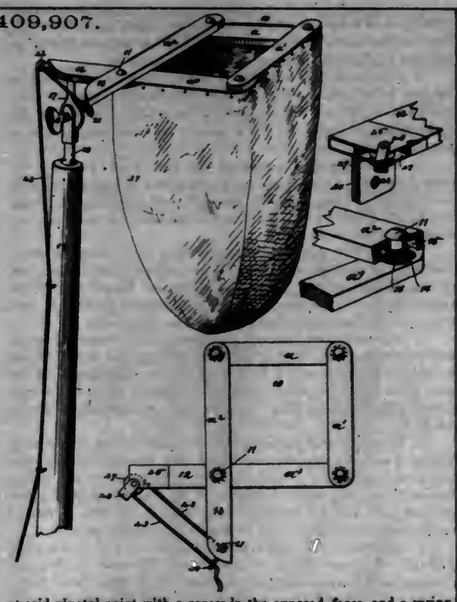
Claim.—The combination, with a corrugated plate 19, formed with an inclined face *b*, of a corrugated-faced plate 20, formed with an inclined section *d*, an agitator extending upward from the plate 20, a hopper that is entered by the agitator, a slide or trap arranged in connection with the hopper, a crank-shaft, and connections between the crank-shaft and the plate 20, substantially as described.

409,906. PROCESS OF PRINTING DARK BLUE COLORS. JOHN BRACEWELL, North Adams, Mass. Filed June 10, 1884. Serial No. 135,042. (No specimens.)

Claim.—1. The described process of printing dark blue indigo colors upon the fabric, which consists in applying the glucose solution upon only one side or face of the fabric and after drying the same applying to said side or face an aqueous mixture of indigo and caustic soda and steaming and washing the fabric, substantially as described.

2. The described process of printing indigo colors upon the fabric, which consists in applying an aqueous mixture of indigo and free caustic soda to the glucose-covered surface of the fabric and producing a reaction between them in such a manner as to be free from the presence of injurious salts of copper or other like metals by means and in the presence of a roller-surface incapable of forming salts injurious to said reaction from the effect of the free caustic soda, indigo, or glucose while undergoing the said reaction in its presence, substantially as described.

409,907. FRUIT-PICKER. STEPHEN BRASER, Preston Hollow, N. Y. Filed Mar. 28, 1889. Serial No. 305,126. (No model.)



Claim.—1. In a fruit-picker, the combination of a lazy-tongs frame provided with a spring capable of forcing the tongs open, a bag attached to the body of the frame, and a handle and draw-line secured to the outer members of the said lazy-tongs frame, substantially as and for the purpose specified.

2. In a fruit-picker, the combination, with a spring-actuated lazy-tongs frame having two of the members of said frame projected beyond the pivotal point, and a bag attached to the frame, of a handle adjustably secured to one of the arms of the frame, a rope or chain attached to the free projecting member of the frame, and a guide-pulley or eye attached to the fixed projecting member over which the said rope or chain is passed, substantially as shown and described, whereby the frame may be contracted, as and for the purpose specified.

3. In a fruit-picker, the combination, with a spring-actuated lazy-tongs frame consisting of four members pivotally connected, two of the members being carried outward beyond their pivotal point, a bag attached to the frame, and a shank or post projected downward from one of the arms of the frame, of a handle provided with a bifurcated post in the upper end capable of receiving the said shank or post, a thumb-screw adjustably connecting the post and the shank, and a rope or chain or its equivalent secured to the free arm of the frame and passing loosely through an eye or equivalent device secured to the opposite arm, all combined for operation substantially as shown and described.

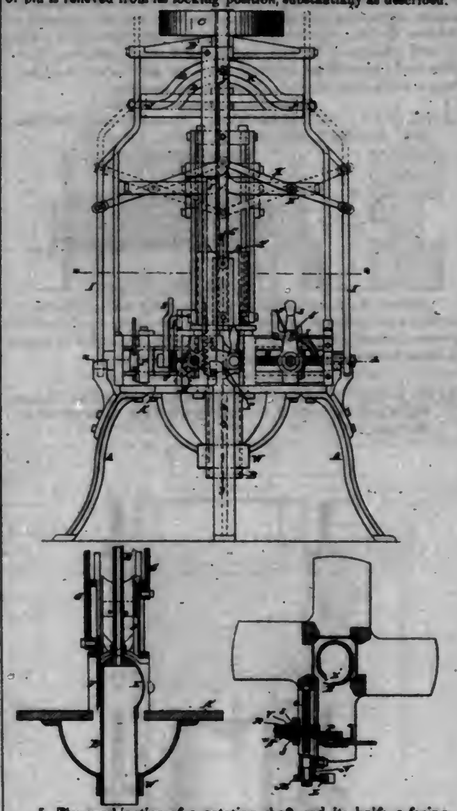
4. In a fruit-picker, the combination, with a lazy-tongs frame consisting of four members pivotally connected, two of which members are projected beyond their pivotal point at one corner, provided

409,907.

at said pivotal point with a recess in the opposed faces, and a spring coiled around the pivot and secured in the said recesses, of a bag secured to the frame, a handle, a pivotal adjusting connection between the handle and one of the frame-arms, and a rope or its equivalent attached to the free arm of the frame and passing loosely through an eye or equivalent device secured to the opposite frame-arm, substantially as and for the purpose specified.

409,908. MEAT-CUTTER. GUSTAVUS V. BERGEY, St. Louis, Mo. Filed Feb. 14, 1889. Serial No. 299,897. (No model.)

Claim.—The combination, with the casing and rotating shaft, of a series of cutters mounted on the shaft and holding-disks at the ends of said cutters, the outer face of one of said disks being provided with a groove for leading or drawing a lubricant to the shaft-bearing, substantially as described.



409,909. MACHINE FOR CUTTING WOODEN DISHES. DAVID H. BURNHAM, Grand Rapids, Mich. Filed Apr. 25, 1889. Serial No. 308,515. (No model.)

Claim.—1. A machine for cutting concave-convex dishes, comprising in its construction a rotating drive-shaft having a cam, and a curved knife and a reciprocating facing-knife connected to and operated by the cam on the rotating drive-shaft, the knives so arranged with reference to each other that the reciprocating facing-knife faces the block after each cut by the curved knife, substantially as described.

2. In a machine for cutting wooden dishes continuously from a block of wood, the combination of a rotating knife, a hollow shaft upon which the knife is mounted, said shaft adapted to receive the several dishes, and a facing-knife adapted to face the block after each cut of the rotating knife.

3. In a machine for cutting wooden dishes continuously from a block of wood, a revolving knife mounted on a hollow shaft provided with an opening for the reception of the dish as it is severed from the block, and an aperture extending the length of the shaft and adapted to receive a blast of air at one end for driving or forcing out at the other end of said shaft the severed dishes, substantially as described.

4. In a machine for cutting wooden dishes, the combination of a feed-screw, a slotted disk adapted to turn in opposite directions, a split nut adapted to engage with the threads of the feed-screw and provided with two pins, each engaging with a slot in the disk, a lever attached to the disk and provided with a pin or catch, a slotted arm or lever, a spring adapted to hold the arm or lever in position to lock the split nut in engagement with the feed-screw, and a coiled spring adapted through the lever to sever such engagement when the catch or pin is relieved from its locking position, substantially as described.

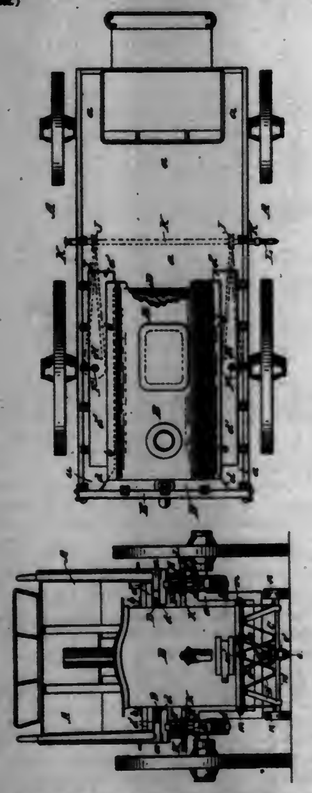
5. The combination of a rotating shaft and its knife, a facing-knife, a sliding knife-bar attached at one end to the facing-knife, a lever attached at one end to the knife-bar and at the other end provided with a pin or roller, and a cam-wheel rigidly attached to the shaft that rotates the knife and engaging said pin or roller, substantially as described.

6. The combination of a main drive-shaft, a cutter moved by the shaft, a grooved cam-wheel on the shaft, an arm having a device moving in the groove in the cam-wheel and terminating at the other end in a rack-bar, a pinion with which the rack-bar engages, and a ratchet operated by said pinion and engaging with the feed-screw and giving it an intermittent movement, substantially as described.

409,910. WICK-RAISER FOR CENTRAL-DRAFT LAMPS. EDSON L. BRYANT, Ansonia, Conn., assignor of one-half to Wallace & Sons, same place. Filed May 13, 1889. Serial No. 310,553. (No model.)

Claim.—1. The herein-described wick-adjuster for central-draft lamps, consisting of a ring to surround the wick, the diameter of the

ring in one direction somewhat less than the external diameter of the wick as it stands upon the tube, and the diameter of the ring at right angles to the said less diameter somewhat greater than the said diameter of the wick, and the ring constructed with a curved rod in the plane of its longer diameter, extending upward and through a suitable guide outside the burner, substantially as described.



2. A wick-adjuster for central-draft lamps, consisting of the ring F, somewhat less in diameter in one direction than the external diameter of the wick as it stands upon the tube, and the diameter of the ring at right angles to the less diameter somewhat greater than the said diameter of the wick, and having a rod G extending therefrom in the plane of the longer diameter, the said rod and ring made from a single piece of wire, substantially as described.

409,911. EXTENSION-TABLE. WILLIAM H. BURK, Sheboygan, Wis. Filed Feb. 9, 1889. Serial No. 299,294. (No model.)

Claim.—A guide and stop block for extension-table slides, cut out to form a spring-tongue integral therewith, and having one face of the groove on its tongue side cut away for a certain distance of its length to offset said spring-tongue, substantially as set forth.

409,912. PORTABLE BOOMING-TANK APPARATUS. CHARLES BUEHLMAN, New York, N. Y. Filed May 13, 1889. Serial No. 310,496. (No model.)

Claim.—1. In portable tank apparatus, the main truck having a depressed axle, and an opening at its rear part allowing the truck to be backed around the tank, substantially as described, whereby the truck-body is adapted to sustain the tank by and above its bent axle, as set forth.

2. In portable tank apparatus, the main truck provided with an opening in its body allowing the truck to be backed around the tank, and provided also with a removable tail-board or piece applicable behind the loaded tank, substantially as herein set forth.

3. In portable tank apparatus, the main truck provided with an opening in its body allowing the truck to be backed around the tank, said body or platform being beveled off laterally at the rear of the tank-opening to guide the truck around the tank, substantially as herein set forth.

4. In portable tank apparatus, the main truck having a depressed axle and a rear body-opening, combined with a tank adapted to enter said opening above the bent axle, and provided with flanges or supports adapted to sustain it on the truck body or platform, substantially as herein set forth.

5. In portable tank apparatus, the main truck provided with a rear body or platform opening and loose planks adapted to close said opening, combined with a tank having lateral flanges or supports sustaining it on the loose planks laid on the truck-platform at each side of its tank-opening, substantially as herein set forth.

6. In portable tank apparatus, the combination, with a main truck provided with a rear body or platform opening, of a tank adapted to said opening and having flanges or supports sustaining it on the main truck-body, and a detachable truck adapted to the tank to support it when unloaded from the main truck, substantially as herein set forth.

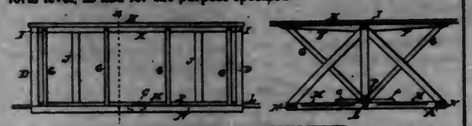
7. In portable tank apparatus, the combination, with a main truck having a rear body-opening and a rear axle depressed at its center below said opening, of a tank adapted to the opening and having flanges or supports which sustain it on the main truck-body above the bent axle, and a detachable truck fitted to the tank in rear of the depressed main truck-axle, substantially as herein set forth.

8. In portable tank apparatus, the combination, with a main truck having a rear body-opening, of a tank adapted to said opening and provided with flanges or supports for sustaining it on the truck-body, and devices, substantially as specified, interposed between the truck body and axle for raising the body and thereby lifting the tank for loading it onto the main truck, substantially as herein set forth.

9. In portable tank apparatus, the combination, with a main truck having a rear body-opening, of a tank adapted to said opening and provided with flanges or supports for sustaining it on the truck-body, and screws threaded into nuts on the truck-body and stepped in bearings above the truck-axle, substantially as described, for the purposes set forth.

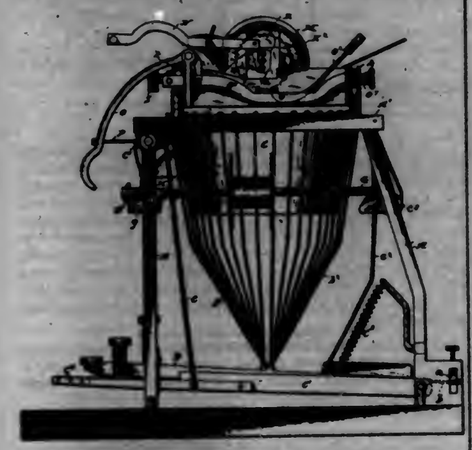
10. In portable tank apparatus, the combination, with a main truck having a rear body-opening, a depressed axle, wheels thereon, and springs on said axle sustaining the truck-body, of screws threaded into nuts on the truck-body and stepped in bearings above the truck-axle and springs, substantially as herein set forth.

11. In portable tank apparatus, the combination, with a main truck having a rear body-opening adapted to receive a tank, and screws threaded into nuts on the truck-body, one at each side thereof, and stepped at the truck-axle, of wheels on the screws, a transverse shaft on the truck, wheels on said shaft, and chains connecting the shaft and screw-wheels, substantially as described, for the purposes set forth.



12. In portable tank apparatus, the combination, with a main truck having a rear body-opening, of a tank having upper flanges or supports sustaining it on the truck-body within its opening and provided also with a bottom flange, and a detachable wheeled truck for the tank made with hooks which loosely engage the bottom flange of the tank, substantially as herein set forth.

13. In portable tank apparatus, the combination, with a main truck having a rear body-opening, of a tank having upper flanges or supports sustaining it on the truck-body within its opening and provided also with a bottom flange, and a detachable truck made with three hooks engaging the bottom flange of the tank at two sides and the rear and provided with two forward wheels and one rear pilot-wheel, substantially as herein set forth.



14. In portable tank apparatus, the combination, with a main truck having a rear body-opening and a tank adapted for support by the truck within said opening, of loose planks on the truck-body at each side of the tank-opening, and screws threaded to nuts on the truck-body and stepped above the axle and adapted to raise the truck-body and tank for loading the tank onto the truck, said screws passed through the loose planks to hold them in place to receive the tank as the truck backs onto and around it, substantially as herein set forth.

409,913. DUMPING-PLATFORM. EDWARD BURNS, Montello, Wis., assignor of one-half to the Berlin & Montello Granite Company, Chicago, Ill. Filed June 11, 1888. Serial No. 313,982. (No model.)

Claim.—A dumping-platform consisting of a stationary part which is formed of the sills A A N N, trusses E D, and the flanged cross-sill A' M, in combination with the tilting frame consisting of the sill P, plate K, posts J J, braces G, timbers F, and platform H, the plate K journaled to the tops of the trusses, and the cam-buttons C C pivoted to the flanged sill A' M to engage the sill P and hold the platform level, as and for the purpose specified.

409,914. TYPE-WRITING MACHINE. FRANK BURNS, Westfield, N. Y. Filed Apr. 9, 1889. Serial No. 306,512. (No model.)

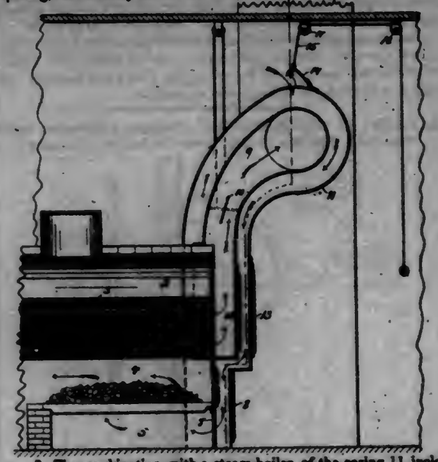
Claim.—1. The combination, in a type-writer, of a tapering type-socket or shank and a member provided with a guide-hole corresponding in shape and dimensions with the base of the type-shank, substantially as described.

2. The combination of a type for type-writers, having a cylindro-conoidal shank or socket, and a centering-plate having a cylindrical guide-hole, substantially as described.

3. The combination, in a type-writer, of a loosely-mounted type-bar, a type having a tapering shank, as described, and a perforated centering-plate, substantially as described.

4. A key-lever and key-lever spring formed integral with each other of thin spring-metal plate, having the flat surface of the spring part at right angles with the flat surface of the lever part, substantially as described.

5. In a type-writer, the combination of a round rear track, a cylinder-carriage, and grooved rollers connected with the carriage and embracing the round track, substantially as described.



6. The combination, in a type-writer, of an intermittently-driven shaft carrying intergearing devices, a pair of spool-carrying shafts mounted to reciprocate in the direction of their length, a vibrating lever connected with the spool-carrying shafts, and a spring-stop whereby the inking-ribbon is mounted and operated step by step and reversed, substantially as described.

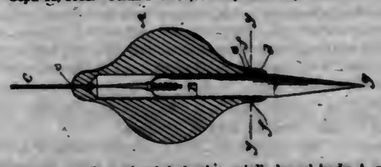
7. The combination, in a type-writer, of a carriage, a platen mounted in movable boxes, and a yoke or lever pivoted to the carriage, flexibly connected with the platen, and extending to the front of the machine to a point for conveniently raising and turning said platen, and thereby bringing the work to view, substantially as described.

8. The combination, in a type-writer, of a carriage having risers provided with "key-hole" slots, movable boxes fitted to reciprocate and rotate in said slots, an impression-cylinder mounted in the boxes, and a yoke connected with said boxes for raising and swinging the cylinder to bring the writing into view, substantially as described.

409,915. MEANS FOR UTILIZING THE RADIATED HEAT OF BOILERS. FRANK H. BUTTS, Minneapolis, Minn. Filed May 6, 1889. Serial No. 309,767. (No model.)

Claim.—1. The combination, with a steam-boiler, of a casing surrounding and inclosing the front of the boiler and its fire-box and ash-pit doors, and the uptake or smoke-pipe of the same, with a continuous air-space between said casing and said surfaces having communication with the fire-box of the boiler, and an inlet for the outer air arranged at or near the top of said casing, whereby the air taken into the fire-box is received from the upper part of the boiler-room and conducted over the heated surfaces of the boiler directly to the draft-opening, substantially as and for the purposes set forth.

2. The combination, with a steam-boiler, of the casing IJ, inclosing the smoke-pipe and boiler-front, with a continuous air-space between the same communicating with the ash-pit, and the air-inlet 16, arranged in the upper part of said casing, provided with the door 14, and the doors 8 and 13, arranged in said casing and allowing access to the fire-box and ash-pit doors and boiler-front, substantially as described.

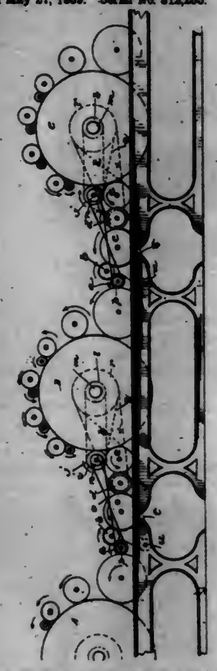


409,916. METAL CEILING. FRANK G. CALDWELL, Wheeling, W. Va. Filed June 8, 1889. Serial No. 313,595. (No model.)

Claim.—1. As a new article of manufacture, a recessed ceiling-panel composed of an open frame and a metal sheet secured to one side of said frame, substantially as described.

2. As a new article of manufacture, a recessed ceiling-panel composed of an open frame having tongued-and-grooved edges and a metal sheet secured to one side of said frame, substantially as described.

409,917. PLUMB-BOB. JOHN M. CAMERON, Philadelphia, Pa. Filed Sept. 18, 1888. Serial No. 285,693. (No model.)



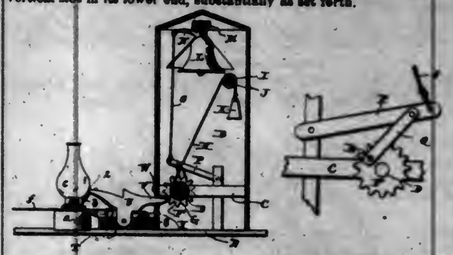
Claim.—1. In a plumb-bob, the axially-bored body A, provided with the annular chamber *d*, and a split spring-ring *c*, held within the chamber, said chamber *d* having lateral apertures *f*, whereby a suitable tool may be inserted to remove the split spring-ring, substantially as specified.

2. In a plumb-bob, the combination of an axially-bored body A, carrying the cord C, and provided with the annular chamber *d*, the split spring-ring *c*, held in said chamber, and the point B, fitted to the bore of the body A and adapted to be adjustably clamped by the split spring-ring, substantially as shown and described.

3. As an improved article of manufacture, a plumb-bob consisting of an axially-bored body provided with a clamping-ring in the lower end of the bore, and a reversible point having a conical-pointed part at one end and a removable point at the other, as set forth.

4. The combination of the axially-bored plumb-bob body A, the point B, provided with the spring-arms *j*, the auxiliary point *i*, provided with the shank *p*, and the spring-ring *c*, adapted to clamp the point B in the body A, substantially as specified.

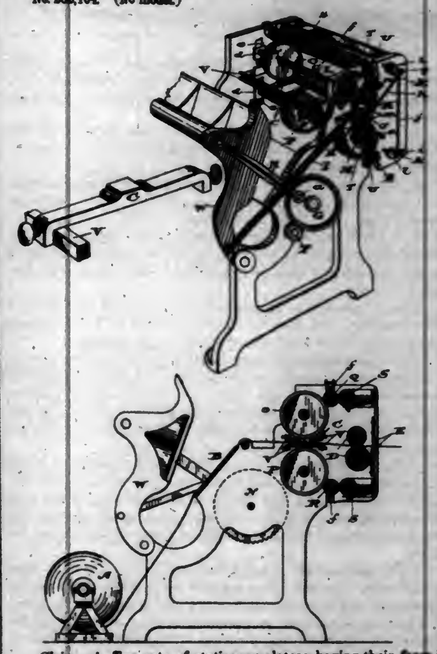
409,918. CARDING-MACHINE. FREDERICK H. CARPENTER, Louisville, Ohio. Filed May 27, 1889. Serial No. 312,233. (No model.)



Claim.—1. In a train of carding-engines, first and second breaker-cylinders equipped with the usual appurtenances, a stripping and stretching roller to take the stock from the doffer of the first breaker, spreading and evening rollers arranged next to the stripper and stretcher, and another stretching-roller arranged next to the second breaker-cylinder, and which also serves to feed the stock to the said second breaker-cylinder, combined with a finishing-card and similar stripping and stretching and spreading and evening and stretching and feeding rollers interposed in the order named between it and the second breaker, substantially as described.

2. In a train of carding-engines, first and second breaker-cylinders equipped with the usual appurtenances, a stripping and stretching roller to take the stock from the doffer of the first breaker, spreading and evening rollers, and means to impart a longitudinal vibration thereto, arranged next to the stripper and stretcher, and another stretching-roller arranged next to the second breaker-cylinder, and which also serves to feed the stock to the said second breaker-cylinder, combined with a finishing-card and similar stripping and stretching and spreading and evening and stretching and feeding rollers interposed in the order named between it and the second breaker, substantially as described.

409,919. BURGLAR-ALARM. ELMIRA CARTER, Clio, Tex. Filed Mar. 27, 1889. Serial No. 304,970. (No model.)



Claim.—1. The combination, with a suitable casing, of a shaft having a winding-drum, a rope connected to said drum and passing over a pulley, a weight attached to said rope, a crank at the outer end of the main shaft, a ratchet-wheel at the inner end of said shaft, a pitman connected to said ratchet-wheel and pivoted at its free end to a vibrating arm pivotally attached to the casing, a rope connecting the outer end of said arm with a bell hung in the top of the casing, and a latch adapted to engage the ratchet-wheel, substantially as set forth.

2. The combination of the casing, the shaft having the winding-drum, a rope connected to the latter passing over a pulley and having a weight attached thereto, a ratchet-wheel at one end of the shaft a pitman connecting said ratchet-wheel with the alarm-sounding mechanism, a spring-latch engaging the ratchet-wheel and having a cam-lever pivoted in a notch at its front end, the lamp having a scratch-plate attached to its burner, and the lamp-chimney having a vertical slot in its lower end, substantially as set forth.

3. The combination of the casing, the main shaft having a ratchet-wheel at its inner end, a pitman connecting said ratchet-wheel with a vibrating arm, a cord connecting the latter with a suitably-arranged bell, a weight adapted to be raised by means of the main shaft and to rotate the latter by its descent, a spring-latch arranged to engage the ratchet-wheel, a match-holding device at the front end of said latch, a lamp arranged in proximity thereto and having a scratch-plate attached to its burner, and a prop adapted to support the outer end of the latch and connected by means of a suitably-arranged cord with the entrance to be guarded, substantially as and for the purpose herein set forth.

409,920. MACHINE FOR NUMBERING PAPER. JOHN R. CARTER, Toronto, Ontario, Canada, assignor, by mesne assignments, to Carter & Company, (Limited,) Niagara Falls, N. Y. Filed May 14, 1886. Serial No. 202,164. (No model.)

Claim.—1. Two sets of stationary platens having their faces in substantially the same plane and facing in opposite directions, and two sets of intermittently-changing printing-types, in combination with mechanism arranged to impart a reciprocating action to the two sets of type, so as to bring each set of type against its respective platen, substantially as and for the purpose hereinbefore described.

2. The combination of two sets of intermittently-changing printing-types supported in reciprocating bearings, two sets of stationary platens having their faces in substantially the same plane and facing in opposite directions, and mechanism arranged to impart a reciprocating motion to the two sets of type in opposite directions to bring each set of type against its respective platen, substantially as and for the purpose specified.

3. The pitman I, connected at one end to the pivoted printing-head, which derives a rocking movement through the pitman H from the revolving spur-wheel G, and at its other end to the coupling-link J, in combination with the spindles L and M and the type-rollers carried thereby, and the bars K, arranged to connect the spindles L and M to the coupling-link J, substantially as and for the purpose specified.

4. The coupling-link J, provided with guide-pieces *h*, which fit into their respective slots *c*, made in the frame N, and the bars K, connecting the spindles L and M to the coupling link J, in combination with the spindles L M, type-rollers O P, and the bearing-boxes *d*, supporting the spindles L and M and fitting into the vertical slots *c*, arranged substantially as and for the purpose specified.

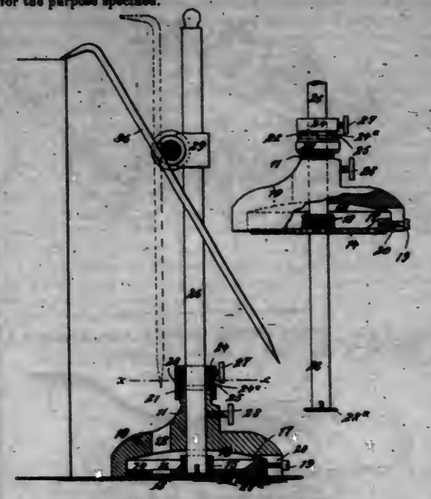
5. The combination, with the press-head W, coupling-link J, and pitman I, connecting said head and link, of the spur-wheels T, dogs *m* on said link and arranged to engage with said spur-wheels, the upper roller S, and connections between said roller and the coupling-link, whereby the spur-wheels T and roller S are rotated simultaneously, as set forth.

6. The combination, with the press-head W, coupling-link J, pitman I, connecting said head and link, the spur-wheels T, and the dogs *m*, pivoted on said link and arranged to engage said spur-wheels, of the upper and lower rollers S, and connections between said rollers and between said upper roller and the link J, whereby said spur-wheels and rollers are all operated simultaneously, as set forth.

7. The coupling-link J, spur-wheels T, and dogs *m*, pivoted on the coupling-link J and arranged to engage with the spur-wheels T, as specified, in combination with the rollers Q and R, intermittently-changing printing type-wheels, the upper roller S, the rod *h*, connected at one end to the coupling-link J and at its other end to the arm *g*, which is loosely journaled upon the spindle of the upper roll S, the dog *k*, pivoted on the arm *g* and arranged to engage with the ratchet-wheel *l*, secured to the spindle of the said roller S, and means for reciprocating said link at stated intervals.

8. The dogs *m*, pivoted on the coupling-link J and arranged to engage with the spur-wheels T, as specified, the rod *h*, connected at one end to the coupling-link J and at its other end to the arm *g*, which is loosely journaled upon the spindle of the upper roller S, and the dog *k*, pivoted on the arm *g* and arranged to engage with the ratchet-wheel *l*, secured to the spindle of the said roller S, in combination with the rollers Q and R, intermittently-changing printing type-wheels, the upper and lower rollers S, the rod *j*, connected at its upper end to the arm *g* and at its lower end to the arm *i*, which is loosely journaled on the spindle of the lower roller S and has a dog *k* pivoted on it and arranged to engage with the ratchet-wheel *l*, secured to the spindle of the lower roller S, and means for reciprocating said link J at stated intervals, substantially as and for the purpose specified.

9. The platens C, adjustably connected upon bars secured to the frame of the machine, so that the faces of the platens shall face in the opposite direction, but will be in substantially the same plane, in combination with the type-rollers O and P, adjustably connected to their spindles, which derive a reciprocating action, so as to bring the faces of the type-rollers simultaneously against their respective platens.



409,921. COMBINED SURFACE, SCRATCH, AND DEPTH GAGE. THOMAS R. CASSIDY, Hoosick Falls, N. Y. Filed Oct. 15, 1888. Serial No. 288,089. (No model.)

Claim.—1. The combination, with a disk-like head provided with a central aperture and a threaded collar surrounding said aperture, of a sleeve screwed upon said collar, a thimble held in contact with said sleeve, a rod loosely passed through the head, the sleeve, and thimble, and a clamping device attached to the thimble, substantially as shown and described.

2. The combination, with a disk-like head provided with a central aperture, a threaded collar surrounding the aperture, a sleeve screwed upon said collar, and a detachable thimble provided with a set-screw secured to said sleeve, of a rod loosely passed through the head, the sleeve, and thimble, a clamp movable upon the rod, and scriber-arms adjustably held by said clamp, substantially as shown and described.

3. In a combined surface, scratch, and depth gage, the combination, with a recessed base having a central aperture and an aperture at one side of the said central aperture, of a rod adjustably secured in the central aperture of the base, a disk on the lower end of the rod and having an aperture in alignment with the side aperture of the base, and scribe-clamp adjustably secured to the upper end of the said rod, and scribe-rods carried by said clamp, substantially as described.

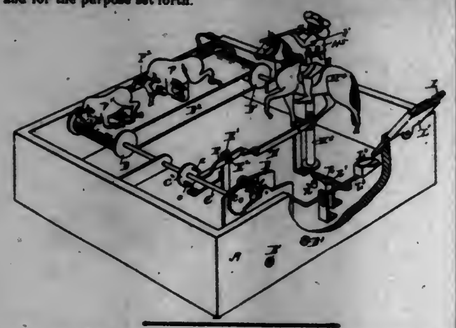
4. The combination, with a base provided with a vertical side bore, a disk provided with a corresponding bore loosely held in said base, an interiorly-grooved sleeve provided with an upper face recess screwed upon the base, and a thimble provided with an exterior annular lip detachably attached to the sleeve, of a gage-rod loosely passed through the disk, the base, the sleeve, and thimble, a clamp adjustable upon the rod, scriber-arms adjustably and detachably held by said clamp, and means, substantially as described, for locking the base and rod or the thimble and rod, all combined to operate as and for the purpose specified.

409,922. BOTTLE-STOPPER. JOHN H. CHESEBRAH, Syracuse, N. Y., assignor of one-half to Lewis H. Redfield, same place. Filed May 6, 1889. Serial No. 309,700. (No model.)

Claim.—1. The combination, with the bottle and its stopper, of a bail formed with a rigid cross-bar integral with the arms of the bail, a cam pivoted at right angles and at two points, respectively, at the end portions of said cross-bar, and a lever extending from one of the pivotal portions of the cam down along one of the arms of the bail and adapted to interlock with said arm at the side of the bottle, substantially as described and shown.

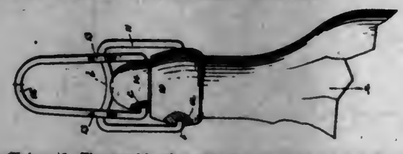
2. The combination, with the bottle and its stopper, of a bail pivoted to the bottle, a cam pivoted to said bail and connected to the stopper, and a lever attached to said cam and having its free end adapted to interlock with one of the arms of the bail, as set forth and shown.

3. The combination, with the bottle and its stopper, of a bail pivoted to the bottle and a wire wound around the cross-bar of the bail at opposite sides of the center of its length and bent intermediately into an offset and connected thereby to the stopper, and one end of said wire extended along the side of one of the arms of the aforesaid bail and terminated with a lateral bend adapted to interlock with said arm of the bail, substantially as described and shown.



4. The improved bottle-stopper attachment consisting of the bottle formed with the sockets *a a*, the bail *b*, having its ends inserted in said sockets, a wire wound into coils *c c*, embracing the cross-bar of the bail and bent intermediately into the shape of the offset *d*, and having the extension *d* along the side of one of the arms of the bail and terminating with the lateral bend *e*, adapted to interlock with said arm of the bail, and the stopper C, hung on the aforesaid offset *d*, substantially as described and shown.

409,923. COIN-OPERATED TOY. FRANK O. CLAFLIN, Boston, Mass., assignor of one-half to Thomas S. Mann, same place. Filed May 22, 1889. Serial No. 311,734. (No model.)



Claim.—1. In a mechanical toy set in operation by the dropping of a coin, the combination of the toy hunter having movable arms and head and the gun H°, and mechanism for giving motion to said parts, with the moving animal figures and mechanism for giving motion to said figures, substantially as and for the purpose set forth.

2. In a mechanical toy set in operation by the dropping of a coin,

having a figure of a hunter and figures of animals, some of said figures of animals being adapted to fall at fixed intervals, the combination of the mechanism for operating said figures with the stop device consisting of the stop-pin L^7, lever L^8, and coin-box L^9, substantially as and for the purpose set forth.

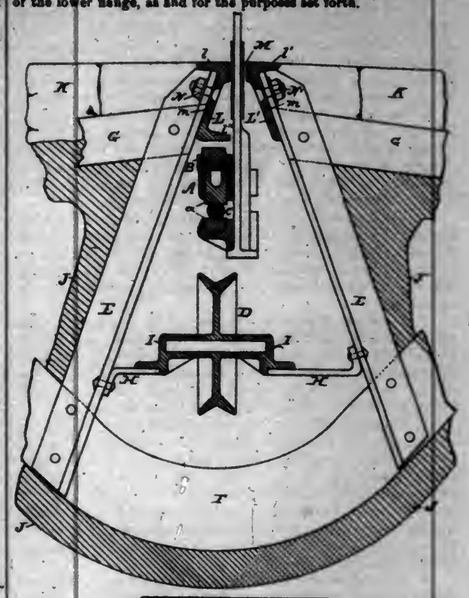
409,924. BOTTLE-STOPPER. FINLEY Y. CLARK, Saratoga, N. Y. Filed Jan. 16, 1889. Serial No. 296,479. (No model.)

Claim.—1. The combination, with the stopper-head and the bottle-head, of a bail pivotally mounted at the bottle-head to swing above and against the top of the stopper-head to hold the stopper in place, and a lifting-lever pivotally engaging the stopper-head and the bail, substantially as herein shown and described.

2. The combination of the cork and a screw passed through it, a head engaging the screw and the cork, a lever connected to the head and formed with loops, and a bail resting within the lever-loops, said bail being constructed for connection with a bottle or neck band, substantially as and for the purposes herein shown and described.

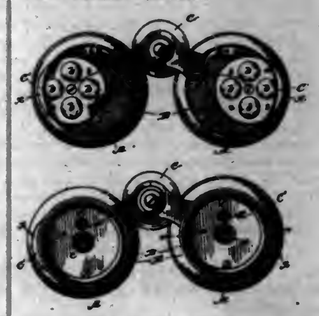
409,925. FLOWER-BOX. ANNIE CLELAND, New Orleans, La. Filed May 15, 1888. Serial No. 310,918. (No model.)

Claim.—1. The flower-box A, curved in at its rear side to form the rectangular recess and having the rear discharge-opening in said recess, the perforated false bottom supported above its solid bottom, and the supporting-bars B B, substantially as set forth.



2. The combination of the box having the pockets *a*, the rear clips, and the discharge-opening, a perforated false bottom, and the bent supporting-bars having the upwardly-bent lower ends, substantially as set forth.

3. The combination of the box having the pockets *a*, the rear clips, and the discharge-opening, the perforated false bottom, the bent supporting-bars having the upwardly-bent lower ends and perforated upper ends, the screws, and the staples, substantially as set forth.

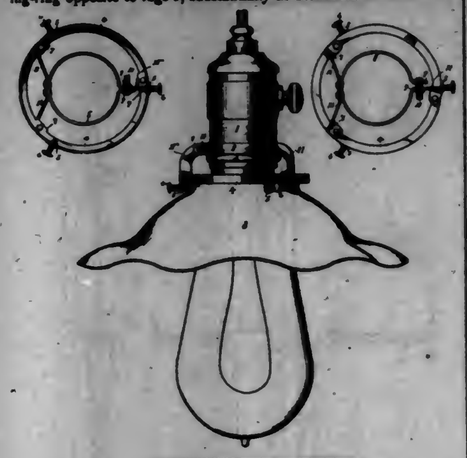


4. The combination of the box having the pockets *a*, the internal end supports and cross-bar, the discharge-opening, and the rear clips, the cork, the perforated false bottom, and the supporting-bars, substantially as set forth.

409,926. CABLE OR ELECTRIC STREET-RAILWAY. LEWIS M. CLEMENT, Oakland, and GEORGE C. WATERS, San Francisco, Cal. Filed Dec. 14, 1888. Serial No. 293,641. (No model.)

Claim.—The herein-described slot-iron L for street-railways having subways to carry the actuating mechanism, consisting, essentially, of an upper surface flange *l*, bottom flange *l'*, and a web *m*, passing diagonally from the inner edge of the upper flange to the outer edge of the lower flange, as and for the purposes set forth.

409,927. OPERA OR FIELD GLASS. ABNER R. CLEMENTS, U. S. Navy, assignor to Levy, Dreyfus & Co., New York, N. Y. Filed Mar. 30, 1889. Serial No. 305,479. (No model.)



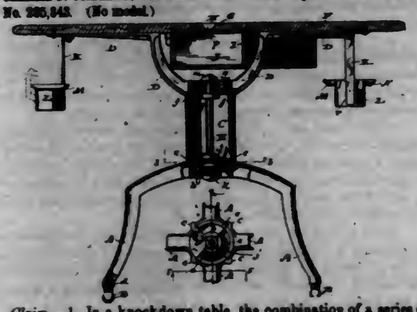
Claim.—1. As a new article of manufacture, an opera or field glass consisting of the barrels A and folding frame, extension-tubes B, each having an independently-adjustable lens-carrying disk C, pivoted eccentrically with relation to the eye-aperture and bearing a series of numbers or symbols corresponding to the eye-lenses, substantially as described.

2. As a new article of manufacture, an opera or field glass consisting of the barrels A and folding frame, extension-tubes B, each having an independently-adjustable lens-carrying disk C, pivoted eccentrically with relation to the eye-aperture and projecting laterally beyond the cap of the extension-tube, a series of numbers or symbols on said disk corresponding to the eye-lenses, an opening in the cap of the extension-tube through which said numbers are displayed, and a detent for maintaining said disk in position, substantially as described.

409,928. SHADE OR GLOBE HOLDER. BENJAMIN L. COE, Waterbury, Conn., assignor to the Steele & Johnson Manufacturing Company, same place. Filed Apr. 17, 1888. Serial No. 307,619. (No model.)

Claim.—A shade or globe holder consisting of a ring 4, to which the shade or globe may be attached in any suitable manner, a ring 8, which is adapted to clasp a fixture and is provided with lugs 9, a screw engaging said lugs to clasp and unclasp ring 8, and holding-arms whereby said ring is connected to the shade-ring, one of said arms being formed integral with the clasping-ring, being a continuation of leg 9, and curved downward and riveted to the shade-ring, and the other arms being riveted to the shade-ring and to the clasping-ring opposite to legs 9, substantially as described.

409,929. INCANDESCENT-ELECTRIC-LAMP SOCKET. JAMES W. COLLIER, New York, N. Y. Filed June 10, 1889. Serial No. 313,676. (No model.)

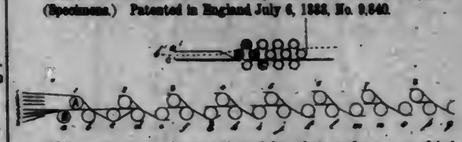


Claim.—1. The non-conducting holder having the socketed main-wire contacts *f f* and their permanent connections molded and embedded within its body and provided with the non-conducting cap B, as and for the purposes hereinbefore set forth.

2. The non-conducting holder having the socketed main-wire contacts *f f* and their permanent connections and provided with the non-conducting right and left screw-cap B, adapted at once and by the same movement to clamp the main or leading-in wires into place and to screw upon the bracket or support for said socket, as set forth.

3. An incandescent lamp-holder, of hard rubber or equivalent non-conducting material, formed in one piece, containing a lamp-socket, and a switch-receiving chamber solidly partitioned from said socket and having molded and embedded in it the fixed contacts for the lamp, switch, and main or leading-in wires, together with the permanent connections between said contacts, and provided with a movable circuit-controlling switch or cam piece in said chamber, a key-stem extending through the side of the holder into said chamber and detachably engaged with both the holder and the cam-piece, and a removable cap for closing the rear end of the switch-receiving chamber, as set forth.

409,930. KNOCKDOWN TABLE. EDWARD A. CORNELLIE and CHARLES P. CORNELLIE, Milwaukee, Wis. Filed Sept. 20, 1888. Serial No. 285,843. (No model.)

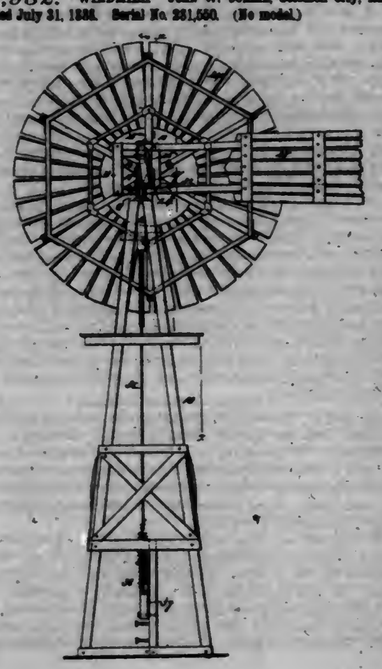


Claim.—1. In a knockdown table, the combination of a series of supports terminated at one end in eyes that converge toward a common center to lie one above another, and lateral extensions shaped to make close joints and form a wall around the eyes, a rod passed through said eyes, and nuts arranged on the rod to clamp said supports in place, substantially as set forth.

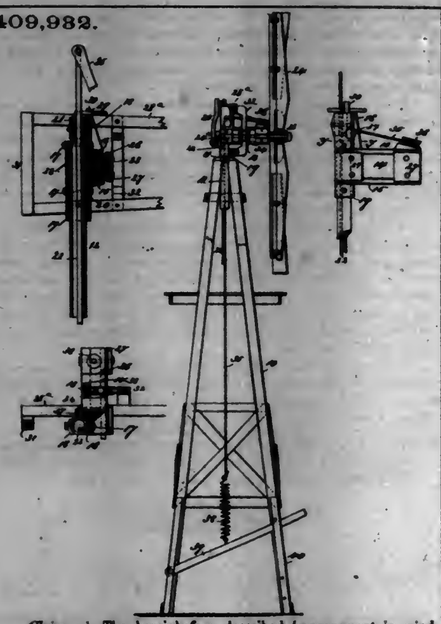
2. In a knockdown table, the combination of a series of legs and a series of top-supporting brackets, the members of each series terminating at one end in eyes that converge toward a common center to lie one above another, and lateral extensions shaped to make close joints and form a wall around the eyes, a rod passed through all the eyes, and nuts arranged on the rod to clamp said legs and brackets in place, substantially as set forth.

3. In a knockdown table, the combination of a series of legs and a series of top-supporting brackets, the members of each series terminating at one end in eyes that converge toward a common center to lie one above another, and lateral extensions shaped to make close joints and form a wall around the eyes, a sleeve inserted between the legs and brackets, a rod passed through the sleeve and all the eyes, and nuts arranged on the rod to clamp said legs and brackets in place, substantially as set forth.

4. In a table, the combination of the top having a V-shaped slot cut therein, a correspondingly-shaped plug for the slot provided with an eye, a pin for engagement with the eye, and a sliding drawer arranged to come under said slot, substantially as set forth.



409,931. CHENILLE FABRIC. JAMES CRABTREE, Heckmondwike, County of York, England. Filed Sept. 18, 1888. Serial No. 285,632. (Specimens.) Patented in England July 6, 1888, No. 9,840.



Claim.—1. As an improved article of manufacture, a fabric whereof the fur or chenille weft appears only on one face, said fabric consisting of a fur or chenille weft, a backing-weft, and a single warp, which latter binds together the two wefts, and serves also as a stuffer-warp, as set forth.

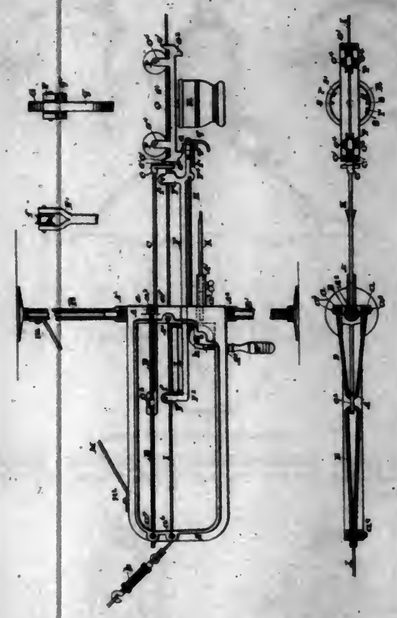
2. As an improved article of manufacture, a fabric wherein the fur or chenille weft appears only on one face, said fabric consisting of a fur or chenille weft, a backing-weft, and a single warp which binds together the two wefts, and serves also as a stuffer-warp, said warp being divided into sections, as described.

409,932. WINDMILL. JOHN W. CURRIE, Solomon City, Kans. Filed July 31, 1888. Serial No. 281,560. (No model.)

409,932.

Claim.—1. The hereinbefore-described improvement in windmills, comprising the pump-rod tube, a sleeve loosely mounted thereon, a pump-rod reciprocating in said tube, a wind-wheel frame, substantially as shown and described, detachably secured to the tube above the sleeve, journal-boxes detachably secured to the said frame, a wheel-shaft journaled in said boxes, a crank and pitman connection between said shaft and pump-rod, and the vane, said vane provided with forwardly-projecting arms, one of said arms (the upper) pivoted upon the wheel-frame and the other connected to the sleeve, said connections being in the same vertical plane, substantially as and for the purpose set forth.

2. In a windmill, the combination of the wind-wheel frame, the pump-rod tube detachably secured thereto, the detachable boxes secured to wheel-frame, as shown, a sleeve loosely mounted on said tube below the wheel-frame and the wind-wheel shaft, the vane 28, disposed to one side of the tube, provided with forwardly-extending arms 28², pivoted, one (the upper) to the wheel-frame, the other to the sleeve, said connections being in the same vertical plane, and a stop-bar 31, secured to one side of the ends of the arms 28², said bar projected laterally from said arms, whereby the said vane may be turned in direct line with the shaft when the mill is in operation, said parts all arranged substantially as and for the purpose described.



3. The combination, with the wind-wheel frame, the piston-rod tube secured thereto, a sleeve 19, loosely mounted on said tube, and the wheel-shaft journaled in bearing-boxes secured to the wheel-frame, provided with a brake-pulley 34, of the vane 28, disposed to one side of the tube, provided with forwardly-extending arms 28², one of which (the upper) is pivoted upon the wheel-frame, as at 29 30, the other connected to the sleeve 19, cross-bars 31 32, secured to the arms 28², one at each side of their pivotal points, and a brake-shoe 33, attached to the inner bar, the bar 31 limiting the outward movement of the vane when it is turned to the wind, said brake-shoe engaging the brake-pulley 34 when the vane is turned out of the wind, substantially as shown and described.

409,933. CASH-CARRIER APPARATUS. JOHN G. DAVIS, Detroit, Mich. Filed Mar. 21, 1889. Serial No. 304,235. (No model.)

Claim.—1. In a cash and parcel carrier apparatus, the combination, with a supporting-frame and a track with a car thereon, of a plunger, a propelling-spring, a check-spring connected to said plunger, said check-spring acting automatically as a check or brake to the plunger, substantially as set forth.

2. In a cash and parcel carrier apparatus, the combination of a frame, a plunger, a propelling-spring, a check-spring, a track with car thereon, a wheeled draw-bar supported by the track and carrying the catch G, the cord H, and handle H', substantially as set forth.

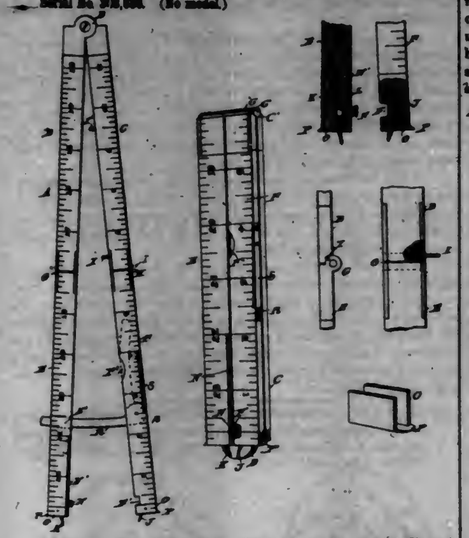
3. In a cash and parcel carrier apparatus, the combination, with a supporting-frame and a track with car thereon, of a plunger adapted to slide through an aperture in said frame, and a propelling-spring and a check-spring attached to the frame and each connected to an eye in the plunger, substantially as set forth.

4. In a cash and parcel carrier apparatus, the combination of the supported frame A, the plunger C, the springs D and E, the track I, with car thereon, the draw-bar F, detachably connected to the car, means for releasing the car, the operating cord and handle, and the spring L, substantially as set forth.

5. In a cash and parcel carrier apparatus, the combination, with a supporting-frame, a plunger, a propelling-spring connected thereto, a track with a car thereon, and a draw-bar detachably connected to the car and provided with an operating cord and handle, of a check-spring connected to the plunger and to the frame, substantially as set forth.

6. In a cash and parcel carrier apparatus, the combination, with the frame A, the track I, with a car thereon, the wheeled draw-bar F, supporting the catch G and detachably connected to the car, the plunger C, the propelling-spring D, and the cord H, with handle H', of the check-spring E, connected to the plunger and to the frame, substantially as set forth.

7. The combination, with the frame A, the track I, with car thereon, the draw-bar F, the plunger C, the springs D and E, and the cord H and handle H', of the returning-springs L, substantially as set forth.



8. In a cash and parcel carrier apparatus, the combination, with a supported frame, a track with a car thereon, and a plunger to which is connected a propelling-spring, of a wheeled draw-bar adapted to ride on the track and provided with a returning-spring, the draw-bar and plunger being in the same vertical plane, one being above, the other below, the track, and together forming a spring buffer or cushion for the car to come in contact with, substantially as set forth.

9. A cash and parcel carrier apparatus comprising the following elements: a frame, a standard, a plunger, a propelling-spring and a check-spring, a track with a car thereon, a wheeled draw-bar supported by and designed to ride on the track, an operating cord and handle, and a returning-spring, substantially as set forth.

10. In a cash and parcel carrier apparatus, and in combination with the standard B, the frame A, carrying the grooved wheel A, the socket A', and the trip-rod K, the plunger C, the springs D and E, the wheeled draw-bar F, carrying the catch G and spring L, and the cord H, attached to the draw-bar and passing over the wheel A and having the handle H', substantially as described.

11. In a cash and parcel carrier apparatus, the combination of the standard B, the frame A, carrying the socket A' and the trip-rod K, the plunger C, the springs D and E, the track I, with a car thereon, the wheeled draw-bar F, carrying the catch G, the spring L, the cord H, and handle H', substantially as set forth.

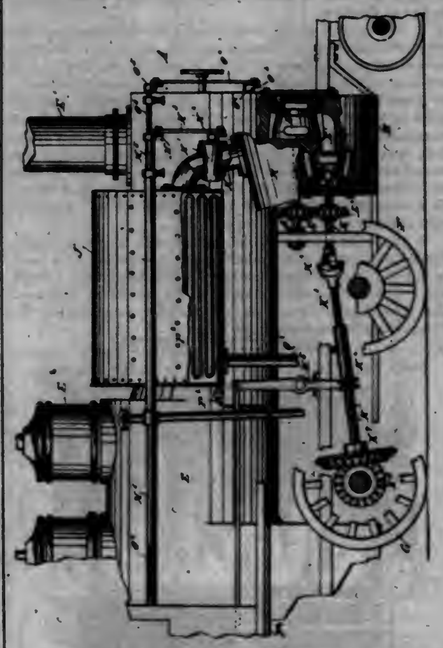
409,934. COMBINED CARPENTER'S RULE, CALIPERS, DIVIDERS, &c. WILLIAM A. DELMAGE, Lowell, Mass. Filed Mar. 18, 1889. Serial No. 303,998. (No model.)

Claim.—1. The combination, with a rule having two middle and two outer members jointed to fold at three points, of a fixed compass-point secured in an inclined position in one outer member, a lead-pencil held loosely in an inclined position in the other outer member, a clamp engaging the said lead-pencil, a set-screw screwing against the said clamp to lock the said pencil in place, and an arm pivoted on one outer member and adapted to extend through an opening in the opposite outer member, substantially as shown and described.

2. The combination, with a rule having two middle and two outer members jointed to fold at three points, of a fixed compass-point secured in an inclined position in one outer member, a lead-pencil held loosely in an inclined position in the other outer member, a clamp engaging the said lead-pencil, a set-screw screwing against the said clamp to lock the said pencil in place, an arm pivoted on one outer member and passing through an opening in the opposite outer member, and a spring for holding the said pivoted arm in place, substantially as shown and described.

3. A combined drawing and measuring instrument comprising a jointed rule having its outer members connected to the middle members by lock-hinges and adjustably connected together, one of the said outer members being provided with a point and the other with a pencil, substantially as described.

4. A combined drawing and measuring instrument comprising a rule having two middle and two outer members, the outer members being connected to the middle members by lock-hinges and adjustably connected together, one of the said outer members being provided with a point and cutter and the other with a pencil and cutter, substantially as herein shown and described.



5. A combined drawing and measuring instrument consisting of a jointed rule A, provided with the arm R, hinged to one member of the rule and engaging the other member, the point J in the end of one member, the pencil K in the end of the other member, and the cutters P Q, projecting laterally from the ends of the said members, substantially as described.

409,935. WAGON-STANDARD. NELSON R. DEPPE, Confluence, Pa. Filed May 9, 1889. Serial No. 310,135. (No model.)

Claim.—The combination, in a wagon-standard, of the vertical member *b*, having the plain tenon at its lower end and upset and perforated at its upper end to form the ring-eye, the inclined member or brace *b'*, having the plain tenon at its lower end and united at its upper end with the vertical member adjacent to the upset portion, both of said members having lateral flanges to serve as strengthening means and at their lower terminal portions as supporting-shoulders, substantially as set forth.

409,936. LOCOMOTIVE. JAMES DUN BERRAY, Vancouver, British Columbia, Canada. Filed Aug. 16, 1888. Serial No. 282,944. (No model.)

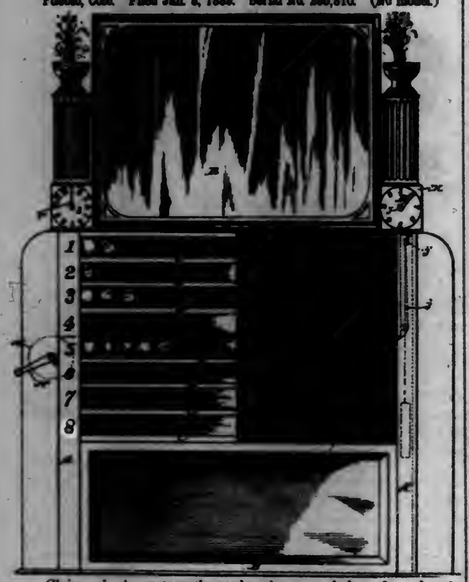
Claim.—1. The combination, with two high-pressure cylinders, a rotary valve controlling both cylinders, a passage leading from said valve into the smoke-box, and a valve therefor, of the low-pressure cylinder and a passage leading from said rotary valve thereto, substantially as set forth.

2. In a locomotive, the combination, with two high-pressure cylinders and two low-pressure cylinders, of a rotary valve controlling both high-pressure cylinders and two rotary valves deriving steam from the first-named rotary valve and controlling the said two low-pressure cylinders, substantially as shown and described.

3. In a locomotive, the combination, with two high-pressure cylinders and two low-pressure cylinders, all connected with the driving-wheels, of a rotary valve controlling the inlet and exhaust steam of the said high-pressure cylinders, two additional rotary valves connected by a passage with the exhaust-port of the said first-named rotary valve, said two rotary valves controlling the low-pressure cylinders, and a condenser into which the exhaust steam from said two rotary valves is discharged, substantially as shown and described.

4. In a locomotive, the combination, with two high-pressure cylinders connected with the drive-wheels, of a rotary valve controlling the inlet and exhaust steam of the said cylinders, two rotary valves connected with the exhaust-port of said first-named rotary valve, low-pressure cylinders connected with the driving-wheels and controlled by the said two valves, pipes leading from the exhaust of the said two rotary valves, and a condenser into which said pipes discharge, substantially as shown and described.

5. In a locomotive, the combination, with two high-pressure cylinders connected with the driving-wheels, of a rotary valve controlling the inlet and exhaust steam of the said cylinders, two rotary valves connected with the exhaust-port of the first rotary valve and operating simultaneously with the said first-named valve, low-pressure cylinders connected with the driving-wheels and controlled by the said two valves, pipes leading from the exhaust of the said two rotary valves, a plug-valve in each of the said pipes, and branch pipes lead-



ing from the said plug-valves to the smoke-stack, substantially as shown and described.

6. In a locomotive, the combination, with two high-pressure cylinders connected with the driving-wheels, of a rotary valve controlling the inlet and exhaust steam of the said cylinders, two rotary valves connected with the exhaust-port of the said first-named rotary valve, low-pressure cylinders connected with the drive-wheels and controlled by the said two valves, a condenser into which the exhaust-steam from the said two rotary valves is discharged, an air-pump operated from one of the driving-wheels and connected with the said condenser to exhaust its vapors, and a pump connected with the said condenser for returning the water of condensation to the boiler, substantially as shown and described.

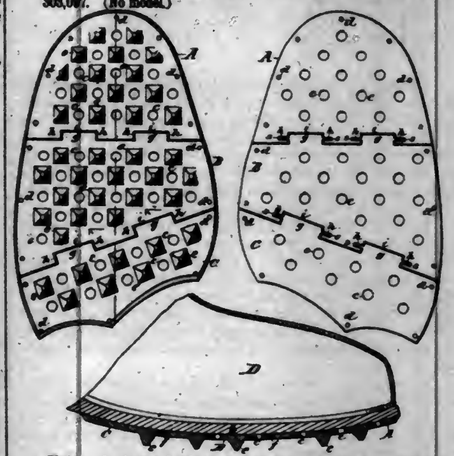
7. In a locomotive, the combination, with two high-pressure cylinders connected with the drive-wheels, of a rotary valve controlling the inlet and exhaust steam of the said cylinders, two rotary valves connected with the exhaust-port of the said first-named rotary valve, low-pressure cylinders connected with the driving-wheels and controlled by the said second rotary valve, a condenser into which the exhaust-steam from the said two rotary valves is discharged, an air-pump operated from one of the driving-wheels and connected with the said condenser to exhaust its vapors, a pump connected with the said condenser for returning the water of condensation to the boiler, and a pump for circulating cold water through the said condenser, substantially as shown and described.

8. The combination, in a locomotive, with two high-pressure cylinders and a rotary valve controlling both cylinders, of a low-pressure cylinder into which said rotary valve exhausts, having a rotary valve provided with a shaft rotated from the shaft of the first-named valve, the pistons of the several cylinders being connected with the driving-wheels, substantially as set forth.

409,937. AUTOMATIC POOL-REGISTER. THOMAS C. DEVLIN, Pueblo, Colo. Filed Jan. 8, 1889. Serial No. 295,810. (No model.)

Claim.—1. An automatic pool-register consisting of an electric circuit and battery, an inclined trough or way for the balls having a movable plate or bar in the same for making and breaking said circuit by the passage of the balls, a series of counters for the different players, an electro-magnetic adjusting device for the counter, and an electric switch for throwing the circuit through any one of the electro-magnetic adjusting devices, substantially as described.

2. In a pool-register, the combination, with a series of shelves, of a series of balls or counters arranged thereon, a series of shutters arranged in front of the same, and adjusting devices for removing the shutters from their position in front of the ball, consisting of a rack-bar on the back of the shutter, a toothed wheel engaging the same and provided with a ratchet and a hub, a cord and pulley actuating the hub, and an electro-magnet and detent-armature engaging the ratchet, as described.

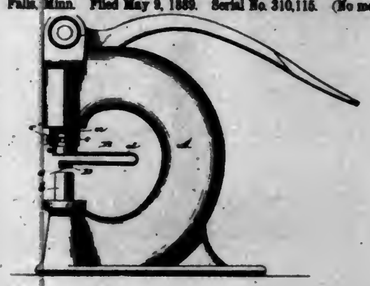


3. In a pool-register, the combination of a series of shelves bearing balls or counters, a series of sliding shutters covering the same, a vertical resetting-bar for pushing the shutters over the counters again, a game-counter dial and index-hand for registering the number of games, and an adjusting-handle and connecting devices for resetting the shutters and actuating the game-register with a single movement, as set forth.

4. In a pool-register, the combination of the series of horizontal shelves with balls or counters arranged thereon, of a series of sliding shutters D, having toothed racks *b* on their rear sides, the vertical shaft E, with wheels *c* arranged thereon and provided with hubs *c'* and ratchets *c²*, the magnets G, with detent-armatures *d*, a series of weights and cords or springs for moving the shutters away from the balls, and an electric circuit and circuit-closer for actuating the magnets, substantially as shown and described.

5. The combination, with the shelves, the counters, and the sliding shutters, of the resetting-bars L L', the cord *k*, grooved pulley M, crank-handle N, fixed upon a shaft having tappet *l*, the vertical bar *n*, with leg *m*, spring *o*, and tooth *h*, and the dial *s*, index-hand *r*, and ratchet *q*, substantially as described.

6. The pool-register consisting of the columns A A', base B, shelves C, with ball-counters between them and a space for the battery below them, the shutters arranged in front of the balls upon one side and a blackboard arranged upon the other side, electric devices for operating the shutters, a player's switch-board arranged at the top of column A', and a game-counter arranged at top of column A, and a mirror R, arranged between the two, substantially as shown and described.

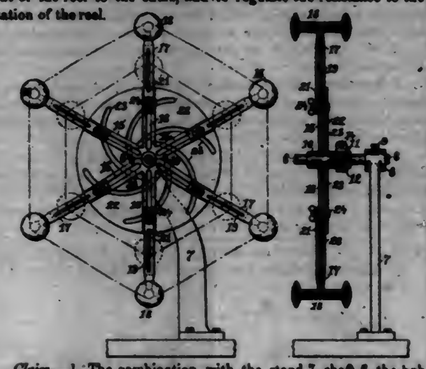


409,938. SOLE-PROTECTOR FOR BOOTS OR SHOES. JOHN G. DICKSON, Beaver Falls, Pa., assignor of two-thirds to John W. McDonald and Allen R. McDonald, same place. Filed Mar. 13, 1889. Serial No. 303,097. (No model.)

Claim.—1. A metal sole protector shaped to cover the entire sole and formed in sections having their adjacent edges provided with interlocking recesses and projections *i g*, the projections having pintles *h h*, and the opposing section having pintle-recesses *e e* on its upper face at opposite sides of the recesses *i*, substantially as set forth.

2. A metal sole-protector shaped to cover the entire sole and formed in three sections A B C, provided with projections *e* on their lower faces, the adjacent edges of the three plates or sections being provided with recesses *i* and projections *g*, beveled as at *f*, the pintles *h h* on said projections, and the pintle-recesses *e e* in the upper sides of the sections A B, at opposite sides of the recesses *i i*, substantially as set forth.

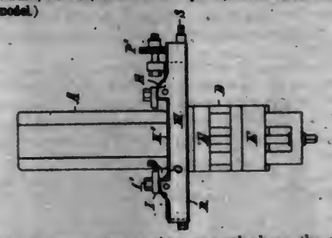
409,939. RIVETING-MACHINE. ABRAHAM G. DIGBY, Granite Falls, Minn. Filed May 9, 1889. Serial No. 310,115. (No model.)



Claim.—1. In a device for upsetting the ends of rivets, an anvil D and an upwardly-projecting portion *c*, said anvil and portion being integrally connected together by a U-shaped spring and presenting the device in a single piece, substantially as set forth.

2. The combination, in a device for upsetting rivets, of a spring-bar bent upon itself and provided at one end with an anvil D and at the opposite end with a block having a plain face, the said block also having means for connecting the same to the follower of a press, so that the anvil will be located above the rigid block *b*, attached to said press, substantially as and for the purpose set forth.

409,940. YARN-REEL. EDWARD C. DUFFY, Pawtucket, R. I. Filed May 4, 1889. Serial No. 309,696. (No model.)

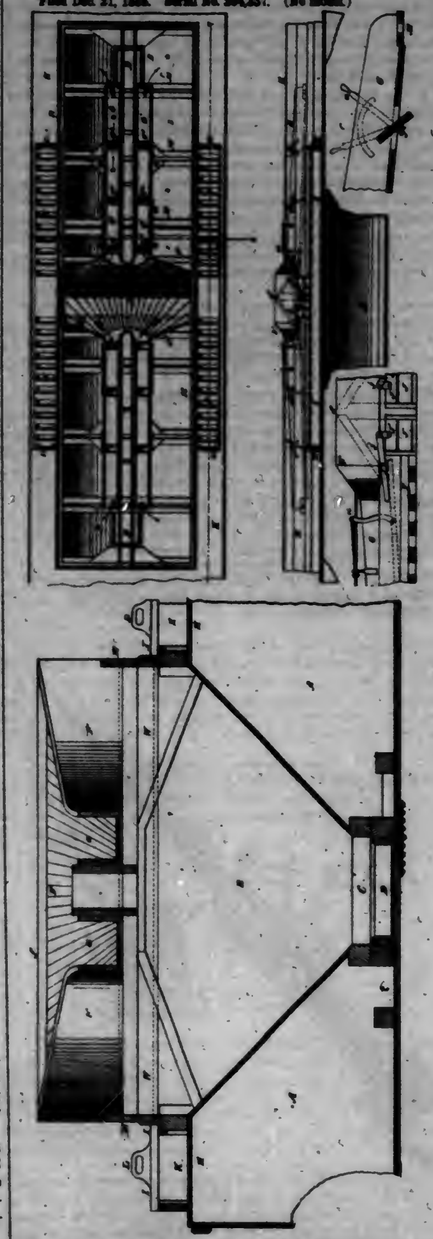


Brief.—The objects of the invention are to facilitate the adjustment of the reel to the skein, and to regulate the resistance to the rotation of the reel.

Claim.—1. The combination, with the stand 7, shaft 6, the hub 10, and the radial arms 15, provided with the slots 16, of the bifurcated extension-arms 17, adjustably secured to the radial arms, the plate 22, provided with the ways 23, and the bolts 24, one or more of which are provided with thumb-nuts constructed to clamp the arms to the plate, as described.

2. In a yarn-reel, the combination, with the standard and the shaft on which the reel revolves, of the hub of the reel provided with a tubular extension, having the cut 11, clamp 12, and regulating-screw 14, the whole constructed to regulate the unwinding of the yarn from the reel, as described.

409,941. DIRT-GUARD FOR SHAPING-MACHINES. ULRICH EBERHARDT, Newark, N. J. Filed Apr. 19, 1889. Serial No. 307,748. (No model.)



Claim.—1. In a shaping-machine or crank-planer, the combination, with the horizontal cross-head and the saddle movable thereon, of a guard affixed upon the cross-head and extended over the sliding joint of the saddle, and the gearing operating the same, as and for the purpose set forth.

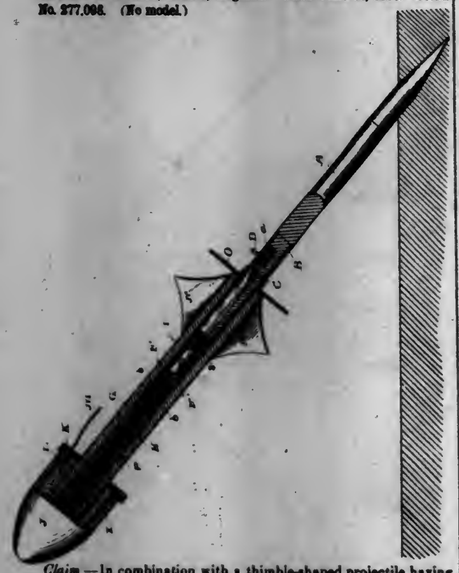
2. In a shaping-machine or crank-planer, the combination, with the horizontal cross-head and the saddle movable thereon, of a guard affixed upon the cross-head and extended over the sliding joint of the saddle and projected upward in front of the frame to which the cross-head is secured, to protect the vertical joint of the frame and cross-head, substantially as herein set forth.

3. In a shaping-machine or crank-planer, the combination, with the frame having the vertical flanges B of the cross-head secured movably thereto, the saddle movable horizontally thereon, the guard N, extended over the top of the cross-head and provided with the flange N' and the angle-pieces O, the whole arranged and operated substantially as set forth.

4. In a shaping-machine or crank-planer, the guard N, secured upon the top of the cross-head, extended over the length of the same and over the feed-gears P P', and provided with the flange N' and angle-pieces O and with the border-strips R, as and for the purpose set forth.

409,942. DUMPING-SCOW. JAMES EDWARDS, Brooklyn, N. Y. Filed Dec. 21, 1888. Serial No. 294,357. (No model.)

Claim.—1. In a dumping-scow, the distributing-flumes G G G' G', one on each side of the longitudinal center of the scow, having in the bottoms of the said flumes at regular distances from each other distributing-gates *g g' g² g³ g⁴ g⁵*, respectively located over the several bins of the scow, in combination with the receiving-hopper P F, located amidship of the scow and somewhat above and connected with the entrance of the said flumes, having a steep descent from the center toward and into the entrance of the said flumes, whereby the mobile mixture of water, sand, and mud discharged upon and into the said hopper will rapidly descend the sides of the said hopper and flow into and through the said flumes, and the sand and mud thereof will



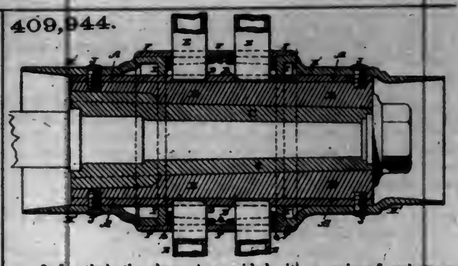
fall through the several said distributing-gates, accordingly as each of them is more or less opened, into the respective bins beneath, and whereby the solid matter of the said mobile mixture can be so controlled in its distribution in the several differently-located compartments of the scow by the said gates as to keep it (the scow) in perfect trim while being freighted, substantially in the manner and for the purpose set forth.

2. In a damping-scow, the ballast-boxes I I, placed one on each side near the outer margins of and upon and along on the deck of the scow, having the outlet-gates K K at the outer ends thereof, and having partially-open tops, in combination with the weirs J J and the compartments of the scow, the said compartments being connected to the said ballast-boxes, whereby a greater or less quantity of the overflow-water can be respectively retained within or liberated from either of the said ballast-boxes, as the case may require, to keep the scow transversely trimmed, substantially as and for the purpose described.

3. In a damping-scow, the combination of the hopper F F, situated transversely to and midway of the scow, the distributing-flumes G G G' G', connected with and longitudinally extending in both directions from the upper hopper, each having in the bottom a series of controllable distributing-gates $g\,g'\,g''\,g'''\,g^4$, one of each of which is located over each of the several compartments of the scow, the ballast-boxes I I, one on either side of and extending near and along the outer margin of the deck, having the gates K K, the weirs J J, the ballast-boxes connected with the said weirs and the compartments of the scow, whereby the overflow-water from the said compartments in its course overboard will pass into and over the top of the ballast-boxes, or out through the gates K K, as may be required, to keep the scow transversely trimmed, and the solid matter of the mobile-mixture of water, sand, and mud is evenly distributed in the different compartments of the scow, and the overflow-water is respectively retained in or discharged from either of the ballast-boxes to further assist in maintaining an even keel to the scow while being loaded, substantially in the manner and for the purposes set forth.

409,943. GUN AND PROJECTILE FOR HIGH EXPLOSIVES.

STEPHEN H. EMERY, London, England. Filed June 14, 1888. Serial No. 277,098. (No model.)

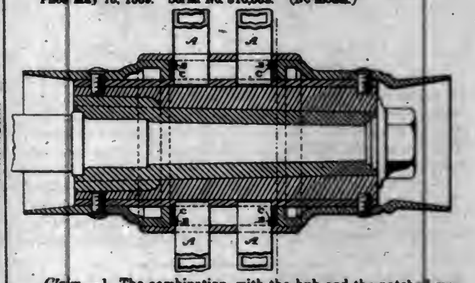


Claim.—In combination with a thimble-shaped projectile having an axial guide-tube open at its rear end and surrounded by an annular charge-space for high explosives, a short powder-tube and a tube inclosing a firing device coupled together end to end and fitted to the interior of said guide-tube, and a stock fitted at its front end to the rear end of said firing device tube, substantially as hereinbefore specified.

409,944. METALLIC WHEEL.

GEORGE H. EVERSON, Pittsburg, Pa. Filed Apr. 2, 1888. Serial No. 305,749. (No model.)

Claim.—1. The combination of the sleeve, the wooden filling placed therein, and the box, the wooden filling being bored out to receive the box, the central ring or band F, the hub-sections, and the fastening devices which engage with the inner ends of the spokes and hold them in position, substantially as shown.



2. In a hub, the sleeve A, provided with a series of sockets or recesses in its outer side to receive the ends of the spokes, in combination with the central band or ring, the spokes, the fastenings to engage with the ends of the spokes, and the hub-sections, substantially as described.

3. A metallic spoke formed of thin metal, and which is made angular at its inner end, oval in cross-section a short distance beyond the hub, and then round at its outer end, so as to correspond to the shape of a buggy-spoke, substantially as set forth.

4. The combination of the metallic felly, the detachably separate fastenings placed therein and provided with ribs or flanges on their inner sides, so as to catch in grooves or recesses formed in the sides of the end of the spokes, and the rivets or fastenings which are passed through the fellies, substantially as specified.

409,945. METALLIC WHEEL.

GEORGE H. EVERSON, Pittsburg, Pa., assignor to the Rolled Steel Carriage Wheel Company, Trenton, N. J. Filed May 13, 1889. Serial No. 310,582. (No model.)

Claim.—1. The combination, with the hub and the notched metallic spokes, of separate springs, which are applied to the spokes for the purpose of securing them in position in the hub and imparting to the wheel the necessary amount of elasticity, substantially as shown and described.

2. The combination, with the hub, of the notched metallic spokes A, with the separate curved springs C, which catch in the notches in the sides of the spokes and have both of their ends to bear against a portion of the hub, whereby each spring is made to act as a spring to its spoke and as a means of holding its spoke in position, substantially as described.

409,946. BAG-HOLDER.

JOHN FERRIS, near French Camp, Cal. Filed May 29, 1889. Serial No. 312,623. (No model.)

Claim.—1. The combination, with the yielding arm having means for engaging with the sack, of the pivoted lever also having means for engaging with the sack, substantially as and for the purpose described.

2. The combination, with the yielding arm provided with means for engaging with the sack, of the pivoted lever adapted to engage with said arm for holding it in a predetermined position and having sack-retaining means, substantially as set forth.

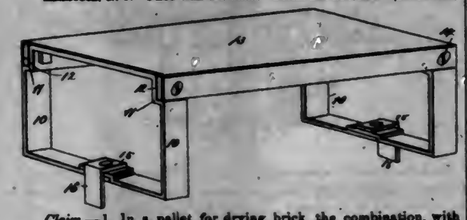
3. The combination, with the inverted-U-shaped support, of the lever pivoted to the inner branch of the support and adapted to engage with the outer branch or arm, substantially as specified.

4. The herein-described bag-holder, composed of the two arms A, having prongs at their lower ends and notches in their edges, and

having the inner branches A', the levers B, pivoted to the lower ends of branches A' and having their upper ends bent and adapted to engage with the notches in the edges of the arms A and provided with hooks at their lower ends, and the support C, substantially as specified.

409,947. IRONING-BOARD AND TABLE.

DAVID PETTERS, Baltimore, Md. Filed May 20, 1889. Serial No. 311,296. (No model.)

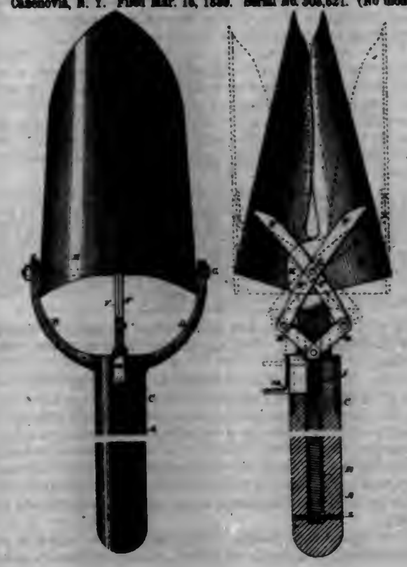


Claim.—1. The combination of the ironing-board A, having two fixed hooks b and a staple c, and a stand having a cross-bar h below the end of the top and a swivel-hook i at the foot.

2. The combination of a stand D, having a cross-bar h below the end of the top, and legs having a cross-bar foot, an ironing-board having a hook to take under the top cross-bar of the table, and a swivel-hook i on the table-foot to hold the board and prevent its hook disconnecting from the table, as set forth.

409,948. PALLET FOR DRYING BRICK.

CHARLES T. FITCH, Elizabeth, N. J. Filed Jan. 22, 1889. Serial No. 297,138. (No model.)



Claim.—1. In a pallet for drying brick, the combination, with the heads, of horizontal bars connecting the same, and a bench resting upon the said heads and secured thereto, substantially as shown and described.

2. In a pallet for drying brick, the combination, with the heads and horizontal bars connecting the same, of a bench resting upon the said heads and connecting-bars, substantially as shown and described.

3. In a pallet for drying brick, the combination, with the heads and horizontal connecting-bars essentially rectangular in cross-section and uniting the said heads, of a bench horizontally supported upon the said heads and secured to the said connecting-bars, substantially as shown and described.

409,949. TRANSPLANTING IMPLEMENT.

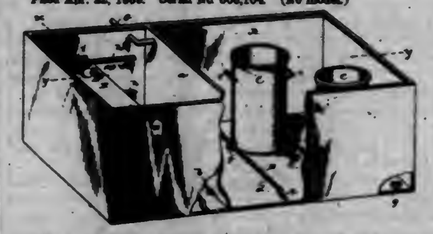
RICHARD FOSTER, Canaseraga, N. Y. Filed Mar. 16, 1889. Serial No. 303,621. (No model.)

Claim.—1. The combination of the handle having a longitudinal recess, the downwardly-extending and outwardly-curved supporting-arms, the trowels having their upper ends extending between the ends of said arms, the crossed operating-arms having their lower ends connected to the trowels, the shaft passing through the crossed arms near their centers, the upper ends of the trowels and the supporting-arms, the connecting-links, the spring, and the rod connecting the links and the spring, substantially as shown.

2. The combination of the handle having a longitudinal aperture, the spring placed therein, the sliding rod, the operating-handle connected thereto, the arms crossed at their center and having their lower ends connected to the trowels, the connecting-links, the supporting-arms extending downward and curved outward from the lower end of the handle, and the shaft passing through the trowels, the operating-arms at their point of intersection, and the supporting-arms, substantially as described.

409,950. REGISTERING-MACHINE.

CHARLES W. FOWLER, Cloverport, Ky. Filed Feb. 9, 1889. Serial No. 299,322. (No model.)



Claim.—1. In a registering-machine, the combination, with a fixed and a loose differential gear-wheel mounted upon a common shaft, of a spiral thread upon the face of one of said wheels and a pinion mounted upon the other of said wheels engaging said thread and moving in a plane at right angles to that of the wheel upon which it is mounted, substantially as set forth.

2. In a registering-machine, the combination, with the shaft M, having gearing, substantially as described, of the fixed and loose differential gear-wheels A B, both engaging with said gearing, a spiral thread S upon the wheel A, a pinion E, mounted in bearings upon the wheel B and gearing into said thread, indicating marks or characters upon the face of the teeth of said pinion E, and an aperture in said wheel B for successively displaying said characters as the pinion revolves, substantially as described.

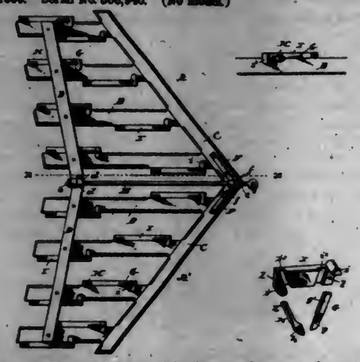
3. The combination, with the shaft M, having gearing, substantially as described, of differential gear-wheels operated by said gearing, a worm-shaft, as V, mounted upon the face of one of said wheels and carrying a pinion engaging with and operated by the other wheel, an independent pinion F, engaging with said worm-shaft V, and indicating-dials for registering the movement of all of said wheels, substantially as set forth.

409,951. CREAMING-CAN.

PHILIP S. FOWLER, Lowville, N. Y. Filed Apr. 22, 1889. Serial No. 308,104. (No model.)

Claim.—1. The combination, with the tank and the ledges secured to the inner walls of the same, of the shelves, each provided with end flanges i, turned upward, and the side flanges j, turned downward, substantially as shown and described, and for the purpose specified.

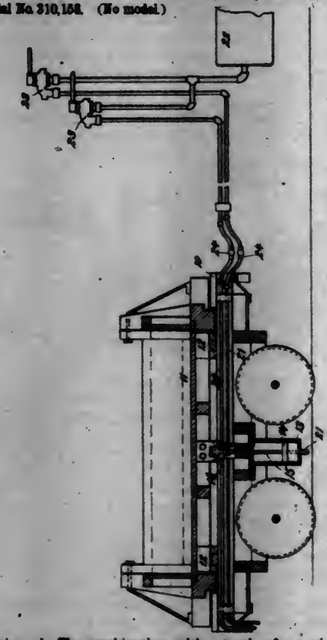
2. The creaming device described, consisting of a tank provided with a partition dividing the same into two compartments and provided with openings, as described, one being in the bottom in one compartment and the other in the partition between the compartments, the inlet-pipe G, the shelves in one of said compartments, the strips B in the other compartment with a space beneath them, and the cans provided with lateral lugs extending in opposite directions, substantially as shown and described, and for the purpose specified.



409,952. FOUNTAIN-PEN.

ANDREW M. FOX, Miamisburg, Ohio. Filed May 6, 1889. Serial No. 309,689. (No model.)

Claim.—The attachment for pens, composed of the cone-shaped spirally-beat perforated tube, the extension *b*, and collar B, as shown.

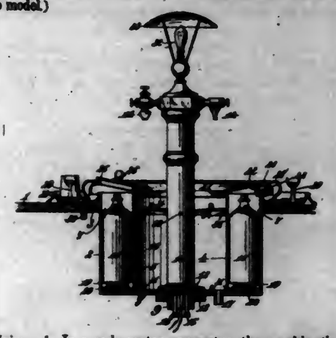


409,953. HARROW. MARCUS J. FRANZ, Emmett, Ohio. Filed Apr. 29, 1889. Serial No. 308,940. (No model.)

Claim.—1. In combination with a harrow-frame, a colter, a tooth, and a bracket for securing the colter and tooth to the frame, said bracket having a laterally-projecting lug on its upper edge at its front end, a similar lug on its under edge at its rear end, recesses on its inner side for the reception of the shanks of the colter and tooth, and bolt-holes through which to pass the bolts for securing it to a beam of the frame, substantially as described.

2. A harrow having a number of beams which are parallel in the line of its travel, to each of which, on opposite sides, are secured a colter and a tooth, which are so positioned that the tooth will follow in the line of cut made by the colter, the tooth and colter being secured by a single bracket, substantially as described.

409,954. DUMPING-CAR. JOSH. H. GRARHART, Leadville, Colo., assignor to himself and William A. Thacher, same place. Filed May 9, 1889. Serial No. 310,158. (No model.)



Claim.—1. The combination, with a truck, of a car-body hinged or pivotally connected thereto, a cylinder having inlet-ports at both ends, a piston mounted therein, connections between the piston and the car-body, and a means, substantially as described, for subjecting both sides of the piston to pressure, as and for the purpose stated.

2. The combination, with a truck, of a car-body hinged or pivotally connected thereto, a cylinder carried by the truck, a piston arranged within the cylinder and provided with an outwardly-extending stem, a connecting link or bar hinged or pivotally connected to the piston-stem and hinged or pivotally connected to the car-body, a system of piping which communicates with the upper portion of the cylinder, a second system of piping which communicates with the lower portion of the cylinder, a pressure-tank, connections between the pressure-tank and the pipe systems, and valves arranged in connection with the pipe systems, substantially as described.

3. The combination, with a truck or platform, of a car-body pivotally connected or hinged thereto, a cylinder carried by the truck or platform, a piston mounted within the cylinder, a stem extending outward from the piston, a link or bar connecting the stem and the car-body, and two systems of piping, each system being provided with pipe-connections, substantially as described.

409,955. APPARATUS FOR DISPENSING SODA-WATER, &c. WILLIAM GEE, New York, N. Y. Filed May 8, 1889. Serial No. 310,003. (No model.)

Claim.—1. In a soda-water apparatus, the combination, with an annular chamber divided into compartments each open at its top end to receive the sirup-bottles, of an annular cover-plate supported by and traveling horizontally upon the top of said chamber, and having an opening covered by a movable cap for the insertion and removal of each bottle when brought in coincidence with the top thereof, substantially as described.

2. In a soda-water apparatus, the combination, with an annular chamber divided into compartments to receive the sirup-bottles, of an annular cover having rolls resting and traveling upon the circular edge of one wall of said chamber and provided with a single opening covered by a hinged cap, substantially as described.

3. In a soda-water apparatus, the combination, with a counter having a circular opening, of a casing inserted therein, and having an annular chamber divided into compartments to receive the sirup-bottles, an annular traveling cover resting upon the walls of said chamber, and a central standard having faucets for the service-pipes, an annular ice-chamber being formed between the standard and the annular chamber, substantially as described.

4. In a soda-water apparatus, the combination, with a circular casing having an annular series of compartments for the sirups, of an annular cover-plate having rolls traveling upon the edge of the wall of said compartments and provided with a hinged cap covering a single opening giving access to the sirup-chambers, and a circular S-shaped flange surrounding the casing and having the names of the sirups displayed thereon opposite each compartment, substantially as described.

5. In a soda-water apparatus, the combination, with a circular casing having an annular series of compartments for sirups, of an annular cover-plate having circular movement on said casing and provided with a movable cap giving access to a single compartment, and a circular tumbler-trough surrounding the casing and provided with a raised flange displaying the names of the sirups opposite the several compartments, substantially as described.

409,956. MALTING AND GERMINATING APPARATUS. JOSEPH F. GERR, Columbus, Ind. Filed Mar. 19, 1889. Serial No. 303,894. (No model.)

Claim.—1. An apparatus for malting or germinating grain, consisting of an outer casing, a series of perforated floors one above the other, provided with automatically-dumping sections, said floors having each a central aperture, an air-supplying pipe extending through said apertures and provided with apertures to discharge air beneath each of said floors, a shaft for rotating said floors, also extending through said openings, and a water-pipe extending within said openings and provided with a discharge above each floor, substantially as described.

2. An apparatus for malting or germinating grain, consisting of perforated floors one above the other, having central apertures in each

a shaft for revolving said floors extending vertically through said apertures, and a water-supply pipe extending also vertically through said apertures and having a spraying-discharge above each floor, the said floors having pivoted automatically-dumping sections, the dumping-point of each floor being a short distance in advance of the dumping-point of the floor above, substantially as described.

3. An apparatus for malting or germinating grain, consisting of an inclosing-casing, revolving perforated floors one above the other, an air-pipe extending centrally through said floors and having a discharge-opening beneath each floor, an air-forcing and air-moistening device communicating with said pipe, a water-supply pipe extending within said air-pipe and provided with a spraying-discharge above each floor, and stirring and leveling devices above each floor, the said floors being provided with pivoted automatically-dumping sections, the dumping-point of each floor being slightly in advance of the floor above, substantially as described.

409,957. RING-SPINNING MACHINE. ERNST GESSNER, Aue, Saxony, Germany. Filed Jan. 2, 1889. Serial No. 295,136. (No model.)

Claim.—1. The combination, with a spindle and the rail, of a winder composed of a thread-guide L, arm L', and guide-piece L^3, held on the copping-rail and embracing the spindle above the cop, so as to be in frictional contact with the spindle, the spindle being made a length to reach above the full cop a distance corresponding to the length of the winder, substantially as described.

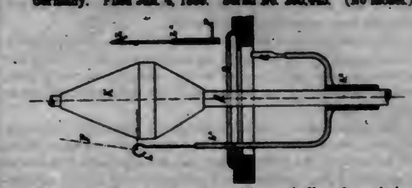
2. The combination, with a spindle, of a winder composed of thread-guide L, arm L', and guiding-piece L^3, having the form of a socket, and an intermediate sleeve L^3, upon which the said socket is seated, and means for rotating said sleeve with and traversing it over the spindle above the cop, substantially as described.

3. The combination, with the spindle and the copping-rail, of a winder rotated by the strain of the thread and by friction from the spindle, composed of a thread-guide L, an arm L', and friction-socket L^3, being provided with a slotted flange B, seated on the copping-rail, the spindle protruding through an opening in the copping-rail, and the latter having an outlet to allow the thread to enter from without into the slot of the flange B, so as to pass round the spindle, substantially as described.

4. The combination of a spindle, the copping-rail, and a winder having its bearing located above the cop and being rotated by the strain of the thread and by friction from the spindle, the said winder being composed of a thread-guide L, arm L', and friction-socket L^3, with a flange B, a brake-spring O, pressing upon said flange, and means for adjusting the spring for regulating the tension of the thread, substantially as described.

5. The combination, with a spindle, the copping-rail, and the winder embracing the spindle above the cop or bobbin and connected to the copping-rail, of means, substantially as described, for elevating the copping-rail above the spindle for lifting the winders off the spindles, substantially as described.

6. The combination, with the spindles, the copping-rail, and the winders embracing the spindles above the cop, of a set of filler-wires, supports for the same, and actuating devices for moving them for drawing a certain supply of yarn off from the full cops or bobbins preparatory to winding the same onto the spindles below the cops or bobbins to start with, and means for imparting a slow rotation to the spindles, substantially as described.



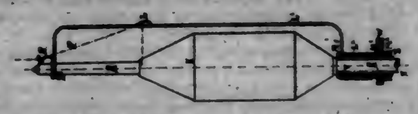
409,958. SPINNING-MACHINE. ERNST GESSNER, Aue, Saxony, Germany. Filed Jan. 3, 1889. Serial No. 295,206. (No model.)

Claim.—1. The combination, with a spindle and the copping-rail, of an oscillating winder composed of a rotatable ring L^3, seated on the copping-rail and embracing the spindle, arm L', connected to said ring in the plane of the spindle, and the thread-guide L, substantially as described.

2. The combination, with a spindle and the copping-rail W, of the winder composed of bowed arm L' with thread-guide, slotted ring L^3, seated on the copping-rail and hinged or pivoted to the arm L' in the plane of the spindle, and the brake-spring D, pressing upon said ring, substantially as shown and described.

409,959. SPINNING-MACHINE. ERNST GESSNER, Aue, Saxony, Germany. Filed Jan. 4, 1889. Serial No. 295,443. (No model.)

Claim.—1. The combination, with a spindle, of a winder composed of a thread-guide L, arm or bow L', and socket L^3, in frictional contact with the spindle below the cop, the said arm or bow being capable of oscillation, substantially as described.



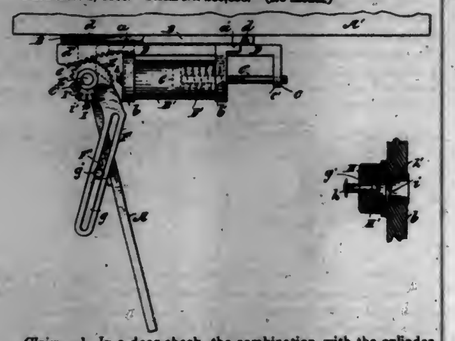
2. The combination, with a spindle, of a winder composed of thread-guide L, laterally-oscillating arm or bow L', a socket or disk L^3, and of an intermediate sleeve Z, rotated with and vertically traversed over the spindle below the cop, substantially as described.

3. The combination, with a spindle, of a winder composed of thread-guide L, laterally-oscillating arm or bow L', and socket L^3, fitting loosely around the spindle below the cop, whereby frictional contact is regulated by the conjoint influence of thread-tension and centrifugal action, substantially as described.

4. The combination, with a spindle and the copping-rail, of a winder composed of a thread-guide L, laterally-oscillating arm or bow L', and socket L^3, encircling the spindle below the cop, provided with a projecting flange B and a brake, substantially as described.

5. The combination, with a spindle and the copping-rail, of a winder consisting of an arm L' and attached socket L^3, carrying the thread-guide L, the said arm having its top end mounted in the copping-rail above the spindle, substantially as described.

409,960. SPINNING-MACHINE. ERNST GESSNER, Aue, Saxony, Germany. Filed Jan. 5, 1889. Serial No. 295,491. (No model.)

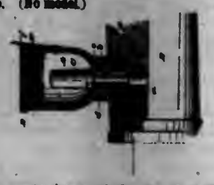


Claim.—1. The combination, with a spinning-spindle, of a winder composed of friction-socket L^3, arm or bow L', thread-guide L, carried by said arm, ring L^3, and guide E, and means whereby the whole winder is traversed or carried up and down over the spindle, the

spindle being lengthened to correspond to the length of the traverse of the winder, substantially as described.

2. The combination, with a spinning-spindle, of a winder composed of socket L^3, arm or bow L', thread-guide L, ring L^2, and guide E, and an intermediate sleeve Z, upon which the said socket L^3 is seated, rotated, and traversed over the spindle, substantially as described.

409,961. **PNEUMATIC DOOR-CHECK.** THOMAS GOODENOUGH, Woodside, assignor to the Alther Manufacturing Company, New York, N. Y. Filed Nov. 2, 1883. Serial No. 289,898. (No model.)



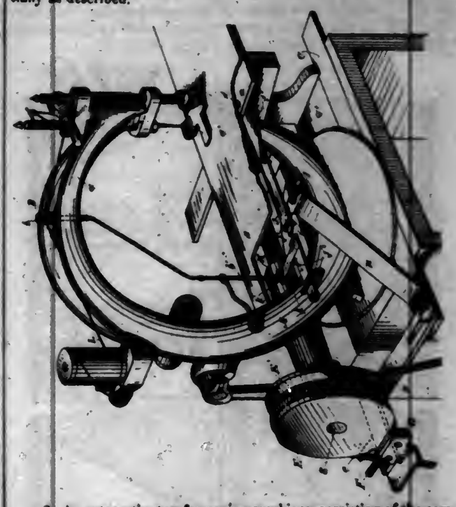
Claim.—1. In a door-check, the combination, with the cylinder, the spring-actuated piston, and the piston-rod, of the operating-bar engaging the piston-rod and having a curved toothed portion of varying projection and a toothed eccentric gear engaging with said toothed portion operated by the door, substantially as specified.

2. The combination, with the cylinder, the spring-actuated piston therein, and the piston-rod, of the operating-rod having the ogee-shaped toothed portion, the anti-friction rollers bearing upon the operating-rod, and the adjustable eccentric gear oscillated by a connection with the door, substantially as specified.

3. The combination, with the cylinder, the piston, the piston-rod, the toothed operating-bar, and the segmental gear, of the valve and the tappet-arm, removably secured to the eccentric segmental gear, operated by means of a connection with the door, substantially as specified.

4. The combination, with the cylinder, the piston, the piston-rod, the toothed operating-bar, and the segmental gear engaging therewith, of the valve in the cylinder-head and the adjustable tappet-arm on the segmental gear oscillated by a connection with a door, substantially as specified.

409,962. **AXLE-LUBRICATOR.** ALBERT A. GREGORY, Canton, Ohio, assignor of one-half to Allen Cook, same place. Filed May 10, 1889. Serial No. 310,235. (No model.)

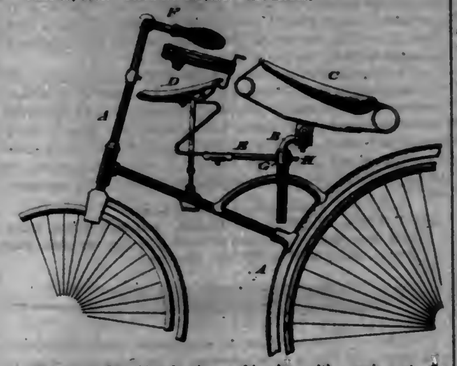


Claim.—1. The combination of the cup A, provided with the screw-threaded cap B and the screw-threaded shank *a*, the weighted plunger C, provided with the neck *b* and the shoulder *c*, adapted to strike the shoulder *d*, substantially as and for the purpose specified.

2. The combination of the cup A, provided with the screw-threaded cap B, the screw-threaded shank *a*, and the tube *c*, the weighted plunger C, provided with the neck *b* and the shoulder *c*, the spring F, adapted to engage one of the notches *g*, substantially as and for the purpose specified.

409,968. **THREAD-CONTROLLED STOP MECHANISM FOR SEWING-MACHINES.** ALBERT J. HART, San Francisco, Cal. Filed Nov. 23, 1888. Serial No. 291,594. (No model.)

Claim.—1. An automatic stop for sewing-machines, consisting of the combination of a horizontally-moving shifter-arm for transferring the driving-belt from a fast to a loose pulley of the machine, a movable gravity-eye through which the thread passes, whereby said eye is supported while the thread is taut and drops when the thread breaks, and connecting mechanism between said eye and the belt-shifter arm, whereby the latter is operated to transfer the belt to the loose pulley when the former is dropped by the breaking of the thread, said mechanism comprising a spring-controlled horizontally-moving bar and a spring-controlled locking-lever engaged thereby, substantially as described.



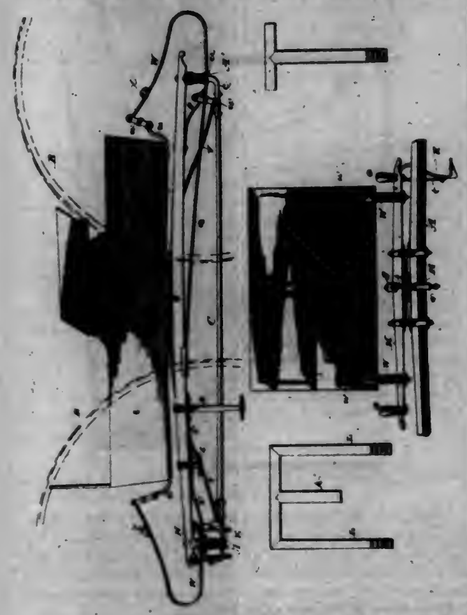
2. An automatic stop for sewing-machines, consisting of the combination of a shifter-arm for transferring the driving-belt from a fast to a loose pulley of the machine, and a brake-block adapted to be thrown into frictional contact with the fast pulley for checking its momentum when the belt is transferred, a gravity-eye through which the thread passes to support it when the thread is taut and to drop it when the thread breaks, and connecting mechanism between said eye and the belt-shifter arm and brake, said mechanism comprising a sliding bar connected with the shifter-arm, and a spring-controlled locking-bar engaged by said sliding bar and gravity-eye, whereby, when the thread breaks and the eye drops by gravity, the shifter-arm is operated to throw the belt onto the loose pulley, and the brake is thrown into frictional contact with the fast pulley, substantially as described.

3. In a stop mechanism for sewing-machines, the shifting-arm embracing the belt and adapted to throw it from a fast to a loose pulley of the machine, and a vertically-movable gravity-eye through which the thread passes, thereby supporting it, said eye having a downwardly-extending trip-rod, in combination with a spring-controlled sliding bar C, with which the shifting-arm is connected, a pivoted spring-controlled locking-lever engaging the sliding bar for holding the same in one position to cause the shifting-arm to direct the belt onto the fast pulley, and a cam on the power-shaft of the machine acting on the trip-rod when dropped by the breaking of the thread to force said rod into contact with and trip the locking-lever, substantially as described.

4. In a stop mechanism for sewing-machines, the shifting-arm embracing the driving-belt and adapted to transfer it from a fast to a loose pulley of the machine, and a vertically-movable gravity-eye through which the thread passes, whereby it is supported when the thread is taut and allowed to drop when the thread is broken, said eye having a downwardly-extending trip-rod *b'*, in combination with the spring-actuated sliding bar C, carrying the shifting-arm, the catch-bar carried by the sliding bar C, the pivoted spring-controlled locking-lever J, having a pin or stud engaging the catch-bar, and an inwardly-extending arm j^3, and the grooved collar on the drive-shaft of the machine, into which the end of the trip-rod *b'* drops when the thread is broken, and the cross-cam *k'* of said collar for forcing the trip-rod against the arm j^3 to trip the locking-lever and release the sliding bar, substantially as described.

5. In a stop mechanism for sewing-machines, a shifting-arm engaging the driving-belt for transferring it from a fast to a loose pulley of the machine, and a brake-block G, adapted to come in contact with the fast pulley when the belt is transferred, in combination with a vertically-movable gravity-eye through which the thread passes, whereby said eye is supported when the thread is taut and is dropped when the thread is broken, the trip-rod *b'* of said eye, the rotating cam *k'* on the driving-shaft of the machine, adapted to come in contact with the end of the trip-rod and to force it over, the spring-controlled sliding bar C, carrying shifting-arm and the brake, the catch-bar I, carried by said sliding bar, the pivoted spring-controlled locking-lever J, having a pin or stud engaging the catch-bar, and the arm j^3, with which the end of the trip-rod *b'* is adapted to come in contact, whereby the locking-lever is tripped to release the sliding bar C, substantially as described.

409,964. **BICYCLE.** CHARLES T. HARVEY, Philadelphia, Pa. Filed June 15, 1889. Serial No. 314,436. (No model.)



Claim.—1. In a bicycle, the combination, with a main seat, of a child's seat having an arm detachably secured to the standard of the main seat, said child's seat being between the main seat and the steering-handles of the bicyle, substantially as described.

2. In a bicyle, the combination of a standard having a main seat secured thereon, a boss adjustable on said standard and having an arm with a seat thereon, and steering-handles, the seat on the said arm being between said handles and main seat, substantially as and for the purpose set forth.

3. In a bicycle, the combination of a standard with a seat secured thereon, a boss consisting of hinged parts provided with a fastening-screw and adapted to be clamped on said standard, an arm attached to said boss and carrying a child's seat intermediate of the main seat and the steering-handles of the device, substantially as and for the purpose set forth.

409,965. **RUNNING-GEAR FOR VEHICLES.** JOHN H. HARVEY, Rich Hill, Ohio. Filed Dec. 4, 1888. Serial No. 292,624. (No model.)

Claim.—1. In a vehicle running-gear, the combination, with front and rear axles, of a reach, a jointed yoke connecting the latter with the front cross bar or bolster, and a king-bolt connecting the cross-bar or bolster and the front axle, substantially as set forth.

2. In a vehicle running-gear, the combination, with front and rear axle and reach-bar, of a cross-bar or bolster, a yoke yieldingly attached to the cross-bar or bolster and to the reach at points behind and in front of the front axle, and a king-bolt connecting the cross-bar or bolster and front axle, substantially as set forth.

3. In a vehicle running-gear, the combination, with front and rear axles, a cross-bar, and body, of a reach and a jointed yoke connecting said reach and cross-bar, the latter having pivotal yielding and turning contact with the axle, substantially as set forth.

4. In a vehicle running-gear, the combination, with axles, cross-bar, body, and reach, the cross-bar and front axle having fifth-wheels thereon, of a jointed yoke with which the reach has pivotal connection, a king-bolt, links pivoted to said bolt and extending through the reach, and springs on said links, substantially as set forth.

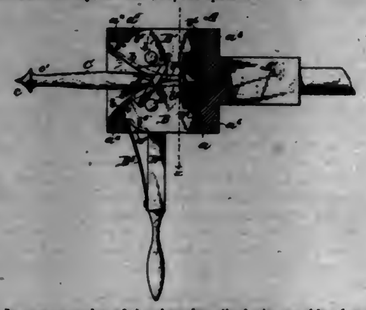
5. The combination, with a vehicle-body and rear axle, of curved springs secured at their upper ends to the body and near their lower ends to the axle, and spring-arms secured to the body and attached at their rear ends to the lower ends of the curved springs.

6. The combination, with the body, cross-bar or bolster, and rear axle, of a set of curved springs connected near their lower ends to the cross-bar and at their upper ends to the body, a set of curved springs connected near their lower ends to the rear-axle and at their upper ends to the body, and spring-arms connected to the body and at their opposite ends to the lower ends of the curved springs, substantially as set forth.

409,966. **CARPET-STRETCHER.** OSCAR F. HERSHAW, JOHN W. POTTERADOR, ASHER A. BROWER, and SALEUS W. HURLOUT, Clarinda, Iowa. Filed Apr. 24, 1889. Serial No. 308,208. (No model.)

Claim.—1. In a carpet-stretcher, a transverse toothed bar having a guide and a laterally-extending bail, in combination with a rack-bar longitudinally slotted and terminating in a toothed bar, and a hand lever pivotally connected with the bail and passing through the slot, a fulcrum-arm pivoted to the lower end of the lever, passing upwardly through the slot and terminating in rack-engaging lugs, and a pawl pivoted to the lever operating in the slot of the rack-bar and disposed in a direction opposite to the arm, substantially as specified.

2. The toothed bar 1, provided with the recessed guide-plate 2 and laterally-extending bail 9, in combination with the opposite angle-sections 3, provided with opposite flanges 4 for entering the guide-plate, said sections being spaced apart by the depending tooth shank 5 and the opposite block 15, thus forming the slot 6, the hand-lever 8, mounted on the bail 9, the pawl 13, connected to the lever above the bail, and the arm 12, connected to the lever below the bail, passing through the slot 6, and terminating in the opposite lugs 11, substantially as specified.



3. In a carpet-stretcher, the combination, with a toothed bar, of a rack-bar loosely mounted thereon and provided with a longitudinal slot, a hand-lever connected with the toothed bar and mounted in the slot and terminating at its lower end in opposite shoulders 10, operating against the lower edges of the rack-bar, and an arm 12, pivoted between the shoulders, passing through the slot, and engaging the rack-bar, substantially as specified.

4. In a carpet-stretcher, the toothed bar having the slotted rack-bar rigidly connected thereto, combined with the lever 8, the bail 9, the pawl 13, the offset jaws 10, bearing on the under side of the rack-bar, and the arm 12, having ears 11 and connected to the lever 8 below the rack-bar, as set forth.

409,967. **CAR-COUPLING.** CLIFTON J. HOKE, Yorkville, S. C., assignor to himself and John Robert Lindsay, same place. Filed Apr. 4, 1889. Serial No. 305,916. (No model.)

Claim.—1. In a car-coupler of the class described, the combination, with an arrow-headed coupling-bar and the draw-head having a

cavity of substantially rectangular form in cross-section, of coupling-jaws pivoted therein and having their proximate faces of curvilinear form, the outer edges thereof extending to the like edges of the draw-head cavity and having a groove formed in said proximate faces, substantially semi-cylindrical at its rear end, from which point to the forward edge of the jaws said groove gradually increases in width and decreases in depth to form a gradually-widening or outwardly-flaring passage from the rear edge of the jaws to the forward edge of the draw-head cavity, for the purpose specified.

2. In a car-coupler of the class described, the combination, with the draw-head and an arrow-headed coupling-bar, of two coupling-jaws pivoted within the draw-head and having their proximate faces of curvilinear form, and a groove formed in each of said faces, a link D, pivotally connecting the jaws, as described, and a spring to hold said jaws in a normal position, substantially as and for the purposes specified.

3. In a car-coupler of the class described, the combination, with the draw-head provided with the bearing-faces a^4 a^5, of two coupling-jaws pivoted within said draw-head and having corresponding bearing-faces b^4 b^5, substantially as and for the purposes specified.

4. In a car-coupler of the class described, the combination, with the draw-head provided with the bearing-faces a^3 a^4 a^5, of two coupling-jaws pivoted within said draw-head and having corresponding bearing-faces b^3 b^4 b^5, substantially as and for the purposes specified.

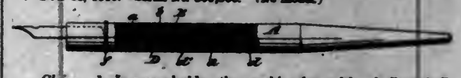
5. In a car-coupler of the class described, the combination, with the draw-head, of two coupling-jaws pivoted therein and provided with a recess b^7, and a socket b^8, arranged relatively, as described, a connecting-link consisting of a bar D, having journals or pivots d at right angles thereto and fitting into said sockets of the jaws, and a spring to hold the jaws in a normal position within the draw-head, substantially as and for the purposes specified.

6. In a car-coupler of the class described, the combination, with the draw-head, two coupled or connected and synchronously-movable coupling-jaws pivoted therein, and a spring for holding the jaws in a normal position, of an actuating-lever extending laterally from one of the jaws for revolving the same on its pivot against the stress of the spring, substantially as and for the purpose specified.

7. In a car-coupler of the class described, the combination, with the draw-head and two coupled or connected and synchronously-movable coupling-jaws pivoted therein, said jaws having a socket b^9, of a hand-lever for rotating one of said jaws on its pivot against the stress of the spring, said hand-lever fitting into said socket, substantially as and for the purposes specified.

8. In a car-coupler of the class described, the combination, with the draw-head and two coupled or connected and synchronously-movable coupling-jaws pivoted therein, of an actuating-lever extending laterally from one of said jaws, and a spring having its bearings on the lever and draw-head for holding the jaws in a normal position, substantially as and for the purpose specified.

9. In a car-coupler of the class described, the combination, with the coupling-jaws B B', provided in their curvilinear proximate faces with a groove of substantially semi-cylindrical form at the rear end and gradually widening and decreasing in depth from that point to the forward end, of an arrow-headed coupling-bar C, having a throat c', of cylindrical form in cross-section, immediately back of its arrow-head and increasing in diameter from that point to its longitudinal center, substantially as and for the purpose specified.

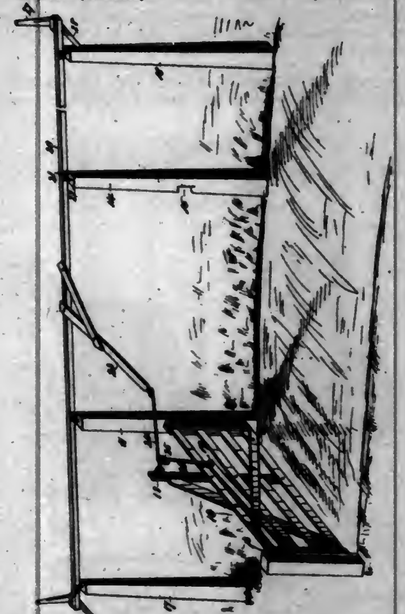


10. The combination, with the draw-head A, provided with openings a in its opposite sides and with bearing-faces a^3, a^4, and a^5, of the coupling-jaws B B', constructed as described and fitted within the draw-head so that their outer lateral faces will lie flush with the corresponding faces of the draw-head and completely close the opening a therein, said jaws being pivoted within said draw-head and provided with corresponding bearing-faces b^4, b^5, and b^6, substantially as and for the purposes specified.

11. The combination, with the draw-head, the coupling-jaws, and the lever B^2, of an actuating-rod R and a cam C, secured thereto and arranged to operate on said lever, substantially as and for the purposes specified.

12. In a car-coupler of the class described, the combination, with the coupling-jaws B B', having their proximate faces of curvilinear form and provided with a groove of substantially semi-cylindrical form at the rear end, and having square vertical rear faces, of an arrow-headed coupling-bar C, having a flaring portion c^3, and a cylindrical throat c' in rear of the greatest diameter of the arrow-head, substantially as and for the purpose specified.

13. In a car-coupler of the class described, the combination, with the coupling-jaws B B', having their proximate faces of curvilinear form and provided with a groove of substantially semi-cylindrical form at the rear end, and having square vertical rear faces inclining toward each other, of an arrow-headed coupling-bar C, having a flaring portion c^3, and a cylindrical throat c' in rear of the greatest diameter of the arrow-head, substantially as and for the purpose specified.

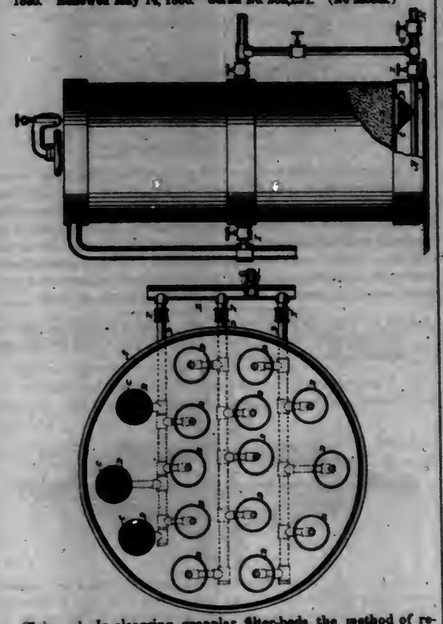


409,968. ELECTRIC PEN-HOLDER. WILLIAM C. HOLMES, Waterbury, Conn., assignor of one-half to Charles L. Holmes, same place. Filed Feb. 11, 1889. Serial No. 299,360. (No model.)

Claim.—1. In a pen-holder, the combination, with a hollow shell, of a thermo-pile having certain portions of its elements extending to the exterior of the holder in position to contact with the hand when the pen is in use, so as to be energized by the heat of the hand, substantially as specified.

2. In a pen-holder, the combination, with a thermo-pile arranged within the pen-holder and having exposed contact-points adapted to contact with the hand when the pen is in use, of a shunt arranged upon the pen-holder and adapted to shunt the current, substantially as and for the purpose specified.

409,969. DEVICE FOR OPENING AND CLOSING SWING-GATES. WILLIAM C. HOLMES, Abingdon, Ill. Filed Feb. 8, 1889. Serial No. 299,163. (No model.)



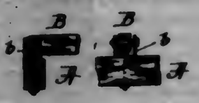
Claim.—1. The combination, with a swing-gate, of a rock-shaft supported by posts at the rear of the gate and hinged centrally on the under side to the said posts, an arm fixed to the rock-shaft, and a link-connection between the said arm and the gate, substantially as described, whereby the rock-shaft as thrown past the center will assist in the movement of the gate, as set forth.

2. The combination, with a swing-gate, of a rock-shaft supported by posts at the rear of the gate and hinged to the tops of the said posts, an arm fixed to the rock-shaft, a link connecting the arm to the gate, and a rod connecting the said link to the inner end of the latch, substantially as herein shown and described.

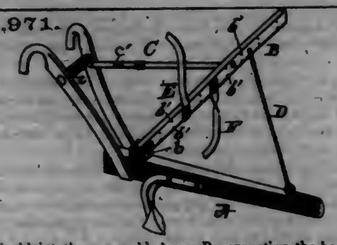
3. The combination, with a swing-gate provided with a pivoted latch and a rock-shaft supported by posts at the rear of the gate and hinged centrally at the under side to said posts, one of which posts is provided with a latch-recess, of an arm rigidly secured at one end to the rock-shaft, a link connecting the said arm and the gate, and a rod uniting the inner side of the gate-latch and the said link, all combined for operation substantially as shown and described.

4. The combination, with a swing-gate, of a rock-shaft having a fixed arm, a link-connection between the said arm and the gate, and two handles or levers pivoted to each end of the said rock-shaft at right angles to each other, substantially as shown and described, whereby the said handles may be moved in any desired direction in order to clear an obstruction, as set forth.

409,970. ART OF FILTRATION. JOHN W. HYATT, Newark, N. J., assignor to the Newark Filtering Company, same place. Filed Sept. 7, 1885. Renewed May 14, 1889. Serial No. 302,221. (No model.)



Claim.—1. In cleansing granular filter-beds, the method of removing the impurities therefrom in such manner that a small portion only of the whole body of the filtering medium is subjected to the cleansing process at the same time, which method consists in reversing the current through the filter-bed and directing the full force of the current first against one portion of the bed and then against another, and so on until the whole has been agitated and cleansed, substantially as set forth.



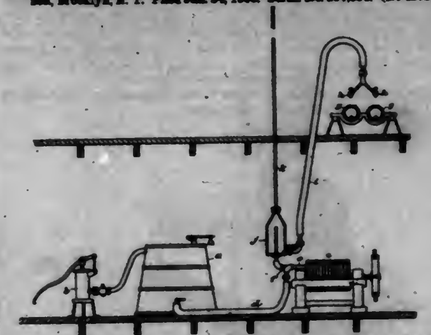
2. In cleansing granular filter-beds, the method of removing the impurities therefrom in such manner that a small portion only of the whole body of the filtering medium is subjected to the cleansing process at the same time, which method consists in reversing the current through the filter-bed and directing the full force of the current first against one portion of the bed and then against another, and so on until the whole has been agitated and thoroughly or partially cleansed, and finally directing the current against the whole of the bed at the same time, substantially as set forth.

409,971. LAND-MARKER. ISRAEL IVEY, Thomson, Ga. Filed Mar. 30, 1889. Serial No. 305,429. (No model.)

Claim.—In a land-marker, the combination of the plow-beam A, the arm B, connected to the plow-beam by a swivel-joint, the blades E and F, projecting from opposite sides of said beam in a line perpendicular to the surface of the ground and at different distances from

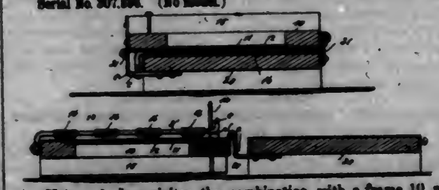
409,971.

the swivel-joint, the removable brace D, connecting the beam B with the front end of the plow-beam, all arranged substantially as and for the purpose set forth.



409,972. MERRY-GO-ROUND. DAVID G. JOHNSON, Trenton, N. J. Filed Apr. 16, 1889. Serial No. 307,368. (No model.)

Claim.—1. A merry-go-round comprising two rotatory overhead wheels, pull or draft ropes or devices hung therefrom, an endless rope or cable running on said wheels, and pull or draft ropes or devices hung from the endless rope or cable, substantially as herein set forth.



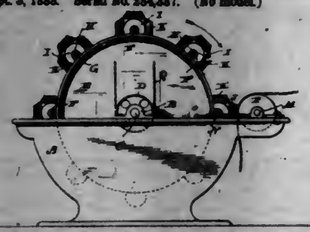
2. A merry-go-round comprising two rotatory overhead wheels, pull or draft ropes or devices hung therefrom at different distances from the axis of the wheels, an endless rope or cable running on said wheels, and pull or draft ropes or devices hung from the endless rope or cable, substantially as herein set forth.

409,973. RACKING-OFF APPARATUS FOR BEER, &c. JOHN JOHNSON, Brooklyn, N. Y. Filed Jan. 24, 1889. Serial No. 297,203. (No model.)

Claim.—In a racking-off apparatus for beer and other liquids, the combination of the hydrostatic vent for the elimination of the air and separated gas and discharge of the same at atmospheric pressure with the filter-press and the keg-filling pipe, said vent consisting of the receptacle j and stand-pipe k, open to the atmosphere through the upper end of the pipe, and connected in the apparatus so as to receive the beer on its way to the filling-nozzles above the outlet-connection of the filling-pipe, substantially as described.

409,974. PLAITING-MACHINE. WILLIAM R. JOHNS, administrator of George Courts Parker, deceased, Paris, Tenn. Filed Apr. 19, 1888. Serial No. 307,396. (No model.)

Claim.—1. In a plaiter, the combination, with a frame 10, pro-

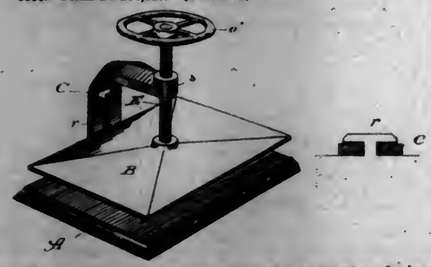


vided with a facing 12, of a frame 13, hinged to the frame 10, and formed with a bent-up longitudinal length *c*, and tapes carried by the frame 13, substantially as described.

2. In a plaiter, the combination, with a frame 10, provided with a facing 12, of a frame 13, hinged to the frame 10, and formed with a bent-up longitudinal length *c*, and tapes provided with elastic sections and with buckles and straps, said tapes being carried by the frame 13, substantially as described.

3. In a plaiter, the combination, with a frame provided with a facing-sheet 12, of a frame 13, hinged thereto and provided with an upraised longitudinal strip *c*, spring-catches arranged to engage the frame 13, tapes carried by the frame 13, and an ironing-board hinged to the frame 10, substantially as described.

4. In a plaiter, the combination, with a frame provided with a facing-sheet 12, of a frame 13, hinged thereto and provided with an upraised longitudinal strip *c*, spring-catches arranged to engage the frame 13, tapes carried by the frame 13, an ironing-board, and hinges 21, that are bent, as at *c*, substantially as described.

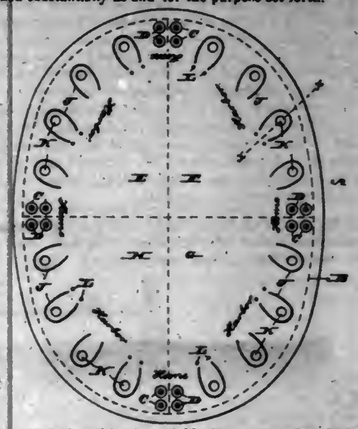


409,975. **TEASELING-MACHINE.** FRANZ JOFF, Milwaukee, Wis. Filed Sept. 3, 1888. Serial No. 284,337. (No model.)

Claim.—1. A teaseling-roll consisting of a center-piece, sheet-metal plates secured thereto, and a series of teasel-burrs arranged on the plates at right angles to the axis of the roll and secured in place by the bending over of the longitudinal edges of said plates, substantially as set forth.

2. In a teaseling-machine, the combination of a frame, the shaft C, having its bearings on the frame, the disks E, arranged on the shaft and provided with the bearings F, rolls journaled in the latter bearings, teaseling-burrs arranged on the rolls at right angles to their axes, spring-controlled sliding bearings arranged on said frame adjacent to the drum formed by said disks and teaseling-rolls, and a pressure-roll journaled in said sliding bearings, substantially as set forth.

409,976. **PRESS.** WILLIAM V. KAY, Houston, Tex. Filed July 21, 1888. Serial No. 280,610. (No model.)



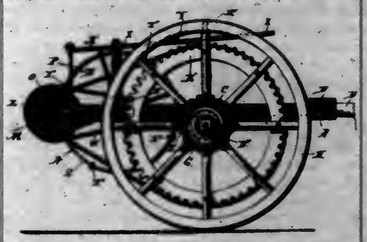
Claim.—1. In a book or letter press, the combination of a base A, provided with a bent arm C, having a slot formed through its upright portion and provided with a nut *s*, a screw E, working in the nut *s*, and a plate B, secured to the screw, and having a lateral headed projection extending through and beyond the slot in the arm C, substantially as and for the purpose set forth.

2. A book or letter press comprising, in combination, the base A, provided with a lateral arm C, bent over the base to bring its extremity over the center of the base, a nut *s*, forming the extremity of the bent arm, a T-shaped slot formed through the upright portion of the arm C, a screw E, working within the nut *s*, a plate B, secured to the screw and having a T-shaped lateral projection *r* extending through and beyond the slot in the arm C, and means for operating the screw, substantially as described.

409,977. **GAME APPARATUS.** HENRY S. KENNEY, Philadelphia, Pa. Filed Feb. 20, 1889. Serial No. 300,566. (No model.)

Claim.—1. A game-board having a field with a surrounding limit-line and provided in each quadrant thereof with U-shaped devices on said field, forming ports, the said ports having their openings toward the center of the field, and pockets or depressions in the field at the inner ends of the ports, circles between the adjacent ports of each two contiguous quadrants, forming home-circles, said parts being combined substantially as and for the purpose set forth.

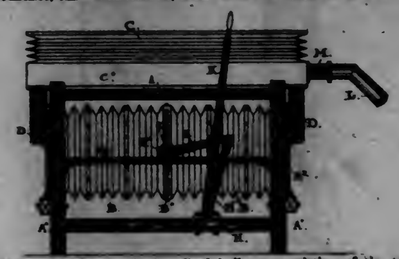
2. A game-board having a field with a surrounding limit-line and provided with U-shaped devices in each quadrant thereof forming ports, the said devices or ports having openings toward the center of the field, pockets or depressions in the field at the inner end of the ports, spots on said field in front of the ports at the ends thereof representing "forts," and circles on said board forming home-circles between the adjacent ports of each two contiguous quadrants, said parts being combined substantially as and for the purpose set forth.



409,978. **WATER-SPRINKLER.** WILLIAM S. KENNEDY, Bellevue, Ky., assignor to Henry G. Stiebel, Cincinnati, Ohio. Filed Dec. 29, 1888. Serial No. 294,961. (No model.)

Claim.—1. The combination, in a water-sprinkler, of a perforated supply-pipe, a hollow head surrounding said pipe, a marginal ventage to said head, a brush applied to said ventage, and means for revolving said head, whereby its centrifugal velocity drives the water through said brush in the manner herein described.

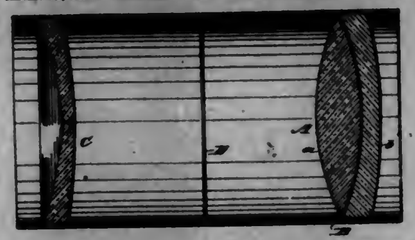
2. The combination, in a water-sprinkler, of an axial supply-pipe A, a hollow head composed of a pair of disks I I', attached to said pipe and surrounding the perforated portion *a* thereof, tubes J J', fitted between said disks, caps L L', secured to the exterior of the latter by ties K K', that traverse the tubes J J', brushes G G', applied to the marginal ventage of said hollow head, and means for revolving said sprinkler, all as herein described.



409,979. **STALK-CUTTER AND MOWER.** WASHINGTON I. KNOX, Terrell, Tex. Filed Oct. 13, 1888. Serial No. 288,019. (No model.)

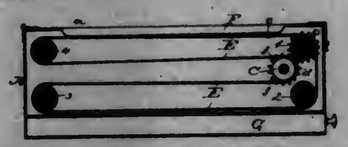
Claim.—1. In a stalk-cutter and mower, the combination of the frame, the driving-wheel having sprocket K, the shaft L, having the sprocket-pinion and pulley O, the chain connecting the sprocket K with the sprocket-pinion, the links U, hinged to and and depending from the shaft L, the reel journaled in said links and having the longitudinal cutters, said reel having the pulley V, the endless belt connecting pulleys O and V to rotate the reel, and the lever pivoted to the frame and connected to the reel to raise and lower the same, substantially as described.

2. In a stalk-cutter and mower, the combination, with the shaft L, having pulley O, and means, substantially as set forth, to rotate the same, of the pivoted links U, the reel having its shaft journaled in said links and provided with the longitudinal cutters and with the pulley V, the endless belt connecting the said pulleys O and V, and the lever connected to the reel to raise and lower the same, substantially as described.



409,980. **DOUBLE-ACTING BELLOWS.** HERMAN KOHN, San Francisco, Cal. Filed Nov. 24, 1888. Serial No. 291,809. (No model.)

Claim.—1. The herein-described bellows, consisting of the two section and three compartments placed end to end and separated by an imperforate movable partition, the fixed heads having valved inlets for air from the outside, and air-passages controlled by valves to deliver air into a common receiving-chamber, above which said chamber is adapted to form an expansible receiver, and a rock-shaft provided with an operating-lever connected, substantially as described, to the said partition.



2. The combination, with the double-acting bellows, of the rock-shaft H, provided with the operating-lever K, and having fixed arms $H^{\times}$ $H^{\times}$, the movable head-board $B^{\times}$, having the fixed studs F F, which are mounted on wheels or rollers *f*, the links I, connecting the fixed arms $H^{\times}$, and the studs F, and the guide-rails G G, substantially as described.

409,981. **PHOTOGRAPHIC LENS.** CHARLES H. R. KROSKARN, Cincinnati, Ohio. Filed Jan. 7, 1889. Serial No. 295,698. (No model.)

Claim.—In a lens for photographic and other purposes, the combination of two unequal lenses, the front lens being a single concave lens with negative focus, and the back lens an achromatic lens with positive focus, the two focuses or powers being separated by a diaphragm, substantially as specified.

409,982. **ARTIST'S FIELD AND MATERIAL CASE.** CHARLES J. KRUESEN, Chicago, Ill. Filed Nov. 10, 1888. Serial No. 290,498. (No model.)

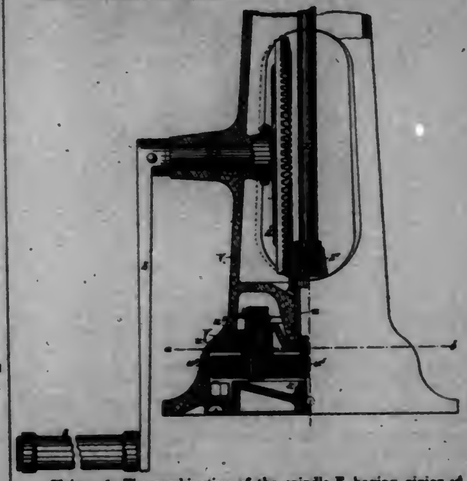
Claim.—1. An artist's field-case consisting of a rectangular box having a suitable opening in the upper side thereof, in combination with a series of rollers 1, 2, 3, and 4, journaled therein, roller C, cut away between the ends thereof, and belt K, as set forth.

2. An artist's field-case consisting of a rectangular box having a suitable opening in the upper side thereof, in combination with a series of transverse rollers 1, 2, 3, and 4, journaled therein, roller C, having a series of spurs projecting from its circumference near its ends and being cut away or reduced to a less diameter between said ends, and an endless belt, as set forth.

3. An artist's field-case consisting of a rectangular box having a rectangular opening in its upper side, and having guards bent inward along its longitudinal sides, as described, in combination with a series of transverse rollers 1, 2, 3, and 4, journaled therein, and roller C, cut away or reduced to a less diameter between said ends a distance corresponding to the width of said rectangular opening in the upper side of said case, as set forth.

4. An artist's field-case consisting of a rectangular box having an opening in the upper side, in combination with a series of transverse rollers 1, 2, 3, and 4, journaled therein, belt K, and a transverse series of buttons *c c c*, secured to the same, as set forth.

409,983. **HAY-BINDER.** REUBEN R. KUHLER, Kingwood, N. J. Filed May 22, 1889. Serial No. 311,736. (No model.)



Claim.—1. A hay-binder comprising a post adapted to be set vertically in the load, ropes secured at their ends and adapted to be wound on the said post, and a lever for turning and locking the said post, substantially as shown and described.

2. In a hay-binder, the combination, with a tapering post provided at its upper end with prongs, of a lever adapted to be inserted at one end between the said prongs for turning the said post, and ropes secured at their ends and passing between the said prongs, substantially as shown and described.

3. In a hay-binder, the combination, with a tapering post provided at its upper end with prongs, of a lever provided with a hook and adapted to be inserted at one end between the said prongs for turning the said post, and ropes secured at their ends and passing between the said prongs, said hook adapted to hook on one of the said ropes, substantially as shown and described.

409,984. **GEARING FOR DRIVING CENTRIFUGAL MACHINES.** JOHN LAIDLAW, Glasgow, Counties of Lanark and Renfrew, Scotland. Filed May 7, 1888. Serial No. 309,942. (No model.) Patented in England Nov. 24, 1888, No. 17,105.

Claim.—1. The combination of the spindle E, having pinion n^4, the sleeve *u*, having arm *u'*, the gear-wheel n^5, carried by the arm, the fixed circular rack n^6, the bevel-pinion S^3 on the sleeve, and the shaft having bevel gear-wheel S', substantially as described.

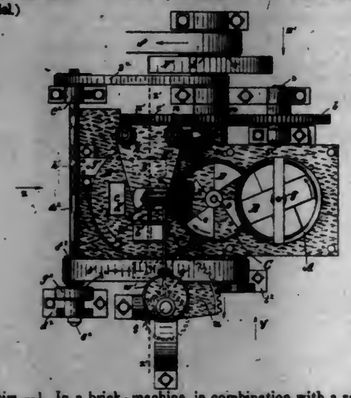
2. The combination of the spindle E, having pinion n^4, the sleeve *u*, having arm *u'*, the pinion n^3 and gear-wheel n^4, carried by the arm, the fixed circular rack n^6, the bevel-pinion S^3 on the sleeve, and the shaft having bevel gear-wheel S', substantially as described.

409,985. **COMPOSITION OF MATTER.** CHARLES T. LEE, Boston, Mass., assignor of one-half to the Gould & Watson Company, same place. Filed July 26, 1888. Serial No. 281,016. (No specimens.)

Claim.—The herein-described composition of matter, consisting solely of comminuted mica and silicate of soda mixed, as set forth.

409,986. PROCESS OF ATTACHING COMPOSITION OF MATTER TO METAL. CHARLES T. LEE, Boston, Mass., assignor of one-half to the Gould & Watson Company, same place. Filed June 14, 1889. Serial (No 314,291. (No specimens.)

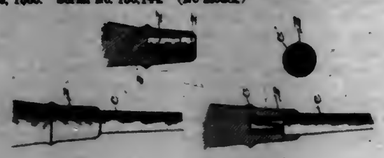
Claim.—The process of producing molded objects, consisting of mica or similar material incorporated with a resinous gum and having a core or strengthening-piece of metal secured therein, consisting in first warming the dies, which are to give the exterior shape to the article to be molded, then heating the core or strengthening-piece to a much higher degree of heat than the dies or the plastic mass, and placing said core and said plastic mass together within the dies, and then molding and compressing into shape and allowing the object thus formed to cool before removing the pressure, substantially as described.



409,987. CORN-HARVESTER. BYRAN R. LEROY, West Independence, Ohio. Filed Mar. 21, 1888. Serial No. 304,174. (No model.)

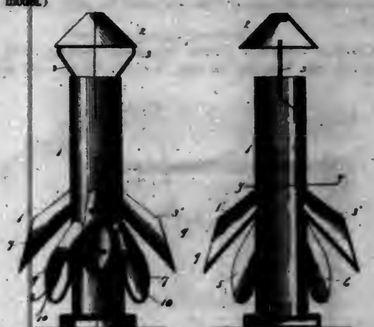
Claim.—1. The combination, with the platform having the slots K L, of the wings hinged to the platform and carrying the knives and the lever fulcrumed below the platform and having its front arm projecting through the slot K and bearing against the wing, and its rear arm projecting through the slot L and adapted to be actuated to elevate the front arm, and thereby raise the wing, as set forth.

2. The combination, with the platform and the wing hinged thereto, of the lever fulcrumed below the platform and bearing against the wing and adapted to raise the same, as set forth.



409,988. BRICK-MACHINE. SACKVILLE G. LETSON and HOWELL THOMAS, Rome, assignors of fifty-one one-hundredths to Leon H. Lempert, Rochester, N. Y. Filed Apr. 24, 1888. Serial No. 308,462. (No model.)

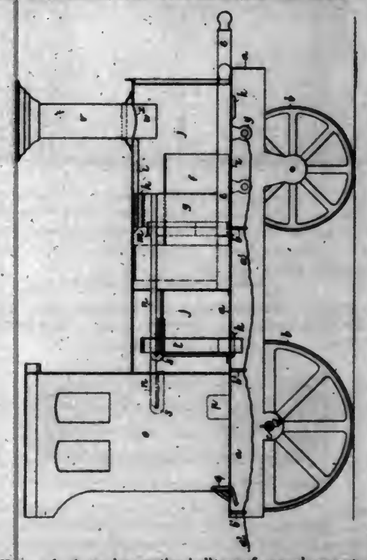
Claim.—1. In a brick-machine, in combination with a rotatory mold-cylinder formed with mold-cavities and rams therefor, a pressing-plate, a lifting-bar to act against the rams, a rotatory shaft, and a crank on said shaft to bear against the lifting-bar, the latter being a spring-bar, substantially as shown and described.



2. In a brick-machine, a rotary mold-cylinder formed with gear-teeth, in combination with a horizontal shaft, a vertical shaft at the side of the mold-cylinder geared to the horizontal shaft, a segmental gear on the vertical shaft to turn the mold-cylinder, a pivotal discharging-arm, and an eccentric on the vertical shaft to operate the discharging-arm, substantially as shown and described.

409,989. TOOL-HANDLE. NEWTON LIMLEY, Freeport, Ill.; Florence Limley executrix of said Newton Limley, deceased. Filed Dec. 19, 1885. Serial No. 186,144. (No model.)

Claim.—The combination, with a handle having a cylindrical socket whose outer portion is of greater diameter than its inner portion, of a tool-shank equal in diameter to said outer portion, and having a prismatic end adapted to readily enter said outer portion, but requiring pressure to force it into said inner portion, substantially as set forth.



409,990. CHIMNEY-COWL AND VENTILATOR. CHARLES B. LOVELL, Worthington, Minn. Filed May 25, 1889. Serial No. 312,103. (No model.)

Claim.—1. A chimney-cowl and ventilator consisting of a cylindrical central vertical tube having an open upper end and two series of downwardly-inclined tubes—an upper and a lower series—said inclined tubes being located exteriorly of and extending entirely around the central tube and communicating with the same below the open upper end thereof, the tubes composing said upper and lower series of tubes being alternately arranged in different vertical planes, substantially as described, for the purpose set forth.

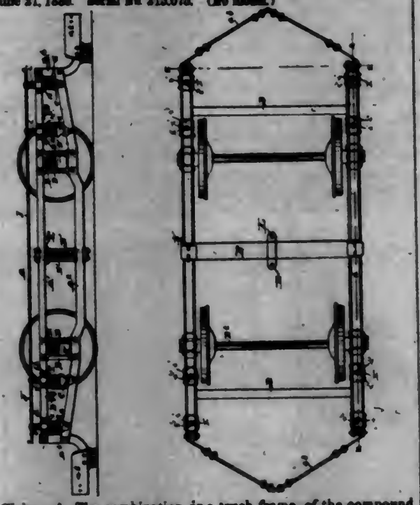
2. A chimney-cowl and ventilator consisting of a cylindrical vertical tube having an open upper end and two series—an upper and a lower series—of downwardly-inclined tubes located exteriorly of said vertical tube, the tubes comprising both series being alternately arranged in different vertical planes, and each tube of each of the series of tubes converging from its outer end to its point of attachment to the vertical tube, and having its outer end truncated on a vertical line to form a mouth in the shape of a broad open ellipse, substantially as described, for the purpose set forth.

409,991. TOY LOCOMOTIVE. GEORGE F. LUTTGENS, London, England. Filed Jan. 17, 1889. Serial No. 296,805. (No model.)

Claim.—1. A toy locomotive built up of several separate pieces, combined with a buffer-bar carrying an upright provided with a clip, detachable sides of a boiler held to place by said clip, a rod carried by the buffer-bar and serving as a striker, and whereby, when the locomotive is advancing and the buffer strikes an object or is pulled back, the cab shall be thrown off and the said boiler sides released, as set forth.

2. In a self-propelling toy locomotive, the combination, with a boiler composed of detachable sections or sides *j*, held temporarily to place both at top and bottom, of springs *m*, bearing against the inner sides of such boiler-sections, a slide-rod or buffer serving, when moved lengthwise, to release said sides at their tops, and the springs then serving to force the sides outward and to throw them off, substantially as set forth.

3. In a self-propelling toy locomotive, the combination of a buffer-bar, a detachable cab *o* and its detaining-wire *q*, a platform having the clip *p* and holes *r*, and the slide-rod *n*, connected with the buffer-bar and adapted to strike the cab and throw it off the platform upon the sudden striking or pulling of said bar, all as shown and described.



4. In a toy locomotive, a clip A, connected with a sliding buffer-bar and serving to clasp and retain the bent flanges *i* of detachable sides or other parts of the locomotive, in combination with springs *m*, the said parts being adapted to fly apart by the action of such spring upon the buffer-bar being suddenly struck or pulled, substantially as set forth.

5. In a toy locomotive, the combination, with a buffer-bar, of a crook or catch on a rod connected with such bar, and a spring-hammer retained by the crook or catch, but adapted to be released by the action of the buffer-bar when the latter is suddenly struck or pulled, substantially as set forth.

409,992. PROCESS OF REFINING NICKEL. PIERRE MARBEK, Lyons, France. Filed Dec. 19, 1888. Serial No. 294,113. (No model.)

Claim.—The herein-described process of refining nickel and cobalt, which consists in casting the crude nickel or cobalt, then oxidizing the surface of the castings by means of oxidizing-flames in the presence of air, then cooling the castings, and afterward melting them in the presence of an alkaline flux, substantially as described.

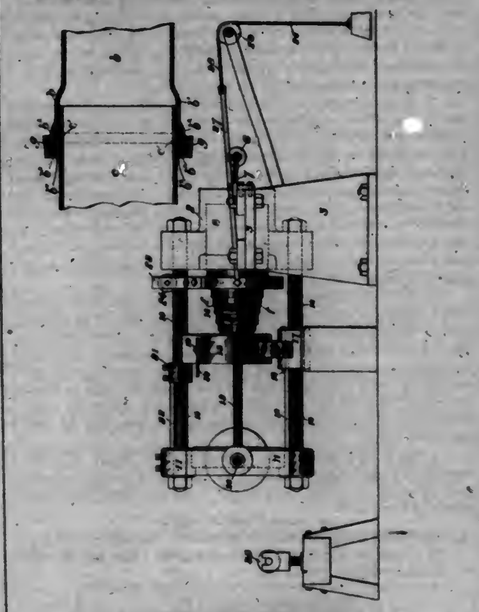
409,993. CAR-TRUCK. BENJAMIN F. MANSER, Troy, N. Y. Filed June 21, 1889. Serial No. 315,075. (No model.)

Claim.—1. The combination, in a truck-frame, of the compound side bars $A' A^3$, composed of flat metal bars arranged vertically edgewise in pairs, and bolted together substantially as described, and the vertical uprights connecting said bars and the transverse connecting-bars, substantially as specified.

2. The combination, in a truck, of the side frames composed of side bars $A' A^3$, each consisting of two parallel flat metal bars set edgewise and connected substantially as described, the uprights B B, and the transverse connecting-bars D D and E, all substantially as and for the purpose set forth.

3. The combination of the truck-frame with the body-supporting springs and the vertically-movable caps I I, resting on said springs and carrying the body, all substantially as specified.

4. The combination of the side bars $A' A^3$, the springs supported on bar A^3 exterior to the axles, the caps I, having shanks *i* playing through bar A', and the bar F, supported on said shanks, substantially as specified.



5. The combination of the truck-frame composed of side bars $A' A^3$, uprights B B, and the transverse connecting-bars D D and E, with the car-axles, boxes B', and springs F F, all substantially as set forth.

6. The combination of the truck-frame having compound side bars $A' A^3$ with the stirrup-blocks C, springs G, caps I, and bars F, all as and for the purpose set forth.

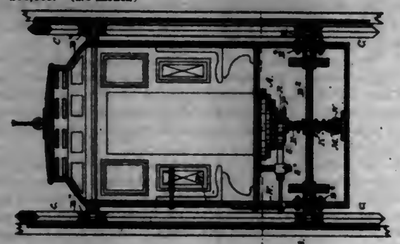
7. The combination of the truck-frame composed of side bars $A' A^3$, the latter being depressed at center, the uprights B B, and transverse bars D D and E, and bolts E', with the car-axle boxes playing between uprights B B, the springs F F, and the car-body-sustaining springs arranged on the truck exterior to the axles, substantially as and for the purposes set forth.

8. The herein-described truck, consisting of the side frames composed of compound bars $A' A^3$, uprights B B, and the transverse braces D D and E, brace-bolts E', the stirrup-blocks C C, springs thereon, the vertically-movable caps I, having shanks *i* playing through bar A', and the body-bars J, all constructed and arranged as and for the purpose described.

409,994. MACHINE FOR EXPANDING THE ENDS OF PIPES. GEORGE MATHESON, Brooklyn, N. Y. Filed Dec. 3, 1888. Serial No. 292,460. (No model.)

Claim.—1. In a machine for shaping the ends of pipe by end compression of a mandrel, a die for confining the pipe during the shaping operation, said die having an internal groove-like recess within which the metal may flow to form a swell in the pipe, substantially as and for the purpose described.

2. In a machine for expanding and shaping the ends of pipes by end compression of a stepped or tapering mandrel, a die for confining the pipe, said die being flared to permit expansion of the pipe, and having an internal groove-like recess within which the metal may flow to form a swell in the pipe, substantially as and for the purpose described.



3. In a machine for expanding the ends of pipes, the combination of a movable expanding cone or mandrel and a rod affixed to the moving head or plunger by which the mandrel is actuated, said mandrel being movably mounted on said rod, and a stop on the rod which affords resistance to the mandrel during the act of stripping the pipe therefrom, substantially as and for the purpose described.

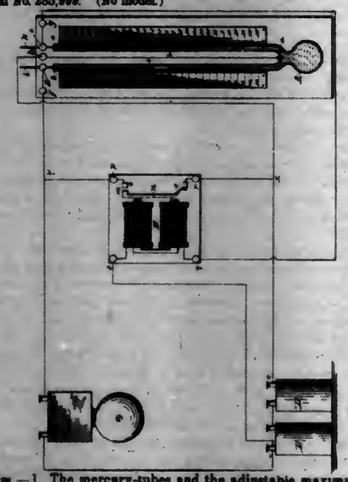
4. In a machine for expanding the ends of pipes, the combination of a movable expanding cone or mandrel, a die which incloses the pipe around the portion thereof which is to be expanded, and a separate clamp or gripper by which the pipe is held while being expanded, substantially as and for the purpose described.

5. In a machine for expanding the ends of pipes, the combination of a plunger 8, a projecting rod 12, the cone or mandrel 14, which is loosely mounted on the rod, a sectional die 15, having a suitable forming-cavity, and a clamp or gripper 25, by which the pipe is held, substantially as and for the purpose described.

409,995. SPEED-CONTROLLING DEVICE FOR ELEVATORS.

THOMAS H. MELROSE, San Francisco, Cal. Filed Jan. 12, 1889. Serial No. 296,165. (No model.)

Claim.—1. In a speed-controller for elevator-cars, the combination of wheels on the car adapted to embrace and run on rails in the well or shaft of the elevator, a controlling-shaft geared into one of the shafts or axles of said wheels by a worm-wheel on the axle, and a loosely-sliding sleeve on the controlling-shaft having a worm engaging with said worm-wheel, a clutch-section on said controlling-shaft and a fellow clutch-section on the end of said sleeve, and friction dogs or blocks fixed on the said controlling-shaft in position for operation by centrifugal force against a fixed friction-ring or circular track surrounding them, substantially as set forth.



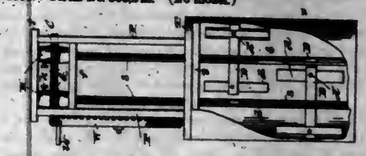
2. In an elevator, the combination, with guide-rails fixed in the well or rim of the car, of wheels on the car having their axles geared together, a controlling-shaft, a friction-ring having centrifugal friction dogs or blocks, on which the controlling-shaft acts to cause them to operate in the direction of rotation of the shaft, a loosely-sliding sleeve on said controlling-shaft having a worm-gear, a clutch-section on the end of said sleeve, and a fellow clutch-section on the shaft, which are adapted to be locked by the movement of the sleeve longitudinally in one direction and to be released to run idly by a contrary movement, and a worm-wheel on one of the axles of said wheels adapted to engage said worm, substantially as set forth.

3. The combination of a controlling-shaft E, carrying a loose sleeve capable of longitudinal movement thereon, and having a worm-gear, a clutch-section on said sleeve, and a fellow clutch-section on the controlling-shaft adapted to be locked or unlocked by the longitudinal movements of said sleeve, and a governor connected with said controlling-shaft, consisting, essentially, of centrifugal dogs or blocks carried by the shaft, and a surrounding fixed ring presenting a friction-surface to engage said dogs, substantially as described, for operation as set forth.

4. The combination of the friction-pulley P, brake R, brake-lever S, and cam-plates Y, fixed in the run of the elevator at given point or points to engage with and throw the said brake-lever, substantially as set forth.

409,996. THERMOMETRIC INDICATOR.

MAX MEYER, New York, N. Y., assignor to Ruben R. Ayres, same place. Filed Sept. 21, 1888. Serial No. 285,999. (No model.)



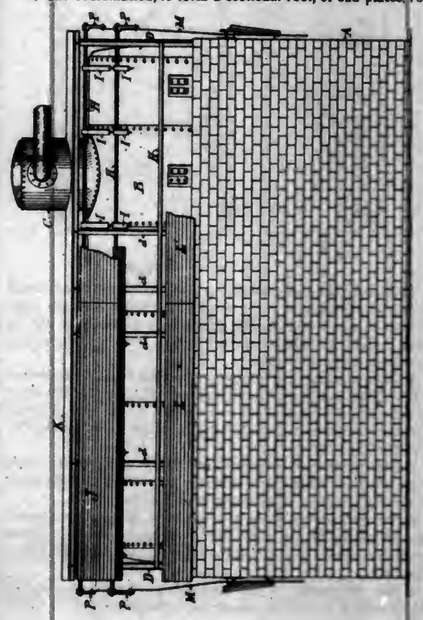
Claim.—1. The mercury-tubes and the adjustable maximum and minimum contacts, in combination with a normally-open maximum circuit, including the maximum contact and the mercury of its tube, a normally-closed minimum circuit, including the minimum contact and the mercury of its tube, and the annunciator or indicator mechanism controlled by each circuit and brought into operation upon change in the condition of said circuit, substantially as and for the purposes hereinbefore set forth.

2. The mercury-tubes and the adjustable maximum and minimum contacts, in combination with a normally-open maximum circuit, including the maximum contact, the mercury of its tube, and the annunciator, a normally-closed minimum circuit, including the minimum contact, the mercury of its tube, and the coils of a relay, and a branch circuit through the annunciator containing contact-points controlled by the relay, substantially as and for the purposes hereinbefore set forth.

409,997. CHURN.

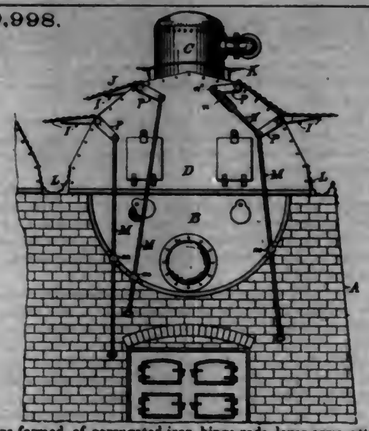
ELI MICHAELS, Sweetser's, Ind. Filed Apr. 23, 1889. Serial No. 308,242. (No model.)

Claim.—The shaft S, the two arms D, passing through transverse holes therein at right angles thereto and to each other, vertical wings *d*, dovetailed in the ends of said arms at right angles thereto, and wooden pins *d'*, for holding them in place, in combination with a second shaft S, having similar arms and wings and standing parallel with said first shaft, the opposite arms being set quartering to each other, a pair of intermeshing gears keyed to said shafts, and a hand-wheel for imparting rotary motion thereto, as set forth.



409,998. SECTIONAL ROOF FOR STILLS.

JAMES G. MITCHELL, Philadelphia, Pa., assignor to the Atlantic Refining Company, same place. Filed Mar. 12, 1889. Serial No. 302,998. (No model.)



Claim.—1. The combination, to form a sectional roof for a cylindrical or other shaped still, of supporting-plates, a series of hinge-rods, a series of roof sections attached to and turning with said rods, and arranged to, when closed, fit or conform as a whole to the shape of the still to which they are applied, and means for turning said hinge-rods, substantially as set forth.

2. The combination, to form a sectional roof for a cylindrical or other shaped still, of supporting-plates, a series of hinge-rods, a series of roof-sections formed of corrugated iron attached to and turning with said rods, and arranged to, when closed, fit or conform as a whole to the shape of the still to which they are applied, and means for turning said hinge-rods, substantially as set forth.

3. The combination, to form a sectional roof, of end plates, roof-

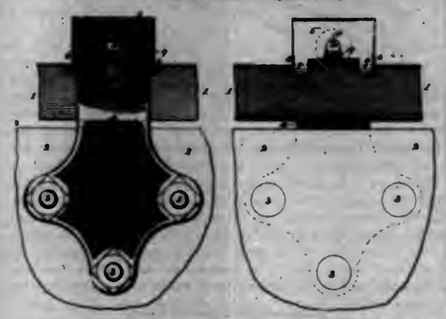
409,998.

sections formed of corrugated iron, hinge-rods, lever-arms attached to said hinge-rods, and manipulating-rods for operating said lever-arms, substantially as set forth.

4. The combination, to form a sectional roof, of end plates, roof-sections formed of corrugated iron, hinge-rods, lever-arms attached to said hinge-rods, manipulating-rods, and slotted links, substantially as set forth.

5. The combination, to form a sectional roof, of end plates, hinge-rods, supporting-arms projecting from said rods, roof-sections mounted upon said arms, lever-arms attached to said hinge-rods, and manipulating-rods to open and close said roof-sections, substantially as set forth.

6. The combination, to form a sectional roof, of a pair of end plates having corresponding sectional faces, roof-sections, each of breadth equal to the length of one of said faces, hinge-rods upon which said roof-sections are mounted, lever-arms upon said hinge-rods, and manipulating-rods connected to said lever-arms, substantially as set forth.



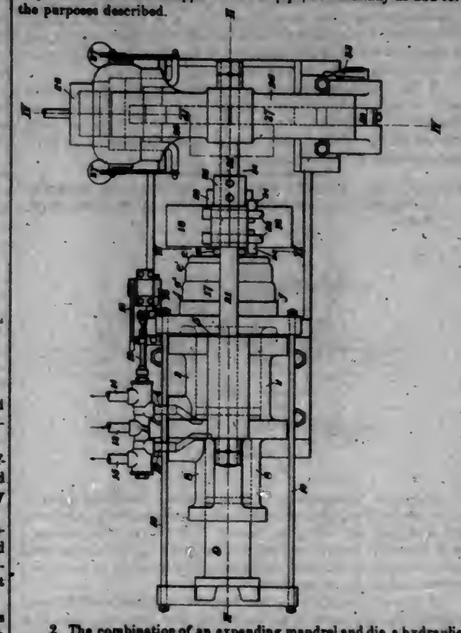
7. In a still-roof, in combination, the end plates, the hinge-rods, the roof-sections, the lever-arms, the links, and the manipulating-rods, substantially as set forth.

8. In a still-roof, in combination, the supporting-arches, the hinge-rods, the roof-sections, the lever-arms, the link, and the manipulating-rods, substantially as set forth.

9. In a still-roof, in combination, the supporting-arches, the hinge-rods, the roof-sections, the lever-arms, the slotted links, and the manipulating-rods, substantially as set forth

409,999. DOOR-HANGER.

PETER H. MURPHY, East St. Louis, Ill. Filed May 22, 1889. Serial No. 311,662. (No model.)



Claim.—In a door-hanger of two parts, the combination of a bracket constituting one part having a slotted head with projections on each side of the slot, bearings in the bracket on each side of said slot, one of which is open at the bottom, and a cylindrical roller having gudgeons adapted to work in said bearings and constituting the other part, substantially as set forth.

410,000. MACHINE FOR EXPANDING THE ENDS OF PIPES.

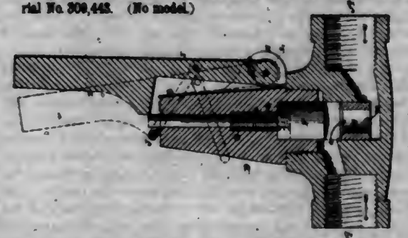
GEORGE MATHESON, Brooklyn, N. Y. Filed June 20, 1889. Serial No. 314,952. (No model.)

Claim.—1. The combination of an expanding mandrel and die, a hydraulic motor comprising a cylinder and plunger by which the mandrel is projected, and an auxiliary cylinder and plunger by which it may be retracted and stripped from the pipe, substantially as and for the purposes described.

2. The combination of an expanding mandrel and die, a hydraulic motor comprising a cylinder and plunger by which the mandrel is projected, and an auxiliary cylinder and plunger by which it may be retracted and stripped from the pipe, said cylinders being situate in substantially the same axial line and formed of an integral piece of metal, substantially as and for the purposes described.

3. The combination of an expanding mandrel and die, a hydraulic motor comprising a cylinder and plunger by which the mandrel is projected, an auxiliary cylinder and plunger by which it may be retracted and stripped from the pipe, and a common valve controlling the cylinders, substantially as and for the purposes described.

4. The combination, with an expanding-mandrel, of a clamp for holding the pipe, said clamp consisting of separable sections, and a hydraulic motor by which one at least of the sections is moved, substantially as and for the purposes described.



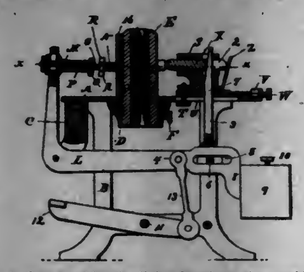
5. The combination, with an expanding-mandrel, of a clamp for holding the pipe, said clamp consisting of separable sections, a hydraulic motor by which one of the sections is moved, and an eccentric by which the other section is moved, substantially as and for the purposes described.

6. The combination, with an expanding-mandrel, of a clamp for holding the pipe, said clamp consisting of separable sections, an eccentric, and an eccentric-box set in a recess or slideway in the machine-frame and connected with the clamp-section, substantially as and for the purposes described.

7. The combination of the machine-frame, a hydraulic motor and mandrel at one end thereof, a gripper or clamp and its actuating mechanism at the other end, and braces or rods connecting the ends of said machine-frame, substantially as and for the purposes described.

410,001. AUTOMATIC SAFETY-LOCK FOR GAS.

ALBERT H. MCCLURE and HUGH HOLLAND, McGovern, Pa. Filed May 3, 1889. Serial No. 309,443. (No model.)



Claim.—1. The combination, with the shell provided with a

valve-seat, the vertical cylinder, and a spring-actuated valve having a stem projecting above the cylinder when it is raised, of a spring-actuated lock having its lower end pivoted to the shell or guide and its upper end engaging the upper end of the valve-stem, in the manner shown, and for the purpose described.

2. The combination of the shell provided with a valve-seat, the guide or cylinder, the spring-actuated valve placed therein and adapted to have its end extend above the guide or cylinder by the pressure of gas against it, the pivoted spring-actuated lock, and a ring connected to the lock, substantially as set forth.

410,002. MACHINE FOR LINING RAILROAD-CAR BEARINGS.

GILBERT MCCULLOCH, Altoona, Pa. Filed Nov. 13, 1888. Serial No. 290,706. (Model.)

Claim.—1. In a machine for lining bearings, the combination of a core, longitudinally-sliding wings fitted against the sides of said core, and mechanism for forcing the bearing which is to be lined in a rearward direction toward the face of said core and into contact with the front edges of the said sliding wings, substantially as herein described, and for the purpose set forth.

2. In a machine for lining bearings, the combination of the core, studs or plugs mounted in perforations in and projecting from the face of said core, longitudinally-movable wings fitted against the sides of said core, and mechanism for forcing the bearing which is to be lined in a rearward direction toward the face of said core and into contact with the front edges of the said sliding wings, substantially as herein described, and for the purpose set forth.

3. In a machine for lining bearings, the combination, with a suitable table or platform, of a core having flattened sides, the longitudinally-sliding wings fitted against the sides of said core, mechanism for forcing the said wings in a forward direction, and mechanism for forcing the bearing which is to be lined in a rearward direction toward the face of said core and into contact with the front edges of the said sliding wings, substantially as set forth.

4. In a machine for lining bearings, the combination of a core having flattened sides, longitudinally-sliding wings fitted against the sides of said core and having rearwardly-extending arms or brackets, a box mounted upon the frame or table in rear of the core, a longitudinally-sliding cross-head mounted in said box and bearing against the rearwardly-extending arms of the longitudinally-sliding wings, and mechanism for operating the said cross-head, substantially as set forth.

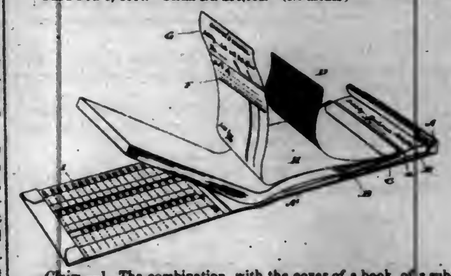
5. The combination of the core, the longitudinally-sliding wings fitted against the sides of said core, the boxing mounted upon the frame or table in rear of said core, a cross-head sliding longitudinally in said boxing and bearing against the longitudinally-sliding wings, a spring arranged to press against the rear end of the stem of said cross-head, and a vertically-movable wedge working in a slot in the said stem, and serving, when moved in an upward direction, to force the cross-head in a forward direction, assisted and continued by the said spring, substantially as herein set forth.

6. In a machine for lining bearings, the combination of the core, the longitudinally-sliding wings fitted against the sides of said core, mechanism for forcing the said wings in a forward direction, a bell-crank lever having an arm extending vertically in front of the said core, and provided with a horizontal bracket extending toward the said core and having an adjustable ram-head, and mechanism for operating the said bell-crank lever, substantially as set forth.

7. In a machine for lining bearings, the combination of a frame or table, a core mounted on the same, a bracket extending downwardly from the front end of said table, a bell-crank lever pivoted to said bracket, a ram-head mounted adjustably in a bracket extending forwardly from the vertical arm of said bell-crank lever, a boxing mounted adjustably in rear of the said core and having a longitudinally-sliding cross-head, a wedge moving vertically in said boxing and forcing the said cross-head in a forward direction, a pin connecting the lower end of said wedge with a longitudinal slot in the horizontal arm of the bell-crank lever, and a link connecting the latter with the rear end of a lever, the front end of which is provided with a treadle, substantially as set forth.

8. In a machine for lining bearings, the combination of a core the face of which is provided with radial openings, with studs or plugs fitted in the said openings and projecting beyond the face of the said core, and the longitudinally-sliding wings, substantially as and for the purpose set forth.

9. The combination, with the table having a flange or collar, of the cylindrical tubular core mounted in the said collar and secured in position by means of a set-screw, and the longitudinally-sliding wings, substantially as herein set forth.



10. In a machine for lining bearings, the combination, with the core having the longitudinally-sliding wings, of the longitudinally-adjustable boxing having a longitudinally-movable cross-head arranged to bear against the said wings, and mechanism, substantially as described, for forcing the said wings in a forward direction, substantially as set forth.

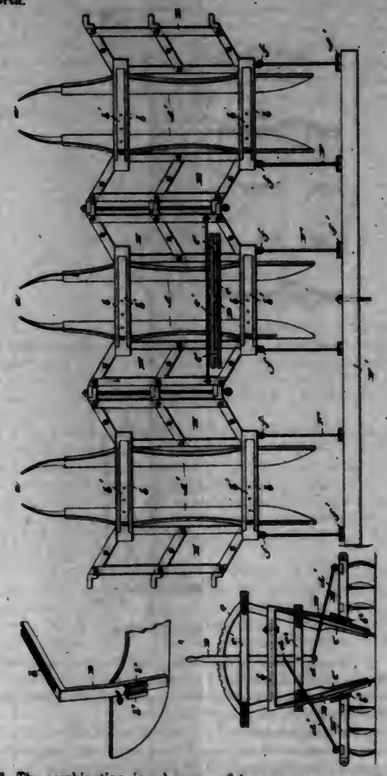
11. In a machine for lining bearings, the combination of the frame or table, the core, the longitudinally-adjustable boxing having the longitudinally-movable cross-head, a bell-crank lever, the vertical arm of which is provided with a bracket having a ram-head extending horizontally in front of the core and the horizontal arm of which is provided with a slot, connected with the lower end of a vertically-movable wedge sliding in a bearing in the longitudinally-adjustable boxing and serving to force the cross-head in a forward direction, a weight mounted adjustably at the rear end of the horizontal arm of the bell-crank lever, and a link connecting the latter with an operating-treadle, substantially as and for the purpose herein set forth.

12. In a machine for lining bearings, the combination, with the core having the longitudinally-sliding wings, of the longitudinally-adjustable boxing, a cross-head arranged to move longitudinally in the said boxing and bearing against arms or brackets extending rearwardly from the longitudinally-movable wings, a vertically-movable wedge adapted to bear against the cross-head and force the latter in a forward direction, and a spring mounted upon the base of the said longitudinally-adjustable boxing and bearing against the rear end of the stem of the longitudinally-sliding cross-head, serving to force the same in a forward direction, substantially as and for the purpose herein set forth.

410,003. BLACK-LEAF CHECK-BOOK.

THOMAS MCDOWELL, Niagara Falls, N. Y., assignor to the Carter & Company, (Limited,) same place. Filed Dec. 3, 1887. Serial No. 256,932. (No model.)

Claim.—1. The combination, with the cover of a book, of a substantially U-shaped spring attached to said cover and the cross-bar thereof adapted to bear on the book at a point between its attachment to the cover and the perforations *a* of the book, leaving the stubs entirely free of the spring, and a black leaf secured to the cross-bar of said spring, substantially as and for the purpose specified.



2. A cover A', formed at one end with a pocket A, and a book fitted into pocket A, formed on the end of the cover A', in combination with a binder or elastic over the portion of the book in the pocket, and the carbon sheet D, attached to a fly C, attached to the spring B, which is attached to the cover A' and extends along the side of the main leaf and across the book at a point between the free end of the main leaf and the perforations *a*, substantially as and for the purpose specified.

410,004. HARROW.

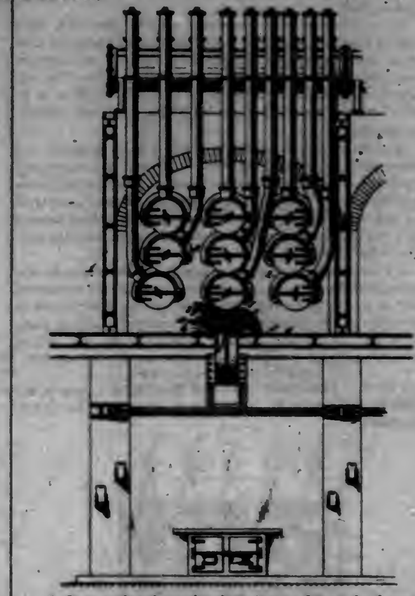
DENVER MCHUGH, Malvern, Iowa. Filed Mar. 23, 1889. Serial No. 305,071. (No model.)

Claim.—1. The combination, in a harrow for cultivating listed corn, of runners connected adjustably to each other by arches, a frame carrying a pivoted lever, harrow-sections pivotally connected to the runners, so that said pivots may move vertically, and rods connecting the outer ends of the harrow-sections to the lever, whereby said harrow-sections may be raised, substantially as shown, and for the purpose set forth.

2. The combination, in a harrow for cultivating listed corn, of runners provided at their rear ends with cultivating-blades, harrow-sections pivoted to said runners, and rods connecting the outer ends of the harrow-sections with a lever carried by a frame attached to the runners, the runner-connecting arches and lever-carrying frame being laterally adjustable, substantially as shown, and for the purpose set forth.

3. The combination, in a harrow, of two or more runner-carrying arches, harrow-sections pivotally connected to said runners, so as to be capable of a vertical movement at their points of connection, the harrow-sections being connected to each other, and means, substantially as shown, for elevating the sides of the harrow-sections where they are pivoted to each other, substantially as shown, and for the purpose set forth.

4. The combination, in a harrow, of the runners connected to each other by laterally-adjustable arches, the upper portion of said arches interlocking with each other and provided with a bolt for securing the parts, harrow-sections pivoted to the lower ends of the arches, draft-eyes *f*, and rods F, adapted to engage therewith and with loops attached to the draft-bar F', substantially as shown, and for the purpose set forth.



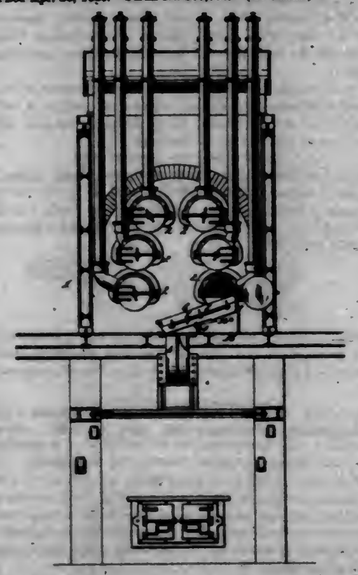
5. The combination, in a harrow, of harrow-sections consisting of two or more parallel bars connected to each other by lateral bars, said harrow-sections having at their corners perforated projections at right angles with the parallel bars, and means for connecting the harrow-sections to each other, so that said sections may be used as an ordinary harrow, and also be capable of attachment to the arches carrying runners, substantially as set forth.

410,005. COKE-CHUTE.

GEORGE A. MCILHENNY, Washington, D. C. Filed Apr. 20, 1889. Serial No. 308,066. (No model.)

Claim.—1. The combination, with a gas-bench having an opening leading to the furnace-chute and another opening leading to the coke-cellar, of a coke-chute located beneath the retort-doors and over the furnace-chute, said coke-chute having a hopper-plate hinged to its bottom and the chute being arranged over the furnace-chute, with its lower end in contiguity to the opening leading to the coke-cellar, substantially as described.

2. In a gas-bench, the combination, with a series of retorts, of a coke-chute consisting of a bottom having a discharge-opening and two converging sides, one of which is hinged to turn outward, and a hopper-plate hinged upon the bottom of the chute and adapted to be turned in opposite directions to form an angle therewith to direct the coke from the retorts through the discharge-opening into the furnace-chute or through the side opening into the coke-cellar, substantially as described.



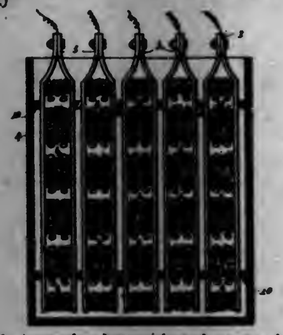
3. In a gas-bench, a coke-chute arranged over the furnace-chute and beneath one or more of the retorts, said coke-chute having an opening in its bottom over the furnace-chute, and a bottom plate adapted to either close said opening or to be used to form in conjunction with the chute a hopper to guide the coke to said opening, substantially as described.

4. In a gas bench, a coke-chute arranged over the furnace-chute and provided with a hinged front wall and an opening in the bottom above the furnace-chute, in combination with a reversible bottom plate, substantially as described.

410,006. COKE-CHUTE.

GEORGE A. MCILHENNY, Washington, D. C. Filed Apr. 20, 1889. Serial No. 308,067. (No model.)

Claim.—1. In a gas-bench, the combination, with a series of retorts, of a coke-chute pivotally mounted between its ends upon one



side of the furnace-chute and having its higher end lying under the retorts and the other end arranged over said furnace-chute, substantially as described.

2. The combination, with a gas-bench having gas-retorts upon both sides of a furnace-chute, of a coke-chute pivotally mounted upon one side of the furnace-chute and having an opening in its bottom lying over said chute, an opening being also formed in the other end and covered by a removable bottom piece to permit the chute to be inclined in both directions and to discharge from either end, substantially as described.

3. In a gas-bench, the combination, with a series of retorts, of a coke-chute pivotally mounted under one or more of said retorts and having one end arranged over the furnace-chute, whereby the drawn coke is guided to the latter, said chute provided with an opening in its other end, covered by a removable plate or bottom piece inserted through a slot in the end of the chute and resting on side lugs, substantially as described.

4. In a gas-bench, the combination, with a series of retorts, of a coke-chute pivotally mounted beneath one or more of said retorts and composed of an oblong conveyer having an opening in its bottom at or near each end, in combination with a removable bottom piece adapted to cover one of said openings, a section of the outer wall of said chute being hinged to turn outward, substantially as described.

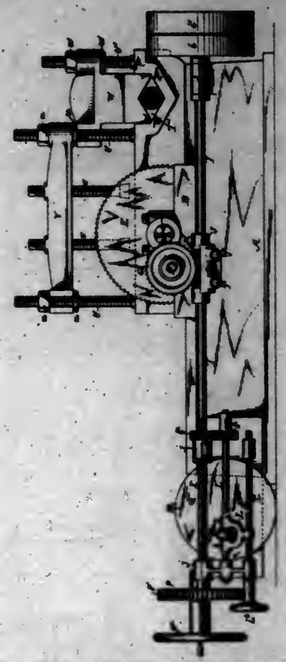
410,007. SECONDARY-BATTERY ELECTRODE. JAMES F. MCLAUGHLIN, Philadelphia, Pa. Filed July 10, 1889. Serial No. 317,019. (No model.)

Claim.—1. A secondary-battery electrode composed, essentially, of two lead plates and a compressed and baked plate of active material clamped between them, substantially as described.

2. In a secondary-battery electrode, the combination of two lead plates held a distance apart by lead tubes extending between and through the same and a baked plate of active material filling the space between the lead plates and between the tubes, substantially as described.

3. In a secondary-battery electrode, the combination of two lead plates held a distance apart by lead tubes having perforated walls and a baked plate of active material filling the space between the lead plates and tubes, substantially as described.

410,008. REMOVABLE CALK FOR HORSESHOES. JOSEPH HEUB, Sr., Berlin, Germany. Filed Jan. 28, 1889. Serial No. 297,259. (No model.) Patented in Germany Mar. 28, 1886, No. 37,400; in France June 4, 1886, No. 176,551; in England June 18, 1886, No. 8,133, and in Belgium July 19, 1886, No. 73,897.

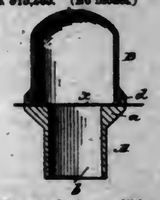


Claim.—A removable calk for horseshoes, having a tapered upper end and provided on two opposite sides with grooves *a*, extending from end to end of the calk, substantially as and for the purpose specified.

410,009. MACHINE FOR SAWING METAL. CHARLES C. NEWTON, Philadelphia, Pa. Filed June 4, 1889. Serial No. 313,057. (No model.)

Claim.—1. The combination of the bed-plate of a metal-sawing machine, the carriage mounted thereon, the saw spindle or shaft mounted on said carriage and carrying at one end a saw, a worm-wheel adapted to drive the shaft, with a driving-shaft, a worm meshing with said wheel and adapted to travel with the carriage, but free to be revolved by the driving-shaft, said worm having its bearings in a lubricating-box in which the worm travels and is lubricated, substantially as described.

2. The combination, in a metal-sawing machine, of the carriage, saw-shaft mounted thereon, a worm-wheel, a driving-shaft carrying a worm free to slide thereon, a bearing for the worm-shaft on the carriage, with a series of balls between the end of the worm and the bearing.

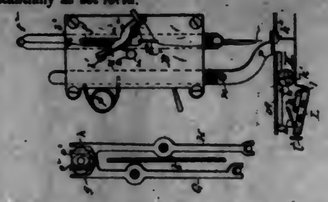


3. The combination of the carriage, nut thereon, feed-screw, feed-shaft, a worm-wheel thereon, a worm carried by a transverse shaft mounted in the lubricating-box, and a bearing on the frame, substantially as and for the purpose set forth.

4. The combination of the screw-threaded saw-spindle, a saw with two sleeves, a bolt securing the saw and sleeves together, one of said sleeves being threaded and adapted to the thread on the screw-spindle, substantially as set forth.

5. The combination of the saw-spindle carrying the saw with a shaft parallel with the spindle, a pinion on the shaft gearing with a wheel on the spindle, a worm-wheel mounted on the shaft and meshing with a worm carried by the driving-shaft, substantially as specified.

410,010. TOY. JOSEPH S. O'BRIEN, Springfield, Mass. Filed June 6, 1889. Serial No. 313,263. (No model.)



Claim.—Devices for producing audible reports, consisting of a lower tubular part A, open from end to end and having a widened upper extremity *a*, to form a seat for a diaphragm to be burst, and a chambered shell of elastic material, separate from part A, having a widened or bead-formed mouth adapted to rest on and closely fit the surface of the diaphragm on said seat, substantially as and for the purpose set forth.

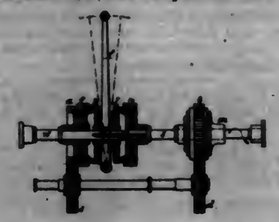
410,011. SEWING-MACHINE. STEPHEN O'CONNOR, Bridgeport, Conn. Filed June 18, 1886. Renewed Jan. 31, 1889. Serial No. 297,105. (No model.)

Claim.—1. In a sewing-machine, the combination, with a bracket-arm the vertical portion of which is provided with a strengthening rib or diaphragm, of the main shaft journaled in the upper part of said arm, the eccentrics thereon, the vertical levers pivoted on either side of said diaphragm and having oppositely-arranged inwardly-extending yokes embracing said eccentrics, and the shuttle and feed levers operated by said vertical levers, substantially as set forth.

2. In a sewing-machine, the combination, with a bracket-arm the vertical portion of which is provided with a strengthening rib or diaphragm, of the main shaft journaled in the upper part of said arm and provided with a needle-bar-operating crank-disk, two eccentrics, and a gear-wheel, a needle-bar adapted to receive motion from said crank-disk, two vertical levers pivoted, one on either side of said diaphragm and having inwardly-extending yokes embracing said eccentrics, the shuttle and feed levers operated by said vertical levers, and a driving gear-wheel meshing with the said gear-wheel on the main shaft, substantially as set forth.

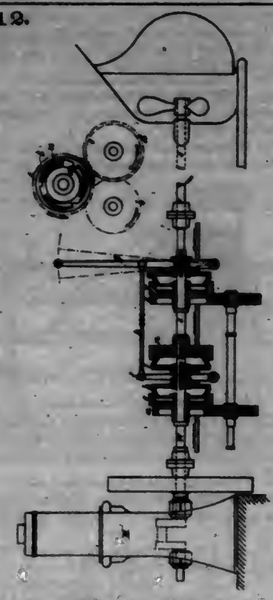
3. In a feed mechanism for sewing-machines, the combination of a feed-bar-operating lever vibrating in a horizontal plane, means, substantially as described, for imparting the vibrations to said lever from the driving-shaft, and a feed-bar sliding upon a fixed fulcrum between the feed-dog and the inclined slot in which said operating-lever works, as described.

4. In a sewing-machine, the combination of a feed-bar having an inclined slot sliding upon a fixed fulcrum between the feed-dog and said slot, an adjusting-bar carried by said feed-bar having a projection for shortening and lengthening said slot, an adjusting-screw for fixing said adjusting-bar in the desired position, a vibrating feed-bar-operating lever working in said slot, and means, substantially as described, for imparting the vibratory movements to said feed-bar-operating lever, as set forth.



5. In a sewing-machine, the combination of a feed-bar pivoted near its center and having an inclined slot through which its pivot-pin passes and a second inclined slot, a vibrating feed-bar-operating lever working in said second inclined slot, and means, substantially as described, for imparting the vibratory movement to the said lever, as specified.

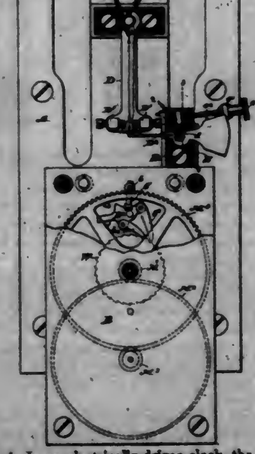
6. In a sewing-machine, the combination, with a pivoted and sliding feed-bar having an inclined slot, of an adjusting-bar loosely attached to said feed-bar having a projection extending across said slot, and an offset, an adjusting-screw tapped through said offset and abutting against said feed-bar, a spring for holding said screw in contact with said feed-bar, and a vibrating feed-lever working in said inclined slot, substantially as described.



410,012. REVERSING MECHANISM. NICOLAUS A. OTTO, Cologne, Prussia, assignor to the Gas-Motoren-Fabrik-Deutz, Deutz, Germany. Filed Apr. 24, 1889. Serial No. 308,463. (No model.) Patented in England Apr. 3, 1889, No. 5,616; in Belgium Apr. 10, 1889, No. 85,734, and in France Apr. 27, 1889, No. 197,791.

Claim.—1. In apparatus for reversing motion, the combination, with a driving-shaft and a driven shaft lying in the same axial line, of a clutch gearing them together for driving the driven shaft direct in one direction, a second clutch on the driving-shaft, one part of which is loose thereon and carries a toothed ring, toothed gearing connecting such toothed ring, through an intermediate wheel, with a toothed ring on a third clutch on the driven shaft, which third clutch is stationary and allows the driven shaft to rotate independently of it when the first clutch is in gear for driving the shaft direct, but which carries the shaft round with it when rotated in the contrary direction to the driving-shaft through the second clutch and intermediate gearing, substantially as herein set forth.

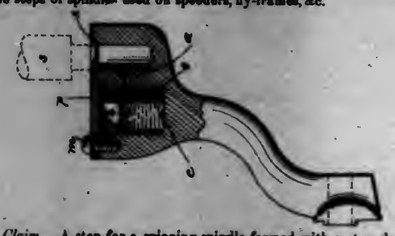
2. In apparatus for reversing motion, the combination, with a motor-shaft *w* and driven shaft *s*, of a double conical friction-clutch *o k l m*, of which the part *o* is loose on shaft *w* and carries a toothed ring *a*, while parts *k* and *l* slide on shaft *w*, and part *m* is fixed on shaft *s*, conical friction-clutch *r m*, of which the part *r* is loose on shaft *s* and



410,012.

carries toothed ring *c*, while part *m* slides on shaft *s*, toothed gear *b c d*, connecting toothed ring *a* with toothed ring *c*, and levers *g f h* and connecting-rod *p*, whereby the parts *k l m* of the three clutches are all operated simultaneously, substantially as and for the purposes set forth.

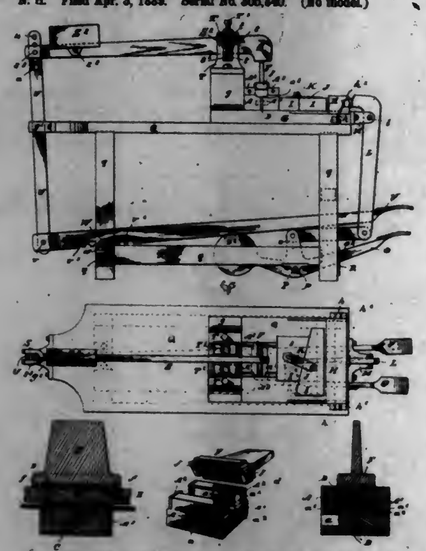
410,013. ELECTRIC PENDULUM CLOCK. ALBERT L. PARCELLE, New York, N. Y. Filed Apr. 27, 1888. Renewed July 16, 1889. Serial No. 317,856. (No model.)



Claim.—1. In an electrically-driven clock, the combination of a pendulum-moving switch having contacts thereon and the transversely-rocking brush bearing on the switch, substantially as set forth.

2. The combination of the pendulum, the pivoted rocking switch, and the pivoted and transversely-rocking brush bearing thereon, substantially as set forth.

3. The combination of the pendulum, the switch operated thereby and carrying adjustable screws embracing the pendulum, the pivoted brush, its pivoted supporting-block, and the adjusting-screw for rocking the block, substantially as set forth.

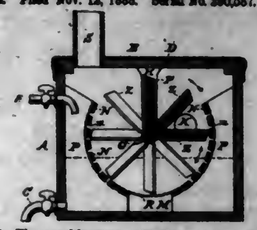


410,014. STEP FOR SPINNING-SPINDLES. CHRISTOPHER B. PARKER and GEORGE T. HOPE, Pawtucket, R. I. Filed Mar. 27, 1889. Serial No. 305,084. (No model.)

Brief.—The object of the invention is to improve the lubrication of the steps of spindles used on speeders, fly-frames, &c.

Claim.—A step for a spinning-spindle formed with a step-chamber, and a separate oil-chamber communicating with said step-chamber, in combination with a perforated partition in the oil-chamber, and packing between said partition and the wall of the oil-chamber, substantially as specified.

410,015. HARNESS-LOOP PRESS. CHARLES FELDNER, Concord, N. H. Filed Apr. 3, 1889. Serial No. 306,340. (No model.)

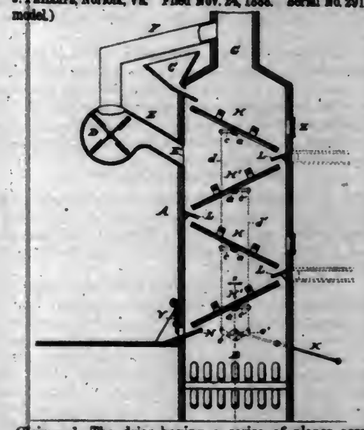


Claim.—1. The combination of a socket or forming die made in two parts connected by a dowel-pin, and plates secured at each end and lapping over the end of each side of said socket, and a top die having a projection at each end adapted to lap over either end of the top of a loop, and means, substantially as described, for applying side pressure to said socket-die and downward pressure to the top die, all substantially for the purpose set forth.

2. In a press for forming harness-loops, a longitudinally-separable socket or forming-die, a follower, and adjustable interposing blocks between said follower and socket-die, a pressure-bar for applying horizontal pressure thereto, and a counterweighted foot-lever and suitable connecting-rods for operating the same, a top die and adjustable counterweighted pressure-bar, and adjustable foot-lever and connecting-rod for applying vertical pressure to said top die, all substantially for the purpose described.

3. In a press for forming harness-loops, the combination, with a longitudinally-separable socket or forming die and the pressure-bar for applying horizontal pressure to the same, of a counterweighted foot-lever having an arm rising in nearly a vertical direction at a point near its point of fulcrum, and a horizontal connecting-bar, whereby the lower end of said pressure-bar is moved outward or toward an operator by the downward movement of the said foot-lever.

4. The combination, with the dies, substantially as described, of a pressure-bar for applying vertical pressure, bearings to which it is fulcrumed capable of vertical adjustment, a foot-lever provided with an adjustable point or fulcrum consisting of a series of slots cut in its lower edge for receiving a fulcrum-pin, and a connecting-bar pivoted near one end to the rear end of said foot-lever, and provided near its opposite end with a series of perforations, to either of which the rear end of said pressure-bar may be pivoted, all substantially for the purpose set forth.

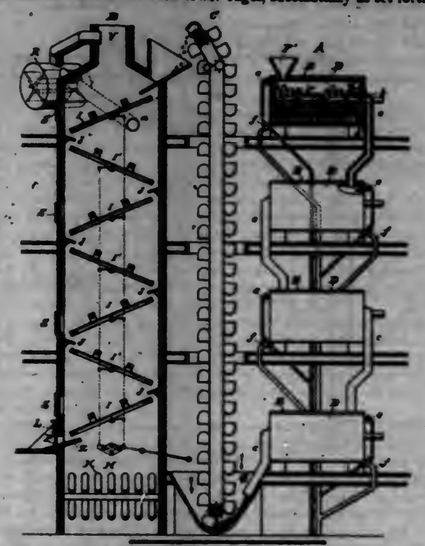


410,016. MACHINE FOR WASHING NUTS. JAMES J. PHILLIPS, Norfolk, Va. Filed Nov. 12, 1888. Serial No. 290,587. (No model.)

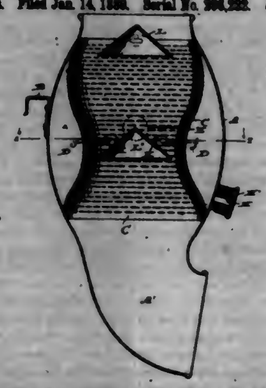
Claim.—1. The combination, with the end-slotted tank having an end discharge-opening, of the rotary agitator having its shaft at one end let into the slot in the end of the tank and provided with oblique or inclined radial blades, an auxiliary concave bottom formed of spaced apart slats, and a removable wire-covered bridge-bottom, substantially as set forth.

2. The combination, with the end-slotted tank having an end discharge-opening, an auxiliary concave bottom formed of spaced apart slats, and a removable wire-covered bridge-bottom, of the rotary agitator having one end of its shaft let into the slot of said tank and provided with oblique or inclined radial wings or blades, said tank also having a discharge-opening above the water-level and an inlet and outlet water-cock, substantially as specified.

410,017. APPARATUS FOR DRYING NUTS, GRAIN, &c. JAMES J. PHILLIPS, Norfolk, Va. Filed Nov. 24, 1888. Serial No. 291,826. (No model.)



Claim.—1. The drier having a series of plates arranged one above the other and in consecutive oppositely-inclined positions, and having central pivot-shafts provided with crank-arms extending in successive opposite directions and connected together in alternate pairs by opposite parallel rods, the lower ends of said rods being connected by interacting levers, actuated by a hand shifting-lever, substantially as set forth.

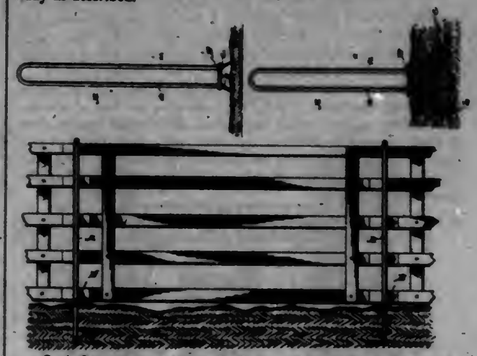


2. The combination, with a vertically-elongated drier-case having alternate turning-ledges attached to its wall, and a top flue, of a discharge-regulator, series of alternating inclined planes, an exhaust connected to the upper part of the case and leading into the flue, the same being arranged wholly to one side of the updraft, and a heater at its base, substantially as specified.

410,018. MEANS FOR CLEANING AND DRYING NUTS, &c. JAMES J. PHILLIPS, Norfolk, Va. Filed Mar. 26, 1889. Serial No. 304,852. (No model.)

Claim.—The apparatus for treating nuts, &c., which comprises the series of baths having elevated discharge-openings and oblique stirring and discharging blades, the connecting-chutes arranged at successively opposite ends of the baths, the water-supply pipes connecting with successively opposite ends of the baths at their upper edges, and the waste-water pipes connecting with successively opposite ends of the baths at their lower edges, substantially as set forth.

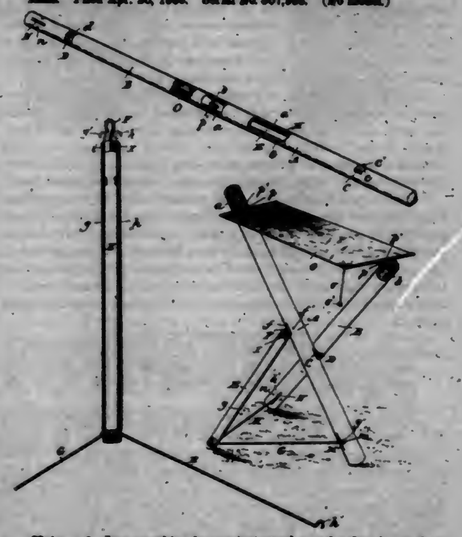
410,019. DEVICE FOR MASHING MALT. HERMANN PFEIFER, Milwaukee, Wis. Filed Jan. 14, 1889. Serial No. 296,222. (No model.)



Claim.—1. The combination of a barrel-shaped shell open at its upper end and terminated at its lower end in a spout, a perforated tube arranged within the shell to occupy as much space as the bulge of the latter will permit and form a chamber therewith, a series of eyes arranged at different stages within the perforated tube, a series of cone-shaped spreaders provided with hooks for engagement with the eyes, and a pipe-coupling arranged to surround a port in the shell, substantially as set forth.

2. The combination of the shell A, provided with the spout A', hook B, the perforated tube secured within the shell and provided with eyes J, the port E, leading into the space between the shell and perforated tube, the pipe-coupling F, surrounding the port, the openings G H in said shell, the caps G' H', for closing the latter openings, and the spreaders L L', having hooks K for engagement with said eyes, substantially as set forth.

410,020. METALLIC FENCE-POST. WILLIAM M. PEEBLES, Adrian, Ohio. Filed Jan. 17, 1889. Serial No. 296,574. (No model.)



Claim.—1. A fence-post constructed of a metallic rod bent into staple shape forming two parallel bars standing a suitable distance apart for the purpose set forth, the lower ends of which are sharpened and bent outwardly, in combination with a vertically-sliding link encircling said bars and designed to rest on or near the ground when the post is set, substantially as described.

2. A fence-post constructed of a metallic rod bent into staple shape forming two parallel bars standing a suitable distance apart for the purpose set forth, the lower portions of which are bent outwardly and beveled on their inner sides outwardly to their ends, in combination with a vertically-sliding link encircling said bars and designed to rest on or near the ground when the post is set, substantially as described.

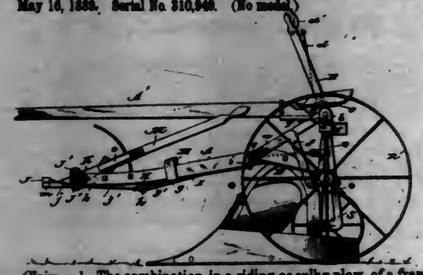
3. A fence-post constructed of a metallic rod bent into staple shape forming two parallel bars standing a suitable distance apart for the purpose set forth, the lower portions of which are bent outwardly and beveled on their inner sides outwardly to their ends, which are flattened, in combination with a vertically-sliding link encircling said bars and designed to rest on or near the ground when the post is set, substantially as described.

410,021. COMBINED CANE AND CAMP-STOOL. ANDREW B. PURINGTON, Westborough, assignor of one-half to J. W. HORNE, Hopedale, Mass. Filed Apr. 30, 1889. Serial No. 307,988. (No model.)

Claim.—1. In a combined cane and stool, a pair of main sections arranged to be removably secured together, a seat portion connecting the tops of said sections, and a third section arranged to be removably secured to one of said main sections, substantially as described.

2. In a combined cane and stool, the combination of a pair of main sections arranged to be removably secured together, an auxiliary section arranged to be removably secured to one of said main sections, arms or braces connecting said auxiliary section and said main sections, and a seat portion connecting the tops of said main sections, substantially as described.

3. In a combined cane and stool, the combination of a pair of main sections removably jointed together, a third section arranged to fit within one of said main sections, and provided with arms or braces which connect with said main sections, and a seat portion connecting the tops of the main sections, in the manner and for the purpose substantially as described.



4. In a combined cane and stool, the combination of a pair of

main sections removably connected together, a seat portion connecting the tops of said sections, an auxiliary section having longitudinal slots formed therein, and arms or braces arranged to fold into said slots, substantially as described.

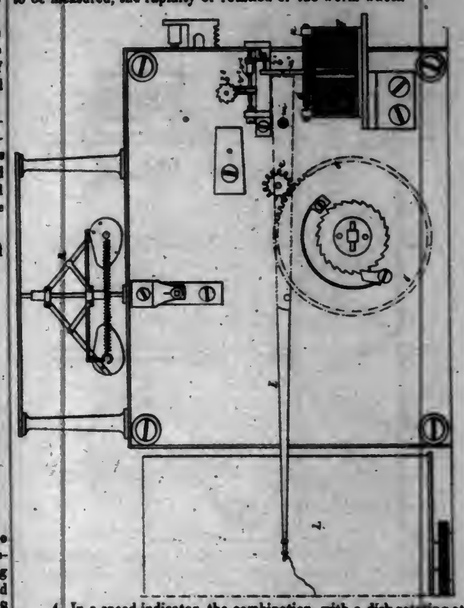
5. In a combined cane and stool, the combination of the main sections removably secured together, a seat portion connecting the tops of said sections, an auxiliary section adapted to fit within one of said main sections and provided with slots, and arms or braces arranged to fold in said slots, in the manner and for the purpose described.

6. In a combined cane and stool, a pair of main sections removably secured together, a seat portion connecting the tops of said sections, a third section having longitudinal slots formed therein, arms or braces adapted to fold into said slots, and a loose sleeve on said third section provided with an aperture, by means of which said longitudinal slots are opened and closed, in the manner and for the purpose set forth.

410,022. SULKY-PLOW. EMIL A. RAATZ, Pier, Wis. Filed May 16, 1888. Serial No. 310,949. (No model.)

Claim.—1. The combination, in a riding or sulky plow, of a frame consisting of a cross-bar having a vertical slot near one end, a pin intersecting said slot, a vertical bar carrying a large wheel and playing in said slot and having a series of recesses at one edge to engage said pin, a removable key to maintain said engagement, and supports S and S', depending from the cross-bar near its other end and having a smaller wheel journaled therein, substantially as set forth.

2. The combination, in a riding or sulky plow, of a frame consisting of a cross-bar, a vertical bar connected therewith near one end and carrying a large wheel, and depending supports S and S', connected to the cross-bar near the other end and having a small wheel journaled therein, and a brace connecting said bars S and S' above the wheel and carrying a scraper, therefor, substantially as set forth.



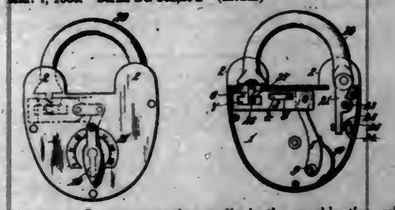
3. The combination, in a riding or sulky plow, of a supporting-frame mounted upon wheels, a plow-beam curved and pivotally connected at its rear and carrying a plow, as described, a rack-bar located at the front of said beam, and an inclined bar pivoted thereat and carrying a draft-evener, and a lever pivoted to said inclined bar to vary the position of the same and the draft-evener and provided with a spring to lock it in engagement with the rack, substantially as set forth.

410,028. SPEED-RECORDER. FELIX RICHARD, Paris, France, assignor to the Société Richard Frères, same place. Filed Mar. 6, 1889. Serial No. 302,121. (No model.) Patented in England Feb. 15, 1888, No. 2,209.

Claim.—1. A speed-indicator consisting of the combination of a disk rotating at a typical or normal speed, a worm-wheel driven at a variable speed proportional to the speed to be measured, and a driven part deriving motion from both said disk and wheel and consisting of a rotative arbor carrying a friction-roller in engagement with said disk and formed with a screw or worm in engagement with said worm-wheel, whereby when the speed of the worm-wheel falls below the normal the rotation imparted to said arbor from said disk causes its worm to act as a screw, reacting against the teeth of said worm-wheel to propel the arbor in one direction, and when the speed of the worm-wheel rises above the normal it acts upon the worm like a pinion upon a rack, to propel the arbor in the opposite direction, so that the longitudinal movements of the arbor constitute an indication of the variations of speed to be measured.

2. In a speed-indicator, the combination, with a worm-wheel driven at a varying speed proportional to that to be measured, an arbor carrying a worm meshing with said wheel and provided with a friction-roller, and a disk turning at a constant or normal speed, of a clock-work mechanism and governor for imparting rotation at such constant speed to said disk.

3. In a speed-indicator, the combination, with a disk rotating at a typical or normal speed, an arbor provided with a friction-roller driven from said disk and carrying a worm, and a worm-wheel meshing with said worm and rotating at a variable speed proportional to that to be measured, of a clock-work mechanism tending to rotate said worm-wheel, and an escapement for restraining said clock-work and determining, by connection with the part the speed of which is to be measured, the rapidity of rotation of the worm-wheel.



4. In a speed-indicator, the combination, with a disk rotating at a typical or normal speed, an arbor provided with a friction-roller driven from said disk and carrying a worm, and a worm-wheel meshing with said worm and rotating at a variable speed proportional to that to be measured, of a clock-work mechanism tending to rotate said worm-wheel, an escapement for restraining said clock-work, an electro-magnet for operating said escapement, and an electric circuit connecting said magnet with the part the speed of which is to be measured, whereby electric impulses are sent to said magnet at varying intervals proportional to variations in the speed of said parts.

5. A speed-indicator consisting of the combination of a disk rotating at a typical or normal speed, a worm-wheel driven at a variable speed proportional to the speed to be measured, and a rotative arbor extending radially of said disk and tangentially of said worm-wheel, carrying a friction-roller in engagement with said disk and formed with a screw or worm in engagement with said worm-wheel, said screw being of such direction of pitch relatively to the direction of rotation of said worm-wheel and disk that when the worm-wheel is stopped or driven at a speed slower than the normal the rotation of the arbor by the said disk causes the worm, by reacting against the worm-wheel, to propel the arbor longitudinally in such direction as to cause its friction-roller to approach the center of rotation of said disk.

6. A speed-indicator consisting of the combination of a disk rotating at a typical or normal speed, a worm-wheel driven at a variable speed, a rotative arbor movable longitudinally, carrying a friction-roller in engagement with said disk, and formed with a screw or worm in engagement with said worm-wheel, and a movable index or pointer connected to said arbor and movable to different positions by the longitudinal displacement of the arbor.

410,024. PADLOCK. AUGUSTUS RICHARDS, Sr., Willis, Tex. Filed Mar. 7, 1889. Serial No. 302,204. (Model.)

Claim.—1. In a permutation-padlock, the combination, with a twin bolt consisting of two similar independent lock-plates lying side by side and locking in both directions of longitudinal movement, of a spring-impelled tumbler throwing one bolt and a guard-plate mounted on a rock-shaft having a lever linked to the other bolt, substantially as described.

2. In a permutation-padlock, the combination, with a twin bolt composed of two similar independent lock-plates lying side by side and operated by independent means, of a hasp having a catch-leg, said hasp being pivoted at one end upon a movable support, substantially as described.

3. In a permutation-padlock, the combination, with a hasp having a catch-leg and pivoted upon a movable support, of a twin bolt composed of two independent lock-plates, each actuated by independent means, a guard-plate operating one of said lock-plates and a key actuating the other, substantially as described.

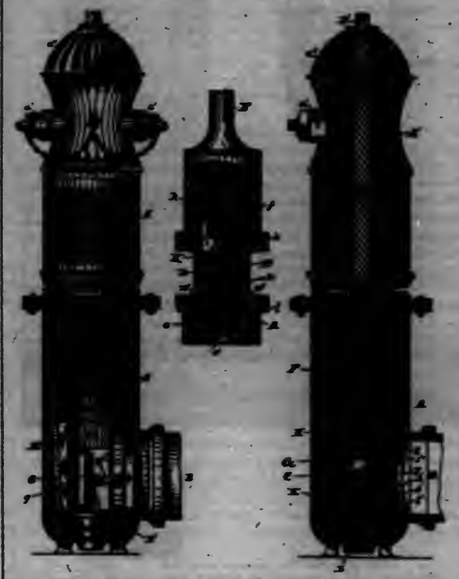
4. In a permutation-padlock, the combination, with a hasp pivotally mounted upon one end of a lever fulcrumed between its ends and having a set-screw tapped through the other end, said set-screw being swiveled in a bracket on the lock-casing and having a squared head lying in an opening in the lock-casing, of a lock-bolt actuated by a spring-impelled tumbler and a separate lock-bolt operated by the guard-plate, substantially as described.

5. In a permutation-padlock, the combination, with the hasp having a suitable catch-leg, of two independent lock-bolts, each consisting of a flat plate having a longitudinal slot and provided with a diverging notch entering the middle part of said slot, a spring-impelled tumbler operating one bolt and a guard-plate operating the other, substantially as described.

6. In a permutation-padlock, the combination, with a hasp pivoted at one end upon the end of a lever having a set-screw tapped through its other end and swiveled in a bracket in the lock-casing, of two similar independent lock-bolts, each having a longitudinal slot and provided with a diverging notch entering the middle part of said slot from the upper edge, a spring-impelled key-actuated tumbler pivoted at one end on the casing and pivotally connected at the other end to the end of the bolt, a rock-shaft having a guard-plate covering the key-opening, and a key operating the spring-impelled tumbler and provided with an adjustable index on the key-spindle, whereby the change of combination may be indicated, substantially as described.

7. In a permutation-padlock, the combination, with an adjustable hasp, of a twin bolt consisting of a lock-plate having a spring-impelled tumbler and provided with a notch leading to a slot forming prongs on both sides of said slot, a similar bolt operated by the guard-plate, a key having a movable index to operate the spring-impelled tumbler, and a graduated scale-plate surrounding the key-opening, substantially as described.

410,025. HITCHING-POST. ADAM H. RIDER, York, Pa. Filed Jan. 17, 1889. Serial No. 296,585. (No model.)



Claim.—1. The combination, in a hitching-post, of a tubular holder adapted to be buried in the ground below the pavement, a coupling-sleeve secured to the upper end thereof, the flanged sleeves secured one within the other, the lower one being secured to the coupling-sleeve, and the vertically-movable stake having a spring-detent at one side and a flange at the lower end to hold the stake when elevated, substantially as specified.

2. The combination, in a hitching-post, of a tubular holder adapted to be secured in the ground below the pavement, a coupling-sleeve secured to the upper end of said holder, an intermediate sleeve secured in said coupling-sleeve, a flanged sleeve secured in said intermediate sleeve, and a vertically-movable stake provided with a detent-spring at one side and a flange at its lower end, the spring and flange being adapted to engage, respectively, the upper and intermediate sleeve-connections, substantially as specified.

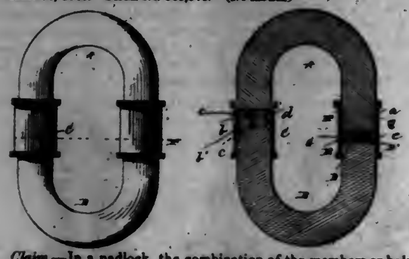
410,026. HYDRANT. ELIJAH L. ROWE, Lansingburg, N. Y., assignor to the Rensselaer Manufacturing Company, same place. Filed Jan. 17, 1889. Serial No. 296,609. (No model.)

Claim.—1. In a hydrant, the combination of the casing having an internal upstanding tube in its bottom and drip-openings therein, and a main-valve stem supported and turning on said tube, but not vertically movable in the casing, and the main valve operated by said stem, with a non-rotatable valve-stem in said tube, having a threaded upper end engaging the threaded lower end of the main-valve stem and adapted to be raised simultaneously with the closing of the main valve by the rotation of the main stem and to be lowered simultaneously with the opening of the main valve by the opposite rotation of the main stem, and the drip-valve on said stem, playing in said tube and adapted to close the drip-openings, substantially in the manner and for the purpose specified.

2. The combination of the casing, the tube therein having drip-openings near its lower end, the inlet-port and valve-seat, and the main stem carrying the main valve having an internally-threaded lower end supported on said tube, but not vertically movable, with the drip-valve stem having a threaded upper end engaging the threaded lower end of the main stem, an angular portion engaging a corresponding angular bore of the tube to prevent rotation of the drip-valve stem, and the drip-valve on said stem adapted to close the drip-openings simultaneously with the unseating of the main valve and to open the same simultaneously with the closing of said main valve when the main stem is rotated, substantially as specified.

3. The combination of the casing provided with an inlet-port, an internal valve-seat for said port, and a valve-stem, with a threaded valve-stem mounted in said casing, but having no vertical or longitudinal movement, a casting mounted upon said stem and having inclined grooves on its front face, and a gate-valve suspended on said casting and having inclined lugs on its rear face engaging the inclined recesses of the casting, substantially as and for the purpose described.

4. The combination of the casing, the tube in the bottom thereof having the upper portion of its bore angular, and the drip-openings communicating with said tube, with the main-valve stem having an internally-threaded lower end resting on the upper end of said tube, a drip-valve stem having a threaded upper end engaging the threaded end of the main stem, an angular portion engaging the angular bore of the tube, and a lower depending portion in the cylindrical bore of the tube, and a drip-valve mounted on said lower portion and adapted to close the drip-openings, substantially in the manner and for the purpose specified.



5. The combination of the casing having an inlet-port and valve-seat, a vertical tube in its bottom and drip-openings communicating with said tube, and a main stem having a lower hollow interiorly-threaded end supported on said tube, and a casting supported on said stem carrying a gate-valve, with the valve-stem K, having a threaded portion engaging the lower end of the main stem, a rectangular portion engaging an angular part of the bore of the tube, and a cup-valve on the lower end of stem K within said tube, all substantially as described.

6. The combination of the casing having an inlet-port, valve-seat, valve-stop, and vertical guide-ribs, substantially as described, and a central vertical valve-stem mounted in stationary bearings in the casing and not vertically movable therein, with the casting G, mounted on said stem having a tubular portion *g*, side wings and rear rib engaging the guide-ribs of the casing, and inclined grooves *h'* and shoulders *h''* in its front face, and the valve I, mounted on said casting and having inclined lugs *i* on its rear face engaging the grooves and shoulders of the casting, all substantially as specified.

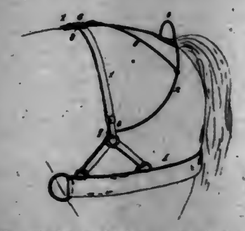
7. The combination of the casing, the inlet-port thereof and its valve-seat, the vertical tube in the bottom thereof, and drip-openings communicating therewith, with the main-valve stem F, supported on said tube having an internally-threaded sleeve on its lower end, a cast-

ing G, playing on said stem, the gate-valve mounted on said casting, and the stem K, engaging the sleeve of stem F and operated thereby, mounted in the vertical tube and carrying a drip-valve, all constructed and arranged substantially in the manner and for the purpose specified.

410,027. PADLOCK. MICHAEL RUSKOSKY, St. Mary's, Mo. Filed Mar. 16, 1889. Serial No. 303,576. (No model.)

Claim.—In a padlock, the combination of the members or halves swiveled together, one of the members having a bayonet-catch in the free end of the sliding sleeve, having a projection for engaging the bayonet-catch and provided with an interior recess, and the screw-locking pin for engaging said recess, all arranged and operating substantially as and for the purpose described.

410,028. RAIL-JOINT. ALLEN R. RUTTER, Salem, Ohio, assignor of one-half to John A. Gamble, same place. Filed Apr. 10, 1889. Serial No. 306,897. (No model.)

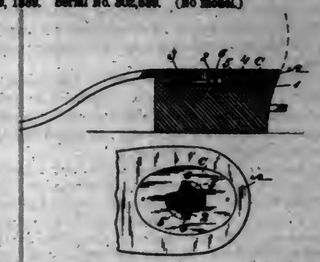


Claim.—1. In a railroad-rail joint, a fish-plate on each side of the rails, having recesses, in combination with a bolt and nut constructed to fit into said recesses and lock the former in place, substantially as described.

2. In a railroad-rail joint, a fish-plate provided with a rectangular recess, having inclines and a seat for the bolt-head, and a bolt and nut, in combination with a plate on the opposite side of the rails, having a recess to receive the nut of a bolt and secure it against turning, substantially as described.

3. In a railroad-road joint, a bolt having a head provided with an inclined inner surface, and a nut, in combination with a fish-plate having a recess provided with an inclined surface, and a plate having a recess to receive the nut of the bolt, substantially as described.

410,029. HARNESS ATTACHMENT. LIONEL D. SAXTON, Kansas City, Mo. Filed Oct. 17, 1888. Serial No. 288,323. (No model.)



Claim.—1. The attachment for harness herein described, consisting of a bow 2, having at its upper end a single projecting bend 4, and suspender 5, substantially as and for the purpose set forth.

2. In an attachment for harness, the combination of the bow 2 and the bail-shaped suspender 5, of spring-wire, attached thereto and having a loop 8 formed in its apex, substantially as and for the purpose set forth.

3. In an attachment for harness, the combination of the bow 2, having at its upper end a single projecting bend 4, and the bail-shaped suspender 5, the ends of which are attached thereto at each side of the bow, and having a loop 8 formed in its apex, substantially as and for the purpose set forth.

410,030. HEEL. GOTTLIEB SCHMIDT, Philadelphia, Pa. Filed Mar. 9, 1889. Serial No. 302,689. (No model.)

Claim.—1. The combination of a heel with a plate secured in a recess therein, the said plate having a head or lug, and the sole of a shoe having on its heel portion a plate with depending boss the inner wall of which is provided with spiral shoulders, substantially as described.

2. A heel having a plate secured in a recess therein, said plate having a lug or head thereon, in combination with a plate adapted to be secured to the sole of a shoe, said plate having a depending boss with inclined inner shoulders and adapted to receive said head, substantially as described.

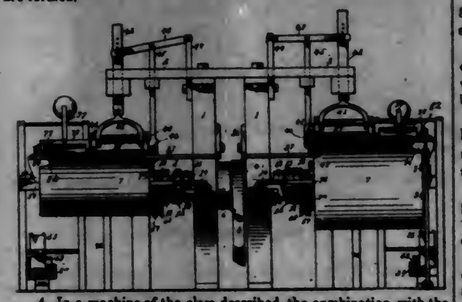
3. A fastening for a heel, consisting of a plate embedded in a recess in the heel and having a head thereon, a plate adapted to be secured to the sole, and having a depending boss adapted to be engaged by said head and provided with inner inclined shoulders having terminal recesses at their upper end, said parts being combined substantially as described.

410,031. NARROWED KNITTED WEB. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis N. D. Williams, same place. Filed May 16, 1889. Serial No. 310,964. (Specimens.)

Claim.—A knitted web narrowed by the merging of wales one into another, the standing wale into which a dropped wale is merged itself constituting the next dropped wale, substantially as specified.

410,032. PIPE-COUPLING. ELIJAH U. SOUVILLE, Manlius, N. Y. Filed Feb. 13, 1889. Serial No. 299,709. (No model.)

Claim.—1. The combination, with the pipes P P', of the case A, attached at one end to the pipe P and provided at the opposite end with the port *a* and with the inward-opening valve C, the tubular guide B, extended from the case at the side containing the port and provided with the flaring mouth B', the collar D, attached to the pipe P', and the packing *d*, secured to said pipe at the side of the aforesaid collar, as and for the purpose set forth.



2. The combination, with the pipes P P', of the case A, attached at one end to the pipe P and provided at the opposite end with the port *a*, the inward-opening valve C in said case, the tubular guide B, extending from the chamber axially in line with the port *a*, and provided with the flaring mouth B', the collar D, attached to the pipe P', packings *d d* at opposite sides of said collar, the valve F, connected to the pipe P' and having the lever *l*, engaging the interior of the guide B, and turned thereby to open the valve, and the spring *b*, holding the valve normally closed, substantially as described and shown.

410,033. MACHINE FOR MAKING PAPER BOXES. IRVING L. SHELDON and GEORGE F. BAILEY, Danbury, Conn. Filed June 11, 1888. Serial No. 276,736. (No model.)

Claim.—1. The combination, with a drum having a slot at its inner end to receive the end of the body-strip and a pair of jaws to hold it, of a presser having a shank adapted to slide vertically in the frame-work.

2. Shaft 3, drums mounted at opposite ends thereof, and clutches whereby the drums may be locked to the shaft independently of each other, in combination with pressers having rollers adapted to bear upon the drums, whereby the bodies of the boxes are formed.

3. Shaft 3, drums mounted at opposite ends thereof having slots 30, and jaws within said slots, and clutches whereby the drums may be locked to the shaft, in combination with the pressers having rollers adapted to bear upon the drums, whereby the bodies of the boxes are formed.

4. In a machine of the class described, the combination, with the shaft and the drums mounted at opposite ends thereof, of the clutches whereby the drums are connected and disconnected, levers 13, for operating the clutches, and angle-levers 15, carried thereby, which stop the rotation of the drums, substantially as described.

5. In a machine of the class described, the combination, with the shaft, of oval adjustable forming-drums 7, consisting of radially-sliding sections 25 and interchangeable side sections 26, whose edges engage the edges of sections 25.

6. The combination, with the shaft and end pieces 8 and 9, journaled thereon, of radial slides 16, having lugs 18, the expanding disks having grooves engaged by said lugs, sections 25, secured to the radial slides, and interchangeable sections 26, whose edges engage the other sections.

7. The combination, with the shaft, the end pieces journaled thereon, and slides 16, secured to the end pieces and having lugs 18, of sections 25 and 26, the expanding disks having spiral grooves engaged by the lugs, and set-screws which pass through said disks and engage the end pieces to lock the parts in position after adjustment.

8. The combination, with the shaft, the end pieces journaled thereon, sections 25 and 26, and radial slides secured to the end pieces and having lugs 18, of the expanding disks having spiral grooves engaged by said lugs and collars 23, and collars 21, secured to the shaft and having flanges extending over collars 23, whereby the expanding disks are held against endwise movement on the shaft.

9. The shaft, the end pieces journaled thereon and having holes 29, slides 16, having lugs 18, sections 25, carried by said slides, and sections 26, whose edges engage the edges of sections 25, in combination with the expanding disks having spiral grooves engaged by the lugs, and set-screws in said disks which engage the holes in the end pieces, as and for the purpose set forth.

10. In combination, the shaft, the end pieces, sections 25 and 26, the radial slides, the expanding disks, and collars 21.

11. In combination, the shaft, the end pieces, the radial slides, the expanding disks, and sections 26 and 25, one of said sections having a slot 30, and jaws within said slot, substantially as described.

12. The frame-work, the shaft, a drum having a slot 30, and fixed and movable jaws within said slot, said movable jaws having a pin 34, in combination with a lever 36, pivoted to the frame-work and having at its forward end a cross-piece which rests on the drum and engages pin 34 to open the jaws, and which may be lifted out of the way by pressing down the lever when it is not desired to open the jaws.

13. The combination, with a drum having a slot 30 and jaws within said slot, of a presser pivoted to a yoke and carrying a roller which follows the curves of the drum, and a vertically-moving shank to which the yoke is connected.

14. The drums having stumps 47 on their inner ends and the pressers carried by shanks 42, in combination with levers pivoted to the frame-work and to the shanks and having midway their length rods 45, carrying rollers 46, which engage the stumps, as and for the purpose set forth.

15. The drums having stumps 47, slots 30, and jaws within said slots, and the pressers carried by vertically-moving shanks and adapted to follow the curves of the drum, in combination with levers pivoted to the frame-work and to the shanks, and downwardly-extending rods pivoted midway of the levers and carrying rollers which engage the stumps, whereby the pressers are raised to insert and remove the body-strips from the jaws.

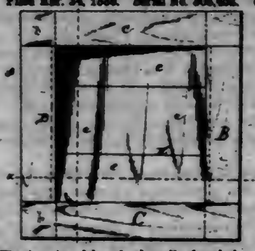
16. The drums having slots 30 at their inner ends and jaws within said slots which hold the ends of the body-strips, and pressers whereby the body-strips are formed about the drums, in combination with heads 78, carrying presser-rollers 77, and pivoted levers which carry said heads at the outer ends of the drums, whereby the bodies are first formed at the inner ends of the drums and then the covering-strips are put on while the second body is being formed.

17. The combination, with the drums, of rods 85, carrying rollers 84, whereby the box-bottoms are held in place, substantially as described.

18. The combination, with the drums and rods 85, carrying rollers 84, which hold the bottoms in place, of folders and pressers 80, whereby the end strips are folded and pressed in place to secure the bottoms to the bodies.

19. The combination, with the drums, of folders and pressers 80, having projections 81 to fold the corner-strips, and projections 82 and rollers 83, engaging, respectively, the bodies and the bottoms, whereby the corner-strips are pressed in place.

20. The combination, with the drums, of heads 78, carrying presser-rollers 77, and folders and pressers 80, secured to said heads, whereby the end strips and the covering-strips are simultaneously secured in place.



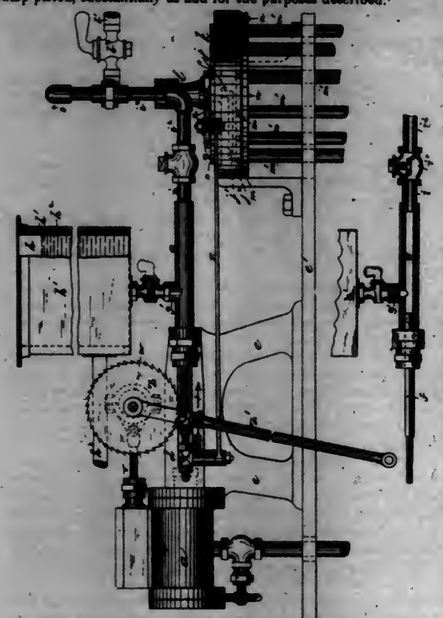
21. The combination, with the drums and rods 85, carrying rollers 84, whereby the bottoms are held in place, of folders and pressers 80 for the end strips, and heads 78, carrying presser-rollers 77 for the covering-strip.

22. The combination, with the drums having slots 30 at their inner ends and jaws within said slots, of pressers whereby the body-strips are formed about the drums, heads 78, carrying rollers at the outer ends of the drums, whereby the covering-strips are put on, and folders and pressers 80, whereby the corner-strips are put on to secure the bottoms to the bodies.

23. The combination, with shaft 3, the drums mounted thereon, shaft 61, shaft 65, and belts connecting said shafts, of a paste-roller mounted on shaft 65, a ratchet secured to said shaft, and a pawl on the paste-roller engaged by said ratchet, whereby the paste-roller is rotated at a predetermined speed and is permitted to move faster than its shaft when a long radius of the drum is drawing the covering-strip.

24. The shaft, a drum having a slot 30, and jaws within said slot, one of said jaws having a pin 34, a flange 9^b, having a slot 9^a, and a clutch for connecting the shaft and drum, in combination with a lever 13, for operating the clutch, a spring engaging said lever, whereby the clutch is connected, an angle-lever secured to lever 13 and engaging the flange, and a lever 36, having a cross-piece which engages pin 34, whereby at the completion of each revolution of the drum the clutch is automatically disconnected, the rotation of the drum is stopped, and the jaws are opened.

410,034. HEAD FOR FRUIT-BOXES. BENJAMIN SHINN, Parmenter, Fla. Filed Apr. 24, 1888. Serial No. 306,452. (No model.)



Claim.—The box-head herein described and shown, consisting of the end pieces provided with tenons and a groove or rabbet in one side, the side pieces having mortises to receive the tenons of the end pieces, and the filling consisting of pieces fitted together and having their ends formed with tongues, providing tenons adapted to fit in the grooves or rabbets of the end pieces, substantially as shown and described.

410,035. AUTOMATIC LUBRICATOR FOR STEAM-ENGINES. JOHN H. SIEGRIST, Jr., St. Louis, Mo., assignor of one-half to Henry A. Siegrist, same place. Filed Nov. 2, 1888. Serial No. 289,803. (No model.)

Claim.—1. In a multiple lubricator for lubricating machinery, the combination, with a bed-plate having a series of ports arranged in a circle or equal distances from the center, of a centrally-pivoted disk having a receiving-port centrally of the disk, and a radial passage leading therefrom and of such length as to register with the successive ports in the bed-plate, substantially as and for the purposes described.

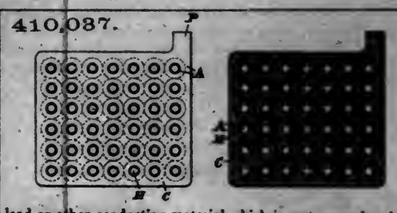
2. In a multiple lubricator, the combination, with a bed-plate having a series of ports arranged at equal distances from its center, of a centrally-pivoted rotary disk having a receiving-port and a radial passage leading therefrom and of such length as to register successively with

the ports in the bed-plate, a pump for delivering oil to the receiving-port in the rotary disk, and mechanism for rotating the disk from the pump-piston, substantially as and for the purposes described.

3. In a multiple lubricator, the combination, with a rotary oil-delivery disk or valve, of a pump for forcing oil to the delivery disk or valve, mechanism for rotating the disk from the piston of said pump, and a steam-cylinder for actuating the pump, said steam-cylinder provided with a valve actuated from a moving part of the machinery to be lubricated, substantially as and for the purposes described.

4. In apparatus for automatically lubricating machinery, the combination of a circular plate having a central supply-pipe and passage therefrom, said passage communicating successively with each of a series of passages formed through a lower plate and provided with pipes communicating respectively with the various parts of the machinery to be lubricated, a force-pump drawing oil from a tank or vessel and delivering the oil through the central supply-pipe of the upper circular plate, means for operating said pump, a ratchet-lever engaging in notches or ratchets on the upper circular plate, with means for vibrating said lever, substantially as shown, and for the purpose described.

5. In apparatus for automatically lubricating machinery, the combination of a circular plate having a central supply-pipe and passage therefrom, said passage communicating successively with each of a series of passages formed through a lower plate and provided with pipes communicating respectively with the various parts of the machinery to be lubricated, a force-pump drawing oil from a tank or vessel and delivering the oil through the central supply-pipe of the upper circular plate, a cross-head attached to the ram of said pump and reciprocated by the piston of an ordinary steam-cylinder provided with a slide-valve, said valve being controlled by an eccentric fixed on a shaft, a ratchet-lever engaging in notches or ratchets on the upper circular plate, a rod connecting said lever to the cross-head, a ratchet-wheel fixed on the eccentric shaft, with a ratchet-lever engaging in said wheel and adapted to be connected to any convenient reciprocating part of the machinery to be lubricated, substantially as shown, and for the purpose described.



410,086. INSECTICIDE. BYRD SMITH and FRANK HOWARD, Devine, Tex. Filed June 15, 1889. Serial No. 314,474. (No specimens.)

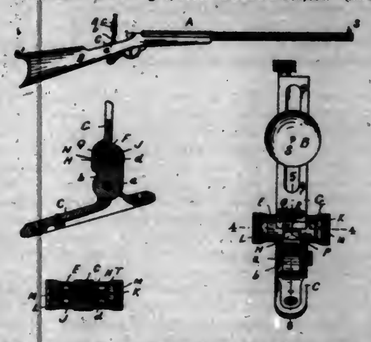
Claim.—The herein-described insecticide, composed of the following ingredients; spirits of turpentine, carbolic acid, (preferably crude,) benzine, bisulphide of carbon, and brimstone, substantially as specified.

410,087. ELECTRODE FOR SECONDARY BATTERIES. FREDERICK H. SMITH, Baltimore, Md. Filed Apr. 3, 1889. Serial No. 305,864. (No model.)

Claim.—A plate or electrode for secondary batteries, consisting of tubular pieces of lead oxide or other active material, or lead sponge or other material conditioned to become active, held in a matrix of

410,087.

lead or other conducting material which is cast around and between said pieces, as set forth.



410,088. FASTENING DEVICE. MEYER C. SOMBORN, Brooklyn, N. Y. Filed Jan. 31, 1887. Serial No. 226,013. (No model.)

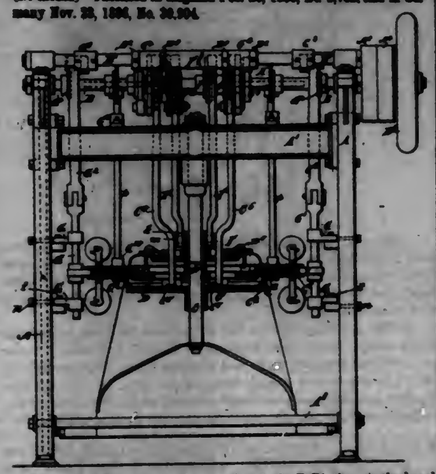
Claim.—1. The improved fastening device consisting of a bar *a*, having a series of three or more points integral therewith and projecting from one side or edge, and being located on said strip more than double the width of a point apart, substantially as described.

2. A fastening device consisting of a bar *a*, provided with a series of three or more points projecting from the edge thereof and integral therewith, and being also provided with indentations or holes *d d'*, substantially as and for the purpose set forth.

410,089. WIND-GAGE SIGHT FOR GUNS. JOHN W. SOUZA, Everett, Mass. Filed Aug. 8, 1888. Serial No. 282,220. (No model.)

Claim.—1. The combination, with the frame or bar carrying a gun-sight, a screw adapted to engage with said bar or frame and provided with a circumferential scale or mark on its outer end, of a support in which said frame is arranged to move back and forth across the gun and provided with a mark or scale adjacent to and to be read with said circumferential scale or mark, for the purpose specified.

2. The combination, with the frame or bar carrying a gun-sight provided with a mark or scale, a screw adapted to engage with said bar or frame and having a head and nut, the head having a mark or scale on its periphery, of a support in which said frame is arranged to move back and forth across the gun and provided with a scale or mark to be read with said mark or scale on said frame, and a scale or mark to be read with said peripheral mark or scale, for the purpose specified.



3. The combination, with a bar or frame carrying a gun-sight provided with a mark or scale, and a transverse cylindrical portion having a longitudinal central internal screw-thread adapted to engage with a screw J, of a support for said bar or frame secured to the stock of the gun and having a tubular portion E, provided with a longitudinal slot in which said cylindrical portion is arranged to move back and forth, and a scale or mark to be read with said mark or scale of the sight-bar or frame, for the purpose specified.

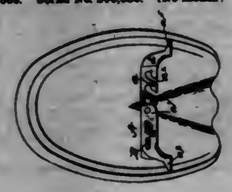
4. The combination, with the bar or frame carrying a gun-sight provided with a mark or scale, and a transverse cylindrical portion H, having a longitudinal central internal screw-thread adapted to engage with a screw J, of a support for said bar or frame secured to the stock of the gun and having a tubular portion E, provided with a longitudinal slot in which said cylindrical portion is arranged to move back and forth, and a scale or mark to be read with said mark or scale on the sight-bar or frame, and said screw having a circumferential scale or mark on it to be read with a mark or scale on the adjacent end of the tube E, for the purpose specified.

5. The combination, with a bar or frame carrying a gun-sight adapted to move back and forth in a tubular support, of a screw

adapted to engage with said bar or frame and support, and having a head K, nut L, and check-screw M, for the purpose specified.

410,040. CIRCULAR WARP KNITTING MACHINE. WILLIAM STANT, Nottingham, England. Filed Dec. 28, 1888. Serial No. 293,322. (No model.) Patented in England Feb. 28, 1888, No. 2,782, and in Germany Nov. 28, 1888, No. 50,904.

Claim.—1. The combination or the shafts B B', the vertical rod C, the vertically-sliding sinker-plate C', the sinker-hooks and presser-bits carried by said plate, the double-armed levers C^4, the vertical rods C^5, to the upper ends of which said levers are hinged, the studs C^6, and the axles *d*, for connecting the lower ends of said rods to the sinker-plate, and the cams C^8 C^9, located on the shaft B, for actuating the levers C^4 and rod C^5 to raise and lower the sinker-plate, substantially as described.



2. The combination of the vertically-sliding sinker-plate C', means for actuating said sinker-plate, the vertical rod C, the circular bed D, secured to said rod above the sinker-plate, the sley D', supported by said bed, the radial slides D^3, supported in the sley, each of said slides being provided with a pivoted looker-plate D^3, the needles, sinker-hooks, and presser-bits, the jacks D^4, one of which is pivoted in the rear or inner end of each slide, the slotted sley D^5, engaging the upper ends of said jacks, the rings E E' and means for rocking the jacks, substantially as described.

3. The combination of the vertical rod C, the vertically-sliding sinker-plate C', means for actuating said sinker-plate, the bed D, the sley D', the radial slides D^3, the needles, sinker-hooks, and presser-bits, the right-angled jacks D^4, the vertical sliding plate F, the vertical rods F', connected with said plate, the levers F^3, hinged to the upper ends of said rods, the shafts B B', and the cams F^5 F^6, substantially as described.

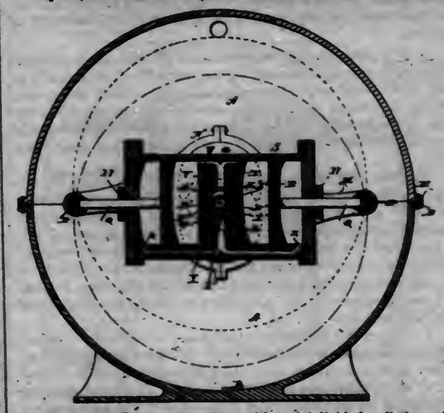
4. The combination of the standards A, having adjustable bearings G, the plunger-rods G', adapted to slide vertically in said bearings, the links G^1, hinged to the upper ends of said rods, the levers G^2, hinged to said links, the shaft B', the shaft B, the cams G^4, mounted on said shaft to actuate the levers G^2, the vertically-sliding sole-bar G^3, carried by the plunger-rods, the circular guide-plates G^5 G^7, carried by the sole-bar, the thread-guides G^8, carried by said guide-plates, and means for revolving the guide-plates, substantially as described.

5. The combination of the vertically-sliding sole-bar G^3, the toothed circular guide-plates G^5 G^7, carried by the sole-bar, and each provided with thread-guides G^8, the toothed wheels G^{10} G^{11}, engaging the guide-plates and provided with vertical shafts *p*, the toothed wheels H on the upper ends of said shafts, the worms H', and the shaft B, carrying said worms, substantially as described.

410,041. HOOP-EXPANDER. BURTON STEWART, South Bend, Ind. Filed Jan. 19, 1889. Serial No. 296,820. (No model.)

Claim.—1. In a horse-hoof expander, the combination of an arm provided with bayonet-slots, an arm having a longitudinal slot in which the said slotted arm fits, and a rivet for engaging the said slots, and a pin designed to pass through an opening in the slotted arm and engage the bayonet-slots to lock the device together, substantially as described.

2. In a horse-hoof expander, the combination of an arm provided with bayonet-slots, an arm having a longitudinal slot in which the said slotted arm fits, and a rivet for engaging the said slots, a pin designed to pass through an opening in the slotted arm and engage the bayonet-slots to lock the device together, and toes on the said arms for engaging hoofs, substantially as described.



410,042. PROCESS OF PRODUCING REFRACTORY COMPOUNDS. JOHN L. STEWART and JAMES L. HASKINS, Philadelphia, Pa., assignors, by mesne assignments, to the Welsbach Incandescent Gas Light Company, of New Jersey. Filed Dec. 20, 1885. Serial No. 186,009. (No specimens.)

Claim.—1. The process of producing a refractory crystalline compound, which consists in pulverizing and mixing two or more mineral substances and a fluoride or a fluorine compound, adding a fluid to render the mixture plastic, molding the mixture and subjecting the molded material to the action of heat, substantially as described.

2. The process of producing a refractory crystalline compound, which consists in pulverizing and mixing a strontium compound or salt with one or more other pulverized mineral substances and a flux, rendering the mixture plastic and molding it into the required form, and then subjecting the molded material to the action of heat, substantially as described.

3. The process of producing a refractory crystalline compound, which consists in pulverizing and mixing a strontium compound or salt with one or more other pulverized mineral substances and with a flux composed of a fluoride or a fluorine compound, then making the mixture plastic and molding it into the required form, then subjecting the molded material to the action of a moderate drying heat, and finally exposing it to a high temperature, substantially as described.

410,043. ROTARY ENGINE. JAMES R. STUBLEY and ROBERT C. BERRY, Oshkosh, Wis., assignors of one-third to John M. McDonald, Lafayette, Ind. Filed Feb. 23, 1889. Serial No. 300,894. (No model.)

Claim.—1. In a rotary engine, the combination, with a subdivided cylinder, of a hollow shaft passing through the partition or dividing block and turning with the cylinder, and a stationary valve inclosed within said hollow shaft, the dividing-block, hollow shaft, and valve being provided with suitable ports, whereby steam is alternately admitted to the front and rear faces of the piston and exhausted alternately from said front and rear faces on each half-revolution of the cylinder, substantially as set forth.

2. In a rotary engine, the combination of a casing and cylinder, pistons, a partition-block dividing said cylinder into two apartments, said block provided with oppositely-arranged channels, one of said channels communicating with lateral extensions for conveying the steam to the inner faces of the pistons and the other channel communicating with lateral extensions for conveying the steam to the outer faces of the pistons, said channels alternately admitting and exhausting the steam from the cylinder on each half-revolution of the cylinder, a hollow shaft secured to the partition-block and provided with opposite longitudinal ports registering with the channels of the partition-block, and also provided with oppositely-arranged exhaust ports or ducts, and a valve provided with a longitudinal port, substantially as set forth.

3. In a rotary engine, the combination of the casing, the cylinder, the partition-block provided with oppositely-arranged channels, the hollow shaft secured to the partition-block and provided with oppositely-arranged ports adapted to act alternately as inlet and outlet ports, and also provided with oppositely-arranged exhaust ports or ducts, and the valve provided with the longitudinal port, with which the oppositely-arranged ports in the hollow shaft alternately register, and also having the annular collars and the rims or raised portions, the springs arranged within the spaces formed by said rims, and the packing above said springs, substantially as set forth.

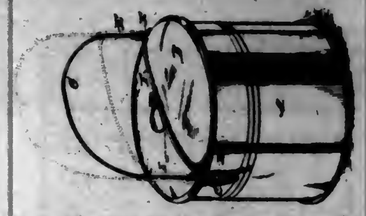
4. In a steam-engine, the combination, with the valve provided with a longitudinal semi-cylindrical port, of the cut-off valve provided with the diametrically-opposite ports, and also having a radially-extending stop interposed between said ports adapted to bear against the sides of the longitudinal semi-cylindrical slot in the valve proper, substantially as set forth.

5. In a rotary engine, the combination of the valve provided with a longitudinal semi-cylindrical port, the cut-off valve provided with the diametrically-opposite ports, and also having a radially-extending stop interposed between said ports, and the valve-rod provided with an adjustable lever, substantially as set forth.

6. In a rotary engine, the combination of the valve provided with a longitudinal semi-cylindrical port, the cut-off valve, the valve-rod provided with a cap upon the outer end thereof, said cap provided with a slotted quadrant, the lever upon the end of said rod, the centrally-apertured block having an inward extension or tongue, the screw-bolt, and the nuts, substantially as set forth.

7. In a rotary engine, the combination of the casing, cylinder, and pistons thereof, the hollow shaft and interior valve mechanism provided with registering ports adapted to permit free passage of steam alternately to the front and rear faces of the pistons, and the exhaustion of the steam alternately from said front and rear faces, the bracket arranged upon the end of the valve and provided with notches upon its outer side, and the lever for reversing the valve, substantially as set forth.

8. In a rotary engine, the combination of the valve having one end extending laterally from the casing of the engine and provided with male screw-threads, the joint or connection provided on one end with female threads adapted to engage the male threads of the valve, and provided with inner collars and strips extending between said collars, the stuffing-boxes, and the T-shaped steam-pipe, substantially as set forth.

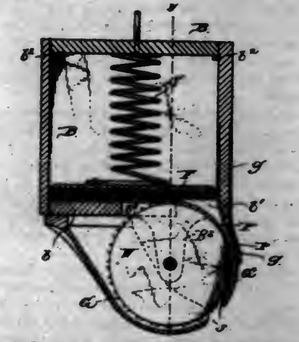


9. In a rotary engine, the combination of the casing consisting of two parts provided with meeting flanges, each of said flanges provided with central semi-cylindrical bearings, the cylinder and pistons, the side connections, the eccentrics provided with laterally-extending hubs, said hubs being provided with suitable flanges, and the bolts for securing said flanges to the casing of the engine, substantially as set forth.

10. In a rotary engine, the combination of the casing, the cylinder, the partition-block provided with oppositely-arranged channels, the hollow shaft secured to the partition-block, and provided with oppositely-arranged ports adapted to act alternately as inlet and outlet ports, and also provided with oppositely-arranged exhaust ports or ducts, and the valve provided with the longitudinal port, with which the oppositely-arranged ports in the hollow shaft alternately register, and also provided with the raised portion around the longitudinal port, substantially as set forth.

11. In a rotary engine, the combination of a cylinder, a hollow shaft passing transversely therethrough and turning therewith, stationary eccentrics located upon opposite ends of the shaft on each side of said cylinder, connections having inner circular opening surrounding the eccentrics, and cross-pieces connecting the outer ends of said connections and carrying piston-rods, substantially as set forth.

12. The combination of the casing, the cylinder provided with central partition having oppositely-arranged channels, the eccentrics provided with laterally-extending hubs, said hubs provided with suitable flanges, the side connections having their inner ends surrounding said eccentrics, the hollow shaft provided on one end with a balance-wheel, and having arranged thereon at this end a cylindrical block provided with an inwardly-extending pintle or bearing-point, said hollow shaft also being provided with oppositely-arranged ports adapted to act alternately as inlet and outlet ports, and having oppositely-arranged exhaust ports or ducts, the valve provided with the longitudinal port, with which the oppositely-arranged ports in the hollow shaft alternately register, and also having the annular collars and the raised portion around the longitudinal port, the cut-off valve, the valve-rod provided on its outer end with a cap, said cap being provided with a slotted quadrant, the lever upon the end of said valve-rod, the centrally-apertured block having an inward extension or tongue, the screw-bolt, the nuts for securing the valve-rod lever in its adjustable position, the supporting-bracket, the lever for adjusting the valve, the connection or joint provided with inner collars and strips extending between said collars, the stuffing-boxes for said valve, the T-shaped steam-pipe, and the hand-wheel upon the end of the hollow shaft, substantially as set forth.



410,044. COMBINED BUCKET-BAIL AND LID-FASTENER. JOHN M. STOKES and OLIVER P. REID, Laredo, Tex. Filed June 22, 1889. Serial No. 315,186. (No model.)

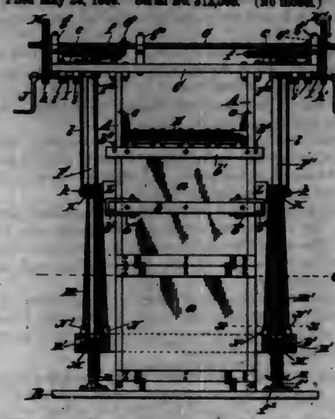
Claim.—1. The combination, with the bucket and the ears, of the wires D, pivotally connected to said ears, the links pivotally connected to said wires, the cross-wire F, connecting the said links, and the bail loosely connected with the ends of the said wire F, substantially as shown and described.

2. The combination, with the bucket and its cover, of the ears on the bucket, the wires D, having eyes pivotally connected with the ears, the links pivotally connected with the wires, the cross locking-wire F, having eyes at its ends engaging the links, and the bail having at its ends eyes connected with the eyes of the cross-wire F, substantially as shown and described, and for the purpose specified.

410,045. APPARATUS FOR DELIVERING CARDS, CIRCULARS, OR OTHER LIKE MATTER. ANATOLE TABOUR, Paris, France. Filed May 23, 1889. Serial No. 311,833. (No model.) Patented in France Apr. 13, 1889, No. 194,312.

Claim.—1. In an apparatus such as described, the combination, with a holder having a delivery-slot in its bottom, and a spring-follower operating to hold the matter to be delivered in proper position, of a delivery-wheel provided with pins projecting from its periphery and operating upon the lowermost sheet or card in the holder to propel the same to or through the delivery-slot, substantially as and for the purposes specified.

2. In an apparatus such as described, the combination, with a holder having a delivery-slot in its bottom, and a spring-actuated follower operating to hold the matter to be delivered in proper position, of a delivery-wheel having pins projecting from its periphery and operating through the bottom of the box upon the lowermost sheet or card in the holder, a guard for and encompassing said wheel, and arranged to form a delivery-slot through which the matter to be delivered is removed, substantially as and for the purposes specified.



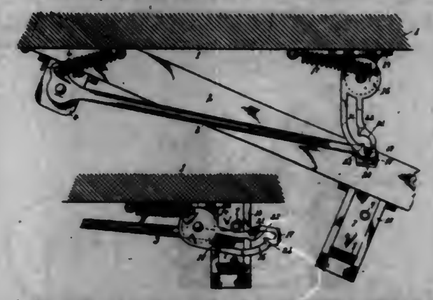
3. The combination, with the box B, having slots $b' b^2$ in its bottom, and the spring-actuated follower F, of the wheel W, having pins P and P' projecting from its periphery in reverse directions, substantially as and for the purposes specified.

4. The combination, with the box B, having slots $b' b^2$ in its bottom, and the spring-actuated follower F, of the delivery-wheel W, the guard G, and the elastic U-shaped guard G', arranged relatively to each other, as to form a slot *s* between their outer ends, substantially as and for the purposes specified.

5. In an apparatus of the class described, a delivery-wheel W, having pins projecting from its periphery in reverse directions, with their points in proximity to each other, substantially as and for the purposes specified.

6. In an apparatus, of the class described, a delivery-wheel having pins projecting from its periphery in reverse directions and on lines tangential to a circle of smaller diameter than that of the wheel, substantially as and for the purposes specified.

410,046. BALING-PRESS. THEODORE TROUT, Hicksville, Ky. Filed May 20, 1889. Serial No. 312,005. (No model.)

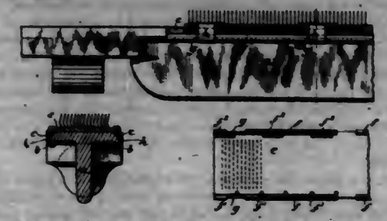


Claim.—1. The combination of a follower or platen, a pair of upright shafts, a pair of ropes winding upon said shafts and thereby constituting, in connection therewith, a vertically-disposed windlass at either side of the machine, a set of tackle-blocks to each said pair of ropes, and through which said ropes pass, a pair of horizontal gear-wheels mounted on said shaft, and a revolving shaft journaled at right angles to said upright shafts and provided with pinions which engage said gear-wheels, the whole being mounted on a suitable frame and adapted to operate substantially as herein set forth.

2. In a baling-press, the combination of the follower D, horizontal shaft G, having the bevel gears or pinions G', and gears H H', mounted thereon, upright shafts or pillars F F', having bevel-gears *f* keyed to their upper ends and engaging said gears G', and the rope and tackle-block mechanism K M M' *m m'*, the whole being arranged, constructed, and adapted to operate substantially as herein set forth.

3. The combination of a follower D, shaft G, having gears G' and H H', mounted thereon, vertical shafts or pillars F F', having bevel-gears *f* on their upper ends and engaging said gears G', ropes *m m'*, tackle-block mechanism K M M', and the adjustable driving gears or pinions *h h'*, the whole being constructed, arranged, and operated substantially as herein set forth.

410,047. DOOR-SPRING. FRED W. TOBEY, Waterbury, Conn. Filed Nov. 26, 1888. Serial No. 291,880. (No model.)



Claim.—1. A door closer and buffer consisting, essentially, of a closing-lever carried by the door and having an angle-arm, and a slide having a buffer and a roller, also carried by the door, a lever 15, pivoted to the jamb and having a slot engaged by the outer end of the closing-lever, and springs connected to the jamb and respectively to the angle-arm and to the base of lever 15 within the pivotal point of said lever, substantially as described.

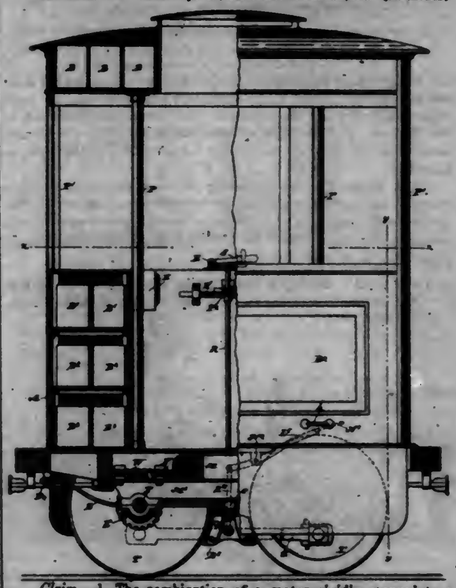
2. The closing-lever having an angle-arm, a spring 6, connected to said angle-arm and to the jamb, a slide carried by the door and having a buffer and a roller, and a spring 12, which controls the movement of said slide, in combination with a lever 15, pivoted upon the jamb and having a slot engaged by the outer end of the closing-lever, and a spring 17, connected to lever 15 within its pivotal point and to the jamb.

3. The closing-lever pivoted to the door and having an angle-arm and a spring 6, connected to said angle-arm and to the jamb, in combination with a slide upon the door carrying a buffer and roller, lever 15, having a slot 16, with inward projections 22 and 23, for the purpose set forth, and a spring 17, connected to the jamb and to the base of lever 15 within its pivotal point.

410,048. MEANS FOR FASTENING CARD-CLOTHING TO THE TOP-PLATE OF CARDING-ENGINES. RICHARD TWEEDALE, Accrington, County of Lancaster, England. Filed May 6, 1889. Serial No. 309,806. (No model.)

Claim.—1. In combination, the card-flat, the card-clothing, the strip for inclosing the raw edges of said clothing, the said bar being cut away beneath the edges of the clothing, and fasteners for the clothing, substantially as described.

2. In combination, the card-flat, the card-clothing, the strip for inclosing the edges thereof, and double hooked fasteners to grip said strips and the card-flat, substantially as described.



3. In combination, the card-flat, the card-clothing, the edging-strips therefor, and fasteners for securing the clothing to the flat, said fasteners engaging with the edging-strip, substantially as described.

4. In combination, the card-flat, the card-clothing, the edging-strip therefor having notches, and the securing-hooks fitted to said notches, substantially as described.

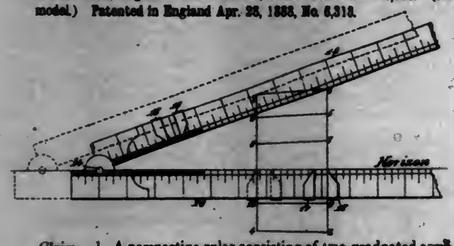
5. In combination, the card-flat, the card-clothing, and fasteners at the edge of said clothing, the said card-flat being cut away under the edge of the clothing, substantially as described.

6. In combination, the card-flat having ribs *b*, the clothing, and the double-hooked fasteners engaging the clothing and the ribs, substantially as described.

410,049. DUMMY OR MOTOR ENGINE. JEAN T. VAN GOETH, New York, N. Y. Filed Sept. 12, 1888. Serial No. 285,174. (No model.)

Claim.—1. The combination of a motor rigidly secured to a frame carried by trucks with loose worm-gears on the axles of the trucks, and clutch mechanism for connecting the motor-shaft to either of said axles, substantially as described.

2. A motor located on a rigid frame secured to the truck of a car, in combination with one right and one left worm-gear running

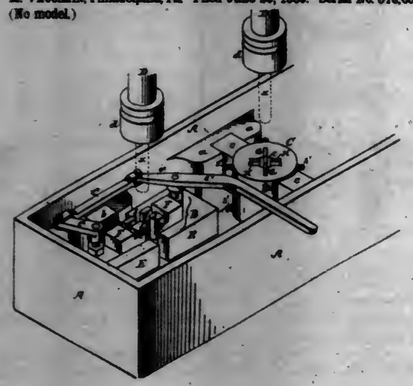


normally loose, each on its own shaft, and clutch mechanism for connecting either of said loose gears to the motor-shaft, as desired, whereby the car may be run in either direction at the will of the attendant without reversing the direction of the motor, substantially as described.

3. In a mechanically-propelled vehicle, the combination of the following elements: a motor rigidly connected to a frame carried by two pairs of truck-wheels connected together by links, two loose worm-gears, one on each axle, a double clutch, one for each worm-gear, and a cord and pulleys and a series of connecting-levers with a hand-operating lever or wheel located in convenient proximity to an attendant on the motor car or vehicle, substantially as described.

4. In a mechanically-impelled vehicle, the combination of the following elements: two pairs of truck-wheels connected together by links Z Z, the axles of which trucks carry a motor on a frame independent of the car-body frame, two loose worm-gears, one on each shaft, two screws on the motor-shaft, one adapted for each loose gear, a pair of clutches, one for each gear and shaft, a lever for connecting said clutches to either of said loose gears, as desired, and a series of levers, pulleys, and cords for controlling said clutches, substantially as described.

5. In a motor car or engine, the combination of a motor fixed rigidly to a frame carried directly by the axles of the truck-wheels, a pair of loose worm-gears, one right and one left, located one on each axle, two worms or screws located one on each end of the motor-shaft and meshing with the loose gears respectively, two spring-clutch attachments, one affixed to each loose gear, two sliding-clutch attachments splined on the car-axles, a pivoted lever fixed at its middle and connected at or near its ends to the sliding-clutch attachments, a cord, pulleys, and levers with a hand-wheel located in close proximity to the attendant on the car, the whole being so arranged that the motor always running in the same direction may be caused to run the motor-car in either direction, as desired, substantially as described.



410,050. PERSPECTIVE-RULER. JOHN VARLEY, London, County of Middlesex, England. Filed Nov. 16, 1888. Serial No. 291,016. (No model.) Patented in England Apr. 28, 1888, No. 6,318.

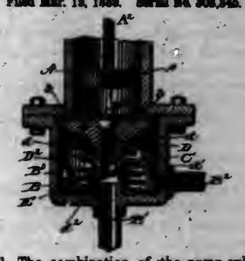
Claim.—1. A perspective-ruler consisting of two graduated arms, one of which is pivotally connected at one extremity with the inner edge of the other at a short distance from the extremity thereof, so that they can open at a right angle, and a pair of independently-movable pointer-slides on one of such pivoted arms, substantially as described.

2. A perspective-ruler consisting of two arms, one of which is pivotally connected at one extremity with the inner edge of the other at a short distance from the extremity thereof, and a pair of independently-adjustable pointer-slides on each pivoted arm, substantially as and for the purposes described.

410,051. MACHINE FOR TURNING TAPERED BOLTS. SAMUEL M. VAUCLAIN, Philadelphia, Pa. Filed June 20, 1889. Serial No. 314,051. (No model.)

Claim.—1. The combination of the tank A with dies B and C, one a roughing-die and the other a taper-cutting die, said dies being mounted in said tank with spindles carrying the bolts to be turned situated directly above said dies, substantially as described.

2. The combination, in a taper-cutting die for turning tapered bolts, of the tapered cutters G G, having cutting-edges extending the full length of the bolt, and devices for adjusting the cutters, substantially as described.

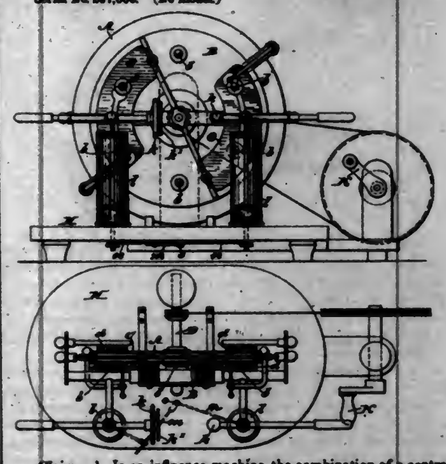


3. The combination, in a die for turning tapered bolts, of a shell, the cutters mounted therein having cutting-faces extending the full length of the bolt to be turned, with guides also extending the full length of the bolt to be turned, and devices for adjusting both the guides and the cutters, substantially as described.

4. The combination of the taper-cutting die, the shell, vertical cutters therein, said cutters having a groove *g*, with a bolt I, having a hooked end adapted to said groove, and adjusting-screws J J, substantially as and for the purpose set forth.

5. The combination of the base E', slides E E mounted thereon and carrying dies F F, forked, substantially as shown, with levers, and cams connected to said levers, whereby on the movement of one of said levers the dies F F will be adjusted from or toward each other, substantially as described.

6. The combination, in a die for turning tapered bolts, of the shell, the cutters G, mounted therein, having a cutting-face *k* for the shank of the bolt, and a cutting-face *k'* for the under side of the head of the bolt, substantially as described.

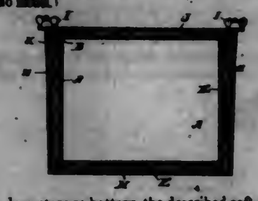


410,052. AIR OR VAPOR PUMP. HECTOR VON BAYER, Washington, D. C. Filed Mar. 19, 1889. Serial No. 303,845. (No model.)

Claim.—1. The combination of the pump-cylinder having the chamber at the end thereof, a delivery-valve provided with the hollow stem in which the inlet-valve is located, and a flexible air-tight pipe to form a connection between the hollow stem of the delivery-valve and the source of supply, substantially as and for the purpose set forth.

2. In an air or vapor pump having the valves located one within the other and arranged at the end of the pump-cylinder within a chamber, an elastic or flexible air-tight pipe connecting the hollow stem of the discharge-valve with the suction-pipe, substantially as described.

410,053. INFLUENCE-MACHINE. ROBERT VOSS, Berlin, Germany, assignor to James W. Queen & Co., Philadelphia, Pa. Filed Jan. 21, 1889. Serial No. 297,066. (No model.)



Claim.—1. In an influence-machine, the combination of a central fixed disk and two rotary disks attached to a shaft extending through the fixed disk, with two electrodes, one of which consists of a non-conducting surface attached to a conducting-surface, but separated therefrom by an air-space, the other electrode being of usual form, and both electrically connected to the influence-machine, substantially as described.

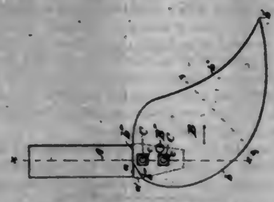
2. In an influence-machine, an electrode consisting of a non-conducting surface attached to the conducting-electrode, said parts being separated by an air-space, substantially as shown and described.

3. An electrode for an influence-machine, consisting of a flat or disk-like conductor, in combination with a flat or disk-like conducting-surface connected to the conducting part by a central stem, as shown and described.

410,054. CONTAINING CELL FOR SECONDARY BATTERIES. CHARLES F. WALDRON, Boston, Mass. Filed Nov. 13, 1888. Serial No. 290,711. (No model.)

Claim.—1. In a storage-battery, the described soft-rubber cell A, having integral flange B extending outwardly from its upper edges, in combination with the rigid case E, the cover F, with its rubber lining G, and suitable clamping means to hold said flange compressed between the cover and edges of the case, substantially as set forth.

2. The subdivided cell described for storage-batteries and like uses, the same consisting of the soft-rubber cell A, having outwardly-projecting flange B, and one or more partitions C, formed integral with the cell, in combination with the case E, cover F, and lining G, and with clamps for tightening the joints without perforating the flange, substantially as set forth.

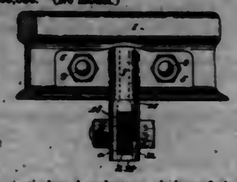


3. In a storage-battery, the combination of the flanged soft-rubber cell having one or more partitions made hollow and furnished with a stiffening-core D, with the case E and cover F, and with adjustable clamps for securing tight joints, substantially as set forth.

4. In a storage-battery, the soft-rubber cell A, having projecting flange B, and the inclosing-case E, having cover F, with suitable fastenings, in combination with the flanged rim K, L-shaped in cross-section and located beneath and outside of the rubber flange and the edges of the cover, for the purpose set forth.

5. In a storage-battery, the soft-rubber cell, the inclosing-case, and the rubber-lined cover, in combination with the tapering connection O, extending through said lining and cover, and with the yielding washer B, applied thereon beneath the cover.

6. In a storage-battery, the combination of a rubber cell having one or more chambers, a rigid bottom and cover, and a soft-rubber lining for said cover, with adjustable clamps surrounding said parts and adapted to hold them in close contact, substantially as set forth.



410,055. PLOW-COLTER. LEVI WALKER, Delhi, Ontario, Canada. Filed Apr. 20, 1889. Serial No. 308,087. (No model.)

Claim.—1. In a plow-colter, the combination of a shank A, having recess *a'*, with shoulder *a* and bolt-holes *a''*, a flat blade B, having a convex cutting-edge *b*, terminating at the point *b'* in a flat sweep, and a partly concave and partly convex cutting-edge *b''*, said cutting-edges joined by a wide top having straight edges *b''' b''''*, joining each other at an obtuse angle and provided with bolt-holes B' B'' B''', and the bolts C, connecting said shank and blade adjustably, substantially as set forth.

2. A reversible colter having a convex cutting-edge *b*, terminating by a flat sweep in a point *b'*, and a concave cutting-edge *b''*, said cutting-edges joined by the point *b'*, and a wide upper part having two straight edges *b''' b''''*, meeting at an obtuse angle and determining the position of the blade on the shank, and said blade provided with bolt-holes B' B'' B''', substantially as set forth.

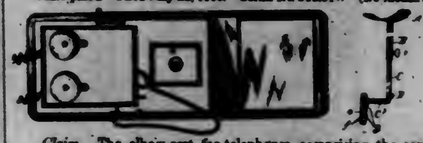
410,056. BRACKET FOR CONNECTING TIE-BARS AND SWITCH-RAILS. FREDERIC C. WEBB and CHARLES PARTINGTON, Cincinnati, Ohio, assignors to the Webb Frog Company, same place. Filed Apr. 20, 1888. Serial No. 308,026. (No model.)

Claim.—1. A tie-bar bracket consisting of the channel-neck 7, having the ears 5 and the shank 12, provided with the mortise 13 for the tie-bar, substantially as described.

2. A tie-bar bracket consisting of the channel-neck 7, provided with the ears 5, and the shank 12, having a mortise 13 and converging side walls, substantially as described.

3. A tie-bar bracket consisting of the channel-neck 7, having the ears 5, the offset 15, the shank 12, having the mortise 13, and the cross-piece 14, substantially as described.

4. A tie-bar bracket consisting of the channel-neck 7, having the ears 5, the mortised shank 12, and the offset 15, connecting the shank and neck, substantially as described.



410,057. PROCESS OF MAKING ORCINE DYE. RUDOLF GREVILLE-WILLIAMS, Albany, N. Y., assignor to the Albany Coal Tar, Dye and Chemical Company, same place. Filed Mar. 5, 1888. Serial No. 301,910. (No specimens.)

Claim.—The new and improved process for the production of coloring-matters, which process consists in combining one molecule of any alkalized orcine or one molecule of a sulpho-acid of an alkalized orcine with the intermediate product formed by combining one molecule of tetrazo-diphenyl, or one molecule of any of the other herein-described tetrazo compounds, with one molecule of each of the present known sulpho-acids of naphthylamine, substantially as set forth.

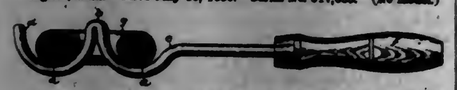
410,058. PROCESS OF MAKING ORCINE DYES. RUDOLF GREVILLE-WILLIAMS, Albany, N. Y., assignor to the Albany Coal Tar, Dye and Chemical Company, same place. Filed June 6, 1888. Serial No. 313,386. (No specimens.)

Claim.—The new and improved process for the production of coloring-matters, which process consists in combining one molecule of the hereinbefore-described compound of orcine and chloride of sodium with the intermediate product formed by combining one molecule of tetrazo-diphenyl, or one molecule of any of the other herein-mentioned tetrazo bodies, with one molecule of one of the present known sulpho-acids of naphthylamine, substantially as set forth.

410,059. ADJUSTABLE ELBOW-REST FOR TELEPHONES. JULIUS J. WOLF, Kansas City, Mo., assignor of one-half to Louis Hammerslough, same place. Filed July 22, 1889. Serial No. 318,217. (No model.)

Claim.—The elbow-rest for telephones, comprising the concave piece A, having the depending tube B and set-screw *c*, the arm or rod C, telescoped in said tube, the arm or rod C', having the pintle *e* at its inner end, the screw *d*, pivoting the arms C C' together and having the thumb-nut D, for the purpose set forth, and the bracket-plate *f*, having the ears *g*, in which the pintle *e* is pivoted, substantially as described.

410,060. COFFIN-LID FASTENER. LYMAN R. WOODARD, Owosso, Mich. Filed June 15, 1889. Serial No. 314,358. (No model.)

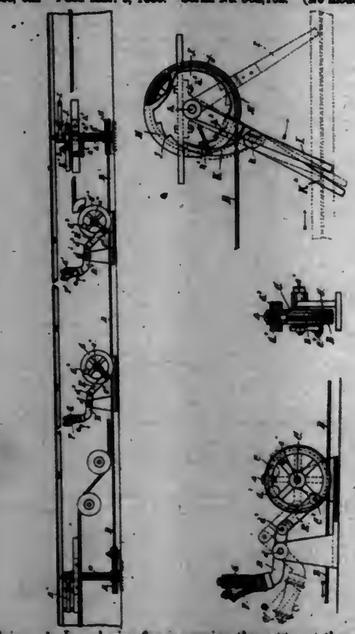


Claim.—1. In combination with a spring-fastening device for securing the lid to a casket or coffin at the head thereof, of the bow-spring catch D, secured to the under side of the casket or coffin lid, and having its free end curved downwardly, as shown at *e*, whereby it will be brought in frictional contact with the upper and lower walls of the recess *m*, and thereby prevent the lid from rattling when secured in place, substantially as and for the purpose set forth.

2. In a fastening for casket or coffin lids, the keeper *c*, spring-latch C, consisting of the arms *f g*, the latter having teeth *e* extending at right angles to the plane thereof, in combination with the bow-spring catch D, secured to the under side of the casket or coffin lid, and having its free end curved downwardly, as shown at *e*, whereby it will be brought in frictional contact with the upper and lower walls of the recess m to prevent the lid from rattling, substantially as and for the purpose described.

3. In a fastening for casket or coffin lids, the combination, with the keeper *c*, of the spring-latch C, consisting of the arms *f g*, the latter having teeth *e* extending at right angles to the plane of said arm, the right-angle bend *h*, thumb-piece *i*, and the fastening-plate *l*, substantially as and for the purpose specified.

410,061. CAR-COUPLING TOOL. OLIVER D. WOODRUFF, Southington, Conn. Filed July 16, 1889. Serial No. 317,683. (No model.)

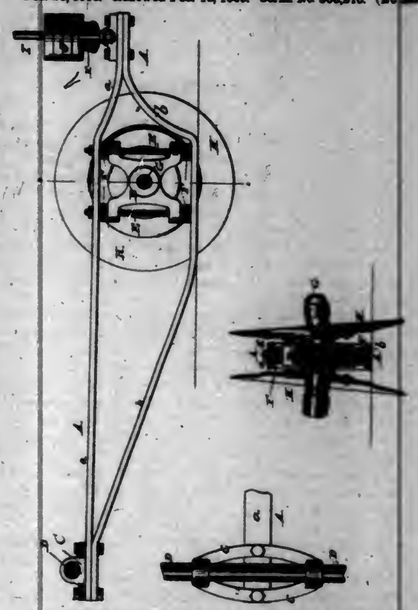


Claim.—1. The herein-described car-coupling tool, consisting, essentially, of a proper handle and body having two seats *a a*, for supporting the opposite sides of the link, and an intermediate upwardly-projecting guide *b*, substantially as described, and for the purpose specified.

2. The herein-described car-coupling tool, consisting of a rod having the return-bend to form the upwardly-projecting guide *b*, and having also two seats *a a* on the opposite sides of said guide for supporting the opposite sides of the link, substantially as described, and for the purpose specified.

3. The herein-described car-coupling tool, consisting of the rod having the two seats *a a* for supporting the opposite sides of the link, an intermediate upwardly-projecting guide *b*, and outer end *d*, bent upwardly from the outer one of the seats *a a*, substantially as described, and for the purpose specified.

410,062. DEVICE FOR DEPRESSING CABLES AT THE STREET-CROSSINGS OF CABLE RAILROADS. GEORGE H. WEIGHT, San Francisco, Cal. Filed Mar. 6, 1889. Serial No. 302,162. (No model.)



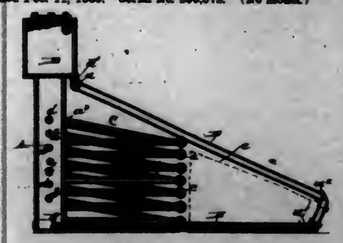
Claim.—1. In a device for depressing the cables at the crossings of cable railroads, the combination, with the lever A× and the sheave A, connected by a wire rope with the sheaves C C× and H, of the levers D D×, carrying the rollers F F×, the latter having connection with the sheaves C C× to effect the depression of the cross-cable, substantially as set forth.

2. The combination, with the lever I and the sheave H, connected by wire rope with the sheaves C C× and A, of the levers D D×, carrying the rollers F F× and connected by means of the links E E× to the sheaves C C×, to effect the release of the pressure on the cross-cable, substantially as set forth.

3. The combination, with the lever I, the pawl K, and ratchet-wheel J, of the sheaves H and C C×, the latter being connected by means of the links E E× with the levers D D×, carrying the rollers F F×, to hold the cables in a depressed position, substantially as set forth.

410,068. WITHDRAWN.

410,064. SEEDER. WILLIAM D. ARENTZ, Springfield, Ohio. Filed Feb. 26, 1889. Renewed Feb. 16, 1889. Serial No. 300,310. (No model.)

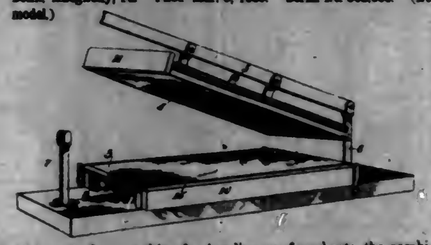


Claim.—1. The drag-bar consisting of the upper and lower members *a* and *b*, in combination with the intermediate disk-supporting plate B, the guide-rods E, and the movable washers F.

2. In combination with a drag-bar having an opening therein, a plate located in said opening and provided with an axle, a furrow-opening disk mounted on said axle, and a series of plates or washers adapted to be applied above or below the plate at will, whereby the plate and disk may be adjusted vertically in relation to the drag-bar.

3. In combination with a drag-bar having a furrow-opening device attached thereto, a weight to depress said bar, and a spring interposed between the weight and drag-bar.

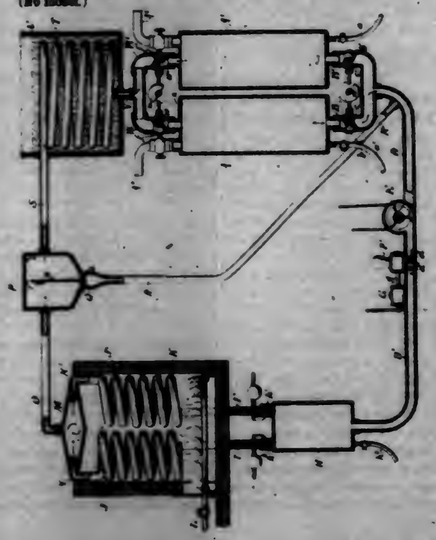
4. The drag-bar, the rod I, rising therefrom, and the weights J, applied to said rod, in combination with the intermediate springs K, also mounted on the rod between the weight and the drag-bar.



410,065. STEAM-BOILER. OMAR BELLMAN, Hagerstown, Md. Filed Feb. 11, 1889. Serial No. 299,572. (No model.)

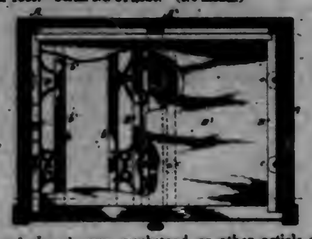
Claim.—1. The boiler or heater having the series of inclined pipes and the water-column having the superposed water tank or column, said inclined pipes connecting at their ends with transverse pipes, one having pipe-connections with the water-column and the other having like connection with the water-tank or chamber upon the water-column, substantially as specified.

2. The boiler or heater consisting of the incased inclined fire-chamber pipes, the upright water chamber or column, the water tank or chamber superposed upon the upright water chamber or column, and the series of inclined pipes connected at one end by a transverse pipe and arms to the water-tank, and having their lower ends connecting-transverse pipe, connected by additional pipe with the lower end of the water-column, a smoke and draft space or flue being provided below the inclined pipes, and air-inlets between elbows at the lower ends of said latter pipes, substantially as set forth.



410,066. MACHINE FOR EDGING ROOFING-SHEETS. LOUIS H. BOEX, Allegheny, Pa. Filed Mar. 5, 1889. Serial No. 302,008. (No model.)

Claim.—1. In a machine for bending roofing-sheets, the combination of the bed 2, the plate 3, arranged upon the bed and having the edge 8 at one end and projecting from its upper surface, and the brake 10, hinged at the other end of the plate, the plate 4, superposed upon the plate 3 and having the edge 9 projecting from the lower surface of one end, and the brake 11, hinged at the other end of said plate, all constructed and arranged substantially as described, the lever 5, pivotally connected to the bed 2, the plate 4 being fixed to and carried by said lever, and a rest for said lever, substantially as set forth.

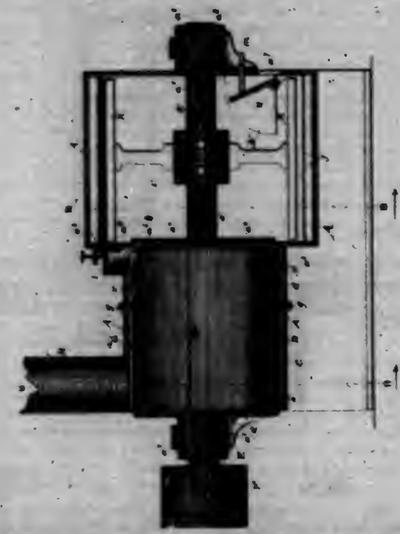


2. In a machine for bending roofing-sheets, the bed 2, the plate 3, arranged above and upon the bed, the brake 12, hinged to one side of said plate, the brake 14, hinged to the other side of said plate 3 and provided upon its upper edge with the edge 15, the plate 4, the brake 13, hinged to one side of said plate 4, to co-operate with the edge 15 to make a standing seam, one member of which is straight and the other having an overturned edge, all constructed and arranged substantially as described, combined with the lever 5, affixed to and carrying the plate 4 and pivotally connected to the bed, and a rest for said lever, substantially as set forth.

410,067. PROCESS OF FACILITATING CHEMICAL REACTIONS. HENRY BOWER, Philadelphia, Pa. Filed Mar. 14, 1889. Serial No. 303,300. (No model.)

Claim.—The hereinbefore-described process of mechanically facilitating chemical reactions, which consists in subjecting two or more substances to be combined to the effect of impact and attrition from opposing jets, substantially as set forth, and with or without the use of a finely-divided solid agent for intensifying such impact and attrition.

410,068. DRAWER. EDWARD J. BROWN, Washington, D. C. Filed June 14, 1889. Serial No. 314,330. (No model.)



Claim.—1. In a bureau, washstand, or other article of cabinet-ware, the combination, with the frame or casing thereof, of a drawer loosely fitted therein, the bottom strips secured thereto, and a yielding frictional bearing secured to said drawer under the bottom thereof and passing through its sides, the bottom strips or the sides of the drawer having slots to guide and retain said yielding bearing, substantially as described.

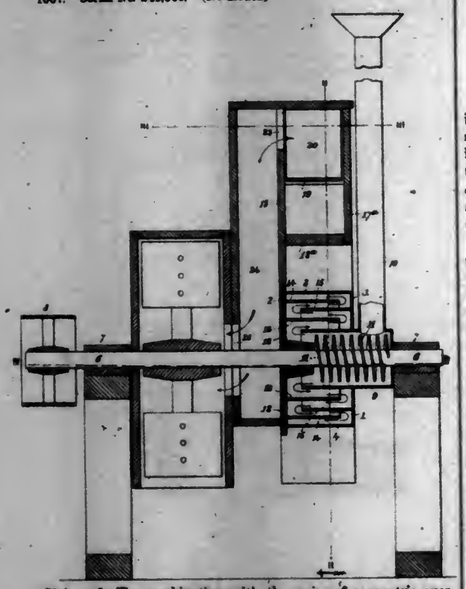
2. The combination, with a frame or casing, of a drawer loosely fitted therein, the bottom strips secured to said drawer, and a spring secured to said drawer under the bottom thereof and passing through its sides, the bottom strips or the sides of said drawer being slotted to guide and retain said spring, substantially as described.

3. The combination of a frame and the slotted bottom strips of a drawer to guide and retain a spring, with a drawer, and a spring secured to said drawer under the bottom thereof and pressing against said frame, substantially as described.

410,069. GRAIN-SCOURER. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Dec. 13, 1886. Serial No. 221,423. (No model.)

Claim.—1. A grain-cleaner comprising the combination of the following elements, to wit: a horizontal scouring-cylinder and a horizontal dusting-cylinder placed end to end, a diaphragm or partition between them having an aperture through which the interiors of said cylinders communicate, said aperture being situated above the bottom of said cylinders, to keep up the pressure in the scouring-cylinder, a scouring-drum situated within the scouring-cylinder and leaving an annular space between its periphery and the inner surface of said cylinder, a reticulated cylinder situated within the dusting-cylinder, a revoluble beater situated within said reticulated cylinder, and a stand-pipe communicating directly with the annular space between the scouring-drum and cylinder, substantially as set forth.

2. In a grain-cleaner, the combination of the cylindrical shell or casing, the partition dividing it into two chambers B and C, and formed with an aperture through which the grain is discharged from the chamber B into the chamber C, a corrugated lining secured within the chamber B, a revolable rubbing-drum mounted to revolve in said chamber, a reticulated cylinder situated within the chamber C, and a rotary duster mounted within said cylinder, substantially as set forth.



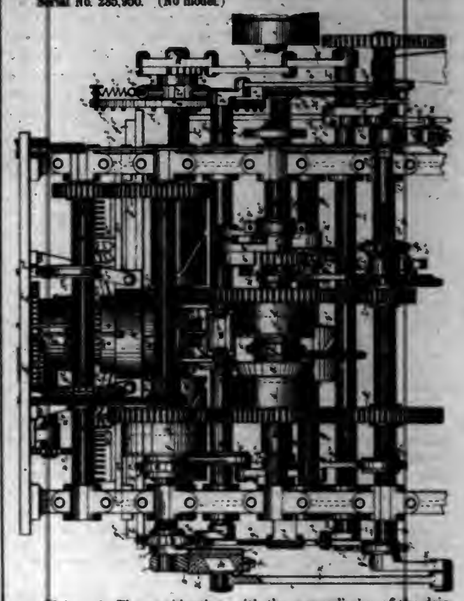
3. The combination, with the casing having the discharge-aperture a^7 and the boards N projecting from the inner wall of the casing in parallel vertical planes, one on each side of the aperture, of the valve M, situated between said boards and hinged at its lower edge, and means for adjusting said valve, substantially as set forth.

4. In a grain-cleaner, a shell or casing formed in two planes united by an offset, an aperture a^6 through said offset, and an aperture a^5 through the top of that portion of the shell which is of smaller diameter, in combination with a partition separating the interior of the shell or casing into two compartments, a rubbing-drum situated in one of said compartments, and a duster situated in the other, substantially as set forth.

5. The combination, with the horizontal cylinder and the partition dividing it into two chambers B C, and having the aperture through which said chambers communicate, of the stand-pipe communicating with the chamber B, the scouring-drum located in said chamber, a valve for controlling the passage of the grain from the chamber B to the chamber C, and a duster situated in the chamber C, substantially as and for the purposes set forth.

6. In a grain-scourer, the combination of a scouring-chamber B, having a stand-pipe H feeding into its top, an agitating-drum D, an outlet a^4 in its upper part, and a valve a^5, controlling said outlet, and a dusting-chamber into which said outlet a^4 leads, said dusting-chamber having the dusters K, reticulated cylinder J, and outlet a^7, said outlet being located in the end and having valve M, all substantially as shown and described.

410,070. GRAIN-SCOURER. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed June 20, 1887. Serial No. 241,866. (No model.)



Claim.—1. The combination, with the series of concentric overlapping rings, means for imparting rotary motion to the alternate rings, and a screw conveyer for forcing the grain into the central ring under pressure, substantially as set forth.

2. The combination, with the rotary shaft, of a series of concentric overlapping rings having spirally-arranged corrugations, means for connecting the alternate rings with said shaft, and a feed-pipe delivering the material to be cleaned into the central ring, substantially as set forth.

3. The combination, with a series of overlapping rings, means for revolving some of said rings, and a feed-pipe discharging into the central ring, of a circular casing having a discharge-aperture situated above the bottom thereof, substantially as set forth.

4. The combination, with a series of overlapping rings and a shaft with which some of said rings are connected, of a horizontal pipe constituting the innermost ring, a spiral conveyer situated within said pipe, and a stand-pipe communicating with said pipe, substantially as and for the purpose set forth.

410,071. CIRCULAR-KNITTING MACHINE. WILLIAM L. CATHCART and ALEXANDER T. CATHCART, Gwynedd, Pa. Filed Sept. 20, 1888. Serial No. 285,950. (No model.)

Claim.—1. The combination, with the cam-cylinder, of the driving-shaft A, a double clutch thereon, gearing whereby the cam-cylinder may be operated from each of the loose members of said clutch, a rotating cam, means for rotating the same, and devices for controlling the rotation thereof, whereby it may be left at rest or given a movement of rotation at desired intervals, and a connection between said cam and the engaging member of the clutch, whereby the desired loose member may be locked to the driving-shaft for operation therewith.

2. The combination, with the cam-cylinder, of the main power-shaft A, a double clutch thereon, gearing whereby the cam-cylinder may be operated from each of the loose members of said clutch, a shaft F, means for rotating the same, devices for controlling the rotation of said shaft, whereby it may be left at rest or given a movement of rotation at the desired times, a cam q' on shaft F, and a connection between said cam and the engaging member of the clutch, whereby the desired loose member may be locked to the shaft A for operation therewith.

3. The combination, with the cam-cylinder, of the main power-shaft A, a double clutch thereon, gearing whereby the cam-cylinder may be operated from each of the loose members of said clutch, a rotating shaft F, carrying a cam q', a connection between the said cam and the engaging member of the clutch for operating the said engaging member, a ratchet on shaft F, a pawl, means for operating said pawl from shaft A, and means for throwing said pawl into and out of engagement with said ratchet.

4. The combination of two shafts, each carrying a gear-wheel, one of said gears being loose on its shaft, an intermediate gear-wheel for revolving said gears in unison, a crank of fixed length on one shaft, a crank of variable length on the other shaft, a clutch for making the loose gear fast on its shaft, a connection between the two cranks, the cam-cylinder, and gearing for driving the same from one of said shafts, substantially as shown and described.

5. The combination, with the driving-shaft A, provided with two loose gears of unequal sizes, and with a double clutch mechanism, by which either of said gears is made fast, of a driven shaft B, provided with gears of unequal sizes which are in mesh with the gears of shaft A, a shaft C, the cam-cylinder and gearing to drive the same from shaft C, the latter carrying a loose gear which is in mesh with one of the gears of shaft A, and a clutch by which said gear is made fast, a crank-connection between the shafts B and C, the crank of the latter being variable in length, and devices in connection with the variable crank and the clutch of shaft C, whereby the crank is lengthened and the clutch thrown out of gear simultaneously, or vice versa, substantially as shown and described.

6. The combination, with shaft B, having a driving-gear k, the shaft C, having a loose gear p and a clutch by which said gear is made fast, and the cam-cylinder and gearing to drive the same from shaft C, of an intermediate gear between the gears k p for imparting motion from one to the other, a crank-connection between the shafts B C, the crank of the latter being variable in length, and devices in connection with the said clutch and the variable crank, whereby the crank is lengthened and the clutch thrown out of action, and vice versa, substantially as shown and described.

7. The combination, with the cam-cylinder, of two shafts, gearing whereby the cam-cylinder is driven from one of the said shafts, a crank of fixed length on one of said shafts, and a crank of variable length on the other, a connection between the two cranks, a clutch on one of said shafts, a connection between said clutch and the other of said shafts, whereby when the clutch is in engagement the two shafts will be caused to move in unison, and a connection between the said variable crank and the clutch, whereby the effective length of the variable crank is changed and simultaneously therewith the clutch is made fast to or disengaged from its shaft, substantially as shown and described.

8. The combination, with the cam-cylinder, of two shafts, gearing whereby the cam-cylinder is driven from one of said shafts, a crank of fixed length on one of said shafts, and a crank of variable length on the other, a connection between the two cranks, a clutch on one of said shafts, a connection between said clutch and the other of said shafts, and means for making said clutch fast to or disengaging it from its shaft and for changing the effective length of said variable crank, substantially as shown and described.

9. The combination, with the knitting devices and controlling mechanism for effecting the changes from continuous rotary knitting to reciprocating knitting and back again, and determining the action of the knitting devices before and after such changes, of two rotating shafts, one of which is in connection with such controlling mechanism, a fixed crank-arm on the other of said shafts, the first shaft having thereon a loose crank-arm and a fixed ratchet, a pawl carried by said loose crank-arm in engagement with said ratchet, lugs on the said crank-arms projecting toward and into the path of rotation of each other, and a device for moving one of said lugs out of the path of rotation of the other as the two arms are moving in unison, substantially as shown and described.

10. The combination, with the knitting devices and controlling mechanism for effecting the changes from continuous rotary knitting to reciprocating knitting and back again, and determining the action of the knitting devices before and after such changes, of two rotating shafts, one of which is in connection with such controlling mechanism, a fixed crank-arm on the other of said shafts, the first shaft having thereon a loose crank-arm and two fixed ratchet-wheels, of which one is reversed with respect to the other, a pawl on said loose arm in engagement with one of said ratchet-wheels, a retaining-hook on said arm in engagement with the other ratchet-wheel, lugs on the said crank-arms projecting toward and into the path of rotation of each other, a device for moving one of said lugs out of the path of rotation of the other as the two arms are moving in unison, and a tripping device for tripping the retaining-hook to permit a backward movement of the loose crank-arm, as shown and described.

11. The combination, with the knitting devices and controlling mechanism for determining the action thereof, of two rotating shafts in axial alignment, one of which is connected with such controlling mechanism, and each having a crank-arm with a lug which projects toward and into the path of rotation of the other, the lug on one of said arms being movable, and a tripping device for moving said movable lug to disengage it from the lug of the opposite arm at a predetermined point, substantially as shown and described.

12. The combination, with the needles, needle-cylinder, cam-cylinder, a main shaft, means for imparting to the cam-cylinder from the main shaft either a continuous rotary motion or a reciprocating motion, as desired, means for placing *en masse* a portion of the needles into or out of operative position, pattern devices for successively throwing out of and into operation a portion of the remaining needles to effect narrowing and widening, and devices for changing the motion of the cam-cylinder from continuous rotary motion to reciprocating motion, and vice versa, of the shaft D, means whereby an intermittent motion is communicated to said shaft D from shaft A, and connections whereby said shaft D throws into and out of operation the motion-changing devices, the pattern devices, and the said means for placing the needles *en masse* into or out of operative position, substantially as shown and described.

13. The combination, with the needles, needle-cylinder, cam-cylinder, means for giving to said cam-cylinder either a continuous rotary motion or a reciprocating motion, means for placing *en masse* a portion of the needles in or out of operative position, pattern devices for successively throwing out of and into operation a portion of the remaining needles for narrowing and widening, and devices for changing the motion of the cam-cylinder from continuous rotary motion to reciprocating motion, and vice versa, of the shaft D and connections whereby said shaft D throws into and out of operation the motion-changing devices, the pattern devices, and the means for placing a portion of the needles *en masse* in or out of operative position, substantially as shown and described.

14. The combination, with the needles, needle-cylinder, cam-cylinder, devices for driving said cam-cylinder, embracing a crank of variable radius, whereby either a continuous rotary motion or a reciprocating motion may be communicated to the cam-cylinder, according to the adjustment of the crank, means for placing in inoperative position a portion of the needles *en masse*, devices whereby the adjustment of the variable crank may be effected, and a yarn stop-off for gripping the yarn after the passage of the yarn-guide by the last of the needles in operation during each of the movements of the cam-cylinder while reciprocating, of a shaft D and connections whereby a movement of said shaft will effect the adjustment of the variable crank and change the motion of the cam-cylinder from continuous rotary to reciprocating, cause the needle-raising means to elevate the needles in connection therewith, and throw into operation the yarn stop-off, substantially as shown and described.

15. The combination, with the needles, needle-cylinder, cam-cylinder, devices for driving said cam-cylinder, embracing a crank of variable radius, whereby either a continuous rotary motion or a reciprocating rotary motion may be communicated to the cam-cylinder, according to the adjustment of the crank, means for placing in operative position *en masse* a portion of the needles that have been raised, devices whereby the adjustment of the variable crank may be effected, and a yarn stop-off for gripping the yarn after the passage of the yarn-guide by the last of the needles in operation during each of the movements of the cam-cylinder while reciprocating, of a shaft D and connections whereby a movement of said shaft will effect the adjustment of the variable crank and change the motion of the cam-cylinder from rotary reciprocating to continuous rotary, cause the needle-lowering means to lower the needles in connection therewith, and throw out of operation the yarn stop-off, substantially as shown and described.

16. The combination, with the needles, needle-cylinder, cam-cylinder, devices for driving said cam-cylinder, embracing a crank of variable radius, whereby either a continuous rotary motion or a reciprocating rotary motion may be communicated to the cam-cylinder, according to the adjustment of the crank, means for placing into and out of operative position a portion of the needles *en masse*, devices whereby the adjustment of the variable crank may be effected, and a yarn stop-off for gripping the yarn after the passage of the yarn-guide by the last of the needles in operation during each of the movements of the cam-cylinder while reciprocating, of a shaft D and connections whereby a movement of said shaft will effect the adjustment of the variable crank and change the motion of the cam-cylinder from continuous rotary motion to reciprocating rotary motion, or vice versa, cause the needle raising and lowering means to raise or lower the needles in connection therewith, and throw into or out of operation the yarn stop-off, substantially as shown and described.

17. The combination, with the jack-holder and with the jacks and needles controlled thereby, of an intermittently rotating or oscillating shaft and an eccentric thereon, and a connection between the said eccentric and jack-holder, whereby the needles controlled by said jack-holder are raised out of or lowered into operative position by a partial rotation of said shaft, substantially as shown and described.

18. The combination, with the needle-cylinder and needles, the jacks l^2, and mechanisms for operating the same, and with the main power-shaft A, of the shaft K, carrying actuating-cams, an escapement-wheel driving the said shaft, an escapement-lever, a pawl-and-ratchet mechanism, and spring-connections intermediate the said ratchet and escapement-wheel, and connections intermediate the said shaft A and said pawl and escapement-lever, whereby reciprocating motion is imparted to the said pawl and slide, substantially as described.

19. The combination, with the needle-cylinder, of two eccentrics, either of which may be brought into action to raise and lower the cylinder during each revolution or forward and backward reciprocation of such cam, a link, the driving-rods of said eccentrics connected to opposite ends of said link, a sliding connection between said link and cylinder, and a cam c^{24}, and connections intermediate said link and cam for reciprocating said link, whereby the times of the upward and downward movements of the cylinder may be changed and the limits of its reciprocation raised or lowered without affecting the stroke of said cylinder, substantially as described.

20. The combination, with the vertically-reciprocating web-holder and with the oscillating or intermittently-rotating shaft D, provided with a cam c^{23}, of intermediate connections whereby the web-holder

is raised out of and lowered into operative position by an oscillation or semi-rotation of shaft I¹, substantially as shown and described.

21. The cam-cylinder provided with the fixed upper and lower needle-actuating cams and having the movable switch-cams b^4 c^4 applied thereto, in combination with the annular gear *l*, having a rigid connection with the switch-cams b^4 c^4, the said gear and switch-cams moving together to change the cam-path, and a thread-guide connected with the annular gear or with the said switch-cams, so as to have an independent motion relatively to the cam-cylinder, substantially as shown and described.

22. The combination, with the cam-cylinder and the switch-cams and their rigidly-attached yoke, the yoke being so connected as to have a slight independent movement relatively to the cam-cylinder, of a thread-guide attached to the yoke, substantially as shown and described.

23. The combination, with the needle-cylinder and needles, the jacks A^2, the cam-bars, and devices for operating the jacks from said cam-bars, of the shaft K, with helical cams, an escapement-wheel keyed to said shaft, a pawl-and-ratchet mechanism, and intermediate spring-connections between the ratchet and escapement-wheel, and an oscillating shaft L, having operative connection with the pawl-lever and with the fork of the escapement-wheel, substantially as shown and described.

24. The combination, with the needle-cylinder and needles, of a series of jacks for raising the needles out of and lowering them into action, a series of compound levers connected with the jacks to operate the latter, a reciprocating cam and connections between said cam and levers, a helical spring-actuated cam to move the said reciprocating cam, and an escapement to control the helical cam, substantially as and for the purpose described.

25. The combination, with the needle-cylinder and needles, of a series of jacks for raising and lowering the needles, a series of compound levers connected with the jacks to operate the latter, and a reciprocating cam and connections between said cam and levers, substantially as and for the purpose described.

26. The combination, with the cam and needle-cylinders and with the needles and jacks, of levers for moving the jacks and needles, reciprocating cam-bars for producing the required movement of the levers at predetermined times, and cams for reciprocating said cam-bars, substantially as shown and described.

27. The combination, with the cam and needle-cylinders and with the needles and jacks, of levers for moving the jacks and needles, reciprocating cam-bars for producing the required movements of the levers at predetermined times, rotating spring-pressed cams for reciprocating said cam-bars, and an escapement to control the action of the cams.

28. The combination, with a needle-cylinder, of means for raising said cylinder and lowering the same again during the knitting of each course in either continuous circular knitting or reciprocating knitting for the purpose of shaping the fabric by varying the lengths of the loops in the different parts of a course, substantially as shown and described.

29. The combination, with a needle-cylinder, of an eccentric, means for rotating the same, and connections intermediate said eccentric and cylinder, whereby the latter is raised and lowered during the knitting of each course for the purpose of shaping the fabric by varying the lengths of the loops in the different parts of a course, substantially as shown and described.

30. The combination, with a needle-cylinder, of an eccentric, means for rotating the same, and connections intermediate said eccentric and cylinder, whereby the latter is raised and lowered during the knitting of each course for the purpose of shaping the fabric by varying the lengths of the loops in the different parts of a course, said connections being adjustable, substantially as described, whereby the average length of the loops may be varied, as described.

31. The combination, with a needle-cylinder, of an eccentric, means for rotating the same, and connections intermediate the eccentric and the cylinder, whereby the latter is raised and lowered during the knitting of each course for the purpose of shaping the fabric by varying the lengths of the loops in the different parts of a course, said connections embracing a rod adjustable in the direction of its length, whereby the average length of the loops may be varied, as described.

32. The combination, with a needle-cylinder, of an eccentric, means for rotating the same, and connections intermediate the eccentric and the cylinder, whereby the latter is raised and lowered during the knitting of each course for the purpose of shaping the fabric by varying the lengths of the loops in the different parts of a course, said connections embracing a rod o^3, made in two parts and connected by a right and left hand coupling, and means for rotating said coupling to lengthen and shorten the rod o^3, substantially as shown and described.

33. The combination, with a needle-cylinder, of an eccentric, means for rotating the same, and connections intermediate the eccentric and the cylinder, whereby the latter is raised and lowered during the knitting of each course for the purpose of shaping the fabric by varying the lengths of the loops in the different parts of a course, said connections embracing a rod o^3, made in two parts and connected by a right and left threaded coupling, a lever for turning said coupling to lengthen and shorten the rod o^3, and a cam for operating said lever, substantially as shown and described.

34. The combination, with the needle-cylinder, of two oppositely-arranged eccentrics q^3 r^3, the rods s^3 t^3, the link p^3, to the opposite ends of which said rods are connected, and connections intermediate said link and the cylinder for raising and lowering the latter, having a sliding connection with the link, substantially as shown and described.

35. The yarn stop-off for knitting-machines herein described, consisting of two clamping-plates, means for imparting to one of said plates a constant reciprocating stroke, a spring-seat for the other of said plates, and means whereby a reciprocating movement is imparted to the spring-seat, in order that the thread may be clamped and released at different points in the reciprocation of the two plates, substantially as shown and described.

36. The yarn stop-off for knitting-machines herein described, consisting of two clamping-plates, means for imparting to one of said plates a constant reciprocating stroke, and means whereby the other of said plates is changed in position, in order that the thread may be clamped at different points in the reciprocation of the two plates, substantially as shown and described.

37. The yarn stop-off for knitting-machines herein shown and described, consisting of a reciprocating rod 16, a clamping-plate mounted thereon, and means for imparting reciprocating motion to said rod, a second clamping-plate, a screw-shaft 26, with which the latter plate is connected, an eccentric m^{11}, and connections between the screw-shaft and eccentric, substantially as shown and described.

38. The combination, with the yarn stop-off, consisting of fixed and movable plates, and an eccentric for reciprocating the movable plates, of a movable link-connection between the said eccentric and plates, whereby the reciprocations of the latter may be varied, and whereby the yarn stop-off may be thrown entirely out of action, substantially as shown and described.

39. The combination, with the fixed and movable plates of the stop-off and the rod 16, of an eccentric for reciprocating said rod, and an intermediate link 12, pivotally joined at one end to the rod of the said eccentric, a vertically-movable rod 13, connected at its upper end with the opposite end of the link, and at its lower end with an eccentric l^2, the change-shaft D, with its eccentric v^2, and crank-connections between the eccentrics l^2 v^2, substantially as shown and described.

40. The combination, with the yarn stop-off, consisting of fixed and movable clamping-plates, the latter being carried by a reciprocating rod 16, and an eccentric for reciprocating said rod, of a link 12, pivotally joined at one end to the eccentric-rod and forming a connection between the latter and the rod 16, and a vertically-movable rod 13, connected with the opposite end of said link to shift the latter, substantially as shown and described.

41. A thread-inserting mechanism consisting, essentially, of two relatively fixed plates 50 51, and an intermediate clamping-plate 52, capable of being moved into contact with either of the plates 50 51 to clamp and stop off either of two threads, and which, when standing in a central position, allows both threads to be fed forward together, and devices for shifting said movable plate and for holding it in a central position, substantially as shown and described.

42. The thread-inserting mechanism consisting of plates 50 51, fixed relatively to each other, a movable plate 52 between the same, a screw for shifting said movable plate toward either of the fixed plates, and a cam and intermediate connections for imparting rotary movement to said screw.

43. A thread-inserting device comprising two relatively fixed plates 50 51 and an intermediate clamping-plate 52, capable of being moved into contact with either of the plates 50 51 to clamp either of two threads, and a cam and intermediate connections constructed to hold the clamping-plate first in a central position, and then to move it into contact with one or the other of the fixed plates, substantially as and for the purpose described.

44. The thread-inserting mechanism consisting of plates 50 51, fixed relatively to each other, a movable plate 52 between the same and capable of being moved into contact with either operating devices for said plate, a thread separator and cutter 55 56, and means, substantially as described, for moving the same between the threads and for placing the cutter in and out of position for acting upon one of the threads.

45. The parting-bar and separator consisting of a vibrating bar pivoted to a rigid frame and a vibrating knife pivotally attached to said bar, a cam and intermediate devices for vibrating said bar, and a cam for vibrating the knife, substantially as shown and described.

46. In a thread-changing mechanism, the combination of a series of clamping-plates adapted to clamp and stop off either of two threads which are being fed to the needles, a pivoted separating-bar, and a severing-knife pivoted on said bar, cams for operating the separating-bar and severing-knife, and connecting devices intermediate the separating-bar and its cam, substantially as shown and described.

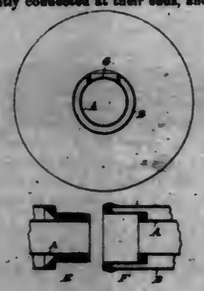
47. A thread-inserting device comprising two relatively fixed plates 50 51 and an intermediate clamping-plate capable of being moved into contact with either of the plates 50 51 to clamp and stop off either of two threads, and which in a central position will allow both threads to be fed forward, and a cam and intermediate connections to operate said clamping-plate, in combination with a pivoted separating-bar carrying a pivoted knife to sever the thread, a cam to vibrate said knife, and a cam and intermediate devices for operating said separating-bar, substantially as shown and described.

48. The combination, with the clamping-plates 50 51 52 and the cam and intermediate connections for operating the plate 52, of a pivoted vertically-vibrating separating-bar, means for operating said bar, a double-edged knife pivotally joined to said bar and capable of being projected beyond the separating-bar on either side to sever either of two threads which are being fed forward, and a forked cam 86, capable of being moved laterally to project the knife from either side, substantially as shown and described.

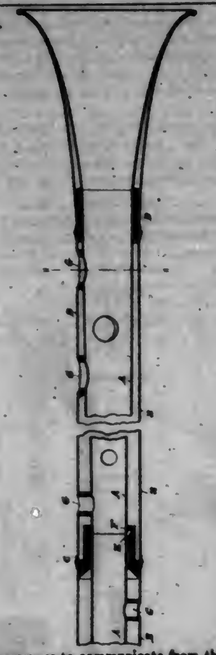
49. The combination, with thread-changing devices and their actuating means, of two shafts, one of which is in operative connection with the said actuating means, the axes of the said shafts being in parallel lines, but normally out of axial alignment, each shaft being provided with a crank and each crank with a lug which projects into the plane of rotation of the lug of the other of said cranks, one of said shafts being movable into and out of alignment with the other, and a cam or pattern-chain for moving said shaft, substantially as shown and described.

50. The combination, with thread-changing devices, of two shafts in axial alignment, one connected with the source of power and the other with the said thread-changing devices for actuating the latter, of an intermediate shaft supported in movable bearings so as to be capable of movement into and out of axial alignment with the first-mentioned shafts, said intermediate shaft having a sliding crank connection with one of said shafts, and with the other an intermittent connection, which consists of a crank on each shaft and on each crank a pin which projects into the plane of rotation of the other pin, substantially as shown and described.

51. The combination, with thread-clamping plates and devices for operating the same, as described, of two shafts which normally are out of axial alignment with each other, each at adjacent ends being provided with a crank carrying a lug, the lug of each crank projecting into the path of rotation of the lug of the other, and means whereby the axis of one of said shafts is moved at desired intervals from one side to the other of the axis of the other shaft.



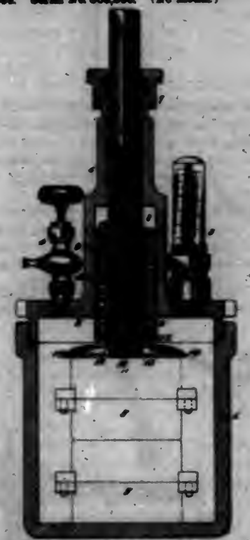
52. The combination, with thread-clamping plates and devices for operating the same, as described, of two shafts w^{10} and n^{11}, whose axes are parallel, but normally out of alignment with each other, each at adjacent ends being provided with a crank carrying a lug, the lug of each crank projecting into the path of rotation of the other, one of said shafts being movable, and means whereby said movable shaft is moved into and out of axial alignment with the other of said shafts, whereby a continuous rotation of one shaft will impart an intermittent rotation to the other, substantially as shown and described.



410,072. CLARIONET. CHARLES G. CONN, Elkhart, Ind. Filed May 23, 1889. Serial No. 311,862. (No model.)

Claim.—1. A wind-instrument formed with a hollow body of two concentric tubes, with radial air-passages to form connections from the interior of the body with the outer air, substantially as set forth.

2. The combination of the inner tube or body A and the outer tube or body B, tightly connected together at the extremities of the sections of the instrument to provide the customary joint 5, as described.

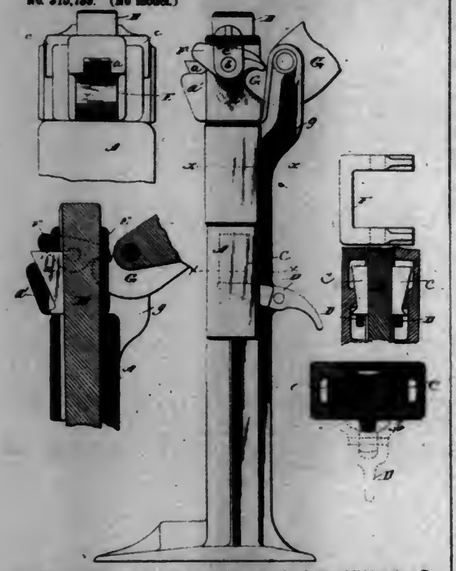


3. The combination of the inner tube or body A and the outer tube or body B, tightly connected at their ends, and the radial tubes

G, forming air-passages to communicate from the interior of the instrument to the outer air, as and for the purposes explained.

410,073. VULCANIZER. EDWARD R. CRANE, California, Mo. Filed Apr. 26, 1889. Serial No. 308,560. (No model.)

Claim.—1. In a vulcanizer, the combination of a suitable casing adapted to hold the flasks, a disk adapted to rest on the flasks, a sleeve to which the disk is secured, a shaft secured to the sleeve, a button on said shaft, and a spring located within the sleeve and bearing against said button, substantially as and for the purpose set forth.

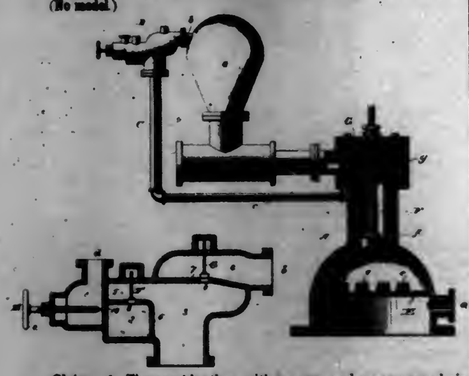


2. In a vulcanizer, the combination of a suitable casing adapted to hold the flasks, a disk, a sleeve fitting in the hollow neck of the casing, and to which the disk is secured by a ball-and-socket joint, a shaft having threaded connection with the said neck, and to which the sleeve is connected by a button or flange 17, and a spring 18, located within the sleeve, substantially as and for the purpose set forth.

3. In a vulcanizer, the combination of a suitable casing adapted

to hold the flasks and having a hollow neck, a sleeve fitting within the neck, a disk secured to the sleeve by means of a nut having a rounded surface 13, adapted to fit the disk, and a screw 15, a spring located within the sleeve, and a shaft having threaded connection with the neck and provided with a flange 17, substantially as and for the purpose set forth.

4. In a vulcanizer, the combination of a suitable casing adapted to hold the flasks, a disk, a sleeve, a nut securing the disk to the sleeve, a spring within the sleeve, and an operating-shaft, said nut being provided with perforations, substantially as and for the purpose set forth.



410,074. LIFTING-JACK. LOUIS J. CRECELIUS, St. Louis, Mo., assignor to Andrew Warren, same place. Filed June 27, 1889. Serial No. 315,739. (No model.)

Claim.—1. In combination with a standard A and lifting-bar B, a lifting-head E, a grip *a*, carried thereby, a lifting-lever G, and a loop F, pivoted to the lifting-head and interposed between the lifting-lever and the grip, said loop being acted upon by the lever, whereby the action of the lever is transmitted to the grip through the loop, substantially as described.

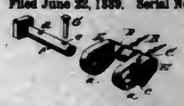
2. In combination with the standard A and lifting-bar B of a jack, a lifting-head E, having a pocket, a grip *a* in said pocket, a pivoted loop F, bearing on said grip *a*, and a lifting-lever G, adapted to act upon the opposite end of said loop, substantially as described.

410,075. AUTOMATIC AIR-COMPRESSOR FOR PUMPS. HENRY A. DANIELS, Yonkers, N. Y. Filed Oct. 15, 1888. Serial No. 288,139. (No model.)

Claim.—1. The combination, with a pump and a compressed-air chamber, of a single-piece casing D, interiorly divided by the partitions 6 and 7 into the chambers 2, 3, and 4, the chamber 3 communicating with the pump between its inlet and discharge valves, the chamber 4 communicating with the compressed-air chamber, and the chamber 2 communicating with the external air, a check-valve G, adapted to close an opening in the partition 7, and a check-valve F, adapted to close an opening in the partition 6, substantially as set forth.

2. The combination, with a pump and a compressed-air chamber, of a pipe communicating with the pump between its inlet and discharge valves, a casing communicating with the pipe and also with the compressed-air chamber, provided with an air-inlet, check-valve in the casing between the said pipe and the compressed-air chamber and the said pipe and the air-inlet, and a regulating-valve for the air-inlet, substantially as set forth.

3. The combination, with a pump and an air-chamber, of a casing having separate chambers, one connected with the pump between its inlet and discharge valves, another with the air-chamber, and the third having an air-inlet, check-valves between the said chambers, and a regulating or stop valve for the air-inlet, substantially as described.



4. The combination, with a pump and an air-chamber, of a casing D, having the chambers 2, 3, and 4, communicating with each other through the openings 8 and 9, the air-inlet opening into chamber 2, the pipe connecting the chamber 3 with the pump between its inlet and discharge valves, the connecting-pipe between the chamber 4 and the air-chamber, the regulating-valve opposite the air-inlet, and the check-valves which close the openings 8 and 9, substantially as described.

410,076. QUICKSILVER-CATCHER. EDWARD A. DOBIE, Silver Reef, Utah. Filed Feb. 26, 1889. Serial No. 301,173. (No model.)

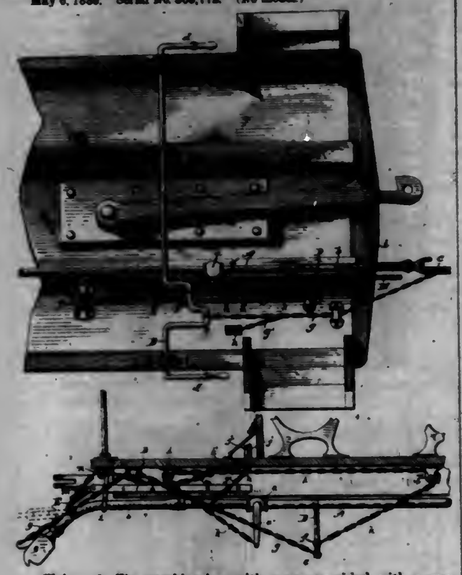
Claim.—The quicksilver collector or flume consisting of the trough-like receptacle having at suitable points approximately diamond-shaped chambers, the riffles disposed about centrally of said chambers, with their ends standing in proximity to the contracted or tapering extremities of said chambers and provided with upwardly-curved hook-like brackets, or catching under and passing through keepers or staples applied to the bottom or bed of said receptacle, cavities below the surface of said bed or bottom, and the gates or boards resting against cleats of the said receptacle, substantially as specified.

410,077. FENCE-WIRE HOLDER AND STRETCHER. RANSOM DOUD, Chili, Ind. Filed June 22, 1889. Serial No. 315,206. (No model.)

Claim.—The improved wire-tightener herein described, consisting of the portion C, comprising the round rod D, designed to receive the wire by which the tightener is fastened in place and from which extend in parallel relation to each other the end bars E, provided at their ends with holes, as shown, the outer face of one of said bars being cut away from side to side to the rear of the hole therein, forming the vertical shoulder *c*, the removable shaft F, having holes *d* and *e* and rectangular head, and the removable pin G, having a flat head and designed to bear against said shoulder, substantially as herein shown and described.

410,078. SAND-SCREEN. PAUL DREISBUL, Chicago, Ill., assignor to Louis G. Boers, same place. Filed May 20, 1889. Serial No. 311,459. (No model.)

Claim.—1. In a wire screen, the combination of the frame A, having wires B B, with the plates C C, having transverse slots *c c*, and removable retaining-rods D D, substantially as and for the purpose set forth.



2. In a wire screen, the combination of the frame A, the wires B B, having loops E, the rods D, and the plates C C, having slots *c c*, substantially as shown and described, and for the purpose set forth.

410,079. AUTOMATIC BRAKE-ADJUSTER. ELISHA D. RANDS, Watertown, N. Y. Filed Jan. 5, 1889. Serial No. 295,543. (No model.)

Claim.—In a brake mechanism, a brake-lever, a brake-rod, and an oscillating and binding shackle to which the short arm of said lever is directly connected, combined with a second oscillating and binding shackle and with a link or rod uniting, by means of a slotted connection, the brake-lever with the said second shackle, substantially as set forth.

410,080. CAR-COUPLING. RICHARD J. EDWARDS, Galena, Ill. Filed May 6, 1889. Serial No. 309,772. (No model.)

Claim.—1. The combination, with a car provided with a conducting-pipe, a stop-cock in said pipe, and a flexible section attached to the said pipe and provided with a hose-coupling, of a multiple crank-shaft journaled upon the car, chains connecting the crank-arms respectively to the coupling and stop-cock, and independent chains *g* and *k*, connected to the said chains and extending up to the platform of the car, substantially as described.

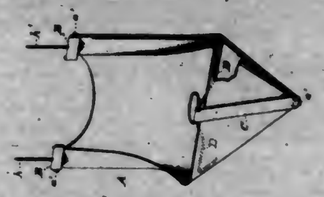
2. The combination, with a car, a conducting-pipe, a stop-cock in this pipe, an arm attached to this stop-cock, a safety-hook E, pivotally attached to the car, of a crank-shaft journaled upon the car, and chains *k* and *m*, connecting the crank-arm on the said shaft to the said safety-hook and stop-cock arm, substantially as described.

410,081. BACK-BAND HOOK. JULIUS A. ELLIOTT, Norfolk, Va., assignor of one-half to Albert S. J. Gammon, same place. Filed Apr. 11, 1889. Serial No. 306,815. (No model.)

Claim.—1. A back-band hook comprising a frame having at one end the bars 3, provided with a hook, the intermediate bar 7, and the slide, the bar 7 being separated from the end bar of the frame to permit the passage of the back-band between them in order that it may be looped around the slide, substantially as set forth.

2. A back-band hook comprising a frame having the side bars and the end bars 1 and 3, the latter provided with a hook, the intermediate stationary cross-bar 7, and the flat slide 8, having long sleeves which surround the side bars, upon which the slide is free to move, substantially as set forth.

3. A back-band hook comprising a frame having at one end the bars 3, provided with a hook, an intermediate cross-bar in front of which the back-band is adapted to pass, and a spring-finger carried by the frame and arranged opposite the said intermediate cross-bar, toward which it is held with a yielding pressure to bear against the back-band, substantially as set forth.



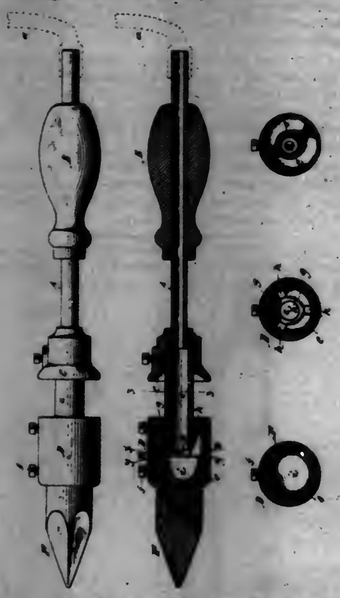
4. A back-band hook consisting of a frame formed of a single piece of wire bent to constitute the cross-piece 1, the side pieces, the end pieces 3, the hook, and the spring-finger 5, an intermediate cross-bar, and a slide, substantially as set forth.

410,082. SAW-GIN. WASHINGTON L. ELLIS, Prattville, Ala., assignor of one-half to Merrill R. Pratt and Daniel Pratt, both of same place. Filed Aug. 10, 1888. Serial No. 282,432. (No model.)

Claim.—In a cotton-gin, the combination, with the main ribs and the saws and spiked roller, of the convex supplemental ribs extending entirely in front of the main ribs below the roll-box and forming therewith the seed-passage, the transverse beams F and H, the cotton-box, and the hinged roll-box cover having the inclined seed-guide L, substantially as specified.

410,083. DENTAL-RIB CLAMP. JOHN D. EVANS, Norfolk, Va. Filed Aug. 31, 1888. Serial No. 284,270. (No model.)

Claim.—1. The combination, with the movable clamp-plate F, having the angle-bend *g* and flange *h*, and the piece *a'*, of the base clamp-plate E, having the acute-angle bend *b* and edge flange *c*, and the spreader-arms arranged in the extension of the back plate of the clamp C, substantially as specified.



2. The combination, with a folded bib, of a bib-clamp consisting of a vertical base clamp-plate having at its upper end the lateral spreader-arms D, and the elongated movable clamp F, applied to said base clamp-plate, substantially as set forth.

410,084. SOLDERING-IRON. JAMES H. FERRY, Montreal, Quebec, Canada. Filed June 5, 1889. Serial No. 313,171. (No model.)

Claim.—1. The combination, with the gas-tube, of a heating-chamber attached to said tube and provided on the inner side of its rear portion with ribs forming flame-passages between them and with a socket in its front portion, and a soldering copper or point detachably secured in said socket of the heating-chamber, substantially as set forth.

2. The combination, with the gas-tube, of a heating-chamber surrounding the end of said tube and provided with internal flame-passages extending rearwardly on the outer side of said tube, a soldering-point detachably secured to the front portion of the heating-cham-

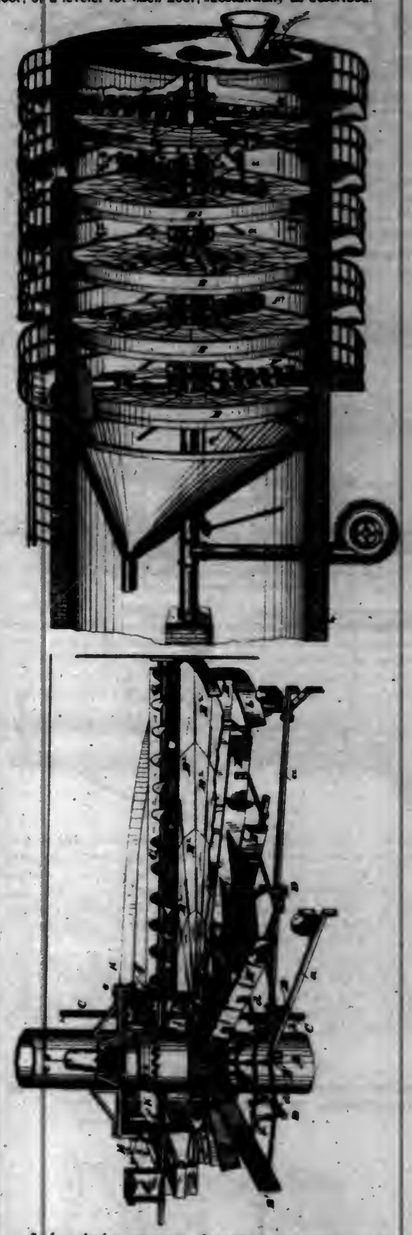
ber and closing the same, and a deflector surrounding the gas-tube in rear of the heating-chamber, substantially as set forth.

410,085. DRYING APPARATUS. JOSEPH F. GRAY, Columbus, Ind. Filed June 23, 1888. Serial No. 277,905. (No model.)

Claim.—1. In a drying apparatus, the combination, with revolving floors having central apertures, of a central tubular air-shaft and a driving-shaft for said floors extending through said central apertures, substantially as described.

2. In a drying apparatus, the combination, with the revolving floors having central apertures surrounding a central air-shaft, said apertures being provided with internal gears supported from said shaft above said floors and provided with gear-teeth on one of their horizontal faces, of a stirrer and a leveler for each floor, having their shafts provided with gears engaging the teeth on the horizontal faces of said internal gears, and a driving-shaft extending through said central apertures and provided with pinions engaging said internal gears, substantially as described.

3. In a drying apparatus, the combination, with the revolving floors surrounding a stationary central air-shaft, of an internal gear provided with gear-teeth on one of its horizontal faces, and with a peripheral groove, a ring in said groove connected to said central shaft, a driving-shaft engaging said internal gear, and a stirrer and a leveler for each floor, having gears engaging the gear-teeth on the horizontal face of said internal gear, substantially as described.



4. In a drying apparatus, the combination, with a stationary central air-shaft, of a revolving floor surrounding the same, a gear-ring surrounding said shaft, the gear-ring support, a driving-shaft engaging said gear-ring, and a stirrer having a gear engaging the gear-ring, substantially as described.

5. In a drying apparatus, the combination of revolving floors one above the other, having central apertures surrounding a central air-shaft, the said apertures being provided with gear-rings, gear-rings supported from said central shaft above said floors, a stirrer for each floor, having their shafts provided with gears engaging the gear-rings above the floors, and a driving-shaft extending through the central apertures of the floors, and provided with pinions engaging all of said gear-rings, substantially as described.

6. In a drying apparatus, the combination, with a series of revolving drying-floors located one above the other and provided with central apertures, and a stirrer and a leveler for each floor, of a central air-shaft extending upward through the apertures of said floors, and a driving-shaft for said stirring and said leveling devices extending through the apertures of the floors between the air-shaft and the inner edges of said floors, substantially as described.

7. A drying apparatus consisting of a number of revolving floors located one above the other, each floor being composed of radial series of dumping-sections pivoted at right angles to the radius of the floor, each series of sections of one floor being adapted to dump at a point in advance of the dumping-point of the floor below, substantially as described.

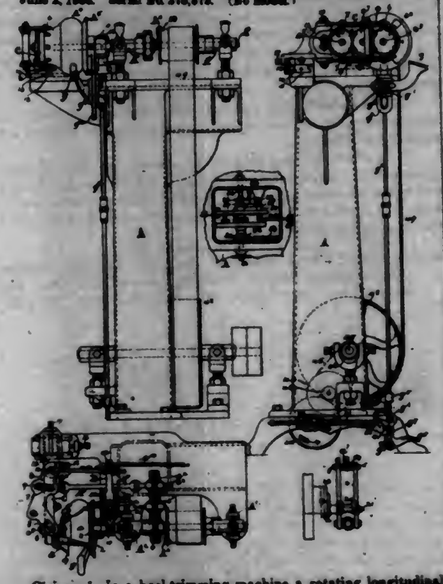
8. In a drying apparatus, the combination, with a number of rotating floors arranged one above the other and composed of radial series of dumping-sections pivoted at right angles to the radius of the floor, of a leveler for each floor, substantially as described.

9. In a drying apparatus, the combination, with a number of rotating floors arranged one above the other and composed of several radial series of dumping-sections dumping toward the centers of said floors, of a leveler for each floor, the dumping-point of each floor being between the dumping-point and the leveler of the floor below, substantially as described.

10. A leveler consisting of a shaft provided with a spiral conveyer and a partial casing for said conveyer, one edge of said casing being located substantially in line with the center of said shaft and conveyer and beneath the same, substantially as described.

11. A leveler consisting of a shaft provided with a right and left spiral conveyer joined near the center of the shaft, and a partial casing for said conveyer, substantially as described.

12. A stirrer consisting of a shaft provided with scoops, each scoop having an approximately straight main body extending outwardly from the shaft at a tangent thereto and having an angular lip at its outer end, the shaft and said lip being on opposite sides of the main body, whereby a free rearward discharge is given each scoop on the opposite side of the shaft, substantially as described.



13. A stirrer consisting of a shaft provided with scoops arranged in pairs extending tangentially from the shaft in opposite directions in a plane transversely of the shaft and attached on opposite sides of the same, each scoop having an approximately straight main body provided at its outer end with an angular lip, the shaft and said lip being on opposite sides of the main body, whereby a free rearward discharge is given each scoop on the opposite side of the shaft, substantially as described

14. A stirrer consisting of a shaft provided with scoops, each of said scoops having a main body attached to said shaft tangentially, extending outwardly and provided at its outer end with an angular lip, and having a free discharge on the opposite side of the shaft, the said scoops being arranged in series, each series consisting of two sets of scoops extending tangentially from the shaft in opposite directions, the sets of one series being located between the sets of the other series and at right angles thereto, substantially as described.

15. A drying apparatus consisting of rotating floors located one above the other, each floor being composed of radial joists and sections of flooring pivoted between said radial joists, of radial rods having a longitudinal movement located beneath said pivoted sections and connected with said sections for dumping the same, substantially as described.

16. In a drying apparatus, the combination, with rotating floors located one above the other, each floor being composed of radial joists and sections of flooring pivoted between said radial joists, of radial rods having a longitudinal movement located beneath said pivoted sections and connected with the same, arms depending from said rods, and a cam mounted on a stationary part of the frame beneath each floor in the path of said depending arms, substantially as described.

410,086. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed June 2, 1888. Serial No. 276,573. (No model.)

Claim.—1. In a heel-trimming machine, a rotating longitudinal movable shaft, its attached rotary cutter, and tread-guard, combined with a rand or counter guard to enter the rand-crease, and a freely-movable carriage to which the rand-guard is attached, and a guide for the said carriage, the said rotary shaft, its cutter, and tread-guard being movable longitudinally in unison toward and from the rand or counter guard, the rand or counter guard being also free to move in a direction substantially at right angles to the axis of rotation of the said rotating shaft, for the purpose specified.

2. In a heel-trimming machine, a rotating longitudinal movable shaft, its attached rotary cutter, and tread-guard, combined with a rand or counter guard to enter the rand-crease, a freely-movable carriage to which the rand or counter guard is attached, and a slotted guide therefor to effect the tipping of the said carriage as it is moved in a direction substantially at right angles to the axis of rotation of the said rotating shaft, substantially as set forth.

3. In a heel-trimming machine, a movable carriage, as C, and its attached rand or counter guard to enter the rand-crease, the rotating shaft, its attached cutter, and the tread-guard, combined with connections between the tread-guard and carriage, whereby the longitudinal movement of the cutter and tread-guard in unison toward and from the rand or counter guard is accompanied by a movement of the said rand or counter guard in a direction substantially at right angles to the said shaft, substantially as described.

4. In a heel-trimming machine, a rotating cutter, an independent freely-movable carriage, as C, a rand or counter guard, combined with a movable rest, as *g*, and a guide therefor, whereby the said rest, while the cutter acts to trim the straight sides of the heel, may be moved substantially at right angles to the rotation of the cutter, substantially as described.

5. In a heel-trimming machine, a rotating cutter, a tread-guard, a tipping carriage, its rand or counter guard, and the guide-plate *b* for the said carriage, combined with connections intermediate the said blade and shaft, whereby the pressure of the tread of the heel against the tread-guard moves the latter, together with the rotating cutter and its shaft, longitudinally, and through the said connection moves the said carriage at right angles to the said shaft, substantially as described.

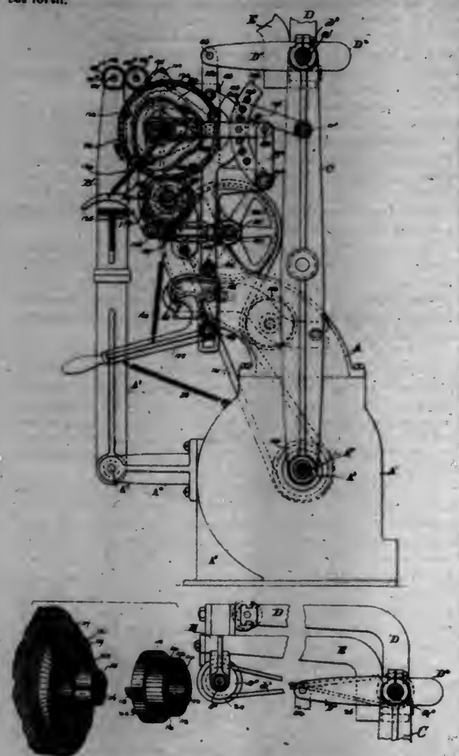
6. In a heel-trimming machine, a rotating longitudinal movable shaft, its attached rotary cutter, and tread-guard, combined with a recessed rand-guard to enter the rand-crease, and a rotating rand-cutter having its blades engaged with a rotating cutter between its blades, a freely-movable carriage to support the said rand-guard and rand-cutter, and a guide, for the carriage, the said shaft, its cutter, and tread-guard being movable longitudinally in unison toward and from the rand or counter guard, the rand or counter guard being also free to move in a direction substantially at right angles to the axis of rotation of the said rotating shaft, for the purpose specified.

7. In a heel-trimming machine, the rotating shaft, its attached cutter, its attached gear, the carriage, rand or counter guard, and rand-cutter, combined with the gear c^4 and with intermediate gearing and flexible shafting, to operate substantially as described.

8. In a heel-trimming machine, the rotating cutter, a tread-guard or guide A^5, combined with the rest *g*, a cam, and means to automatically operate the said rest, as described, while the sides of the heel are being trimmed, the rest being substantially stationary while the rear part of the heel is being trimmed, substantially as described.

9. In a heel-trimming machine, the edge-rest *g* for the shoe the heel of which is to be trimmed, and the cam for moving the said rest vertically, combined with a treadle to operate the said cam, substantially as described.

10. In a heel-trimming machine, the rest for the shoe the heel of which is to be trimmed, the cam for moving the said rest vertically, and the bar 31, attached thereto and provided with the cam-groove, combined with a shaft 34, having a crank-pin or projection to actuate the said slide-bar, and with means to rotate the said shaft 34 or leave it at rest, substantially as described.



11. In a heel-trimming machine, the shaft 34, its attached crank-pin or projection 33, the slide-bar actuated thereby, the cam g^7, connected to the slide-bar, the sleeve 35, splined loosely upon the shaft 34, and the gear 42, loose on the shaft 34 and provided with teeth at its hub to be engaged by the teeth of the sleeve, combined with means to rotate the gear 42, the latter rotating the shaft 34 when the teeth of the sleeve are in engagement with the teeth at the hub of the said gear, substantially as described.

12. In a heel-trimming machine, the shaft 34, its attached crank-pin or projection 33, the slide bar actuated thereby, the cam g^7, connected to the slide-bar, the sleeve 35, splined loosely upon the shaft 34, and the gear 42, loose on the shaft 34 and provided with teeth at its hub to be engaged by the teeth of the sleeve, combined with means to rotate the gear 42, the latter rotating the shaft 34 when the teeth of the sleeve are in engagement with the teeth at the hub of the said gear, and with means to automatically reverse the direction of rotation of the shaft 34 when the sleeve is disengaged from the said toothed wheel 42, substantially as described.

410,087. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed Feb. 26, 1889. Serial No. 301,286. (No model.)

Claim.—1. In a heel-trimming machine, the swing-frame, a rotating shaft, an attached rotating cutter, and frame to sustain the said shaft, combined with the rotating cam-wheel, and connecting devices between the said cam-wheel and swing-frame to swing the lat-

ter and move the rotating cutter horizontally, as and for the purposes set forth.

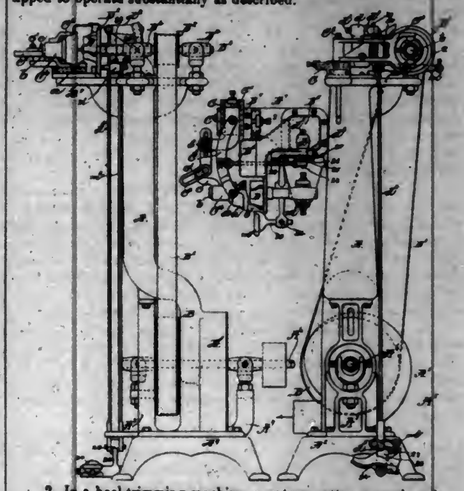
2. In a heel-trimming machine, the swing-frame, a rotating shaft, and a rotating cutter thereon, and frame to sustain the said shaft in order that it may be moved with the said swing-frame, combined with the rotating cam-wheel, and adjustable links between the said cam-wheel and swing-frame to swing the latter according to the requirements of the cam in the cam-wheel, substantially as described.

3. In a heel-trimming machine, the swing-frame to impart to the cutter-shaft and cutter a movement along the side of the heel, and the rotating cam-wheel and connections between it and the said swing-frame, combined with a clutch mechanism to actuate the said cam-wheel at intervals, substantially as described.

4. In a heel-trimming machine, the cam-wheel, the worm-shaft, and the worm-gear moved continuously by it, combined with the gear 117 and clutch mechanism between the said gears, to operate substantially as described.

5. In a heel-trimming machine, the cam-wheel, the worm-shaft, and the worm-gear moved continuously by it, combined with the gear 117, and clutch mechanism between the said gears, and a clutch-controlling device and means to automatically operate it to effect the release of the said clutch at the proper times, substantially as described.

6. In a heel-trimming machine, the cam-wheel and the sector actuated thereby, combined with the jack, its shaft a, gear a', and pinion a^4, actuated by the said sector, substantially as described.



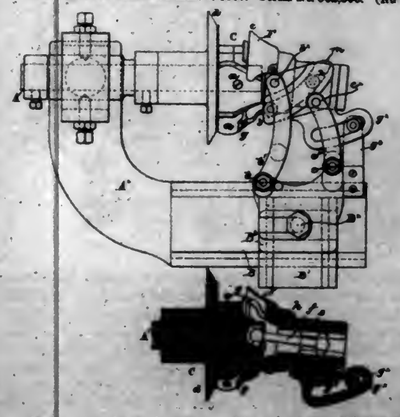
7. In a heel-trimming machine, the cam-wheel, its projection 135, and the rocker-frame, combined with the slide actuated by the said projection and connected to the said rocker-frame, substantially as described.

8. In a heel-trimming machine, the cam-wheel, its projection 135, and the rocker-frame, combined with the slide actuated by the said projection and the cam-lever, to operate substantially as described.

9. In a heel-trimming machine, the jack, its shaft, and pattern-plate, combined with the sector, and gearing between it and the said shaft to partially rotate the same in opposite directions, and a cam to actuate the said sector, substantially as described.

410,088. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed June 25, 1888. Renewed Mar. 7, 1889. Serial No. 302,990. (No model.)

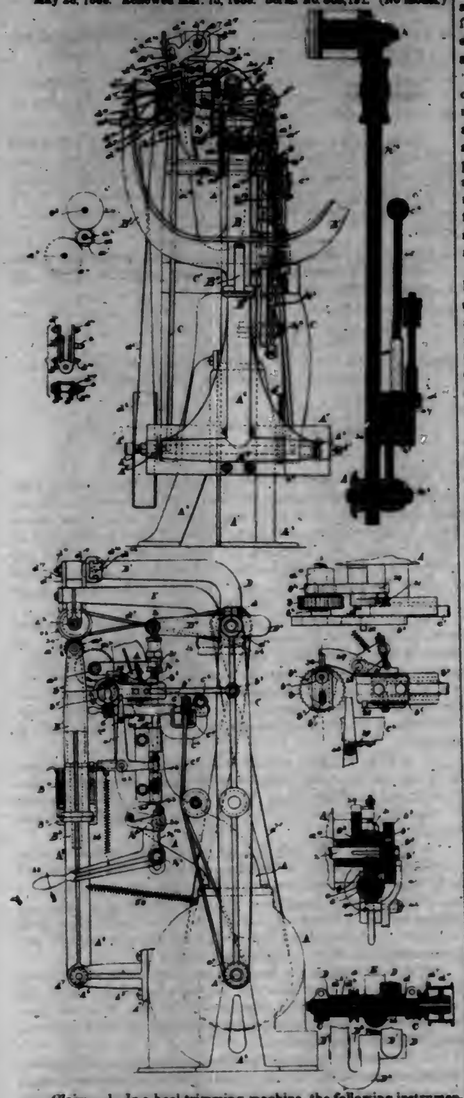
Claim.—1. In a heel-trimming machine, a rotary cutter to trim the heel, and a carriage having an attached rand or counter guard to enter the rand-crease, combined with a single link, upon which the carriage is pivoted, and with a roller or other stud c and a cam with which it co-operates, substantially as described, whereby when the link is moved toward and from the rotary cutter the carriage may be tipped to operate substantially as described.



2. In a heel-trimming machine, a rotary cutter, a carriage having an attached rand or counter guard, and means to support the carriage, combined with a treadle and connections between the treadle and support for the said carriage, whereby the carriage may be moved positively toward and from the rotary cutter, as and for the purpose described.

3. In a heel-trimming machine, a carriage, a rand or counter guard attached thereto, and support for the said carriage, a rotary cutter, a rest on which the heel of the shoe is placed while being trimmed, and a treadle, combined with connections between the said rest and the support for the said carriage, whereby the said carriage and rest are moved automatically in both directions, substantially as described.

4. In a heel-trimming machine, the lever m', combined with the adjustable arm 33 and the adjustable rest m, mounted thereon, substantially as described.



5. In a heel-trimming machine, the combination, with the rotary cutter having a tread-guard, of the rest m for the heel to be trimmed, and means to support the said rest, the rest being adjustable upon its support to place it at an angle to the plane in which the tread-guard stands, substantially as described.

410,089. SOLE-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed May 28, 1888. Renewed Mar. 7, 1889. Serial No. 302,393. (No model.)

Claim.—In a heel-trimming machine, a rotary molded cutter and a rand or counter guard and links to support it, combined with a cam to automatically control independently of the links the tipping movement of the rand or counter guard as the latter moves to uncover the blades of the rotary molded cutter, substantially as described.

410,090. HEEL-TRIMMING MACHINE. CHARLES W. GLIDDEN, Lynn, assignor to James W. Brooks, trustee, Cambridge, Mass. Filed May 28, 1888. Renewed Mar. 13, 1889. Serial No. 303,191. (No model.)

Claim.—1. In a heel-trimming machine, the following instrumentalities, viz: a jack, a partially-rotating heel pattern-plate, a rocking frame, means to support it, a rotating cutter-carrying shaft, a heel-trimming cutter, and a pattern-guide carried by the said shaft, combined with a tipping frame having bearings for the said shaft and means to support the said tipping frame on the said rocking frame, whereby the said tipping frame is free to move in a circular path about a center or axis of motion at right angles to the axis of motion of the rocking frame, the center or axis of motion about which the said tipping frame moves to adapt the heel-trimming cutter to the varying angle or inclination of the exterior of the heel always remaining in line with the contact-point between the usual pattern-guide and the usual heel pattern or plate at the tread end of the heel, substantially as described.

2. In a heel-trimming machine, a jack to hold the shoe the heel of which is to be trimmed, a partially-rotating heel pattern-plate, a rocking frame, means to support it, a rotating cutter-carrying shaft, a heel-trimming cutter, a pattern-guide carried by the said shaft, and a tipping frame having bearings for the said shaft, and means to support the said tipping frame on the said rocking frame, whereby the said tipping frame is free to move in a circular path about a center or axis of motion at right angles to the axis of motion of the rocking frame and at right angles to the center or axis of motion to the cutter-shaft, combined with a carriage having a rand or counter guard, substantially as described.

3. In a heel-trimming machine, a jack to hold the shoe the heel of which is to be trimmed, a partially-rotating heel pattern-plate, a rocking frame, means to support it, a rotating cutter-carrying shaft, a heel-trimming cutter, a pattern-guide carried by the said shaft, and a tipping frame having bearings for the said shaft, and means to support the said tipping frame on the said rocking frame, whereby the said tipping frame is free to move in a circular path about a center or axis of motion at right angles to the axis of motion of the rocking frame and at right angles to the center or axis of motion to the cutter-shaft, combined with a carriage having a rand or counter guard and a rotating rand-cutter, to operate substantially as described.

4. In a heel-trimming machine, a jack to support the shoe the heel of which is to be trimmed, a rotating heel-trimming cutter, its shaft, and frame to support it, a swing-frame pivoted to swing at right angles to the axis of rotation to the cutter-shaft, and means between and connecting the said swing-frame, and means for supporting the said rotating shaft, combined with a pattern-cam to move the said swing-frame intermittingly to cause the heel-trimming cutter to be moved horizontally during its rotation to trim the sides of the heel, substantially as described.

5. In a heel-trimming machine, a jack, a heel pattern-plate, means to partially rotate it, a cutter-shaft, its attached heel-trimming cutter, means to support the said shaft, the swing-frame, and rocking frame, combined with a pattern-cam, connections between it and the swing-frame, and a locking device to hold the pattern-cam in position while the approximately-circular portion of the heel is being trimmed, substantially as described.

6. In a heel-trimming machine, the rotating cutter, its shaft, and a tipping frame in which the said shaft has its bearings, (the axis or center of movement of the said frame being substantially at right angles to the axis of rotation of the shaft carrying the said cutter,) combined with the rand or counter guard and a carriage to which it is attached, and with connections between the said tipping frame and the said carriage, whereby the tipping frame in its movements simultaneously moves the said carriage and the rand or counter guard to uncover more or less of the cutting-edges of the blades of the said rotating cutter, substantially as described.

7. In a heel-trimming machine, the heel-trimming cutter, its shaft, the tipping frame, in which the said shaft has its bearings, and means to support the said tipping frame, whereby it may move in a circular path about an axis or a center substantially at right angles to the shaft carrying the said cutter, combined with a carriage, an attached rand or counter guard, a rotating shaft mounted in the said carriage, a rand-cutter connected to the said shaft, and with connections between the said tipping frame and the said carriage, whereby the tipping frame in its movements simultaneously moves the said carriage and its attached parts, enabling the counter-guard to uncover more or less of the cutting-edges of the blades of the rotating heel-trimming cutter, substantially as described.

8. In a heel-trimming machine, the tipping frame, the rotating heel-trimming cutter, its shaft supported in the said tipping frame, the rocking frame upon which the tipping frame is mounted to move about an axis or center at right angles to that about which the rocking frame moves, and the guide portion d^{30}, connected to the said rocking frame, combined with a block and guide-plates, as d^{10}, adjustably connected thereto, a carriage mounted in the said guide-plates, a rand or counter guard attached to the said carriage, and connections between said tipping frame and carriage, to operate substantially as described.

9. In a heel-trimming machine, a rotating cutter, a swing-frame C, and the pattern-cam in operative connection therewith, combined with a roll or stud b^4 entering the groove in the said cam, and with means to actuate the said roll, substantially as described.

10. In a heel-trimming machine, a trimming-cutter, the swing-frame C, and the pattern-cam in operative connection therewith, combined with a roll or stud b^4 entering the groove in the said cam, and with means to actuate the said roll and the cam b^3 and locking device, to operate substantially as described.

11. In a heel-trimming machine, a rotating cutter, the worm-gear having the roll b^4, the pattern-cam entered by the said roll, the projection 38, the bracket c^6, the shaft c' therein, and its worm c, to engage and rotate the worm-gear, combined with the lever to support

the said bracket until the said lever is tripped, to then automatically release the worm from the worm-gear, substantially as described.

12. In a heel-trimming machine, a rotating shaft, a heel-trimming cutter thereon, a rocking frame, and means to support the said shaft to rise and fall in unison with the said rocking frame, combined with a link and a cam to actuate the same to turn the said rocking frame and remove the cutter from contact with the heel being trimmed, substantially as described.

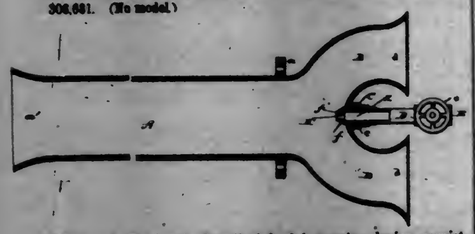
13. In a heel-trimming machine, a trimming-cutter, the rocking frame, its attached link, and a cam to move the said link and turn the said frame about its center of motion, combined with the holding-plate, as 45, a locking-pin, and a locking device, and means to release the said locking device and to move the said cam automatically, substantially as described.

14. In a heel-trimming machine having a rotating heel-trimming cutter, a pivoted double or twin jack, a pattern-plate against which to hold the tread of the heel being trimmed, and gears d', combined with a gear, as d^4, and means to rotate it, the movement of the said jack in one direction effecting the disengagement of the gear d' from the gear d^4 and in the opposite direction effecting the engagement of the said gears, substantially as described.

15. In a heel-trimming machine, a rotating heel-trimming cutter and a tipping frame, combined with a carriage and its attached rand or counter guard, and with the connection between the said frame and carriage, to operate it substantially as described.

16. In a heel-trimming machine, a rotating heel-trimming cutter and a tipping frame, combined with a carriage and its attached rand or counter guard, and with the connection between the said frame and carriage to operate it, and with a rotating rand-cutter supported by the said carriage, substantially as described.

17. In a heel-trimming-machine, a rotating cutter, its shaft, and a frame to support the shaft, combined with a double or twin jack, the head of the jack rotating upon a vertical axis, while the foot of the jack is free to tip toward and from the cutter upon a horizontal axis, substantially as described.



18. In a heel-trimming machine, a jack, a heel pattern-plate carried thereby, its shaft, and attached gear d', combined with an independent gear d^4, mounted upon a stud fixed to the frame, the said gear, when the jack is put into trimming position, being engaged by a gear d' on the shaft of the heel pattern-plate, thus rotating the latter, the two gears being disengaged when the jack is swung out of trimming position, substantially as described.

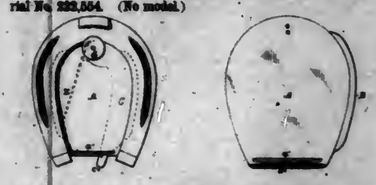
19. In a heel-trimming machine, a rotating cutter, the swing-frame C, and its hollow bushings d', combined with the rocking frame D and the rotating shaft d^3, to operate substantially as described.

20. In a heel-trimming machine, the combination, with a rotary cutter, pattern-cam, and gearing for operating it, of means, substantially as described, for engaging the said gearing automatically as the molded cutter is placed in position to start the trimming of a heel, substantially as described.

21. In a heel-trimming machine, a swing-frame to impart horizontal movement to the cutter-carrying shaft while the same is being rotated to trim the side of the heel, a jack, a heel pattern-plate, its shaft mounted in the said jack, a gear on the said shaft, and an intermediate gear, as d^4, to rotate the shaft carrying the said heel pattern-plate when the jack is in trimming position, combined with means intermediate the said gear d^4 and the swing-frame to restore the latter to its normal position when the jack is moved to disengage the gear of the shaft of the heel pattern-plate from the said gear d^4, substantially as described.

410,091. BLOWER FOR FURNACES. CHARLES A. GOYNE, Ashland, Pa., assignor of three-fourths to F. H. Goyne, Arthur H. Goyne, and Thomas R. Goyne, all of same place. Filed Apr. 10, 1889. Serial No. 306,681. (No model.)

Claim.—1. The herein-described draft-increasing device, consisting of the main tube having the inner flaring mouth, the outer curved diverging inlet-tubes having flaring mouths, the opening between said inflow-tubes, and the steam-injector nozzle fitting in said opening provided with a regulating-valve and having its inner end contracted and then widened or flared, substantially as and for the purpose described.



2. The herein-described draft-increasing device, consisting of the main tube having the inner flaring mouth and annular flange, the curved inflow-tubes having flaring mouths, the threaded boss in the main tube between said inflow-tubes, the steam-injector having its inner end engaging said boss and having the point of its nozzle conical and the bore thereof contracted and then flaring outward, the steam-pipe communicating with the nozzle, and the regulating-valve in the nozzle, said parts being arranged and combined and operating substantially in the manner and for the purpose described.

410,092. BURNER FOR GAS-STOVES. HENRY R. GORRIE, Dayton, Ohio. Filed Feb. 20, 1889. Serial No. 300,614. (No model.)

Claim.—In a burner for gas-stoves, the arc-shaped hollow base C, provided at one end with the air and gas inlet and on its convex side with the recess, in combination with the arc-shaped covering-plate B, the flange thereon formed to fit in the recess in the base C and having the series of radiating openings or notches b formed therein.

410,093. HOOF-PAD. ARTHUR D. HAMLIN, Portland, Me., assignor of one-half to Dennis A. Meaher, same place. Filed Dec. 27, 1886. Serial No. 222,554. (No model.)

Claim.—1. A snow-ball plate or hoof pad consisting of an outer section of sheet metal having the contour of the interior of a horseshoe and adapted to fit in said interior and fill the entire space therein when in place, an inner and smaller section of sheet metal having an outer convex edge to fit against the adjacent edge of the shoe and pivoted near its front end upon the outer section, and a spring secured to one of the sections and forcing it outward on the other, substantially as specified.

2. The combination of the plate A, having the contour and adapted to fill the interior of a horseshoe and provided on one edge with the flange B, bent longitudinally upon itself at right angles, the plate C, pivoted upon the plate A near its front end and provided on its convex edge with the flange D, similar and opposite to the flange B, and the spring E, having its front end secured to the front end of the section C and its free rear end bearing on the flange B, substantially as specified.

3. A snow-ball plate or hoof-pad consisting of the flanged plate A, having the slot a' and filling the entire space within the shoe when in place, and the flanged plate C, having the spring E and the handle c^3, whereby the device can be attached and removed by hand, substantially as specified.

4. In a snow-ball plate or hoof-pad, an outer section of sheet metal having the contour of the interior of the horseshoe and adapted to fit snugly therein and cover or fill the space within and having a slot a' in its lower end, combined with and pivoted to an inner and smaller section of sheet metal having a handle or end c^3, and a spring secured to a smaller section, the handle c^3 extending through said slot, substantially as and for the purposes set forth.

5. A snow-ball plate or hoof-pad composed of two plates pivoted to and movable on each other and a spring whereby they can be held within the horseshoe, and a finger-piece projecting from one plate, whereby the plates or pad can be removed from the hoof without a tool, substantially as described.

6. A snow-ball plate or hoof-pad in which are combined the following elements, viz: a flanged plate wholly covering the inside of the hoof, a smaller plate pivoted to and movable under the first plate, also flanged, and a handle on its end whereby the pad can be adapted to or removed from the shoe.

7. A hoof-pad composed of two plates, each flanged at one side, pivoted together, and movable on each other, the one slotted at its end and the end of the other projecting through said slot, whereby not only are said plates held singly together against the entrance of snow or water, but a handle on which to move one of said plates on the other is afforded, substantially as described.

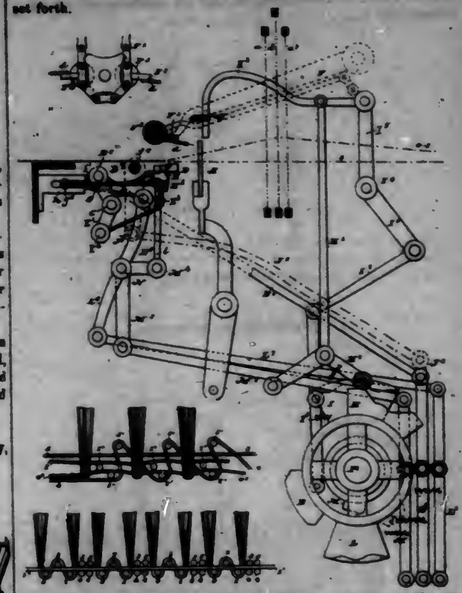
410,094. BUCKBOARD-VEHICLE. GEORGE B. HAMLIN, Providence, R. I. Filed Dec. 19, 1888. Serial No. 294,056. (No model.)

Claim.—1. In a buckboard-vehicle, a rear or additional seat mounted on supporting-bars secured to the body of the vehicle, in combination with springs secured at their ends respectively to the rear axle and the said bars, substantially as set forth.

2. In a buckboard-vehicle, the combination, with the seat-supporting bars detachably secured to the vehicle-body, of the springs, the upper ends whereof are fastened to said bars while the lower extremities are removably attached to the rear axle, substantially as shown and set forth.

3. The combination of the seat-supporting bars, seat-frame, check-plates and bolts whereby said bars are secured to said frame, staples secured to the rear axle, and springs having hooks formed at their lower extremities for connection with said staples and clipped at their upper ends to said bars, substantially as and for the purposes hereinbefore set forth.

4. In a buckboard, the combination, with the seat mounted on suitable supports detachably connected to the body of the buckboard, of independent springs secured to the hind axle and sustaining said seat, whereby any load on said seat is supported by the rear axle and not by the board, substantially as set forth.



410,095. MAIL-BAG DELIVERER. AUGUSTUS P. HAMM, New Albany, Ind. Filed Apr. 5, 1889. Serial No. 306,079. (No model.)

Claim.—In a mail-bag deliverer, the upright, the arm hinged near its inner end to the top thereof, the arm hinged below the top thereof, the similar-shaped hooks arranged one on each side of the lower arm, and the devices on the arms for retaining the bag, substantially as and for the purpose described.

410,096. LOOM FOR WEAVING TUFTED FABRICS. ANDRÉ C. H. SALLANDROUZE, Paris, France, assignor to Société Sallandrouze Frères, same place. Filed Apr. 12, 1888. Serial No. 270,496. (No model.) Patented in England Mar. 1, 1888, No. 3,175; in France Feb. 28, 1888, No. 189,000; in Belgium Feb. 23, 1888, No. 80,811; in Germany Mar. 3, 1888, No. 45,090; in Austria-Hungary June 5, 1888, No. 10,250 and No. 22,553; in Switzerland Nov. 30, 1888, No. 150, and in Italy Apr. 9, 1889, XXII, 22,344, and XLVI, 301.

Claim.—1. The combination, with the shedding mechanism, of the reed which separates the warp-threads into groups, the lateral displacers which displace the tuft strands laterally, mechanism, substantially as described, whereby said displacers are actuated, the lifters which lift the strands, mechanism, substantially as described, whereby said lifters are actuated, the strand-carriers, and the mechanism for actuating the same, all arranged to operate substantially as set forth.

2. The combination, with the shedding mechanism, of the reed A, having elbow-like beads in its dents, all turned in one direction for shifting the warp, substantially as set forth.

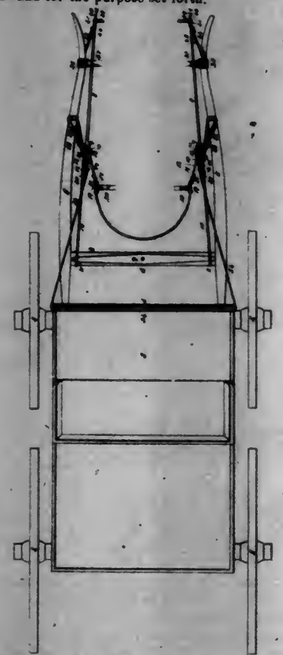
3. The combination, with the shedding mechanism, the reed A, having beads in its dents, as described, the strand carriers and lifters, and the operative mechanism of said carriers and lifters, of the lateral displacer D, consisting of a bar with blades, as described, and mechanism for operating said displacer, substantially as described.

4. The combination of the evener-bar G, adapted to play over the web and against the range of tufts, whereby the same are aligned, and mechanism, substantially as described, for operating said bar.

410,097. HORSE-DETACHER. CHARLES D. HILL, St. Louis, Mo., assignor of one-half to Silas Black, Monmouth, Ill. Filed Dec. 4, 1888. Serial No. 292,660. (No model.)

Claim.—1. In a detacher, the sectional tug, in combination with a hook pivoted to one section of the tug and adapted to open the downward, and a retaining-trigger, substantially as and for the purpose set forth.

2. In a detacher, the combination of the sectional tugs, the plates secured to the rear sections of said tugs, the pivoted hooks 14, and the sliding triggers that release said hooks, substantially as and for the purpose set forth.



3. In a detacher, the combination of the sectional tugs, the plates secured to the rear sections of said tugs, the hooks pivoted to said plates, and which engage with the forward sections of said tugs, and the holdback-hooks 16, secured to said plates, substantially as and for the purpose set forth.

4. In a detacher, the combination of the sectional tugs, the plates secured to the rear sections of the tugs, the pivoted hooks, the holdback-hooks, the straps that connect said holdback-hooks to the breeching, the sliding spring-trigger, the catch 29 on the end of said trigger, that engages the said pivoted hooks, and the actuating-cord, substantially as and for the purpose set forth.

5. In a detacher, the combination of the sectional tugs and their detaching devices, the plates that carry said devices, the loops 31, and the outer holdback-straps that engage with said loops and are secured to the shafts, substantially as and for the purpose set forth.

6. In a detacher, the combination of the sectional tugs, the plates that carry the detaching devices, and which are secured to the rear sections of the tugs, the pivoted hooks, the holdback-hooks, the sliding-triggers that release the tug-hooks, the actuating-cord that operates said triggers, and the sectional or separable holdback-straps, the inner ones of which connect from the holdback-hooks to the breeching, the outer ones that connect from the loops of the bearer-plates to the shafts, and the rounded hitch-loops 9 on the forward sections of the tugs, which loops engage with said pivoted hooks, substantially as and for the purpose set forth.

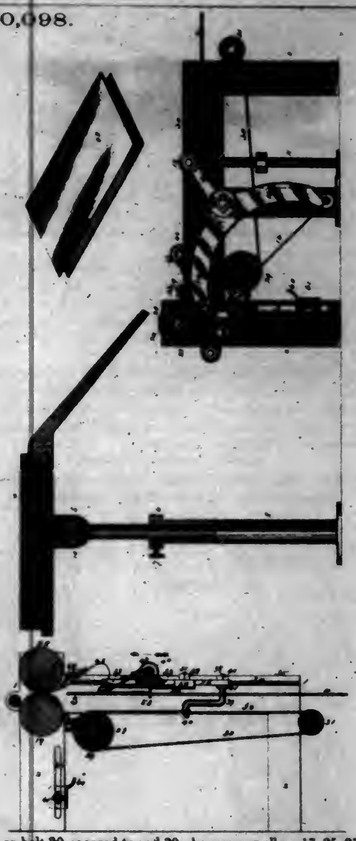
7. In a detacher, the combination of the loop 31 and hook 16; and the double holdback-straps 32 and 19, combined and operating substantially as and for the purpose set forth.

8. In a detacher, the combination of the sectional tugs and their detaching devices, the back-band having pendent loops that support the shafts, the neckband and breast-strap, the rings 41, that connect said neckband, breast-strap, and the fore sections of the tugs, and the releasing-straps 43, that connect the pendent loops that carry the shafts with said rings 41 and facilitate the disengagement from the shafts, substantially as and for the purpose set forth.

410,098. FOLDING-MACHINE. CHARLES F. HEITER, St. Louis, Mo. Filed Nov. 10, 1888. Serial No. 290,434. (No model.)

Claim.—1. The combination, in a folding-machine, of the table 3, the pressure-rollers, as 19 20, and a reciprocating push-plate, as 43, adapted to form an upward bend and a fold in the paper and push such fold between the rollers.

2. The combination, in a folding-machine, of a table adapted to receive the sheet to be folded, the feed-plate, the hinged push-plate 43, having reciprocating longitudinal and oscillating movements, and rollers 19 20, having reciprocating rotary motion, all adapted to operate substantially as set forth.



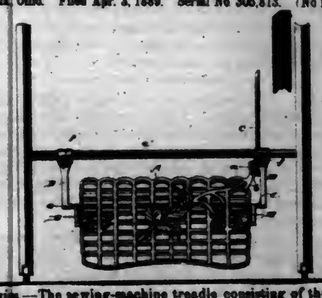
3. The combination, in a folding-machine, of the table 3, provided with slots 54, the reciprocating cross-head or slide 32, the push-plate 43, hinged to the cross-head, push-pins 53, connected to the cross-head and traversing the slots 54, and rollers 19 20, having rotary reciprocation, all adapted to operate substantially as set forth.

4. The combination, in a folding-machine, of the table 3, provided with slots 54, the reciprocating cross-head 32, plate 49, carrying push-pins 53 and adjustably attached to the cross-head, push-plate 43, hinged to the cross-head, and rollers 19 20, having rotary reciprocation, all adapted to operate substantially as set forth.

5. The combination, in a holding-machine, of the table 3, with slots 54, the cross-head carrying the hinged push-plate 43 and adjustable plate 49, with push-pins 53, traversing the slots 54, slotted extension 36 on the cross-head, and actuating-rod 39, passing through the slot 37 and adjustably secured to the extension 36, and the rollers 19 20, having rotary reciprocation, all substantially as set forth.

6. The combination, in a folding-machine, of the table 3, adapted to receive the sheet to be folded, the cross-head 32, having slotted extension 36, rod 39, passing through the slot 37 of the extension and through a slot 55 in the table and secured to the reciprocating cord or belt 30, and rollers 19 20, having rotary reciprocation, substantially as and for the purpose set forth.

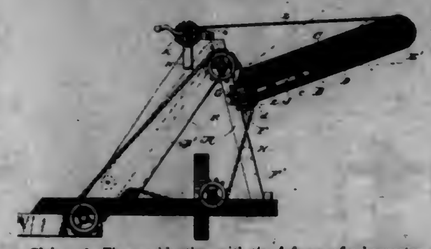
7. The combination of table 3, with slots 54 and 55, the cross-head 32, carrying hinged push-plates 43 and push-pins 53, the rod 39



cord or belt 30, secured to rod 39, sheaves or pulleys 17, 25, 27, 29, and 31, cords or belts 16 and 26, and lever 13 14 15, all connected and arranged to operate substantially as and for the purpose set forth.

8. The combination, in a folding-machine, of the table 3, cross-head 32, having longitudinal reciprocation over said table, hinged push-plate 43, secured to a rock-shaft 44, having bearing on the cross-head, arm 56 on the rock-shaft, and stop 57, secured to the table or frame, and reciprocating rollers 19 20, all adapted to operate substantially as set forth.

9. The combination, in a folding-machine, of the table 3, with slots 54, 55, cross-head 32, push-plate 43, plate 49, with push-pins 53, rod 39, adjustably connected to the cross-head, drive-roller 19, pressure-roller 20, shafts 18 and 28, sheaves or pulleys 17, 25, 27, 29, and 31, cords or belts 16, 26, and 30, and actuating-lever 13 14 15, attached to the end of the cord or belt 16 and to an actuating-rod 11, all connected and adapted to operate substantially as set forth.

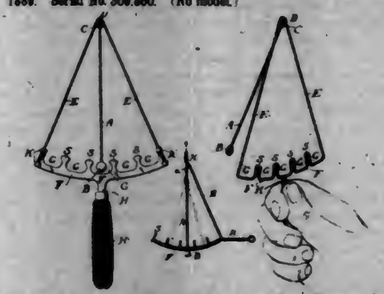


410,099. SEWING-MACHINE TREADLE. HIRAM K. HOUSE, Norwalk, Ohio. Filed Apr. 3, 1889. Serial No. 305,813. (No model.)

Claim.—The sewing-machine treadle consisting of the foot-plate having the outwardly-inclined arms and the hangers held upon the

crom-bar of the sewing-machine frame, and having inwardly-projecting lower ends which engage apertures in the upper or outer ends of said arms, said foot-plate having at one corner a fixed arm provided with a vertical leg, to which is connected the sewing-machine pitman, substantially as set forth.

410,100. HARVESTER ATTACHMENT. EDWARD HOUTS, Hunt, Dak., assignor of two-thirds to Solomon Elmer, Salesville, Ohio, and Archie Brown, Hunt, Dak. Filed June 19, 1888. Serial No. 277,562. (No model.)

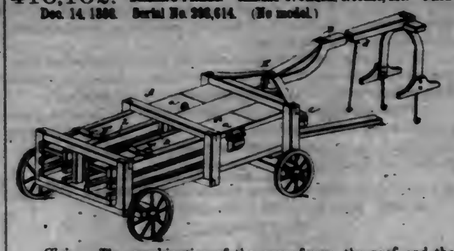


Claim.—1. The combination, with the A-frame of a harvester, of the header attachment consisting of the side-boards, the apron, the rollers E and E', mounted therein, the roller E having extended journals, the journal-boxes secured to the struts of the A-frame and having concave bearings on their outer faces, the plates secured to the side-boards of the attachment and having offsets engaging the concave bearings, and the suspending-cords, substantially as specified.

2. The combination, with the A-frame of a harvester, of the header attachment consisting of the side-boards, the apron D, its outer roller E' and inner roller E, having an extended threaded journal, the boxes F, having concavities on their outer faces, the sprocket-wheel adapted to be turned by the harvester-chain H and adjustable on said threaded journal, the adjusting-nut bearing against the inner face of said wheel, the plates having the offsets bearing in the concavities of the boxes, the windlass, the suspending-cords, the pawl, and the ratchet-wheel, substantially as specified.

3. The combination, with the A-frame of a harvester and gear-chain, of the journal-boxes secured to the struts of the A-frame and having the concavities *c* on their outer faces, and the header attachment consisting of the side-boards, the rollers E and E' and the apron D, the plates J, having the longitudinal slots and the rounded offsets to bear in the concavities *c*, and the set-bolts, substantially as specified.

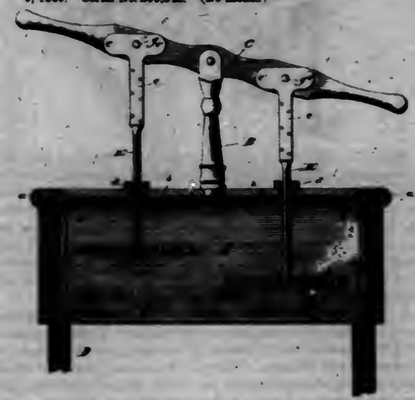
410,101. TOY. WOODBURY S. HOW, Philadelphia, Pa. Filed May 7, 1889. Serial No. 309,860. (No model.)



Claim.—1. In a toy, the combination of the following elements, viz: a controllably-movable support, a pendulum suspended therefrom and vibratile by means of said support, together with one or more stops or obstacles attached to said support to be optionally struck or passed by said pendulum, at the will of the operator, substantially as set forth.

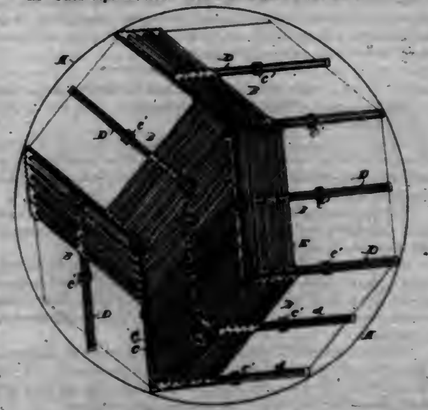
2. In combination, a pendulum and its controllably-movable support, with a bar extending from said support across one or other of the paths of said pendulum, provided along its length with suitable stops or loops 8, substantially as hereinbefore described and shown.

3. In combination, a pendulum and its movable support, with a pivoted stop on the support in the path of the pendulum, substantially as described and shown.



4. A pendulous body freely pendent from a support which may be optionally rocked, oscillated, or gyrated to impart a swinging or gyrated motion to said pendulous body, and so cause it either to pass or to hit, or to come to a rest in or upon or to gyrate around an obstacle attached to said support and intersecting a path of said pendulous body, substantially as hereinbefore described and shown.

410,102. BALING-PRESS. REUBEN P. JAGER, Hoosho, Mo. Filed Dec. 14, 1888. Serial No. 293,614. (No model.)

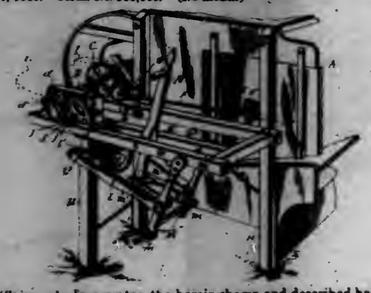


Claim.—The combination of the press-frame, the roof, and the spring passing transversely across the roof and having its ends secured to the frame, and its central portion depressed and secured to the roof, as set forth.

410,103. CHURN. PETER KALLER, Fort Wayne, Ind. Filed Feb. 9, 1889. Serial No. 299,342. (No model.)

Claim.—The combination of a churn-body provided with a perforated cover, a post erected on the cover, a vibrating lever C, pivoted upon this post and provided with longitudinal slots *f*, the wearing-plates *f'*, secured in these slots, the dasher-rods provided with dashers, the plates *e e*, secured upon opposite sides of the dasher-rods and projecting above the same, and embracing the slotted portions of the said lever C, these plates being provided with oppositely-projecting wings *e'*, adapted to cover the slots in the lever C, pins *g*, passing through the plates *e* and the slots in the lever C, and anti-friction rollers *h*, journaled upon the pins *g* and working in the said slots, as and for the purposes described.

410,104. GRATE FOR REFUSE-BURNERS. PHILIP KREBS, Moline, Ill. Filed Sept. 22, 1888. Serial No. 286,064. (No model.)



Claim.—1. In a refuse-burner for saw-mills, a grate composed of independently-movable bars arranged in groups, the bars in each group being at an angle to those in adjacent groups.

2. In a refuse-burner for saw-mills, a grate composed of independently-movable grate-bars arranged in groups, the bars forming a group being disposed in the same direction and each group being disposed at an angle to an adjacent group.

3. In a refuse-burner for saw-mills, the grate composed of independent grate-sections B B B B B B, each section formed by several independently-movable bars, and displayed as herein described.

4. The combination, in a refuse-burner for saw-mills, of the grate composed of several independent sections formed by groups of single grate-bars E, the grate-standards C, and the grate-supports D, all constructed and arranged as herein set forth.

410,105. MOTOR. HENRY KELLER, Sauk Centre, Minn. Filed Apr. 26, 1889. Serial No. 308,669. (No model.)

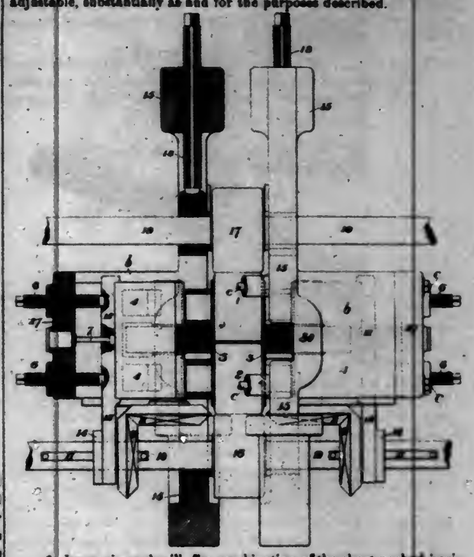
Claim.—1. In a motor, the herein shown and described hand and foot mechanism, composed of the treadle-bars M, adjustably connected at their upper ends with the frame and having treadles *m* at their lower ends, the pitmen connecting the treadle-bars with the cranks at the ends of the master-wheel shaft *i*, the hand-lever N, and the links *n*, connecting the said treadle-bars M with the hand-lever N, substantially as described, the pitmen and links being placed on opposite sides of the bars M and secured thereto by the same connection, substantially as shown.

2. In a motor of the hereinbefore-specified type to be operated by hand and foot, the combination, with the shafts D and *j*, the gear-wheel C, at the inner end of the shaft D, meshing with the pinion *b*, and the pinion *d* at the outer end of shaft D, meshing with gear-wheel J on the shaft *j*, of the shield K, the seat L, placed on the shield K to protect the gearing *d* and J, and having the lateral extension *l* to extend over and protect the gearing C and *b*, substantially as set forth.

3. In a motor, the herein-described means for connecting the same to the shoe of a fanning-mill, consisting of the bracket F, the elbow-lever F', the rod F^2, and the ⌐-shaped link *f*, adjustably connecting the lever F' with the bracket F, substantially as and for the purpose described.

4. The herein shown and described hand and foot power for fanning mills, comprising the shafts D and *j*, the gearing *d* and J, connecting the two shafts, the pinion *b*, operated by gear-wheel C on shaft D, the bracket F on the shoe E, the elbow-lever adjustably connected with the bracket F and driven from pinion *b* by rod F^2, the master-wheel I, having cranks *i'* on the ends of its shaft *i*, the treadle-bars M, adjustably connected with the frame and having treadles *m*, the pitmen *m'*, the hand-lever N, and the links *n*, the latter being placed against the bars M on the side opposite the pitmen and secured thereto by the same means, substantially as shown.

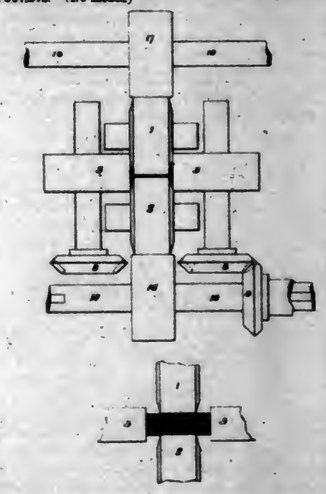
410,106. MILL FOR ROLLING FLANGED BEAMS. JULIAN KENNEDY, Latrobe, and HENRY AIKEN, Homestead, Pa. Filed Nov. 19, 1888. Serial No. 291,210. (No model.)



Claim.—1. In a universal mill, the combination, with side rolls, of horizontal rolls, one at least of which is frictionally driven, and an outer roll which drives and supports said horizontal roll, substantially as and for the purposes described.

2. In a universal mill, the combination, with side rolls, of horizontal rolls and outer rolls, which drive and support the horizontal rolls, substantially as and for the purposes described.

3. In a universal mill, the combination, with side rolls, of horizontal rolls and driving-rolls arranged on the outside of the horizontal rolls, the axes of the horizontal rolls and their driving-rolls being in substantially the same plane, substantially as and for the purposes described.

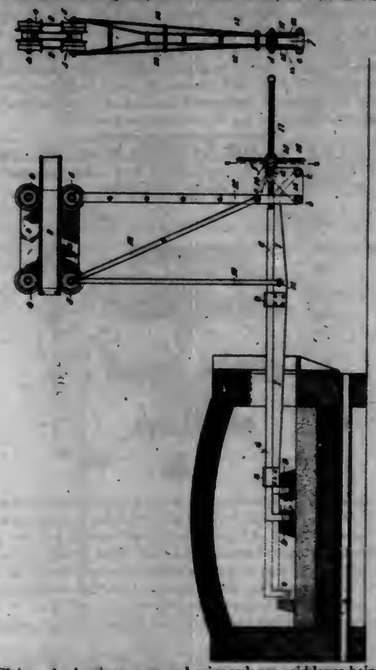


4. In a universal mill, the combination of the side rolls, horizontal rolls, outer rolls, which drive and support the horizontal rolls, the driving-shaft of the outer roll, and gearing connecting the side rolls therewith, substantially as and for the purposes described.

5. In a universal mill, the combination of horizontal rolls, one at least of which is frictionally driven, an outer roll which drives and supports said horizontal roll, side rolls and their carriers, positive driving-gear for the side rolls, and independent adjusting mechanism bearing on the carriers of the side rolls, by which they are laterally adjustable, substantially as and for the purposes described.

6. In a universal mill, the combination of the short-necked horizontal rolls, the outer rolls, which drive and support the same, and positively-driven side rolls, the axes of all said rolls being in substantially the same plane, substantially as and for the purposes described.

410,107. ART OF ROLLING FLANGED BEAMS. JULIAN KENNEDY, Latrobe, and HENRY AIKEN, Homestead, Pa. Filed Apr. 15, 1889. Serial No. 307,272. (No model.)



Claim.—1. An improvement in the art of rolling flanged beams, which consists in forming such beams by reduction of metal blooms, and rolling such beams (at different passes between rolls) on the sides of the flanges and on the edges of the flanges for the purpose of finishing the same, substantially as and for the purposes described.

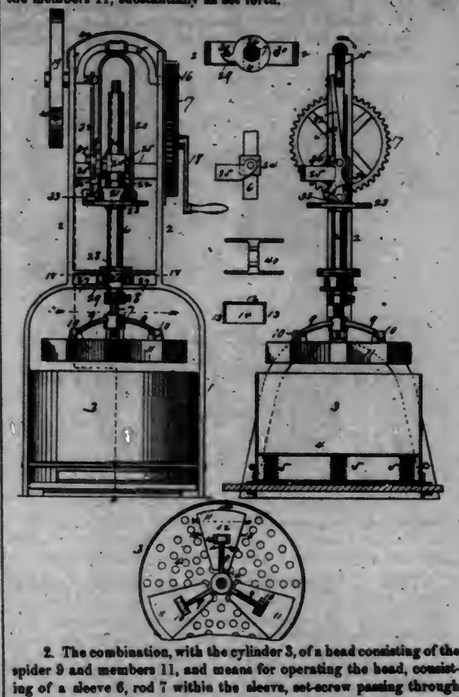
2. An improvement in the art of rolling flanged beams, which consists in forming such beams by reduction of metal blooms, and rolling such beams (at different passes between rolls) on the web and the sides of the flanges and on the edges of the flanges for the purpose of finishing the same, substantially as and for the purposes described.

3. In the art of rolling flanged beams, wherein such beams are finished by means of rolls whose partings produce a fin on the outer sides of the flanges, the improvement which consists in producing, prior to such finishing, grooves or depressions on said flanges on lines coincident with the lines of said fins, substantially as and for the purposes described.

410,108. MILL APPLIANCE. JULIAN KENNEDY and SAMUEL FOSTER, Latrobe, Pa. Filed Apr. 16, 1889. Serial No. 307,403. (No model.)

Claim.—1. A gripper-arm and gripper-lever, said lever being pivotally connected with and suspended from the supporting-frame by which the gripping device is raised and lowered, and a lever having pivotal connections—namely, with the gripper-arm and gripper-lever and with the supporting-frame—so that the motion of the gripper-lever on its fulcrum shall cause a relative motion of the gripper-arm and gripper-lever, substantially as and for the purposes described.

2. The combination of the gripper-lever 7 and longitudinally-movable gripper-arm 6, with 5 screw-extension from the outer end of the arm 6, and a nut and lever or wheel working thereon, the lever 7 being connected with a collar on such nut for the purpose of adjusting the bite of the gripping devices, substantially as and for the purposes described.



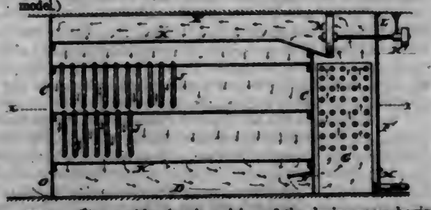
3. In a gripping device for handling heavy articles—such as ingots—the combination, with a gripper-lever 7, pivoted to the suspending-frame 10 12, of a gripper-arm 6, operating with such gripper-lever 7 to engage the article to be lifted, a lever 13, connected at or near the outer end of the gripper lever and arm by pivotal connections, one with the gripper lever 7, another with the suspending-frame 12, and a third with a collar 14 on a rotary sleeve-nut 15, working on a screw 17 at the outer end of the gripper-arm 6, arranged and operating substantially as and for the purposes set forth.

4. The combination, with gripping-jaws, of a projecting lever or frame which carries the same, said lever or frame being movable independently of its support, and being mechanically connected with said gripping-jaws, whereby elevation of the lever or frame with its burden will through gravity effect a gripping action of the jaws, substantially as described.

5. A gripping device capable of projection under the roof of a furnace, connected with the suspending-frame by a lever or combination of levers, or their equivalent, in such manner that the raising of the suspending-frame will cause the gripping device to grasp a heavy article—such as an ingot, slab, or bloom—with a force proportional to the weight of said article, and the lowering of the suspending-frame and the resting of the article on a support will release the gripping device, substantially as and for the purposes described.

410,109. WASHING-MACHINE. JAMES P. KIMBLEY, Adrian, Mo. Filed Oct. 5, 1888. Serial No. 287,315. (No model.)

Claim.—1. The combination of the cylinder 3, having an open top and a head for entering the cylinder, and means for operating the head, said head consisting of a spider 9, members 11, having lugs and pivots passing through the lugs and the ends of the spider close up to the members 11, substantially as set forth.

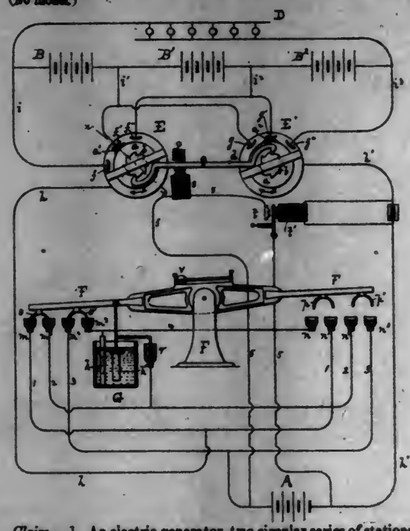


2. The combination, with the cylinder 3, of a head consisting of the spider 9 and members 11, and means for operating the head, consisting of a sleeve 6, rod 7 within the sleeve, set-screw passing through the sleeve and adjustably retaining the rod 7, suitable gearing, and connection between the gearing and the sleeve, substantially as set forth.

3. The combination of a cylinder 3, a head for entering the cylinder, a rod carrying said head, ratchet-wheel 23, collar 21 above the latter surrounding and rotatable on said rod, but reciprocating therewith, pawl 33, lever 32, crank-shaft 15, having axial projection 35, a yoke pivoted to the crank-shaft and said collar for reciprocating the rod, collar, and ratchet-wheel together, and mechanism for rotating the crank-shaft, substantially as set forth.

4. The combination of the cylinder 3, a head for entering the cylinder, rod 7, sleeve 6, cross-strip 27, collar 26, having a hook or horn 29, collar 24, and cross-strip 25, all substantially as and for the purpose set forth.

5. The combination of the cylinder 3, a head for entering the cylinder, a reciprocating rod carrying said head, a bottom guide-piece, said rod being removable therefrom, and an upper pivoted collar or guide-piece, through which the upper end of the rod projects, substantially as and for the purposes set forth.



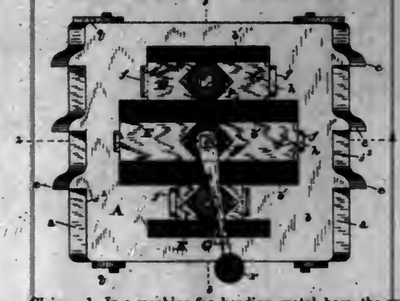
410,110. DRYING-MACHINE. JOHN H. KNOWLES and JOSIAH K. PROCTOR, Philadelphia, Pa., assignors to the Philadelphia Textile Machine Company, same place. Filed Nov. 17, 1888. Serial No. 291,151. (No model.)

Claim.—The combination, in a drier, of the drying-room having diametrically-opposite sides formed with perforated barriers, a blower, a heater, passage ways connecting the parts of the drying-room exterior to the two barriers respectively with the heater and with the blower, a short connecting-passage between the heater and the blower, valves to control the discharge from the drying-room to the atmos-

phere exterior to the apparatus and to the heater, and a valve to admit air to the suction side of the blower without passing through the drying-room.

410,111. APPARATUS FOR CHARGING SECONDARY BATTERIES. WILLIAM P. KOCHGEY, Brooklyn, assignor to the Kochgey Electric Company, New York, N. Y. Filed Jan. 28, 1889. Serial No. 297,204. (No model.)

Claim.—1. An electric generator, two circular series of stationary contacts in which two corresponding contacts (one in each series) constitute the two ends, respectively, of a corresponding number of different circuits, two disks bearing the terminals of the generator and being continuously actuated to revolve, and thus make successive connection between the generator and the successive circuits, ratchets attached to such disks with notches corresponding in number to the number of separate circuits, and a double pawl connecting with such ratchets and when released allowing the two disks to carry the terminals of the generator from one circuit to the succeeding one, substantially as and for the purpose described.



2. In combination with an electric generator and main circuit, two synchronously-moving conductors or contact-points constituting the terminals of the generator, and two series of stationary contacts constituting the respective ends of a series of different circuits, the combination of a local circuit which, when energized, causes the conductors to move, a magnet in the main circuit holding the local circuit open, a depositing-cell in the main circuit, having one plate movable and attached to one end of a balance-beam, circuit closers and breakers on each arm of the balance so arranged than when the balance changes the main circuit is broken for a moment, and circuit-connections between the circuit closers and breakers, by which at each change of the balance the course of the current through the depositing-cell is reversed, substantially as and for the purpose described.

3. The combination of an electric generator and main circuit containing a magnet, a local circuit containing another magnet and also containing a circuit-breaker, which is held open by the magnet in the main circuit when the main circuit is complete, an electro-depositing cell having one plate movable and attached to one arm of a balance-beam, a series of circuit breakers and closers in the main circuit upon each arm of the balance, the circuit being broken for a moment whenever the balance changes, circuit-connections by which the main current is led through the depositing-cell in opposite directions, according to the position of the balance, and a rolling ball upon the top of the balance retaining the balance in each alternate position for a given period, substantially as and for the purpose described.

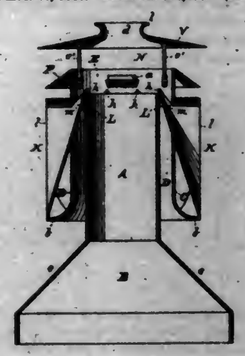
4. The combination of an electric generator, a storage-battery connected with a working-line, such storage-battery being also divided into sections, two synchronously-moving conductors or contact-points, constituting the terminals of the generator, and two series of stationary contacts arranged adjacent to the moving conductors, in which the two corresponding contacts in the two series constitute the two ends, respectively, of a circuit including one section of the storage-battery, substantially as and for the purpose described.

5. The combination of an electric generator, a storage-battery connected with a working-line, such storage-battery being also divided into sections, two synchronously-moving conductors or contact-points, constituting the terminals of the generator, two series of stationary contacts arranged adjacent to the two conductors, in which the two corresponding contacts in the two series constitute the two ends, respectively, of a circuit including one of the sections of the storage-battery, a local circuit which, when energized, causes the conductors to move, a magnet in the main circuit holding the local circuit open, a depositing-cell in the main circuit having one plate movable and attached to one end of a balance-beam, circuit-closers and breakers on each arm of the balance, so arranged that when the balance changes the main circuit is broken for a moment, and circuit-connections between the circuit closers and breakers, by which at each change of the balance the course of the current through the depositing-cell is reversed, substantially as and for the purpose described.

410,112. MACHINE FOR BENDING METAL BARS. THEODORE F. KRUG, Baltimore, Md., assignor to G. Krug & Son, same place. Filed Apr. 3, 1889. Serial No. 305,851. (No model.)

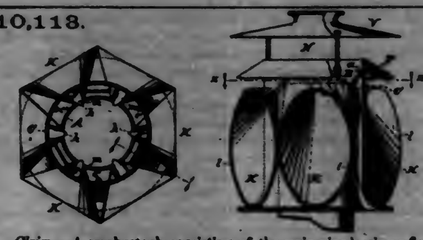
Claim.—1. In a machine for bending metal bars, the combination of a block A, provided with a grooved slideway, a grip-jaw movable in said slideway and having a hole or recess *n*, a block loosely occupying said hole or recess, and a shaft fitted to turn in the main block and having an eccentric end which turns in the said loose block.

2. In a machine for bending metal bars, the combination of a block A, provided with a grooved slideway and having on its side a cross-ledge *c*, a grip-jaw movable in said slideway, and an eccentric to move said grip-jaw.



3. In a machine for bending metal bars, the combination of a block A, provided with a grooved slideway having stop ends *f*, which are solid or integral with the block and form one side of a grip, a jaw movable in said slideway and constituting the other side of the grip, an eccentric whose shaft has a bearing in said block and moves the sliding grip-jaw, a crank-arm to turn the eccentric-shaft, and a weight *r* to hold the shaft in position, as set forth.

4. In a machine for bending metal bars, the combination of a block A, provided with a grooved slideway and having at the corner a hook *g*, which projects above the top, and having on its side a cross-ledge *c*, a grip-jaw movable in said slideway, and an eccentric to move said grip-jaw.

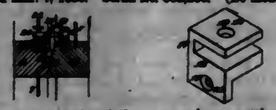


5. In a machine for bending metal bars, the combination of a block A, provided with a slide-jaw, each end of which forms one side of a grip, a base, and a pivot connecting the block and base.

6. In a machine for bending metal bars, the combination of a block A, provided with two opposite beveled or inclined sides, and a slide-jaw, each end of which forms one side of a grip.

410,113. VENTILATOR-SMOKESTACK. OSCAR R. KUEHNE, Topeka, Kans. Filed Mar. 26, 1889. Serial No. 304,763. (No model.)

410,113.



Claim.—A smokestack consisting of the main pipe having a flaring base, and an outer parallel cylinder having top and bottom flanges and forming an annular passage around said main pipe, and an enlarged chamber E above it, ellipsoidal-formed mouths connected to said chamber, the inclined tongues of the cylinder below its upper flange bent inward to form openings, and the cap supported above the cylinder and having a central opening provided with a curved guard-flange, substantially as specified.

410,114. FOLDING UMBRELLA. ELIJAH J. PERSON, Dayton, Ohio. Filed Feb. 9, 1889. Serial No. 299,949. (No model.)

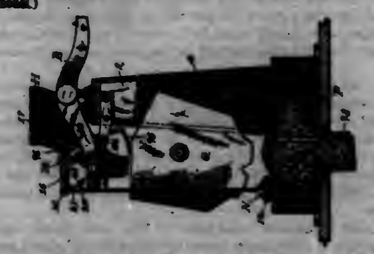
Claim.—The combination, with a jointed stick provided with a stationary collar B, the jointed ribs having their inner sections pivoted to this collar, a runner G, pivotally connected by the braces E to the outer sliding sections of the ribs, of the sliding collar H, located upon the umbrella-stick between the collar B and the runner G, and the sub-braces pivotally connecting the said sliding collar H to the outer ends of the braces E, substantially as herein described.

410,115. FASTENER FOR THE MEETING-RAILS OF SASHES. HUGH RIXEY, St. Louis, Mo., assignor of one-half to Isidore Simon, same place. Filed Mar. 7, 1889. Serial No. 302,966. (No model.)

Claim.—In a combined sash-fastener and anti-rattler, the combination of the metal bracket 15, having a downturned flange 27, secured to the meeting bar of the upper sash, said bracket being also provided with an overlapping plate 16, the pivoted link-bar 20, the pivot-screw 18, on which the link 20 turns, the locking-screw carried by said link-bar, the locking-plate 24, secured to the meeting bar of the lower sash, the screw 26, passing through plate 24 and having a buffer-head to limit the swing of the link-bar and locking-screw it carries, and the surmounting flange 26 of the locking-plate, around the outside of which the locking-screw traverses, substantially as set forth.

410,116. REGULATOR FOR GRAIN-SCALES. FRANCIS H. RICHARDS, Hartford, Conn., assignor to The Pratt & Whitney Company, same place. Filed Nov. 9, 1888. Serial No. 290,202. (No model.)

Claim.—1. In a regulator for grain-scales, the combination of the regulator-hopper vertically movable, substantially as described, the fixed receiving-conduit below said hopper, and the guard-pipe depending from said hopper and having a motion in said conduit toward and from one side thereof, whereby the outlet from said hopper is reduced on the downward movement thereof, all substantially as described.

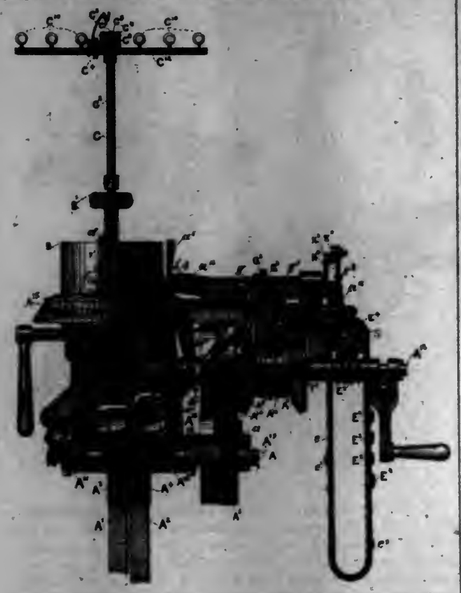


2. In a regulator for grain-scales, the combination of the oscillating hopper pivoted near one side thereof, the fixed receiving-conduit below said hopper, and the curved guard-pipe depending from said hopper concentrically to the pivot thereof and arranged to move toward and from one side of said conduit, whereby the outlet from the hopper is reduced on the downward movement thereof, all substantially as described.

3. In a regulator apparatus, the combination, with the regulator-valve, of the regulator-hopper connected to actuate said valve and vertically movable and counterbalanced, substantially as described, the fixed receiving-conduit below said hopper, and the guard-pipe depending from said hopper and having a motion in said conduit toward and from one side thereof, whereby the outlet from said hopper is reduced on the downward and increased on the upward movement thereof, and whereby the opening of the closed valve when once begun is fully completed, all substantially as described.

4. In a regulator apparatus, the combination of the pivotally-supported regulator-hopper P, having the discharge-opening N, the conduit 93 below said opening, and having the tunnel 50, and the curved guard-pipe 94, surrounding said opening and depending into the tunnel of said conduit, substantially as shown and described.

410,117. REGULATOR FOR GRAIN-SCALES. FRANCIS H. RICHARDS, Hartford, Conn. Filed Jan. 17, 1889. Serial No. 296,676. (No model.)



Claim.—1. In a regulator for grain-scales, the combination, with the regulator-valve and with the reciprocating beam, of a grain-receiving hopper, a plunger located in said hopper and operatively connected with said valve, catches, substantially as described, on said connections, and a pawl carried by said beam and constructed to engage said catches, all substantially as described.

2. In a regulator for grain-scales, the combination, with the regulator-valve, of the plunger N, connections, substantially as described, connecting said valve and plunger and having catches substantially as described, the stop limiting the backward motion of said valve, and the arm 20, carrying pawl 40, substantially as described.

3. In a regulator for grain-scales, the combination, with the plunger, the valve, and connections, substantially as described, of the catches 30 and 31, the arm carrying the pawl engaging with said catches, and a stop disengaging said pawl on the upstroke of the arm, all substantially as described.

410,118. CIRCULAR-KNITTING MACHINE. HARRY C. RICHARDS, Philadelphia, Pa., assignor of one-half to Thomas A. Pearce, same place. Filed Dec. 1, 1888. Serial No. 292,413. (No model.)

Brief.—The invention relates to devices for controlling the successive movements of the machine in the formation of the heel and toe, to devices for controlling an extra thread, and to devices for stopping the machine, and to various details of construction.

Claim.—1. The combination of the bolt-shifter for the reverse motion, the pattern-chain, the lever actuated thereby, and mechanism, substantially as set forth, whereby the movement of said lever actuates the bolt-shifter, as and for the purposes set forth.

2. The combination, with the needle-cylinder, and the needle raising and lowering cam M, arranged therein, of the stem M^3, the exterior cam-piece M^2, mounted thereon, the bolts F F', the pattern-chain, and mechanism, substantially as set forth, whereby said bolts are by the action of the pattern-chain alternately protruded into and withdrawn from the range of said cam-piece M^2 as the same moves with the cylinder.

3. The combination, with the double-headed needles, of the raising and lowering cams M M', the link *m'*, connecting the same, and mechanism, substantially as set forth, whereby said cams are actuated at proper intervals with reference to the movements of the cam-cylinder.

4. The combination, with the spring-actuated lifting-pawls whose stems extend outwardly through the cam-cylinder, of a vertically-movable shifting device connected with the said stems, a cam-piece P', mounted on said shifting device, the bolts *w w'*, the pattern-chain, and mechanism, substantially as set forth, whereby said bolts are by the action of said pattern-chain alternately protruded into and withdrawn from the range of rotation of said cam-piece, substantially as set forth.

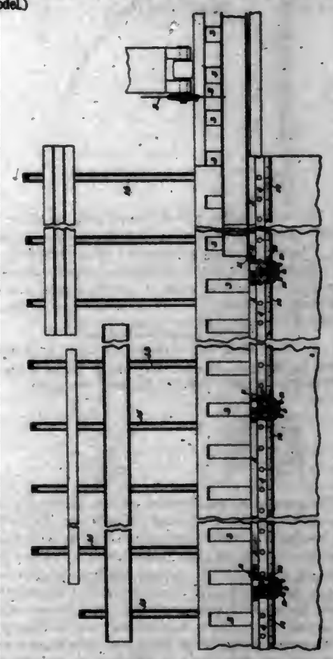
5. The lifting-pawl constructed in two parts, hinged together upon an axis at right angles to the axis of oscillation of said pawl.

6. The combination of the lowering-pawl, the hinged spring-actuated standard carrying said pawl, the wedge bearing against said standard, the cam-piece P', connected with said wedge, the bolts *w w'*, the pattern-chain, and mechanism, substantially as set forth, whereby said bolts are by the action of the pattern-chain alternately protruded into and withdrawn from the range of rotation of said cam-piece.

7. The combination, with the needle-raising cams, and with the cam-shifter for the reverse motion, of a pattern-chain, a lever actuated thereby, a rock-shaft actuated by said lever, and mechanism, substantially as set forth, whereby the raising-cams and the cam-shifter of the reversing mechanism are coincidently actuated from the same movement of the lever, substantially as set forth.

8. The combination, with the vertically-movable piece P^2, of the segment P, the hinged arms P^3 P^4, and the lifting-pawls and their stems, the wedge D^2, the spring-actuated standard D, for the lowering-pawl, and mechanism, substantially as set forth, for shifting said piece P^2 vertically, whereby, when the lifting-pawls are thrown into play, the depressing-pawls are thrown out of play by the same movement, and vice versa.

9. The combination of the thread-breaking mechanism, substantially as set forth, the reversing mechanism, substantially as set forth, and the needle-elevating cams, substantially as set forth, with a single pattern-chain, whereby said several groups are simultaneously actuated, as and for the purposes specified.



10. The combination of the tripping-rod C^{12}, the bell-crank actuated thereby, the lever C^9, the rollers C^7 C^8, the former of which is mounted upon said lever C^9, the tube C^6, and mechanism, substantially as set forth, whereby said tripping-rod is shifted at proper intervals with relation to the movements of the knitting mechanism.

11. The combination, with a thread-controlling device adapted to break the thread by nipping it, and with the rotating thread-eye, of a stationary tube interposed between said breaking mechanism and the thread-eye, whereby the broken end of the thread will be held in position for re-engagement at the proper time.

12. The combination of the spring-actuated belt-shifter, the curved link connected therewith, the shaft a^9 and lever-arm thereon connected with said link, the tripping-rod a^8, the lever a^{12}, and the pattern-chain provided with projections adapted to trip said lever, substantially as set forth.

13. The combination, with the belt-shifting mechanism, substantially as set forth, and with the pattern-chain and lever actuated thereby, of the notched tripping-rod adapted to engage with said lever, the spring bearing against one side thereof, the stud mounted on said lever, and the spring-actuated dog having an incline upon one side which engages with said stud, substantially as set forth.

410,119. APPARATUS FOR HOT-SAWING BEAMS. CHARLES M. SCHWAB, Homestead, Pa. Filed Mar. 13, 1889. Serial No. 303,144. (No model.)

Claim.—1. The combination, with the rotary cutter, of a table for supporting the beam while being cut, and adjustable stops by which the lengths to be cut may be fixed on the table preparatory to placing the beam thereon, substantially as and for the purposes described.

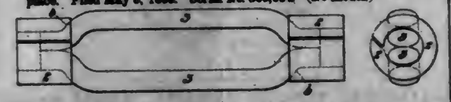
2. The combination, with the rotary cutter, of a table for supporting the beam while being cut, adjustable stops by which the lengths to be cut may be fixed on the table preparatory to placing the beam thereon, and driven feed-rollers by which the beam is moved, substantially as and for the purposes described.

3. The combination of a beam-supporting table, a rack, a stop-carriage mounted on the rack, and a pinion on the carriage engaging the rack, substantially as and for the purposes described.

4. The combination of a beam-supporting table, longitudinally-movable carriages, and stops situate on the carriages and movable into or out of the path of the beam on the table, substantially as and for the purposes described.

5. The combination of the rack, the carriage mounted thereon, the pinion, and the pivoted stop, substantially as and for the purposes described.

6. The combination of a beam-supporting table, a longitudinally-movable carriage, a stop situate on the carriage and movable into or out of the path of the beam on the table, and locks for the carriage, substantially as and for the purposes described.



7. The combination with a table for supporting hot beams, of a wooden scale extending beside the same, substantially as and for the purposes described.

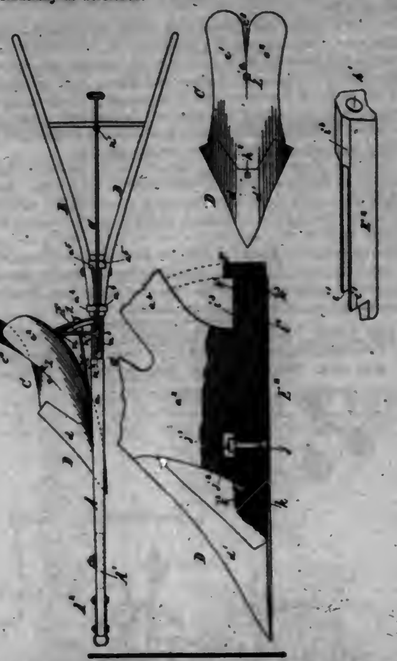
8. The combination, with the rotary cutter, of a table for supporting the beam while being cut, adjustable stops, and an index connected with and set in advance of the stop for the purpose of compensating for the contraction of the beam, substantially as and for the purposes described.

9. In a plant for continuously working a bloom or billet into two or more rails or bars of predetermined lengths the equivalent of or corresponding to the size of the bloom or billet, the combination, with the rolls, of a receiving-table for receiving the hot rail or bar from the rolls, an interposed rotary cutter for cutting the hot rail or bar into lengths as it comes from the roll, and stops which are longitudinally adjustable on the table to and from the rotary cutter and rolls, substantially as and for the purposes described.

10. In a plant for continuously working a bloom or billet into two or more rails or bars of predetermined length equivalent of or corresponding to the size of the bloom or billet, the combination, with the rolls, of a receiving-table for receiving the hot rail or bar from the rolls, an interposed rotary cutter for cutting the hot rail or bar into lengths as it comes from the roll, and stops which are longitudinally adjustable on the table to and from the rotary cutter and rolls, the leading one of said stops, or that nearest the saw, adapted to be moved into and out of the path of the advancing beam, substantially as and for the purposes described.

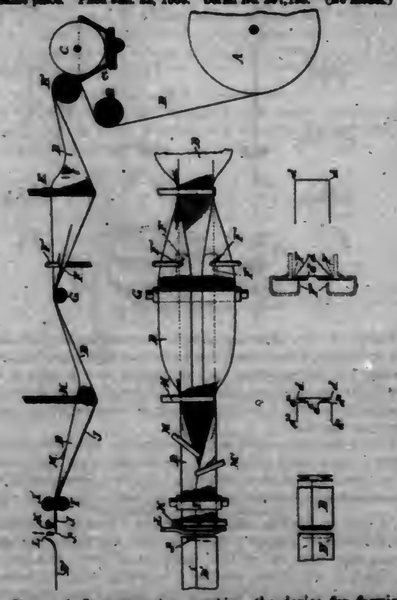
410,120. ART OF MAKING TURN-BUCKLES. JAMES H. SIMPSON, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed May 6, 1889. Serial No. 309,654. (No model.)

Claim.—An improvement in the manufacture of turn-buckles, which consists in forming a blank having side pieces and end pieces, confining the blank in a die the cavity of which is closed laterally, and subjecting the blank to end compression, whereby the material of the side pieces and end pieces of the blank is upset or compressed and is caused to fill accurately the cavity of the die, substantially as and for the purposes described.



410,121. PLOW. WILLIAM HENRY SMITH and HIRAM SMITH, Dickson, Pa.; said Hiram Smith assignor to said William Henry Smith. Filed May 20, 1889. Serial No. 312,499. (No model.)

Claim.—1. In a reversible or duplex mold-board plow, the combination of the angular locking-rod G, provided with a longitudinal bolt *n*, and arranged both to slide and turn in its guiding-eyes, with a share or point, and a reversible angular mold-board having a supporting-bracket provided with longitudinal bolting-holes and connected to the standard portion of the plow by a longitudinal pivotal connection, substantially as and for the purpose described.

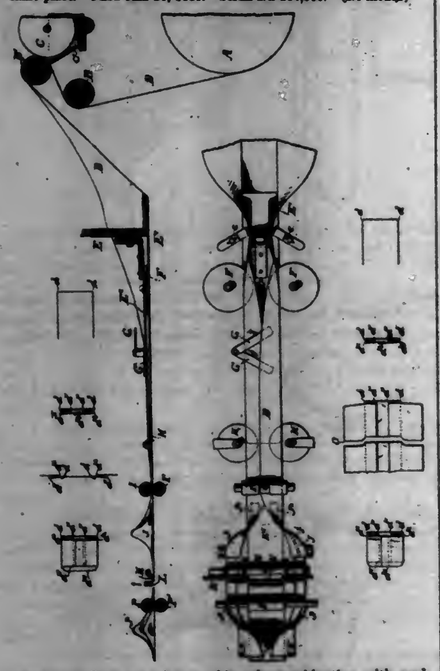


2. A reversible duplex mold-board plow comprising, in combination, the following parts, to wit: the united beam, standard, and handle-supporting bracket-arm, the beam being curved, as at *a*, and the standard provided with beveled shoulders i^2, pivot *k*, and tongue or dowel i^3, the sole-bar E^3, having a tongue or dowel-socket i^3 and a pivot-socket *k'*, the uniting-bolt *j*, the pivot or share D, having a horizontal sole-surface, a vertical landside-surface, an inwardly-curved oblique surface, and a pivot-socket k^2, the supporting-bracket F matching on its upper end the under transverse shape of the duplex mold-board and having pivot k^2, the screw connecting-rod H, and the duplex mold-board C, formed for about one-third its length with a broad united body-surface extending from side to side and rearwardly of said portion formed with an inclined concaved parting-ridge *c*, the angle of which ridge gradually becomes more acute, and with symmetrical mold-board wings $c' c^2$, the helical curved surfaces of which are separated completely by said ridge along the remaining length of the mold-board, and the locking-bolt, substantially as and for the purpose described.

3. In a reversible duplex mold-board plow, the combination of the mold-board having holes *k'* extending entirely through it, the share having a tongue *k* cast upon it and entering through said hole and bearing against the under side of the mold-board, and the uniting screw-bolt k^2, passed through the share and mold-board, substantially as described.

4. In a reversible duplex mold-board plow, the united curved beam and standard cast with a handle-supporting bracket-arm a^2, on which are cast the staying stop-lugs a^3, and the divided clasping-lugs a^4, substantially as described.

410,122. PAPER-BAG MACHINERY. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Jan. 22, 1889. Serial No. 297,196. (No model.)



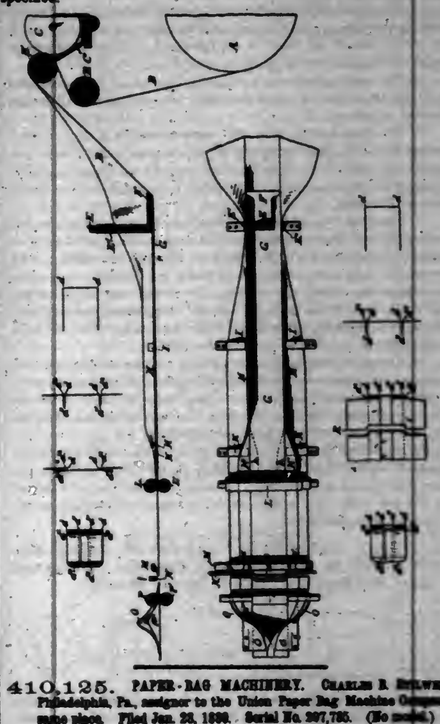
Claim.—1. In a paper-bag machine, the device for forming a bellows-folded tube, which consists in a folder-plate E, for forming the folds which define the under side of the tube, in combination with folder-plates F F, for forming the bellows fold, a former-plate H, for forming the folds of the upper side of the tube, a plate J, arranged to

enter the tube after it leaves former-plate H and having a knife-edge J', deflectors for turning down the edges of the paper to complete the formation of the tube, a knife K, arranged above and back of knife-edge J', and a striker L, all arranged substantially as and for the purpose specified.

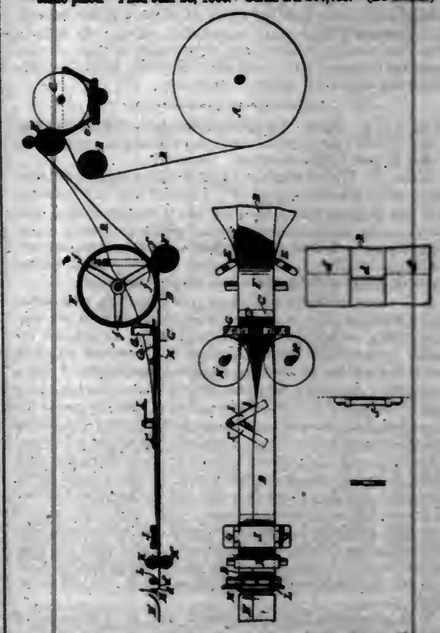
2. In a paper-bag machine, the device for forming a bellows-folded tube, which consists in a folder-plate E, for forming the folds which define the under side of the tube, in combination with folder-plates F F, for forming the bellows fold, fingers F' F', acting to turn out the edges of the paper web, a former-plate H, for forming the folds of the upper side of the tube, and deflectors for turning down the edges of the paper to complete the formation of the tube, all arranged substantially as and for the purpose specified.

3. In a paper-bag machine, the device for forming a bellows-folded tube, which consists in a folder-plate E, for forming the folds which define the under side of the tube, in combination with folder-plates F F, for forming the bellows fold, fingers F' F', acting to turn out the edges of the paper web, a roll G, for flattening the web as folded by the plates E and F F, a former-plate H, for forming the folds of the upper side of the tube, and deflectors for turning down the edges of the paper to complete the formation of the tube, all arranged substantially as and for the purpose specified.

410,123. PAPER-BAG MACHINERY. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Jan. 26, 1889. Serial No. 297,599. (No model.)



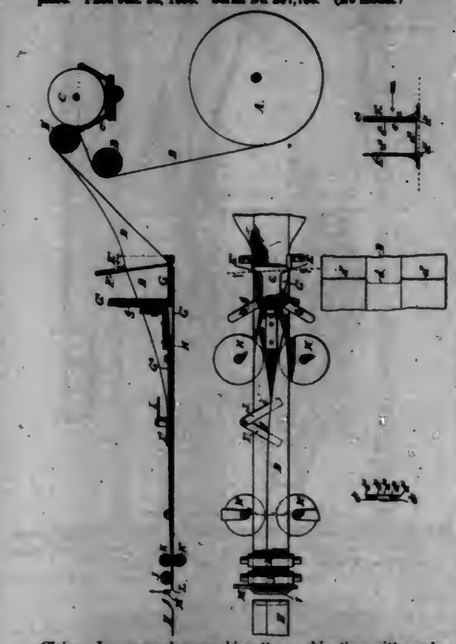
Claim.—1. In a paper-bag machine, the combination, with mechanism for forming a web of paper into a bellows-folded tube, of curved spreaders J J, for spreading open the folded tube, a knife K, and striker L, for severing the opened tube, and curved closing-plates J' J', for refolding the opened end of the blank, all substantially as and for the purpose specified.



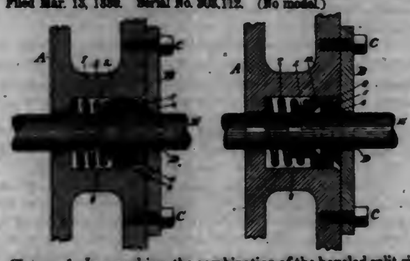
2. In a paper-bag machine, the combination, with mechanism for forming a web of paper into a bellows-folded tube, of curved spreaders J J, for spreading open the folded tube, and a rib *j*, formed on the side of the spreader J, against which the pasted edge of the paper rests.

410,124. PAPER-BAG MACHINERY. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Jan. 26, 1889. Serial No. 297,600. (No model.)

Claim.—In a paper-bag machine, a device for forming a bellows-folded tube and severing it into bag-blanks, having a former G, around which the web is folded on the lines which define the under side of the tube, folder-plates H H, with curved ends H' H', fingers I I and K K, coacting with the folder-plates H H to form the bellows fold and spread the folded web flat, a knife M and striker N, to sever the folded and flattened web into blanks, and curved plates O O, arranged to fold the flattened web into a tube, all substantially as and for the purpose specified.



410,125. PAPER-BAG MACHINERY. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Jan. 28, 1889. Serial No. 297,785. (No model.)

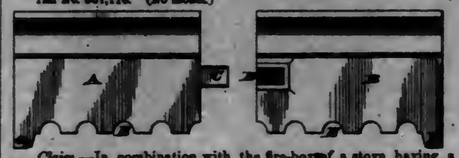


Claim.—In a paper-bag machine, the combination, with mechanism for folding a web of paper into a bellows-folded tube, of a cutter F F', arranged at the end of the folding mechanism to which the web passes, so as to cut the web centrally in the form of a lip *d*, and a knife L and striker M at the other end of the folding mechanism, arranged to sever the folded tube on the line *d' d'*, all substantially as and for the purpose specified.

410,126. PAPER-BAG MACHINE. CHARLES B. STILWELL, Philadelphia, Pa., assignor to the Union Paper Bag Machine Company, same place. Filed Jan. 26, 1889. Serial No. 297,796. (No model.)

Claim.—In a paper-bag machine, the combination, with mechanism for folding a web of paper into a bellows-sided tube, of mechanism consisting of cutting-knives E E' and a striker F, arranged at the end of the folding mechanism to which the web passes, so as to cut the web on each side on the lines *d d'*, and a knife and striker at the other end of the folding mechanism for severing the under side of the tube and forming a lip *d*, all substantially as and for the purpose specified.

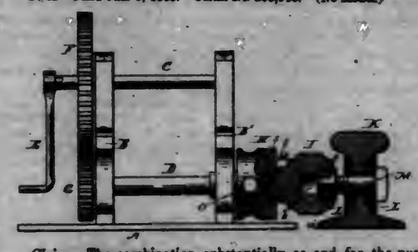
410,127. PACKING-RING. JEREMIAH J. SULLIVAN, Ludlow, Ky. Filed Mar. 13, 1889. Serial No. 303,112. (No model.)



Claim.—1. In a packing, the combination of the beveled split ring 5 and wedge-shaped split ring 6, one resting by its inclined face upon the inclined face of the other, with the intermediate rigid follower 4, having an inclined face resting on the inclined face of the beveled ring, the inside rigid follower 1, for advancing the intermediate follower upon the beveled ring against which it bears, and means for advancing the inside rigid follower, with the intermediate rigid follower, along a piston-rod, substantially as described.

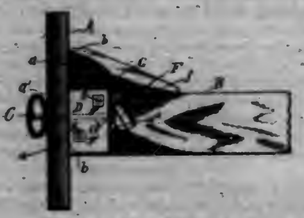
2. The combination, with the cylinder A, the cap B, and the piston-rod E, passing loosely through the cylinder-cap, of the beveled split ring 5 and the wedge-shaped split ring 6, both resting against the cap and one resting upon the other, the intermediate follower 4, having an inclined face resting against the inclined face of the beveled ring, the inside follower 1, bearing against the intermediate follower, and means for advancing both followers simultaneously along the length of the piston-rod, substantially as described.

3. A combined cylindrical and stem packing, consisting of the beveled follower 1, the split rings 2 and 3, the beveled follower 4, the split rings 5 and 6, and the devices for pressing the said follower against the other device to form a compound packing-joint, substantially as herein specified.



4. In combination with the cylinder S and the piston E, passing freely through the same, the beveled follower 1, the packing-rings 2 and 3, the beveled follower 4, and split packing-rings 5 and 6, in contact with the piston-rod, and a spring 7 for forcing the packing-rings together, substantially as herein specified.

410,128. STOVE-LINING. CHARLES TRUESDALE, Cincinnati, Ohio, assignor to William Rasor & Co., same place. Filed Apr. 13, 1889. Serial No. 307,110. (No model.)



Claim.—In combination with the fire-box of a stove having a grate, as J, a front lining composed of a series of detachable sections, as A B, supported wholly at their outer ends, as at *a b*, and having an expansive joint, as C D, at their meeting edges, whereby said sections are prevented bowing inwardly or sagging down in the center, and thus closing the uninterrupted opening I between said grate and lining, all as herein described.

410,129. POWER-WRENCH. THOMAS F. WELLS, Winchester, Mass., assignor to the Mechanical Manufacturing Company, Nashua, N. H. Filed Jan. 9, 1889. Serial No. 295,913. (No model.)

Claim.—The combination, substantially as and for the purpose set forth, of a bed-plate, upright fixed standards on said bed-plate, a crank-shaft supported in said standards and provided with a head having radial lever-sockets therein, a crank-shaft also supported on said standards above the wrench-shaft, gearing connecting said shafts, a detachable wrench on said head, and a crank attached to the crank-shaft.

410,180. BED-LOCK. CHARLES WESTON, Chester, assignor of one-half to John W. Wilkes, Wilkesburg, S. C. Filed May 6, 1889. Serial No. 309,722. (No model.)

Claim.—1. The combination of the bed-post A, provided with holes *a* and perforation *a'*, side rails B, provided with the pins *b* and rectangular opening g^3, block G, secured to said rail by means of glue and screws *g*, covered with blocks *g'*, and having through its center the perforation g^3, bolt D, passing through perforations *a'* and g^3, its elbow end *d* turned down into the rectangular opening g^3, cover F, having the recess *f*, fitting over the elbow end of said bolt D, and rectangular opening g^3, hand-nut C, having the dished face *c*, openings *c'*, threaded nut c^3, fitting into said opening, and block c^3, glued into and completely closing the outer part of said opening, all substantially as shown and described, and for the purposes set forth.

2. The combination of the bed-post A, provided with holes *a* and perforations *a'*, side rails B, provided with the pins *b* and rectangular opening g^3, block G, secured to said rail and having through its center perforations g^3, threaded and elbow bolt D, passing through perforations *a'* and g^3, cover F, fitting over the elbow end of said bolt and said rectangular opening, and hand-nut C, having nut c^3 fitting into its opening *c*, substantially as shown and described.

410,131. CORSET-FASTENING. SAMUEL S. WILLIAMSON, Bridgeport, Conn. Filed Apr. 27, 1889. Serial No. 308,867. (No model.)

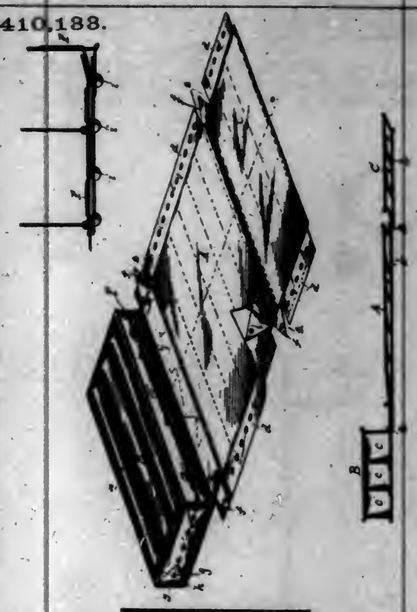
Claim.—1. In a clasp, the combination, with a stationary stud or post forming one element thereof, of the complementary element consisting of a plate having a slot extending inward from the front end thereof and enlarged at its rear end, a hook having a corresponding opening and pivoted against the plate and movable relative thereto, and a finger projecting upwardly from said hook behind the beak and movable with said hook, substantially as set forth.

2. In a clasp, the combination, with the stationary headed stud and the slotted plate opposite said stud, the rear end of the slot being adapted to admit the stud-head, of the hook having a downwardly-projecting grasping-beak whose line of movement is across the slot, near the outer end of the latter, having also an opening substantially identical with that in the plate and registering therewith, and having also the curved upwardly-projecting finger whose line of movement is across the line of the plate-opening, said finger adapted to be actuated by the forward movement of the stud, substantially as specified.

3. In a clasp, the combination, with the stud and the steel on which it is mounted, of the complementary steel, the plate slotted from its front end, the pivoted hook, a rivet whereby said hook is pivoted to the plate and the plate secured to the steel, a second rivet above and in line with the first-named rivet passed through the plate and steel, and an opening in the hook, into which the last-named rivet projects, said opening being formed in the arc of a circle struck from the lower rivet, substantially as specified.

410,132. WATER-MOTOR. LORIN R. WITHERELL, Davenport, Iowa, assignor of three-fourths to Edwin W. Brady, Oscar W. Brady, and Albert B. Brady, same place. Filed May 2, 1889. Serial No. 309,354. (No model.)

Claim.—1. The combination, with the two side plates and the inclined water-guide plate secured between them, of the water-wheel journaled in the side plates substantially in line with the top of the guide plate, and the adjustable curved plate provided with flanges at each end having their extremities journaled on the water-wheel shaft, and a longitudinal flange resting on the upper end of the said guide-plate, substantially as and for the purpose set forth.



2. The combination, with the two side plates and the inclined water-guide plate secured between them, of the water-wheel provided with a shaft and journaled in the side plates substantially in line with the top of the guide-plate, the curved plate provided with end flanges pivoted on the water-wheel shaft, and the longitudinal flange resting on the top of said guide-plate, and a toothed rack, and a revoluble toothed pinion gearing into the said rack for adjusting the position of the said curved plate, substantially as and for the purpose set forth.

410,133. MATTRESS. JOHN BLOCHER, Franklin Grove, assignor of one-half to Daniel F. Riddlebarger, China, Ill. Filed Mar. 27, 1889. Serial No. 304,961. (No model.)

Claim.—1. In a mattress, the combination, with the case formed with compartments and with end flaps provided with holes, as shown, of the buttons, the lacings passed through the undermost of the overlapped flaps and through the eyes of the buttons, which are passed through the holes in the outer flaps, and the lacing united, substantially as shown and described.

2. The mattress described, composed of the case formed in sections connected by flexible connections and with end flaps provided with holes, as shown, the buttons, the strips united to the upper and lower faces of the case upon the inner side thereof to form separate compartments, the filling in said compartments with the end flaps overlapped over the ends of the compartments, the lacings fast at one end and passed through the holes in the undermost of the overlapped flaps, and the buttons having their shanks passed through the holes in the outer flaps, and having the lacings passed through the eyes of said shanks between the flaps and the said lacings united around the side of the sections, substantially as shown and described.

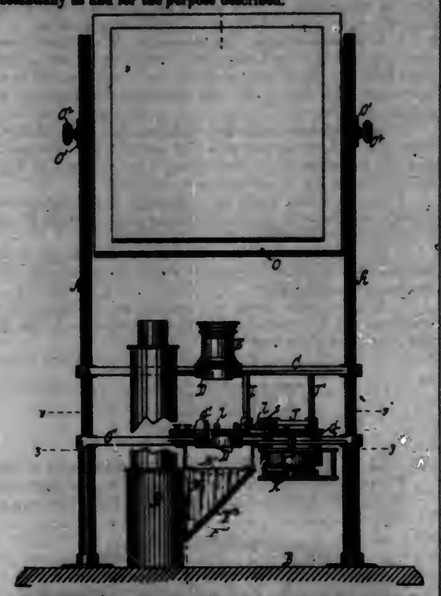
410,134.

410,134. METAL PILE OR FAGOT. HENRY W. SCHEIDHAUER, Pittsburg, Pa., assignor to Carnegie, Phipps & Co., (Limited,) same place. Filed May 3, 1889. Serial No. 309,460. (No model.)

Claim.—1. A fagot or pile consisting in the combination, with the layers of bars, of separate strips having scarfed or beveled edges and covering the exterior joints, substantially as and for the purpose described.

2. A fagot or pile consisting in the combination, with the inner layers, of separate strips covering the exterior joints and having tongues or ribs fitting within the same, substantially as and for the purpose described.

3. A fagot or pile consisting in the combination, with the inner layers of separate strips covering the exterior joints and having tongues or ribs fitting within the same and extending to the bases thereof, substantially as and for the purpose described.



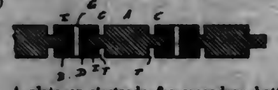
410,135. MAGIC LANTERN FOR ADVERTISING OR OTHER PURPOSES. CHARLES C. BECKNER and HENRY W. THORNTON, New York, N. Y. Filed Nov. 17, 1888. Serial No. 291,085. (No model.)

Claim.—1. An optical apparatus in which are combined a magnifying-lens and a condensing-lens axially coincident with each other, an intermittingly-revolving plate-carrier having a circular row of light-orifices adapted to axially coincide with said lenses, and a motor for operating said carrier, substantially as and for the purpose described.

2. An optical apparatus in which are combined a magnifying-lens, two condensing-lenses at right angles to each other, one condensing-lens being axially coincident with the magnifying-lens, a light-reflector at an angle to both condensing-lenses, an intermittingly-revolving plate-carrier having a circular row of light-orifices, and a motor for operating said carrier, substantially as and for the purpose described.

3. An optical apparatus in which are combined a magnifying-lens and condensing-lens axially coincident to each other, an object-reflector opposite to said magnifying-lens, an intermittingly-revolving plate-carrier having a circular row of holes between said lenses, and a motor for operating said carrier, substantially as and for the purpose described.

4. An optical apparatus in which are combined a magnifying-lens, two condensing-lenses at right angles with each other, one condensing-lens being axially coincident to said magnifying-lenses, an illuminator opposite to the other condensing-lens, a light-reflector at an angle to both condensing-lenses, an object-reflector opposite to said magnifying-lens, an intermittingly-revolving plate-carrier having a circular row of light-orifices, and a motor for operating said carrier, substantially as and for the purpose described.

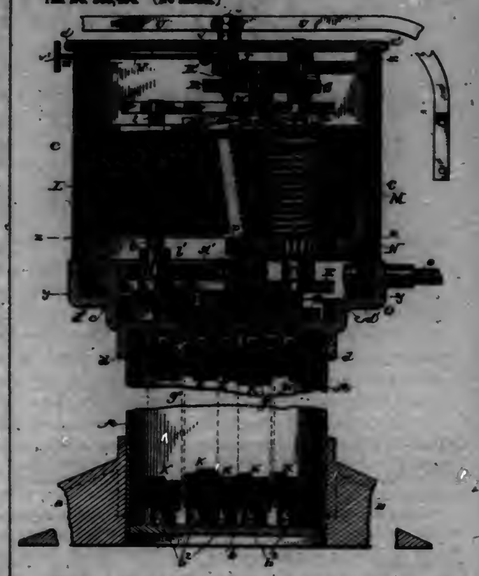


5. An optical apparatus in which are combined an intermittingly-revolving plate-carrier having a circular row of light-orifices and a corresponding row of stop-pins, a revolving tappet-arm adapted to engage with said pins of the carrier, a shaft carrying said arm, and a motor geared with said shaft, substantially as and for the purpose described.

6. An optical apparatus in which are combined an intermittingly-revolving plate-carrier having a circular row of light-orifices and a corresponding row of stop-pins, a tappet-arm having a transverse groove, the inner edge of which forms a continuation of one edge of said arm for engaging said pins of the carrier, a shaft carrying said arm, and a motor geared with said shaft, substantially as and for the purpose described.

7. An optical apparatus in which are combined two cross-heads having light-orifices axially coincident with each other, a magnifying-lens fitted in said orifice of the upper cross-head, a condensing-lens arranged below said orifice of the lower cross-head, an intermittingly-revolving plate-carrier having a circular row of light-orifices, and a motor for imparting motion to said carrier, substantially as and for the purpose described.

410,136. ELECTRODE FOR SECONDARY BATTERIES. CHARLES H. CARTER, Brooklyn, N. Y. Filed July 3, 1889. Serial No. 316,262. (No model.)



Claim.—1. A plate or electrode for secondary batteries, composed of a plate of metal or alloy not affected injuriously by the exciting-liquid of the battery and lead plugs or buttons held in apertures of said plate and provided at each end with a head located in recesses in the faces of said plate, substantially as set forth.

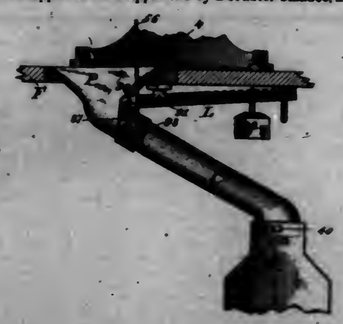
2. In a plate or electrode for secondary batteries, the combination, with a metal or alloy plate having apertures and a recess in each face at the ends of said apertures, of lead plugs held in said apertures and provided at their ends with heads within the recesses in the plate, said heads being smaller than the recesses, whereby annular spaces are formed between the edges of the heads and sides of the recess, substantially as set forth.

3. In a plate or electrode for secondary batteries, the combination, with a metal or alloy plate having apertures and a recess in each face at the ends of said apertures, of lead plugs held in said apertures and provided at their ends with heads within the recesses in the plate, said heads being smaller than the recesses, whereby annular spaces are formed between the edges of the heads and sides of the recess, said plugs each having a longitudinal bore, substantially as set forth.

410,137. SPRING-MOTOR. THOMAS P. COOK, Columbus, Miss., assignor of one-half to I. M. Tusher, same place. Filed Dec. 12, 1888. Serial No. 293,604. (No model.)

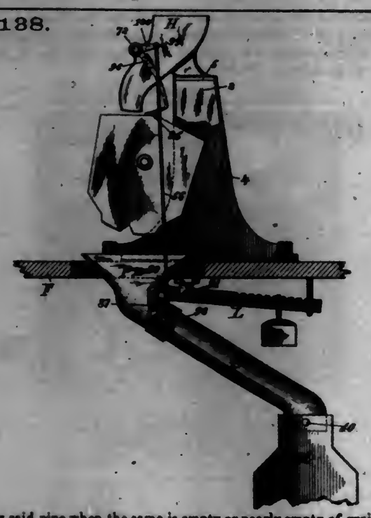
Claim.—1. In a spring-motor, the combination, with the coiled torsion-springs, of the inclosing-casing for said springs provided with notches or recesses, and a bottom plate having the springs rigidly connected thereto and provided with projections fitting the notches or recesses of the casing, whereby the said bottom plate will be held in position by the tension of the springs, substantially as described.

2. The combination, with the two fusees, one of which is provided with a stop and their connecting cord or rope, of the weighted stop-lever, substantially as described.



3. The combination, with the hollow column, of the torsional spring inclosed therein, the broad-faced pinion H, centrally located with respect to said springs, and the overlapping gears connected to said springs and engaging said broad-faced pinion, substantially as described.

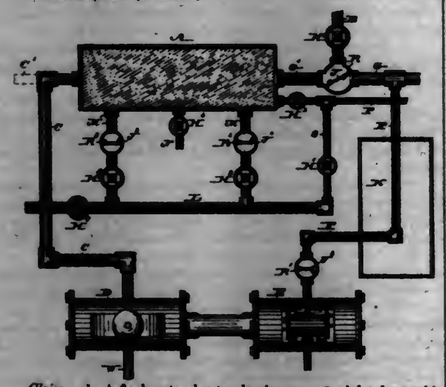
4. The combination, with the hollow supporting-column, of the gear-casing mounted thereon and the gearing-supports within said casing, the same consisting of the bottom casting *c*, the top plate *d*, the spiders E F, and the connecting-rods *e*, substantially as described.



410,138. REGULATOR FOR GRAIN-SCALES. CHARLES H. COOLEY, Hartford, Conn. Filed Jan. 17, 1889. Serial No. 296,678. (No model.)

Claim.—1. In apparatus for regulating the discharge of grain, the combination of the fixed chute, the inclined conductor supported at its lower end and counterbalanced, substantially as described, and the regulator-valve, said conductor being operatively connected with said valve to close the same on the downward movement of the conductor, all substantially as described.

2. In a regulator for grain-scales, the combination, with the inclined receiving-pipe G, sustained in part by a fixed pivot at its lower end and supported at its upper end by a counter-balance, normally ap-



410,188.

holding said pipe when the same is empty or nearly empty of grain, of the regulator-valve above said conduit, and connections, substantially as described, actuating said valve to close the same on the downward movement of said pipe, substantially as described.

3. In a regulator for grain-scales, the combination, with the chute and the regulator-valve, of the pipe C, pivotally supported at its lower end, weighted lever L, links 87, and rod 56, substantially as shown and described.

410,189. FEED-WATER HEATER. ALEXANDER DE BRAUMONT, Philadelphia, Pa. Filed July 14, 1887. Renewed June 26, 1889. Serial No. 315,592. (No model.)

Claim.—1. A feed-water heater having a water-inlet, in combination with a steam-pipe leading into said water-inlet, a valve-chamber with check-valve at the junction of said steam-pipe and water-inlet, and an outlet-pipe for said filter, substantially as described.

2. A feed-water heater having a water-inlet, in combination with a steam-pipe leading into said water-inlet, an outlet-pipe from said filter, an engine with pumping device, and an exhaust-pipe leading from said engine to said steam-pipe, substantially as described.

3. A feed-water heater with water-inlet, in combination with steam-pipe leading into said water-inlet, a valve-chamber with a check-valve at the junction of said steam-pipe and water-inlet, and an exhaust-steam pipe leading into said steam-pipe, substantially as described.

4. In a feed-water heater and condenser, the combination of a filter-chamber A, having inlet-pipes B C', and with the outlet-pipe C', with the steam-pipe G, the steam-pump D, and exhaust-pipe F, extending into the pipe G, substantially as described.

5. In a feed-water heater, the combination of the inlet and outlet pipes with the steam-pipe G and the cleansing-pipes L, M, M', and P, substantially as described.

6. In a feed-water heater or condenser, the combination of the inlet-pipes G G' B and the exhaust-pipe F with the check-valves J J', substantially as described.

7. In a feed-water heater or condenser, the combination of a water-inlet pipe B, a steam-inlet pipe G, and check-valve J, with the pipe G', substantially as described.

REISSUES.

11,027. COVER FOR BARRELS. JOSEPH MOOSBRUGGER, St. Paul, Minn., assignor of one-third to Charles Bruno McBride, same place. Filed Oct. 23, 1887. Serial No. 253,129. Original No. 368,967, dated Aug. 30, 1887.

Claim.—1. A grated receptacle-cover composed of an outer and an inner band, an intermediate band lying in a higher plane than the other bands, and a series of strands connecting the several bands and forming a central grated portion to cover a receptacle, substantially as described.

2. A grated receptacle-cover composed of the series of three bands, the middle one lying in a higher plane than the others, and the series of strands connected at one end to the inner band, then passing around the middle band, and thence downward and connected to the outer band, substantially as described.

3. A grated receptacle-cover formed of strands interwoven with one another to form a central grated portion, and then extended in single unwoven strands upwardly above the plane of the central portion, and then downwardly to form diverging sides, and a band to which the single strands are connected to hold them in position, substantially as described.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the District of Columbia.

THE UNITED STATES *ex rel.* ANTHONY POLLOK *v.* HALL, Commissioner of Patents.

Decided November 12, 1888.

1. Whenever a reasonable suggestion of its necessity for the purposes of evidence is made by the person requesting it, the Commissioner of Patents cannot lawfully refuse to furnish a certified copy of an abandoned or rejected application for a patent. The right to be furnished such a copy is given to the public by statute, and the refusal thereof entitles the applicant to the writ of *mandamus* against the Commissioner to compel a compliance with such request.
2. An attorney at law who has requested such a copy in behalf of his client and been refused has such an interest in the subject-matter as entitles him to commence proceedings in his own name as relator for the writ of *mandamus*.

PETITION for *mandamus* against the Commissioner of Patents.

Mr. Phillip Mauro for the relator.
Mr. L. A. Palmer for the Commissioner.

Before the CHIEF JUSTICE and JUSTICES COX and MERRICK.

Mr. Justice MERRICK delivered the opinion of the court:

The court has had under consideration the application of Anthony Pollok for a writ of *mandamus* against the Commissioner of Patents to compel him to give a certified copy of a certain abandoned application for a patent remaining on file in the archives of that Office.

In response to that application the Commissioner sets up that, while he considers that the relator is an attorney in the regular practice of his profession before the Patent Office, and that he is also, in point of fact, the attorney employed by the party in whose behalf he makes the application for the copy in question, he has no right to it, first, because he is not the party having the legal title to the subject-matter; second, that it does not appear that the paper is really requisite for the purposes of evidence in the alleged cause, and, third, that under Rule 179 of the Patent Office the Commissioner of Patents has a discretion to grant or withhold information in that class of cases at his pleasure, or at his discretion—the terms as used seem to be convertible.

In order to ascertain if there were just foundation for the refusal of the Commissioner of Patents, as well as to understand the scope of that refusal, it is proper for a moment to advert to first principles. For what was the Patent Office established, what was the design of its institution, and what rights does it protect? We know that at common law there was no such thing as a monopoly in an invention, or a monopoly in the use of knowledge which the party possessing it had once communicated in any manner to his fellow beings; that the revelations of thought and intellect are common property, and there is no monopoly or exclusive right in such things except so far as they have been conferred by positive law, and positive law has never gone any further to confer exclusive property in such things than for purposes of encouragement of science and the development and advancement of art. That it may not be supposed that the court is for the first time announcing this as a general principle of the common law, though it is familiar to all lawyers, we refer to the language of the Supreme Court in the case of *Gayler* v. *Wilder* (10 How., 495) and read a certain passage from that opinion:

> Now, the monopoly granted to the patentee is for one entire thing; it is the exclusive right of making, using, and vending to others to be used the improvement he has invented and for which the patent is granted. The monopoly did not exist at common law, and the rights, therefore, which may be exercised under it cannot be regulated by the rules of the common law. It is created by the act of Congress, and no rights can be acquired in it unless authorized by statute and in the manner the statute prescribes.

The authority for legislation on the subject is found in that clause of the Constitution which says:

> The Congress shall have power to promote the progress of science and the useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries.

Here we find the entire scope of the right of exclusiveness, and as involved in the right of exclusiveness the entire scope of the right of secrecy. In pursuance of the above delegation of power Congress has established the Patent Office and has established certain rules and regulations with respect to it, and among those rules the only rule of secrecy is that which is made in aid of the inventor who has not yet perfected his design, and which enables him to present an application to the proper authorities to secure his invention, and while he is using all diligence to confer upon the public the knowledge that he possesses it gives him further opportunities to perfect his invention before he makes an application for a definitive patent. That limitation of the authority of publicity, that single grant of secrecy, is to be found in section 4902 of the Revised Statutes, in these words:

> Any citizen of the United States who makes any new invention or discovery and desires further time to mature the same may, on payment of the fees required by law, file in the Patent Office a caveat setting forth the design thereof and of its distinguishing characteristics, and praying protection of his right until he shall have matured his invention. Such caveat shall be filed in the confidential archives of the Office and preserved in secrecy, and shall be operative for the term of one year from the filing thereof; and if application is made within the year by any other person

for a patent with which said caveat would, in any manner, interfere, the Commissioner shall deposit the description, specification, drawings, and model of such application in like manner in the confidential archives of the Office and give notice thereof, &c.

That is the only qualification in regard to publicity which runs through the entire patent law, because you will find, not only from the general principles that have been spoken of, but also from the provisions of various sections of the patent law, that there is an obligation on the part of the officers of the Patent Office to make known and to disseminate before the public the knowledge of all inventions. They are required by divers sections to publish from time to time and have printed, and that, too, under seal, so that they may be evidence in courts of justice, volumes containing the specifications, descriptions, and drawings of all patents that have been issued under the authority of the United States. (See sections 490, 491 R. S., U. S.)

Besides being required to make these public communications of knowledge for the benefit of mankind, to promote the progress of science and the useful arts, there is a section (493) which makes it incumbent upon the Commissioner of Patents to give specific information by uncertified copies, which goes on to say:

The price to be paid for uncertified printed copies of specifications and drawings of patents shall be determined by the Commissioner of Patents, within the limits of ten cents as the minimum and fifty cents as the maximum price.

So that by this section of the law it is the right of any and every man to obtain an uncertified copy of specifications and drawings on file in the Patent Office at the minimum price to be fixed by law. Besides that, and besides the general provision in regard to published copies of the proceedings in the Patent Office under seal, there is another provision in section 892 for certified copies in particular classes of cases:

Written or printed copies of any records, books, papers, or drawings belonging to the Patent Office, and of Letters Patent authenticated by the seal and certified by the Commissioner or Acting Commissioner thereof, shall be evidence in all cases wherein the originals could be evidence, and any person making application therefor and paying the fee required by law shall have certified copies thereof.

Now, the Commissioner of Patents in his response to the present application of the relator seeks to withdraw this case from the ordinary requirements of publicity and bring it within the special requirements of secrecy under section 4894, which is in these words:

All applications for patents shall be completed and prepared for examination within two years after the filing of the application, and in default thereof, or upon failure of the applicant to prosecute the same within two years after any action therein, of which notice shall have been given to the applicant, they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable.

In connection with that clause of the statute they have promulgated a rule in the Patent Office, (Rule 179,) which is as follows:

Copies of the files of rejected and abandoned applications may be furnished when ordered by the Commissioner. The requests for such copies must be presented in the form of a petition properly verified as to all matters not appearing of record in the Patent Office.

It is upon the construction of that rule as compared with the clause of the statute that I have read that the Commissioner seeks to maintain that he has a discretionary power to grant or refuse an application. Why? Is there anything in the law which I have read about the duration of time when an application may remain without abandonment that justifies the supposition that the right of secrecy shall attach to an application of that sort after it has lain in the Office during all the period provided by law? The statute expressly says that after it has lain in the Office the period provided by law—viz., two years—as an unperfected application, it shall be considered as abandoned, unless there be good cause of delay shown, which is not in this case.

What is abandonment? The definition is given in the case which I have already quoted, by one of the judges, in part of one of the opinions there, that abandonment is a dedication to the public—that is to say, that the party has withdrawn himself from the claim of monopoly and exclusive use which he might have had for his invention, and, notwithstanding whatever it may be worth, it thenceforth belongs to the public. It is abandoned to the public.

Now, when a thing has been dedicated to the use of the public, taken out of the special provisions contemplated in the monopoly in favor of an individual in derogation of the principles of the common law, the question arises, can the Commissioner of Patents assume a discretionary power to keep that in secret which belongs to the public, that which the inventor thought out under the revelation of the Divine mind and which has been consecrated to the use of mankind? It cannot be. And while the Commissioner of Patents has the right to make all just rules and regulations for the administration of his office, he has no right to make a rule which derogates from common right and deprives mankind of that which belongs to it as common property. Then, according to the construction which has been indicated as flowing from these statutes, an application once made and filed in the Patent Office belongs to the whole public, and, according to the scheme of the patent law, everything placed in the Patent Office (completed or incompleted) belongs to the public, subject to the qualification of the individual rights of the applicant and patentee. Then has not every man a right in common to the benefit of that knowledge which is thus dedicated to the public?

It was urged in the argument that the Commissioner had a right to hold abandoned applications as part of the secret and confidential archives by reason of a decision of the Supreme Court in *Brown* v. *Guild*, (23 Wall., 181.) All that the Supreme Court decided in that case as to abandoned applications was that an abandoned application stood upon the same level with an abandoned experiment and did not constitute a bar within the terms of the patent law to the grant of a patent to a subsequent discoverer. They say in that case that—

a mere application for a patent is not mentioned (in the statutes) as a bar. It can only have a bearing on the question of prior invention or discovery. If upon the whole of the evidence it appears that the alleged prior invention or discovery was only an experiment and was never perfected or brought into actual use, but was abandoned and never revived by the alleged inventor, the mere fact of having unsuccessfully applied for a patent therefor cannot take the case out of the category of unsuccessful experiments.

But there is nothing in that decision which detracts from the right of the public to the knowledge which the applicant has by his abandonment placed at the disposal of the public. On the contrary, the Court recognizes distinctly that such application may have a bearing upon the question of prior invention. If, then, it be in the opinion of the Supreme Court a proper element of evidence when the question of prior invention or discovery arises, it must follow that the Commissioner of Patents cannot withhold the necessary information to be derived from the record of such application whenever it may reasonably be demanded for the purposes of evidence, as in the controversy now before us.

The only question that remains is whether an applicant for information thus withheld is entitled to the compulsory process of a court of justice to require the disclosure of that knowledge and possession of the proper evidences of that knowledge.

The writ of *mandamus*, being a "prerogative" writ, as it is called—one not to be granted upon light considerations—is yet a writ which belongs to every citizen where the law gives him no other remedy, and where it appears that he has a right which has been obstructed. To put a familiar case before going on with the one under consideration, suppose an attorney at law, in the progress of his professional business and avocation, has occasion to go to the office of the recorder of deeds for the purpose of investigating a title or of gaining knowledge in respect to a title there of record, and the recorder of deeds refuses him permission to examine the records. Is it not clear that he is entitled to the benefit of the writ of *mandamus* for that purpose? Is not the right of the client, and is not also the right of the attorney at law employed by the client in the ordinary pursuit of his profession, violated so as to give him a substantial position in a court of justice to demand redress for the wrong which has been committed upon him? Now, how does that case differ in substance from the application which has been made in this particular case? The relator sets forth that he is an attorney at law in the pursuit of his profession; that he has constant occasion to inspect and examine the records which are on file within the office of the Commissioner of Patents; that in this particular case he has been delegated by his client to obtain information in this particular case requisite for the purpose of a suit now pending between his client and the party interested or supposed to be interested in this application in the courts of France. Is it necessary under such circumstances that the client himself should apply for the writ of *mandamus*? It was argued here that no one except the person that had title to the property could make an application for a *mandamus;* that an attorney, as such, could not make the application for the writ. But the rights that have been spoken of which appertain to the attorney, *qua* attorney, and appertain to him individually, irrespective of anybody else, show that he has a property of a sort in this case which a court of justice will protect, and that it is very different from the case which was relied upon in argument where an attorney seeks a *mandamus* to compel an officer to issue a patent to a party for some subject-matter in which the party alone is interested. The attorney has no interest in the title to the property, and therefore cannot in the case supposed apply for and compel the issue of the *mandamus*, because he has no specific interest in the subject of the title. But in this case the attorney has specific interest, not in any distinctive title, but in a matter of property common to himself and all mankind, and in regard to which he has also, to a certain extent, what may be called a "peculiar special property"—the interest devolved upon him by his avocation of attorney in the proper prosecution of his professional rights and professional duties. It seems, therefore, that the objection which is made by the Commissioner of Patents, upon the ground that the relator is not a party in interest having title to the property does not avail when we consider the character and object of the application.

The Commissioner makes another objection, which is that it does not appear to his satisfaction that the purpose for which it is wanted—viz., to be used in evidence in a case—is substantial, because he does not see how the matter is to become evidence. Now, the court is of opinion that he is not placed in his position for any such purpose, and that it is sufficient that a reasonable suggestion of necessity for the use of a document for evidence be made, in order to set in motion his duty to furnish the copy. He is not there to sit as a judge in the controverted cause. If the suggestion be made by a reasonable person and under reasonable conditions, that suggestion should be conclusive upon him so far as the efficacy of the paper for the purposes of evidence is to be an element in the application for a copy for the purposes of evidence under the clause of the statute which has been read. But in this case it should have been evident to the Commissioner of Patents that it was his manifest duty to give the copy, for two reasons: It appears upon the face of the application not only that it is wanted for the purposes of evidence but that, in point of fact, properly considered, the paper which is in question, and which he denies access to, belongs to the public and is properly part and parcel of the patent with reference to the litigation about which the document has been wanted for purposes of evidence, for the reason that that rejected application and the descriptions of the matter contained in that rejected application are made by reference part of the very specification of the patent in question, and therefore it was his duty, independent of the general requirement of furnishing a copy for the purposes of evidence, to have given that copy as part and parcel of the published patents and published specifications of the patent in question. Being incorporated into it by reference, it is in contemplation of law part and parcel of the specification of the patent, which patent with its specifications, by the general provisions of law, it is incumbent upon the Commissioner of Patents to publish to the world in the various modes which have been indicated under the Rules of the Patent Office, which have been read. It will appear in the seventy-fifth paragraph of the specifications of Patent No. 279,717, which is the patent of the party in question, that he does incorporate this rejected application in these words:

While the sides of the counter-stiffeners will be pressed inward by the action of the mold J to form what I term a "reshaped unflanged counter," substantially as shown and described by me in another application of even date herewith.

Which application "of even date herewith" is the rejected application which he now refuses to permit anybody to have access to. Of course, any lawyer, reading that specification and seeing that it referred to the rejected application for the purpose of part of

its description, and as a more full and complete identification of its subject-matter, and of the manner in which the subject-matter acts, will see that that rejected application is by contemplation of law a parcel of the specification, and therefore that the whole public is entitled to have what is in that rejected application in order to comprehend the nature of the specification in the patent which has been published; but the Commissioner of Patents, (or, rather, we should say, in justification of the Commissioner of Patents personally, some subordinate in his Office, because he has so many large duties that all these things have to be confided to subordinates, and consequently, although the return is under his name, it is probably at second hand,) notwithstanding the quotations that have been made, in his return undertakes to justify his refusal by a part of his return, in which he says that he had referred the application to a subordinate, with this result, that his refusal to order such copy to be furnished to the relator was in the following words:

Examiner: Please report below, without delay, whether the abandoned application referred to in the letter attached contains any invention or matter not covered by Patent No. 279,717.
(Signed) BENTON J. HALL.

Respectfully returned with remark that upon careful examination I am unable to find any legitimate connection between the Patent No. 279,717 and the abandoned application referred to. The patent covers a machine for the manufacture of counter-stiffeners without reference to the special configuration. The abandoned application describes as the alleged invention a counter-stiffener of definite construction, and incidentally states that it may be made by a method claimed in the patent, and may also be made by other methods. The patent and abandoned application stand clearly independent of each other.
(Signed) J. P. CHAPMAN,
Examiner Div. 11.

And then follows the rest of the communication:

The within request is denied for the reason that the showing is insufficient wherein the abandoned application is material and important as evidence, and for the further reason that the Commissioner is advised by the Examiner that there is no legitimate connection between the Patent No. 279,717 and the abandoned application referred to.
(Signed) BENTON J. HALL,
Commissioner.

It seems, then, to have been on the above mistaken considerations that the Commissioner refused the application of the relator.

Without going any further into the matter, it must be apparent from the review that has been given that the Commissioner is without legal ground of objection to the demand which has been made by the relator in the particular case, not only the general considerations referred to, but for the special reason deduced from the identity of the document itself as one of the documents belonging to the public as parcel of patent and specification No. 279,717, and that the Commissioner should not have denied the application. And if the Commissioner had followed up the rules of his Office, to which he refers, with a just appreciation of the relation between those two documents, the one to the other, he would have been enabled to escape from the error into which he was led by inadvertence in this particular instance. Among other things in his return, he relies upon Rule 15, which is in these words:

Caveats and pending applications are preserved in secrecy. No information will be given, without authority, respecting the filing by any particular person of a caveat or of an application for a patent or for the reissue of a patent, the pendency of any particular case before the Office, or the subject-matter of any particular application, unless it shall be necessary for the proper conduct of business before the Office, as provided by Rules 97, 108, and 108.

Now, if he had been enlightened as to the true nature of this application and the interdependence between these two documents, he would have found the following in the very next rule:

16. After a patent has issued, the model, specification, drawings, and all documents relating to the case are subject to general inspection, and copies, except of the model, will be furnished at the rates specified in Rule 218.

There was therefore his own Rule 16, which shows that it was imperative upon him, under circumstances such as have been indicated, appertaining to this particular document and its relation to an existing patent, to have granted the application which he has refused. All this was doubtless from inadvertence upon the part of the Commissioner of Patents, and it is only justice to the Commissioner that the court should say that he is not personally to have imputed to him any fault or misconduct, although, of course, he is held legally responsible for the acts of his subordinates. For these reasons, without enlarging further upon the matter, the court is of the opinion that the relator is entitled to the writ prayed for.

U. S. Circuit Court—Northern District of Illinois.

COLEMAN HARDWARE COMPANY *et al. v.* KELLOGG *et al.*

Decided May 27, 1889.

SHUMARD—SASH-BALANCE—INFRINGEMENT.

The patent granted September 18, 1883, No. 285,079, to Warren Shumard, for a sash-balance which has a brake so arranged as to be adjustable from the outside, the brake being an ordinary brake-shoe bearing on the periphery of the drum, with the pressure secured by a spring, is infringed by the use of a band-brake bearing on the periphery of the drum and adjustable from the outside, band-brakes having been well-known equivalents for spring-brakes at the time of the issue of the Shumard patent.

ON MOTION for injunction. Bill to restrain infringement of a patent by the Coleman Hardware Company and others against Kellogg, Johnson & Bliss, impleaded with the Pullman Sash Balance Company.

Messrs. Banning & Banning & Payson for the complainants.

Mr. George P. Barton for the defendants.

BLODGETT, *J.:*

This is a motion for an injunction to restrain the infringement by defendants of a patent granted September 18, 1883, to Warren Shumard, for a sash-balance. The device covered by this patent is what is known as a "spring-balance" for a window-sash, instead of the ordinary pulley-balance. The proof now before me shows that this class of devices is not new, one of the patents cited having been issued in 1856; but the feature in the complainants' patent which seems to me to be new and meritorious is the brake so arranged that it is adjustable from the outside. Defendants' patent also shows a brake adjustable from the outside, and differing only from the complainants' in the fact that it is what is known as a "band-brake," bearing upon the periphery of the drum, while complainants' brake is the ordinary brake-shoe, bearing upon the periphery of the drum, and the pressure secured by a spring. There is no essential difference in the function of the two brakes; but the band-brake was a well-known equivalent for a spring-brake like the complainants' at the time complainants' patent was issued. I think, therefore, as at present advised from the proof before me, that the difference so far as the brake is concerned between complainants' and defendants' device is merely colorable, and that defendants infringe upon this feature of complainants' patent, and possibly upon other features.

An injunction will therefore be ordered according to the prayer of the bill.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1863, to June 30, 1887, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.
